Multiple sclerosis

NICE guideline
Draft for consultation, April 2014

If you wish to comment on this version of the guideline, please be aware that all the supporting information and evidence is contained in the full version.

Introduction

Multiple sclerosis (MS) is an acquired chronic immune-mediated inflammatory condition of the central nervous system, affecting both the brain and spinal cord. It affects approximately 100,000 people in the UK. It is the commonest cause of serious physical disability in adults of working age.

People with MS typically develop symptoms in their late 20s, experiencing visual and sensory disturbances, limb weakness, gait problems, and bladder and bowel symptoms. They may initially have partial recovery, but over time develop progressive disability. The cause of MS is unknown. It is believed that an abnormal immune response to environmental triggers in people who are genetically predisposed, results in immune-mediated acute, and then chronic inflammation. This is followed by degeneration of the CNS.

MS is a potentially highly disabling disorder with considerable personal, social and economic consequences. People with MS may live for many years after diagnosis with significant impact on their ability to work, as well as an adverse and often highly debilitating effect on their quality of life and that of their families.

This guideline replaces NICE clinical guideline 8 (2003) and covers diagnosis, information and support, treatment of relapse and management of MS-related symptoms. The guideline does not address the use of disease-modifying treatments; there are NICE technology appraisals about these treatments and these are listed along with NICE guidelines about the management of bladder and bowel symptoms, neuropathic pain and depression in ‘Related NICE guidance’.

The guideline is aimed primarily at services provided in primary and secondary care. Many people with MS may also attend specialised tertiary services, often established particularly to provide and monitor disease-modifying therapies.

Drug recommendations

The guideline will assume that prescribers will use a drug’s summary of product characteristics to inform decisions made with individual patients. This guideline recommends some drugs for indications for which they do not have a UK marketing authorisation at the date of publication, if there is good evidence to support that use.
The prescriber should follow relevant professional guidance, taking full responsibility for the decision. The patient (or those with authority to give consent on their behalf) should provide informed consent, which should be documented. See the General Medical Council’s Good practice in prescribing medicines – guidance for doctors for further information. Where recommendations have been made for the use of drugs outside their licensed indications (‘off-label use’), these drugs are marked with a footnote in the recommendations.

**Patient-centred care**

This guideline offers best practice advice on the care of adults with multiple sclerosis.

Patients and healthcare professionals have rights and responsibilities as set out in the NHS Constitution for England – all NICE guidance is written to reflect these. Treatment and care should take into account individual needs and preferences. Patients should have the opportunity to make informed decisions about their care and treatment, in partnership with their healthcare professionals. Healthcare professionals should follow the Department of Health’s advice on consent. If someone does not have the capacity to make decisions, healthcare professionals should follow the Department of Health’s advice on consent, the code of practice that accompanies the Mental Capacity Act and the supplementary code of practice on deprivation of liberty safeguards. In Wales, healthcare professionals should follow advice on consent from the Welsh Government.

NICE has produced guidance on the components of good patient experience in adult NHS services. All healthcare professionals should follow the recommendations in Patient experience in adult NHS services.

**Strength of recommendations**

Some recommendations can be made with more certainty than others. The Guideline Development Group makes a recommendation based on the trade-off between the benefits and harms of an intervention, taking into account the quality of the underpinning evidence. For some interventions, the Guideline Development Group is confident that, given the information it has looked at, most patients would
choose the intervention. The wording used in the recommendations in this guideline denotes the certainty with which the recommendation is made (the strength of the recommendation).

For all recommendations, NICE expects that there is discussion with the patient about the risks and benefits of the interventions, and their values and preferences. This discussion aims to help them to reach a fully informed decision (see also ‘Patient-centred care’).

**Interventions that must (or must not) be used**

We usually use ‘must’ or ‘must not’ only if there is a legal duty to apply the recommendation. Occasionally we use ‘must’ (or ‘must not’) if the consequences of not following the recommendation could be extremely serious or potentially life threatening.

