4	Hypertension in adults: diagnosis and
5	management
6	Draft recommendations for consultation, December 2021
7	

This is an update to NICE guideline NG136 (published August 2019). We have:

- reviewed the evidence on blood pressure targets for people with hypertension and cardiovascular disease
- re-assessed evidence on antihypertensive drug treatment from the previous update, to cover people with cardiovascular disease
- made 2 new recommendations.

#### What does it include?

- the new recommendations
- new recommendations for research
- a rationale and impact section that explains why the committee made the recommendations and how they might affect practice.

## Commenting on this update

You are invited to comment on the new recommendations, the supporting evidence reviews, and the equality impact assessment.

See the <u>update webpage</u> for the evidence reviews, the equality impact assessment, the scope, details of the committee and any declarations of interest.

For the the current recommendations, see the <u>2019 NICE guideline on hypertension in adults</u>.

# Recommendations

1

6

- 2 This section contains the recommendations that are being updated, and other
- 3 relevant recommendations needed for context (shaded in grey and marked [2019,
- 4 amended 2021]). See update information for a full explanation of what has been
- 5 updated, and the 2019 guideline for the full list of recommendations.

# 1.4 Treating and monitoring hypertension

### 7 Monitoring treatment and blood pressure targets

- 8 For specific recommendations on blood pressure control in people with other
- 9 conditions or who are pregnant, see also the following NICE guidelines:
- chronic kidney disease in adults
- type 1 diabetes
- hypertension in pregnancy.
- 13 1.4.20 Reduce clinic blood pressure to below 140/90 mmHg and ensure that it is
- maintained below that level in adults with hypertension aged under 80.
- 15 **[2019, amended 2021]**
- 16 1.4.21 Reduce clinic blood pressure to below 150/90 mmHg and ensure that it is
- maintained below that level in adults with hypertension aged 80 and over.
- 18 Use clinical judgement for people with frailty or multimorbidity (see also
- 19 NICE's guideline on multimorbidity). [2019, amended 2021]
- 20 1.4.22 When using ABPM or HBPM to monitor the response to treatment in
- adults with hypertension, use the average blood pressure level taken
- during the person's usual waking hours (see <u>recommendations 1.2.6 and</u>
- 23 <u>1.2.7</u>). Reduce blood pressure and ensure it is maintained at the following
- 24 levels:
- below 135/85 mmHg for adults aged under 80
- below 145/85 mmHg for adults aged 80 and over.

27

1 2		Use clinical judgement for people with frailty or multimorbidity (see also <a href="NICE's guideline on multimorbidity">NICE's guideline on multimorbidity</a> ). [2019, amended 2021]		
3 4	1.4.23	Use the same blood pressure targets for people with and without cardiovascular disease. [2021]		
	impact s	ort explanation of why the committee made the recommendation on blood e targets for people with cardiovascular disease, see the <u>rationale and</u> section on blood pressure targets for people with cardiovascular disease.  ails of the evidence and the committee's discussion are in the <u>evidence</u> or blood pressure targets for people with cardiovascular disease.		
5	Choosin	ag antibyportonsiyo drug troatment (for people with or without		
7	Choosing antihypertensive drug treatment (for people with or without type 2 diabetes)			
8	1.4.30	For people with cardiovascular disease:		
9 10 11 12 13		<ul> <li>follow the recommendations for disease-specific indications in the NICE guideline on their condition (for example, when prescribing an ACE inhibitor or an ARB for secondary prevention of myocardial infarction)</li> <li>if their blood pressure remains uncontrolled, offer antihypertensive drug treatment in line with the section on choosing antihypertensive drug treatment (for people with or without type 2 diabetes). [2021]</li> </ul>		
	For a sh	ort explanation of why the committee made the recommendation on		

For a short explanation of why the committee made the recommendation on choosing antihypertensive drug treatment for people with cardiovascular disease, see the <u>rationale and impact section on choosing antihypertensive drug treatment</u> for people with cardiovascular disease.

Full details of the evidence and the committee's discussion are in the <u>evidence</u> review for choosing antihypertensive drug treatment for people with cardiovascular disease.

# 1 Terms used in this guideline

- 2 This section defines terms that have been used in a particular way for this guideline.
- 3 For other definitions see the <u>NICE glossary</u>.

#### 4 Cardiovascular disease

- 5 Medical history of ischaemic heart disease, cerebrovascular disease, peripheral
- 6 vascular disease, aortic aneurysm or heart failure. Cardiovascular disease is a
- 7 general term for conditions affecting the heart or blood vessels. It is usually
- 8 associated with a build-up of fatty deposits inside the arteries (atherosclerosis) and
- 9 an increased risk of blood clots. It can also be associated with damage to arteries in
- organs such as the brain, heart, kidneys and eyes through deposition of glassy
- 11 material within the artery walls (arteriosclerosis). Cardiovascular disease is 1 of the
- main causes of death and disability in the UK, but it can often largely be prevented
- 13 by leading a healthy lifestyle.

## 14

15

# **Recommendations for research**

- 16 The 2021 guideline committee updated the 2019 recommendation for research on
- 17 blood pressure targets for people over 80, and made 2 new recommendations for
- 18 research.

