Methods	Participants	Outcomes	Interventions	Notes
ALTERMAN1993				
Study Type: RCT (randomised controlled trial) Study Description: Gellerman series randomisation Type of Analysis: Completers Blindness: No mention Duration (days): Mean 28 Setting: COUNTRY: US Day hospital vs inpatient Info on Screening Process: 94 men seeking treatment for cocaine abuse and dependence at a medical centre included in study	 n= 94 Age: Mean 34 Sex: all males Diagnosis: 100% cocaine dependence by DSM-III Exclusions: - Older than 59 years Not willing to accept either inpatient or day hospital rehab treatment for approx 1month Unstable residence/unable to be contacted at follow-up History of psychotic disorder Indication of dementia Possibility of medical problems requiring inpatient treatment Not meeting current DMS-III diagnosis of cocaine misuse No current substance misuse problems Female Notes: ETHNICITY: 96.8% Black Baseline: (Day hospital/Inpatient) Years of cocaine use: 2.7 (2.4) / 3.2 (2.9) Years of marijuana use: 9.2 (7.7) / 7.5 (17.1) 	Data Used Abstinence: from alcohol Cocaine use: times in past month Treatment completion ASI (Addiction Severity Index)	 Group 1 N= 48 Day Hospital - Group meetings focus on overcoming denial & helping ppts to cope with everyday problems/stresses. Individual counselling & ancillary psychotropic med on as-needed basis. Education re: effects of addiction. Recreational therapy & self help groups encouraged. Ppts paid \$15 for completing baseline assessment and \$10 for providing urine samples and completing each follow-up interview and given tokens for daily weekend travel to programme plus lunch coupons. Group 2 N= 46 Inpatient treatment - Participants received exactly the same intervention as those in the day treatment condition, the only difference is setting. More medical care is usually provided in the inpatient program. 	
GREENWOOD2001 Study Type: RCT (randomised controlled trial) Study Description: Residential clients housed whereas day clients returned home at the end of day Blindness: Open Duration (days): Mean 180 Followup: 6, 12 and 18 months Setting: US Notes: RANDOMISATION: method not reported; baseline taken at 2 weeks post- randomisation Info on Screening Process: Total of 534 participants randomly assigned	n= 215 Age: Mean 33 Sex: 183 males 78 females Diagnosis: 13% opioid dependence 10% alcohol dependence 67% stimulant dependence Notes: Crack cocaine (stimulant dependence) Baseline: Crack use = 67%, heroin use = 13%, alcohol = 10%	Data Used Abstinence at 6 months Completion rate Urinalysis: positive for any drug Notes: DROPOUTS: Residential TC = 42%, community TC = 55%	 Group 1 N= 115 TC (therapeutic community) with residential rehabilitation - Four phases: orientation (education about TC rules), treatment (focus on drug misuse problems), re-entry (focus shifted to setting up employment) and aftercare (outpatient follow-up) Group 2 N= 101 TC (therapeutic community) with outpatient - Four phases: orientation (education about TC rules), treatment (focus on drug misuse problems), re-entry (focus shifted to setting up employment) and aftercare (outpatient follow up) 	All participants seeking treatment 58% African, 24% Caucasian ,18% other backgrounds Study quality: 1+
SCHNEIDER1996 Study Type: RCT (randomised controlled trial) Study Description: Blinding of research assistant at intake assessment and of treatment providers	n= 74 Age: Mean 34 Sex: 54 males 20 females Diagnosis: 100% cocaine dependence by DSM-III-R	Data Used Abstinence: no use for 3 consecutive weeks a end ASI (Addiction Severity Index)	Group 1 N= 32 Day treatment (>20hr/wk) with outpatient 5 hours/day for 5 days/wk over 2 wks. Focused primarily on group work: psychoeducation groups, discussion groups to address denial and feelings, CBT (RP) groups, family meetings,

Duration (days): Mean 14	- medically unstable	missed first appointment or dropped out after 1	aftercare plans. NA/AA encouraged.	
Followup: 3 and 6 months Setting: Recruitment from two private hospitals in the US Notes: Randomisation not described Info on Screening Process: 364 eligible and admitted for detoxification; 290 refused consent (had specific aftercare preference or wanted no aftercare); 22 left detoxification early or previously participated in study; 74 enrolled	 - coexisting Axis I disorder Notes: PRIMARY DIAGNOSIS: Undergoing detoxification from cocaine at intake Baseline: (Residential / day treatment) Years' cocaine use: 6.5 / 7.2 Freebase use: 73% / 81% Previous inpatient treatment: 48% / 50% 	day): residential 5%, day treatment 53%	Group 2 N= 42 Residential rehabilitation 6 hours/day of treatment in a private, inpatient non-hospital facility. Content of treatment similar to day treatment group. At discharge, referred to another appropriate treatment programme (e.g. halfway house) or back to primary mental health provider.	

Characteristics of Excluded Studies

Reference ID	Reason for Exclusion
CZUCHRY2003	No drug-use outcomes
DRAKE1998A	Dual diagnosis
FISHER1996A	Sample sizes not reported (appear to be <10 in each group)
HAWKINS1986	No drug-use outcomes
KASKUTAS2005	'Hospital' setting was not residential
NUTTBROCK1998	High proportion were psychotic
SACKS2003	Dual diagnosis
ZULE2000	No intervention