**Interventions that should (or should not) be used – a ‘strong’ recommendation**

We use ‘offer’ (and similar words such as ‘refer’ or ‘advise’) when we are confident that, for the vast majority of patients, an intervention will do more good than harm, and be cost effective. We use similar forms of words (for example, ‘Do not offer …’) when we are confident that an intervention will not be of benefit for most patients.

**Interventions that could be used**

We use ‘consider’ when we are confident that an intervention will do more good than harm for most patients, and be cost effective, but other options may be similarly cost effective. The choice of intervention, and whether or not to have the intervention at all, is more likely to depend on the patient’s values and preferences than for a strong recommendation, and so the healthcare professional should spend more time considering and discussing the options with the patient.
Key priorities for implementation

The following recommendations have been identified as priorities for implementation.

Diagnosing MS

- Refer people suspected of having multiple sclerosis (MS) to a consultant neurologist. [1.1.5]
- A consultant neurologist should make the diagnosis of MS on the basis of established up-to-date criteria, such as the revised 2010 McDonald criteria, after:
  - assessing episodes are consistent with an inflammatory process
  - excluding alternative diagnoses
  - establishing that lesions have developed at different times and are in different anatomical locations for a diagnosis of relapsing–remitting MS
  - establishing progressive neurological deterioration over 1 year or more for a diagnosis of primary progressive MS. [1.1.6]
- Do not diagnose MS on the basis of MRI findings alone. [1.1.7]

Information and support

- The consultant neurologist should ensure that people with MS and their family members or carers are offered verbal and written information at the time of diagnosis. This might include, but should not be limited to, information about:
  - what MS is
  - treatments, including disease-modifying treatments
  - symptom management
  - how support groups, local services, social services and national charities are organised and how to get in touch with them
  - legal requirements such as notifying the Driver and Vehicle Licensing Agency (DVLA) and legal rights including social care, employment rights and benefits. [1.2.3]
- Offer the person with MS a face-to-face follow-up appointment with a healthcare professional with an expertise in MS to take place within 6 weeks of diagnosis. [1.2.5]

---

Coordination of care

- Care for people with MS using a coordinated multidisciplinary approach. Depending on the needs of the person, involve the following professionals with expertise in managing MS:
  - consultant neurologists and MS nurses,
  - physiotherapists and occupational therapists
  - speech and language therapists, psychologists, dietitians, social care providers and continence support specialists
  - GP. [1.3.1]

Non-pharmacological treatment for MS symptoms

- Consider supervised exercise programmes involving moderate progressive resistance training and aerobic exercise to treat:
  - MS-related fatigue
  - mobility problems. [1.7.10]

Treating acute relapse of MS with steroids

- Offer treatment for relapse of MS with oral methylprednisolone 0.5 g daily for 5 days. [1.8.6]
- Develop local guidance and pathways for treating relapses of MS. Ensure follow-up is included in the pathway and guidance. [1.8.10]
1 Recommendations

The following guidance is based on the best available evidence. The full guideline [hyperlink to be added for final publication] gives details of the methods and the evidence used to develop the guidance.

1.1 Diagnosing MS

1.1.1 Be aware that clinical presentations in multiple sclerosis (MS) include:

- loss or reduction of vision in 1 eye with painful eye movements
- double vision
- ascending sensory disturbance and/or weakness
- problems with balance, unsteadiness or clumsiness
- altered sensation travelling down the back and sometimes into the limbs when bending the neck forwards (Lhermitte’s symptom).

1.1.2 Be aware that people with MS usually present with neurological symptoms or signs as described in recommendation 1.1.1, and:

- are aged under 50 and
- may have a history of previous neurological symptoms and
- have symptoms that have evolved over more than 24 hours and
- have symptoms that may persist over several days or weeks and then improve.

1.1.3 Do not routinely suspect MS if a person’s main symptoms are fatigue, depression or dizziness unless they have a history or evidence of focal neurological symptoms or signs.