# 19 1 Blood pressure targets for people over 80

- 20 What is the optimum blood pressure target for people aged over 80 with treated
- 21 primary hypertension (with or without cardiovascular disease)?

#### 22 2 Blood pressure targets for people with a ortic aneurysm

- What are the optimal blood pressure targets in adults with hypertension and aortic
- aneurysm, and does this vary by age?

#### 25 3 Blood pressure targets for people with prior ischaemic or

- 26 haemorrhagic stroke
- 27 What are the optimal blood pressure targets in adults with prior ischaemic or
- 28 haemorrhagic stroke, and does this vary by age?

For a short explanation of why the committee made these recommendations see the <u>rationale and impact section on blood pressure targets for people with cardiovascular disease</u>.

Full details of the evidence and the committee's discussion are in the <u>evidence</u> review for blood pressure targets for people with cardiovascular disease.

1

# 2 Rationale and impact

- 3 This section briefly explains why the committee made the recommendations and how
- 4 they might affect practice.

# 5 Blood pressure targets for people with cardiovascular disease

- 6 Recommendation 1.4.23
- 7 Why the committee made the recommendation
- 8 The evidence did not show a robust or consistent clinical benefit from using lower
- 9 blood pressure targets for people with cardiovascular disease compared with
- 10 standard blood pressure targets.
- 11 The vast majority of people in the control arms of the studies achieved blood
- pressures well below 140/90 mmHg. In the committee's experience of practice, some
- people with hypertension can have their blood pressure maintained at 140/90
- 14 mmHg, rather than below this level. To address this issue, the committee amended
- the 2019 recommendations on blood pressure targets to emphasise the importance
- of reducing and maintaining blood pressure below 140/90 mmHg.
- 17 The committee made research recommendations for:
- People aged over 80, because there was no evidence specifically for this group.
- The only evidence was from mixed age groups, and the committee agreed that
- 20 this evidence was too limited to support a new practice recommendation.
- People with aortic aneurysm, because there was no evidence for this group.
- People who have had a stroke, because there was limited evidence that lower
- 23 blood pressure targets reduced the risk of future strokes, but there was also

- 1 evidence on the possible harms of lower targets. Evidence for both potential
- 2 benefit or harm was too limited to inform a recommendation.

### 3 How the recommendations might affect practice

- 4 The new recommendation reflects current practice for most types of cardiovascular
- 5 disease, so there should be no change in practice or increase in resource use.
- 6 The Royal College of Physicians Intercollegiate Stroke Working Party guideline
- 7 recommends a lower blood pressure target for people after stroke. However, the
- 8 national quality indicators used in primary care do not use a lower blood pressure
- 9 target for people with cardiovascular disease (including stroke and transient
- 10 ischaemic attack).
- 11 Return to recommendations
- 12 Choosing antihypertensive drug treatment for people with
- 13 cardiovascular disease
- 14 Recommendation 1.4.30
- 15 Why the committee made the recommendation
- 16 New evidence in this area was not reviewed as part of the 2021 update. Instead, the
- 17 evidence from previous versions of the guideline was re-assessed to look at
- outcomes for people with cardiovascular disease. Only evidence up to 2010 was re-
- analysed, because the 2019 update did not review evidence for people with
- 20 cardiovascular disease.
- 21 There was no difference in clinically relevant outcomes between people with and
- 22 without cardiovascular disease.
- 23 Evidence was limited for people with stroke, transient ischaemic attack, or coronary
- 24 artery disease. This evidence did not cover enough treatment comparisons to allow
- 25 the committee to draw any firm conclusions.
- 26 There are NICE guidelines on <u>acute coronary syndromes</u> and <u>chronic heart failure</u>,
- 27 and these guidelines make recommendations on drug treatment that overlap with
- treatment for hypertension. To avoid confusion over the treatment pathway, the

- 1 committee highlighted that these condition-specific recommendations should be
- 2 applied first (for example, when prescribing an ACE inhibitor or an ARB for
- 3 secondary prevention of myocardial infarction).

## 4 How the recommendations might affect practice

- 5 The recommendation reflects current practice for most types of cardiovascular
- 6 disease.
- 7 The committee were aware that after a stroke the thiazide-like diuretic indapamide is
- 8 sometimes used first, rather than a calcium channel blocker. However, it is unclear
- 9 how common this is. As people with cardiovascular disease are commonly
- 10 prescribed more than 1 antihypertensive drug, any impact on prescribing would be
- 11 limited.
- 12 Return to recommendations

# 13 Update information

- 14 **December 2021**
- We have reviewed the evidence on blood pressure targets for people with
- cardiovascular disease, and made a new recommendation. This is marked [2021].
- We have also re-assessed the evidence on antihypertensive drug treatment, and
- 18 made a new recommendation for people with cardiovascular disease. This is marked
- 19 **[2021]**.
- 20 For recommendations shaded in grey and ending [2019, amended 2021], we have
- 21 not reviewed the evidence for people without cardiovascular disease. We have made
- 22 minor changes to the wording of the recommendations without changing the intent.
- 23 See the rationale for an explanation of these changes.
