

## Breast cancer – reducing arm and shoulder mobility problems after breast cancer surgery or radiotherapy (update)

### Consultation on draft guideline - Stakeholder comments table 03/02/23 – 17/02/23

| Stakeholder                   | Document  | Page No | Line No | Comments  | Developer's response   |
|-------------------------------|-----------|---------|---------|---|--|
| Association of Breast Surgery | Guideline | 3       | 22      | It would be a challenge to ensure supervised support as most NHS facilities do not have access to physiotherapy support for routine post-op care. It is challenging to organise timely physiotherapy support for high risk individual at present. | Thank you for your comment. The committee discussed your concerns. This was added to the equalities and health inequalities assessment form (EHIA). Interventions delivered virtually may help to reduce health inequalities and address access options for people where other interventions are not locally available. This is likely to have a lower impact on NHS resources than being in-person 1-to-1 sessions and could free up resources for face-to-face interventions for those for whom virtual is not appropriate or cannot access. |
| Association of Breast Surgery | Guideline | 3       | 22      | I would suggest discussion of post-op cording after axillary surgery in this document for education and counselling along with impact on recovery of shoulder function and need for exercises.  | Thank you for your comment. The committee recommended breast care units to have documented local guidelines for postoperative physiotherapy that have been agreed with the physiotherapy department. These guidelines should include details on the type of upper limb exercises to be carried out, who and when to give information and instructions on these exercises, and that the exercises should be tailored for each person based on their needs.  |

|---|-----------|---------|---------|---|---|
| Association of Chartered Physiotherapists in Oncology and Palliative Care | Guideline | 4       | 4       | We have concerns about the phrase “trained in physiotherapy”. The title “Physiotherapist” is a protected title, you cannot claim to be “trained in physiotherapy” without being a physiotherapist, therefore it would seem more sensible for this line to read “is delivered by a qualified physiotherapist”. It is the equivalent of saying “trained in nursing” – this phrase would not be used, so it shouldn't be used for physiotherapy. | Thank you for your comment. The recommendation has been amended to clarify that supervised support for upper limb exercises should be delivered by physiotherapy staff members or other appropriately trained allied health professionals.  |
| Association of Chartered Physiotherapists in Oncology and Palliative Care | Guideline | 4       | 5       | Referring to the physiotherapy department for people with reduction in movement is a perfect recommendation. However we have concerns that not all physiotherapy departments have cancer specialist physiotherapists. Those who live locally to a cancer specialist hospital are likely to get better access to   | Thank you for your comment. We did not find any evidence on the most effective interventions for people with ongoing arm and shoulder pain following breast cancer treatment. Therefore, the committee could not make more detailed recommendations on the training needed for non-specialist physiotherapists who are providing physiotherapy to people who have more long-term arm and shoulder problems. |

|                       |                 |         |         | specialist treatment, however those in more rural communities or who are unable to travel far may not have the access to this level of physiotherapy. There needs to be more access to training for generalist physiotherapists so they are better able to support those with cancer related needs.   |   |
| Boost Innovations Ltd | Evidence Review | 15      | Table   | We agree that structured exercise might be of benefit, but has there been consideration of the issues centred around doing these exercises if you are a breast form wearer? Boost's customers often report difficulties in completing exercise while wearing traditional breast forms or 'softies' as they are either too heavy or too light. Boost's breast forms have been solving these issues for women, because they are structured differently. We would like to see more | Thank you for your comment. This update was specifically about the most effective interventions to reduce the risk of arm and shoulder mobility problems. The most appropriate type of breast form options were not part of the interventions and therefore we could not make recommendations on this. However, we expect this could form part of the discussions that come with supervised support for upper limb exercises. |

|--|-----------|---------|---------|---|---|
|  |           |         |         | undergo radiotherapy would be valuable in providing patient centred, specific information.  | the exercises should be tailored for each person based on their needs. We have edited the recommendation and rationale to include further details on this. The committee recommended further research on the most effective and cost-effective way of delivering the intervention (for example type of physiotherapy or exercise, mode of delivery, number of sessions) to reduce arm and shoulder problems after breast cancer surgery or radiotherapy   |
| Guys and St Thomas' NHS Foundation Trust | Guideline | 2       | 10      | It is recommended that patients have baseline shoulder assessment prior to surgery/radiotherapy to determine risk status to allow for radiotherapy treatment planning. Also exercise advice should be given post operatively when most relevant for patient. However this could have service implications for local physiotherapy services who do not currently provide these services. | Thank you for your comment. The committee were aware that there is currently variation in practice. They feel that the recommendations are therefore a service development opportunity for places which do not provide these services. The recommendations can therefore help to improve access to care and support after surgery. The committee also discussed and agreed that baseline shoulder assessment could be done by a member of the clinical team (for example, clinical nurse specialist) alongside standard post operative assessments. This would include assessment of the person's medical history |