1.1.4 Before referring a person suspected of having MS to a neurologist, perform blood tests including:

- full blood count
- inflammatory markers for example erythrocyte sedimentation rate, C-reactive protein
- liver function tests
- renal function tests
- electrolytes
- calcium
- glucose
- thyroid function tests
- vitamin B\textsubscript{12}
- HIV serology.

1.1.5 Refer people suspected of having MS to a consultant neurologist.

1.1.6 A consultant neurologist should make the diagnosis of MS on the basis of established up-to-date criteria, such as the revised 2010 McDonald criteria\textsuperscript{2}, after:

- assessing episodes are consistent with an inflammatory process
- excluding alternative diagnoses
- establishing that lesions have developed at different times and are in different anatomical locations for a diagnosis of relapsing-remitting MS
- establishing progressive neurological deterioration over 1 year or more for a diagnosis of primary progressive MS.

1.1.7 Do not diagnose MS on the basis of MRI findings alone.

1.1.8 If a person is suspected\textsuperscript{3,4} of having MS but does not fulfil the diagnostic criteria, plan a review.

1.1.9 Discuss the timing of the review with the person suspected of having MS and ensure they know what to do if they develop further neurological symptoms such as those in recommendation 1.1.1.

1.1.10 Offer people suspected of having MS information about support groups and national charities.

\textsuperscript{4} The McDonald criteria refers to 'suspected MS' as 'possible MS'.
Optic neuritis and neuromyelitis optica

1.1.11 If a person has an episode of isolated optic neuritis, confirmed by an ophthalmologist, refer them to a consultant neurologist for further assessment.

1.1.12 Diagnosis of neuromyelitis optica should be made by an appropriate specialist based on established up-to-date criteria.

1.2 Providing information and support

Information and support

1.2.1 NICE has produced guidance on the components of good patient experience in adult NHS services. This includes recommendations on communication, information and coordination of care. Follow the recommendations in Patient experience in adult NHS services (NICE clinical guideline 138).

1.2.2 Ask the person with MS to specify what information they want and how it is delivered. Ask the person with MS if they are happy for that information to be shared with a family member or carer.

Information at the time of diagnosis

1.2.3 The consultant neurologist should ensure that people with MS and their family members or carers are offered verbal and written information at the time of diagnosis. This might include, but should not be limited to, information about:

- what MS is
- treatments, including disease-modifying treatments
- symptom management
- how support groups, local services, social services and national charities are organised and how to get in touch with them
- legal requirements such as notifying the Driver and Vehicle Licensing Agency (DVLA) and legal rights including social care, employment rights and benefits.
1.2.4 Discuss with the person with MS and their family members or carers whether they may have social care needs and if so refer to social services for assessment.

1.2.5 Offer the person with MS a face-to-face follow-up appointment with a healthcare professional with expertise in MS to take place within 6 weeks of diagnosis.

Ongoing information and support

1.2.6 Review information and support needs regularly, even if people with MS or their family members or carers initially appear unwilling to accept it.

1.2.7 Advise people with MS and their family members or carers about what to do if their symptoms change significantly and the possible causes of these changes including:

- another illness such as an infection
- further relapse
- change of disease status (for example progression)
- new MS symptoms.

1.2.8 Talk to people with MS and their family members or carers about the possibility that the condition might lead to cognitive problems.

1.2.9 When appropriate explain to people with MS about power of attorney and advanced care planning.

1.3 Coordination of care

1.3.1 Care for people with MS using a coordinated multidisciplinary approach. Depending on the needs of the person, involve the following professionals with expertise in managing MS:

- consultant neurologists and MS nurses
- physiotherapists and occupational therapists
- speech and language therapists, psychologists, dietitians, social care providers and continence support specialists
1.3.2 Offer the person with MS an appropriate single point of contact.

