## Recognising neurological conditions in children, young people and adults

A neurological condition is an illness or injury that affects the brain, spine, muscles or nerves. There are many different neurological conditions. Some are lifelong, and some get better over time. They can be inherited, like muscular dystrophy. They can also develop during childhood, like some types of epilepsy. Some conditions, such as motor neurone disease or Parkinson's disease, are more common later in life. Neurological problems can also happen suddenly at any age, after a head injury or stroke.

One in 10 visits to GPs are about neurological symptoms. These symptoms range widely, from speech and memory to muscle, movement, balance and coordination problems. Neurological conditions often look like lots of other conditions, making them hard to spot.

We want this guideline to make a difference to anyone who might have a neurological condition by making sure:

- GPs can recognise when symptoms could have a neurological cause
- GPs and doctors in emergency departments know when to refer people to a specialist straight away and when to do more tests first
- people who most need to see a specialist can see one sooner
- people are not referred to a specialist if they don't need to be.

## Working with you

Your GP should give you clear information, talk with you about your options and listen carefully to your views and concerns. They should explain:

- what they suspect is causing your symptoms and what will happen next
- if you do need to see a specialist, how quickly you should expect to be seen.

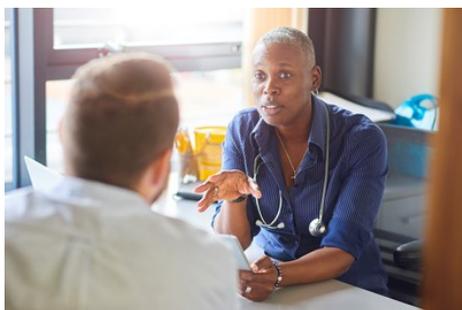

If you can't understand the information you are given, tell your GP.

## In the news

Read NICE news about how this guideline will help.

### **New NICE guideline will help doctors recognise and refer people with suspected neurological conditions**

NICE's new guideline is the first to offer comprehensive information on neurological conditions to help non-specialist healthcare professionals to identify people who should be referred for specialist assessment and care.
