## NATIONAL INSTITUTE FOR CLINICAL EXCELLENCE

## INTERVENTIONAL PROCEDURES PROGRAMME

# Interventional procedure overview of balloon angioplasty for systemic to pulmonary arterial shunts

#### Introduction

This overview has been prepared to assist members of the Interventional Procedures Advisory Committee (IPAC) advise on the safety and efficacy of an interventional procedure previously reviewed by SERNIP. It is based on a rapid survey of published literature, review of the procedure by Specialist Advisors and review of the content of the SERNIP file. It should not be regarded as a definitive assessment of the procedure.

#### **Date prepared**

This overview was prepared by Bazian Ltd in April 2003.

#### **Procedure name**

Balloon angioplasty for systemic to pulmonary arterial shunts

#### **Specialty societies**

British Society of Interventional Radiologists British Paediatric Cardiac Association

#### Description

Systemic to pulmonary shunts are surgically-created connections between the aorta and a pulmonary artery in children with cyanotic congenital heart disease such as tetralogy of Fallot or tricuspid atresia. They increase the blood supply to the lungs and the arterial oxygen saturation. The procedure is palliative, aiming to improve symptoms. In some children, definitive surgery may be possible later. The most common type of systemic to pulmonary shunt is known as the Blalock-Taussig shunt.

Systemic to pulmonary shunts may become blocked or narrowed (stenosed) because of scarring or thrombosis. Balloon angioplasty of shunts is a palliative procedure carried out to relieve the blockage or narrowing. The procedure involves inserting a catheter into a large blood vessel (usually in the groin), passing it up in to the chest under X-ray surveillance and inflating a balloon in the narrowed area. This may avoid a repeat surgical systemic to pulmonary shunt procedure.

#### Efficacy

According to the literature, balloon angioplasty of systemic to pulmonary shunt improves arterial oxygen saturation. There are no studies comparing the benefits of balloon angioplasty with repeat open surgical shunt creation.

According to the Specialist Advisors, the procedure is efficacious.

#### Safety

The literature on risks of the procedure is very limited.

According to the Specialist Advisors, risks tear of vessel or shunt, death, complete shunt occlusion, rupture, thrombosis, haemorrhage, embolic stroke, and pulmonary embolism.

#### Literature review

#### Appraisal criteria

Studies examining balloon angioplasty procedures for systemic to pulmonary arterial shunts were included.

#### List of studies found

No systematic reviews, randomised controlled trials or non-randomised controlled studies were found.

Thirteen case series including two or more people were found. The five largest are described in the table.

References to smaller studies are given in the Appendix.

# Summary of key efficacy and safety findings

Study details	Key efficacy findings	Key safety findings	Key reliability and validity issues
Wang, 2001 <sup>1</sup>	Successful angioplasty (defined as	8 people required early	Uncontrolled case series
Case series	>20% increase in oxygen	additional procedure	
Taiwan	saturation): 42 people		Excluded 21 people referred for
		At follow up, 29 people had	definitive repair
n=46 (age range 1 month to 7.4 years)	Mean oxygen saturation in the aorta	repeat imaging; 26 had open	
	increased from 74 to 81%	heart surgery, of whom 2 died	10 people had additional balloon
Follow up 12 months			angioplasty to pulmonary artery
Saltik, 2000 <sup>2</sup>	Increase in mean arterial oxygen	Pulmonary hypertension: 1	Uncontrolled case series
Case series	saturation from 66% to 78%	person	
Turkey	(p<0.05)		Very small study
		1 person could not be weaned	
n=8 (7 children, age range 1 to 11 years)	At follow up, condition of all patients	off ventilator, died of pneumonia	
and 1 adult (aged 38)	improved		
Follow up 3 to 37 months			
Alcibar, 1994 <sup>3</sup>	Mean oxygen saturation increased	None provided	Uncontrolled case series
Case series	from 63% to 82% (p<0.05)		
Location not clear, assumed to be Spain	u ,		Very small study
n=6			
			Data extracted from abstract
Rao, 1990 <sup>4</sup>	Technical 'success': 5/6	'No complications'	Uncontrolled case series
Case series			
USA	Mean oxygen saturation increased		Very small study
	from 71% to 81%		
n=6 (age range 6 to 60 months)			
Mean follow up 6 months			
Marx, 1988 <sup>5</sup>	Mean oxygen saturation increased	3 complications:	Uncontrolled case series
Case series	from 72% to 77%:	1 thrombosed femoral artery	
USA		<ul> <li>1 balloon rupture</li> </ul>	Very small study
	Technical success: 5/6	<ul> <li>1 severe arterial vasospasm</li> </ul>	-
n=6 (mean age 12 months)			
/			
Mean follow up 4 months			

#### Validity and generalisability of the studies

Only case series were found. These provide limited evidence of efficacy and safety of the balloon angioplasty of systemic to pulmonary shunts compared with repeat surgical shunt creation. One of the case series was reasonably large.<sup>1</sup>

#### Specialist advisor's opinion / advisors' opinions

Training required in complex interventional procedures. Catheterisation laboratory, anaesthesia and cardiac surgery backup required.

UK Central Cardiac Audit Database (UKCCAD) database is registering these procedures.