1.4 Regular review

1.4.1 Discuss how often to have a formal review taking into account the needs of the person with MS and of their family members or carers, and the course the disease is taking. For most people this will be at least once a year.

1.4.2 At formal review, ask the person about any changes they have experienced since their last formal review, in particular assess:

- MS symptoms:
  - mobility and balance including falls
  - use of arms and hands
  - muscle spasms and stiffness
  - tremor
  - bladder, bowel and sexual function
  - sensory symptoms and pain
  - speech and swallowing
  - vision
  - cognitive symptoms
  - fatigue
  - depression and anxiety
  - sleep.

- General health:
  - weight
  - smoking, alcohol and recreational drugs
  - exercise
  - access to routine health screening and contraception.

- Social activity and participation:
  - family and social circumstances
  - driving
1.4.3 Ensure people with MS, especially those with reduced mobility, are regularly assessed and reviewed for:

- bone health
- risk of contractures
- areas at risk of pressure ulcers.

1.4.4 Refer people with MS to palliative care services for symptom control and for end of life care when appropriate.

1.5 **Modifiable risk factors for relapse of MS**

**Exercise**

1.5.1 Encourage people with MS to exercise and advise them that exercise does not have any harmful effects on their MS. Advise people that regular exercise may have beneficial effects on their MS.

**Vaccinations**

1.5.2 Be aware that live vaccinations may be contraindicated in people with MS who are being treated with disease-modifying therapies.

1.5.3 Discuss with the person with MS the possible risk of relapse after flu vaccination for people with relapsing–remitting MS.

---

5 A contracture is a shortening in the soft tissues (that is, tendons, muscles or ligaments) around a joint that limits the passive (and active) range of movement at that joint.
1.5.4 Offer flu vaccinations to people with MS in accordance with national guidelines\(^6\).

**Pregnancy**

1.5.5 Explain to women of childbearing age with MS that:

- relapse rates may reduce during pregnancy and may increase 3–6 months after childbirth
- pregnancy does not increase the risk of progression of disease.

1.5.6 If a person with MS is thinking about pregnancy, give them the opportunity to discuss with an appropriate healthcare professional issues such as:

- fertility
- in vitro fertilisation (IVF)
- the risk of the child developing MS
- use of vitamin D before conception and during pregnancy
- medication use in pregnancy
- pain relief during delivery (including epidurals)
- care of the child
- breastfeeding.

**Smoking**

1.5.7 Advise people with MS not to smoke because it may increase the progression of disability.

**1.6 Pharmacological treatment for MS symptoms**

**Spasticity**

1.6.1 Involve people with MS in treatment decisions and encourage them to manage their own spasticity symptoms by explaining how doses of drugs can be adjusted within agreed margins.

\(^6\) ‘Chronic neurological disease: conditions in which respiratory function may be compromised, due to neurological disease (e.g. polio syndrome sufferers). Clinicians should consider on an individual basis the clinical needs of patients including individuals with cerebral palsy, multiple sclerosis and related or other similar conditions; or hereditary and degenerative disease of the nervous system of muscles; or severe disability.’ (Department of Health 2013)
1.6.2 Ensure that the person with MS has tried the drug at an optimal dose, or the maximum dose they can tolerate.

1.6.3 Stop a drug if there is no benefit at the maximum tolerated dose.

1.6.4 Once the optimal dose has been reached, review drug treatment for spasticity at least annually.

1.6.5 Offer baclofen or gabapentin as a first-line drug for treating spasticity in MS depending on contraindications and the person’s comorbidities and preferences.

1.6.6 If the person with MS cannot tolerate one of these drugs consider switching to the other.

1.6.7 Consider a combination of baclofen and gabapentin for people with MS if

- individual drugs do not provide adequate relief or
- side effects from individual drugs prevent the dose being increased.

1.6.8 Consider tizanidine or dantrolene as a second-line option to treat spasticity in people in MS.

1.6.9 Consider benzodiazepines as a third-line option to treat spasticity in MS and be aware of their potential benefit in treating nocturnal spasms.