## Breast cancer – reducing arm and shoulder mobility problems after breast cancer surgery or radiotherapy (update)

### Consultation on draft guideline - Stakeholder comments table 03/02/23 – 17/02/23

| Stakeholder                              | Document  | Page No | Line No | Comments   | Developer's response   |
|--|-----------|---------|---------|--|--|
|  |           |         |         |  | and asking the person if they have experienced any of the issues listed in the recommendation (for example asking if they have stiffness of their shoulder or if the function of their shoulder is reduced). This would reduce the impact on physiotherapy services.   |
| Guys and St Thomas' NHS Foundation Trust | Guideline | 2       | 13      | When exercises commence should be agreed locally, or following consultation with a specialist physiotherapist or surgeon. Commencing exercise day 1 following a free flap reconstruction could compromise blood supply and success, and with implant reconstruction it could compromise implant fixation | Thank you for your comment. The committee agreed that time to start exercises should be discussed with the person because the decision about starting time will depend on the person's circumstances such as the type of surgery. Therefore, we have changed the bullet point 'explain the exercises should be started the day after surgery' to 'explain when the exercises should be started'. There is more information in the rationale about what considerations would be relevant when having these discussions with the person. |
| Guys and St Thomas' NHS Foundation Trust | Guideline | 3       | 3       | Challenge relating to question 1: Volume of patients at pre surgical stage.<br><br>Suggestion to overcome  | Thank you for your comment. It has been shared with our Adoption and Implementation Team who will consider it  |

| Guys and St Thomas' NHS Foundation Trust | Guideline | 3       | 18      | Please also consider supervision in circumstances where post operative recovery could be impacted through additional cancer treatments. For example the effects of hormone therapy on joints, pain, bone health/density/osteoporosis, mood, fatigue and energy levels and chemotherapy effects (used as neoadjuvant or adjuvant intervention) for example, peripheral neuropathy and falls risk, pain, fatigue, mood, cognitive effects. Always consider quality of life with any intervention/prescription of exercise | Thank you for your comment. We expect that local guidelines will include information about the effects of additional cancer treatment. The recommendation for people who are at high risk, is based on the criteria used in the PROSPER trial which is the paper that provided evidence for the effectiveness of this type of intervention. There was no evidence for other people in which this intervention would be most effective, and so the committee decided to limit the people who are considered high risk to those specified in the PROSPER trial. Other people who may benefit from supervised support are covered by an additional recommendation. This should include people whose post operative recovery could be impacted through additional cancer treatments. The committee also recommended that supervised support should be tailored to the person's circumstances, needs and preferences. We included quality of life as one of the outcomes in our review. Some of the |

|  |           |         |         |   | relevant and appropriate, even if delivered by a clinician who is not a physiotherapist. The recommendations in this section of the guideline set out the care that should be in place for someone who will benefit from supervised support for arm and shoulder mobility after surgery or radiotherapy. In addition there is a recommendation that specifically addresses referral for people with persistent reductions in arm and shoulder mobility.  |
| Guys and St Thomas' NHS Foundation Trust | Guideline | 8       | 2       | Not all patients can access virtual health advice/input. Additionally those undergoing cancer treatment require physical assessment and input alongside exercise intervention e.g. myofascial/scar release to ease shoulder complaints, axillary web syndrome (Fourie and Robb, 2009). Additionally please consider the psychological impact/distress of cancer and its treatment and virtual input may not be appropriate in all cases | Thank you for your comment. We have added to the rationale and discussion your suggestions for when virtual support is not the best option. This includes people undergoing cancer treatment who require physical assessment and input alongside upper limb exercises and people with psychological impact and distress from cancer and its treatment. The recommendation about what should be included with supervised support states that this should be dependent on a person's needs and should be tailored to those needs. This means that face-to-face |

|  |          |         |         |  | with recovery or rehabilitation) because they might need specific instructions and feedback.  |
| The Royal College of Surgeons of Edinburgh | General  | General | General | The Royal College of Surgeons of Edinburgh are content with and supportive of this draft guideline.  | Thank you for your comment.   |
| The Royal College of Surgeons of Edinburgh | General  | General | General | However it may be helpful to highlight that the recommendations described are more relevant to patients undergoing some form of axillary surgery. NB: There are patients who do not undergo such surgery e.g. DCIS or very frail patients. | Thank you for your comment. The committee noted that these recommendations are also relevant to other people with breast cancer having surgery, including people with ductal carcinoma in situ (DCIS) because they may have a lumpectomy and people with high grade DCIS need to be able to get into position for radiotherapy. The recommendations are also relevant to frailer people because they may already have poor arm movements and upper limb exercises may be helpful to make them able to have radiotherapy. Although the recommendation to offer supervised support is for people having breast cancer surgery, there is another recommendation to consider supervised support for other |

|  |          |         |         |  | people. This means that other people may still benefit from supervised support if it is considered beneficial.   |
| The Royal College of Surgeons of Edinburgh | General  | General | General | There are also similarities in the context when the patient who is at high risk of arm and shoulder problem is also at high risk of lymphoedema, so it may be helpful to mention this, and/or to highlight the relevant guideline on lymphoedema as appropriate. | Thank you for your comment.<br>The recommendations for lymphoedema are directly above the arm and shoulder mobility recommendations in the guideline section 1.12 Complications of local treatment and menopausal symptoms and so people should be able to identify any related information. |
| The Royal College of Surgeons of Edinburgh | General  | General | General | It is good that NICE guideline now describes its relevance to other populations including LGBT+, minority ethnic groups, disabilities etc. and at the same time admits the lack of evidence.   | Thank you for your comment.  |