1.6.10 Do not offer nabiximols to treat spasticity in people with MS.

Mobility

1.6.11 Do not use fampridine to treat lack of mobility in people with MS.

Fatigue

1.6.12 Offer amantadine to people with MS and fatigue.

---

7 At the time of consultation (April 2014), gabapentin did not have a UK marketing authorisation for this indication. The prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented. See the General Medical Council’s Good practice in prescribing medicines – guidance for doctors for further information.

8 At the time of consultation (April 2014), gabapentin did not have a UK marketing authorisation for this indication. The prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented. See the General Medical Council’s Good practice in prescribing medicines – guidance for doctors for further information.
1.6.13 Do not use vitamin B$_{12}$ injections to treat fatigue in people with MS.

Oscillopsia$^{10}$

1.6.14 Consider gabapentin$^{11}$ as the first-line treatment for oscillopsia in people with MS.

1.6.15 Consider memantine$^{12}$ as the second-line treatment for oscillopsia in people with MS.

1.6.16 Refer the person with MS for specialist advice if there is no improvement after treatment or side effects prevent continued use.

Emotional lability$^{13}$

1.6.17 Consider amitriptyline$^{14}$ to treat emotional lability in people with MS.

Pain

1.6.18 Treat neuropathic pain in people with MS according to the NICE clinical guideline on neuropathic pain – pharmacological management and refer to pain services if appropriate.

---

9 At the time of consultation (April 2014), amantadine did not have a UK marketing authorisation for this indication. The prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented. See the General Medical Council’s Good practice in prescribing medicines – guidance for doctors for further information.

10 The subjective sensation of horizontal and/or vertical movement of the visual field that is unexplained by movement of the observer or environment.

11 At the time of consultation (April 2014), gabapentin did not have a UK marketing authorisation for this indication. The prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented. See the General Medical Council’s Good practice in prescribing medicines – guidance for doctors for further information.

12 At the time of consultation (April 2014), memantine did not have a UK marketing authorisation for this indication. The prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented. See the General Medical Council’s Good practice in prescribing medicines – guidance for doctors for further information.

13 Involuntary laughing and crying related to a brain stem lesion.

14 At the time of consultation (April 2014), amitriptyline did not have a UK marketing authorisation for this indication. The prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented. See the General Medical Council’s Good practice in prescribing medicines – guidance for doctors for further information.
1.7 **Non-pharmacological treatment for MS symptoms**

### Cognition including memory

1.7.1 Be aware that the symptoms of MS can include cognitive problems, including memory problems that the person may not immediately recognise or associate with their MS.

1.7.2 Assess and offer treatment to people with MS and evidence of memory and cognitive problems for anxiety, depression, difficulty in sleeping and fatigue.

1.7.3 Consider referring people with MS and persisting memory or cognitive problems to a neuropsychologist or memory service.

1.7.4 Consider involving an occupational therapist in managing cognitive problems in people with MS.

### Fatigue

1.7.5 Assess and offer treatment to people with MS who have fatigue for anxiety, depression, difficulty in sleeping, and any potential medical problems such as anaemia or thyroid disease.

1.7.6 Be aware that MS-related fatigue may be precipitated by heat, overexertion and stress or may be related to the time of day.

1.7.7 Consider mindfulness, cognitive behavioural therapy or fatigue management for treating MS-related fatigue.

1.7.8 Advise people that hatha yoga may be helpful in treating MS-related fatigue.

### Mobility

1.7.9 Establish individual goals with people with MS to treat mobility problems.

### Exercise programmes for fatigue and mobility

1.7.10 Consider supervised exercise programmes involving moderate progressive resistance training and aerobic exercise to treat:
• MS-related fatigue
• mobility problems.

1.7.11 Consider a comprehensive programme of aerobic and resistance activity combined with cognitive retraining for fatigue in people with MS with moderately impaired mobility (an EDSS$^{15}$ score of less than 4).

1.7.12 Consider vestibular rehabilitation for people with MS who have fatigue or mobility problems associated with limited standing balance.

1.7.13 If a choice of treatments is available for mobility or fatigue, offer treatment according to the person with MS’s preference and their ability to continue the activity when the supervised treatment programme ends.

1.7.14 Encourage people with MS to keep exercising after the programme ends for longer term benefits.

1.7.15 Help the person with MS continue to exercise, for example by referring them to exercise referral schemes.

1.8 **Treating acute relapse of MS with steroids**

**Recognise a relapse**

1.8.1 Diagnose a relapse of MS if the person:

- develops new symptoms or
- has worsening of existing symptoms lasting more than 24 hours in the absence of infection or any other cause after a stable period of at least 1 month.

1.8.2 Before diagnosing a relapse of MS:

- rule out infection – particularly urinary tract and respiratory infections and
- discriminate between the relapse and fluctuations in disease or progression.

$^{15}$ Expanded Disability Status Scale.
1.8.3 Assess and offer treatment for relapse of MS as early as possible and within 14 days of onset of symptoms.

1.8.4 Do not routinely diagnose a relapse of MS if symptoms are present for more than 3 months.

1.8.5 Non-specialists should discuss a person's diagnosis of relapse and whether to offer steroids with a healthcare professional with an expertise in MS.

**Treating a relapse**

1.8.6 Offer treatment for relapse of MS with oral methylprednisolone 0.5 g daily for 5 days.

1.8.7 Consider intravenous methylprednisolone 1 g daily for 3–5 days as an alternative for people with MS:

- with severe relapses or
- in whom oral steroids have failed or not been tolerated or
- who need admitting for monitoring of medical or psychological conditions such as diabetes or depression.

1.8.8 Do not prescribe steroids at lower doses than methylprednisolone 0.5 g daily for 5 days to treat an acute relapse of MS.

1.8.9 Do not give people with MS a supply of steroids to self-administer at home for future relapses.

1.8.10 Develop local guidance and pathways for treating relapses of MS. Ensure follow-up is included in the pathway and guidance.

**Information about treating a relapse with steroids**

1.8.11 Discuss the benefits and risks of steroids with the person with MS, taking into account the effect of the relapse on the person’s function and wellbeing.
1.8.12 Explain the potential complications of high-dose steroids, such as effects on mental health, depression and worsening of blood sugar control in people with diabetes and MS.

1.8.13 Give the person with MS and their family members or carers (as appropriate) written information about side effects of high-dose steroids.

1.8.14 Ensure that the MS multidisciplinary team is told that the person is being treated for relapse, because relapse frequency may influence which disease-modifying therapies are chosen and whether they need to be changed.

**Medical and social care needs at time of relapse**

1.8.15 Identify whether the person with MS having a relapse or their family members or carers have social care needs and if so refer to social services for assessment.

1.8.16 Offer inpatient treatment to the person having a relapse of MS if their relapse is severe or if it is difficult to meet their medical and social care needs at home.

1.8.17 Be aware that a relapse of MS may have short-term effects on cognitive function.

**1.9 Other treatments**

**Vitamin D**

1.9.1 Do not offer vitamin D to treat MS.

**Omega fatty acids compounds**

1.9.2 Do not offer omega-3 or omega-6 fatty acid compounds to treat MS. Explain to people that there is no evidence that they affect relapse frequency or progression of MS.
2  Research recommendations

The Guideline Development Group has made the following recommendations for research, based on its review of evidence, to improve NICE guidance and patient care in the future. The Guideline Development Group’s full set of research recommendations is detailed in the full guideline.

2.1  Cognitive rehabilitation

What is the clinical and cost effectiveness of cognitive rehabilitation for people with MS?

Why this is important

Cognitive impairment affects 43–70% of people with MS and can affect their ability to carry out everyday activities. People with MS who have cognitive problems often engage in fewer social and vocational activities, are less likely to be in employment, can have problems carrying out routine household tasks, can have difficulties with driving and are more vulnerable to psychiatric illness. Caring for a person with MS is also likely to be more difficult if they have cognitive impairment and outcomes from research should include effect on caregivers.

2.2  Continued relapses

Is intravenous methylprednisolone more clinically and cost effective than oral methylprednisolone in people with relapsing–remitting MS and people with secondary progressive MS with continued relapses?

Why this is important

It has been estimated that 8000 to 10,000 MS relapses will occur per year in the UK, which place a burden on individual patients and the NHS. The primary treatment of acute relapses is with corticosteroids, using a variety of different dosing regimens with both intravenous and oral administration. There is large variation in practice around the UK. The available evidence does not directly compare equivalent doses of oral and intravenous methylprednisolone in the subacute setting in which it is usually delivered.
### 2.3 Mobility

What is the optimal frequency, intensity and form of rehabilitation for mobility problems in people with MS?

**Why this is important**

Reduced mobility is one of the most common problems in MS and 85% of people with MS report a gait disturbance as their main complaint. Gait is a complex function and many of the symptoms of MS, such as fatigue, weakness, spasticity and ataxia can impact on its quality. Following an assessment by a physiotherapist with expertise in MS, some gait-related problems can be improved by the use of devices. One of the main contributors to poor gait is muscle weakness which may be primary (for example, because of the disease process) or secondary (as a result of deconditioning). The latter is common as people with MS are known to reduce their activity levels soon after diagnosis. Allowing people to regain and then maintain maximal strength is important so that they can function optimally and remain independent for as long as possible.

### 2.4 Spasticity

What non-pharmacological interventions are effective in reducing spasticity in people with MS?

**Why this is important**

Spasticity is a common symptom affecting up to 80% of people with MS. Many people with MS also experience spasms, which are sudden, involuntary, often painful movements affecting any part of the body. Spasticity can range from a feeling of tightness or stiffness in a limb, especially the legs, which cause mild problems with walking, to a tightening of the muscles throughout the body which is so severe that the person is unable to move voluntarily and is confined to a wheelchair or bed. If left unmanaged in the severe stage, it can lead to the secondary complications of muscle shortening, permanent contractures and pain. Although medications exist which reduce spasticity, many people with MS cannot tolerate the side effects, especially of tiredness, which can compound their fatigue. This means that other, non-pharmacological interventions need to be identified which can reduce spasticity and improve function and independence in people with MS.
2.5 Vitamin D

Can vitamin D slow down the progression of disability in MS?

Why this is important

Despite considerable success with agents that substantially reduce relapse frequency in the initial inflammatory, relapsing–remitting phase, over half of people eventually develop non-relapsing, secondary progressive MS 1 to 2 decades after the onset of relapsing–remitting MS. While a variety of symptomatic treatments is available, progression in secondary progressive MS is currently intractable, and immunomodulatory strategies used for relapsing–remitting MS have not proven effective when extended into secondary progressive MS (for example, cyclophosphamide, beta interferon, and myelin basic protein). Direct neuroprotection strategies (for example, lamotrigine and tetrahydrocannabinol) have also been ineffective. The critical and as yet unmet challenge therefore is to find effective and well-tolerated treatments for secondary progressive MS.

3 Other information

3.1 Scope and how this guideline was developed

NICE guidelines are developed in accordance with a scope that defines what the guideline will and will not cover.

How this guideline was developed

NICE commissioned the National Clinical Guideline Centre to develop this guideline. The Centre established a Guideline Development Group (see section 4), which reviewed the evidence and developed the recommendations.

The methods and processes for developing NICE clinical guidelines are described in The guidelines manual.
3.2 Related NICE guidance

Details are correct at the time of consultation on the guideline (April 2014). Further information is available on the NICE website.
