# **Postnatal Care**

[O] Emotional attachment

NICE guideline <TBC>
Evidence reviews
October 2020

Draft for consultation

This evidence review was developed by the National Guideline Alliance part of the Royal College of Obstetricians and Gynaecologists

#### **Disclaimer**

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the <u>Welsh Government</u>, <u>Scottish Government</u>, and <u>Northern Ireland Executive</u>. All NICE guidance is subject to regular review and may be updated or withdrawn.

### Emotional attachment

2 This evidence review supports recommendations 1.3.14, 1.3.15, 1.3.16 and 1.3.17.

### 3 Review question

- 4 What interventions in the postnatal period are effective at promoting emotional
- 5 attachment?

#### 6 Introduction

- 7 Emotional attachment is a type of innate behaviour in children. It is the earliest
- 8 relationship that a child develops with their primary caregiver(s), and is where a baby
- 9 behaves in a way that ensures physical proximity and safety. It is affected by the
- primary caregiver's behaviour. For example, responding sensitively to a baby's
- distress provides a 'secure base' from which the baby can explore their physical
- surroundings and help with emotional and social development. This helps them to
- form positive relationships with others in the future. Disturbance of this attachment
- 14 'system' can have life-long adverse implications for the emotional and social
- development of the child. Bonding is the other side of the coin and means the
- positive emotional and psychological connection that the primary caregiver(s),
- 17 usually the mother, develop with the baby. Sometimes emotional attachment and
- bonding are used interchangeably to describe the relationship between the mother
- and the baby. The aim of this review is to determine what interventions in the
- 20 postnatal period (defined as up to 8 weeks following birth) are effective at promoting
- 21 emotional attachment.

#### 22 Summary of the protocol

- 23 See Table 1 for a summary of the Population, Intervention, Comparison and
- 24 Outcome (PICO) characteristics of this review.

#### 25 Table 1: Summary of the protocol (PICO table)

Population	Women who have given birth at term to a healthy baby, from the birth of the baby to 8 weeks after birth.
Intervention	Intervention 1. Provision of information (verbally, electronically or on paper); for example, handing out a leaflet about the following topics:  • skin-to-skin contact  • cuddling the baby  • talking to the baby  • massaging the baby  • being responsive to cues or small signals the baby may send  • copying the baby's noises and gestures  • providing comfort when the baby is upset  • getting enough sleep and having support.  Intervention 2. Skills training (for example, teaching mothers how to
	massage babies or role modelling by a healthcare professional during home visits)  Interventions will be included if they are:  • initiated in the first 8 weeks after birth

initiated in the antenatal period and continue into the postnatal period.
Comparator 1. Standard care or different information packets. Modalities of information (for example, oral versus written) will be not be compared.
Comparator 2. Standard care or different educational intervention
Intervention 1 will be compared to comparator 1, intervention 2 will be compared with comparator 2. Data permitting, interventions 1 and 2 will be compared against each other.
Critical outcomes
<ul> <li>Mother's feelings towards the baby when the baby is 12 to 18 months of age</li> </ul>
<ul> <li>Quality of mother-baby interaction when the baby is 12 to 18 months of age</li> </ul>
<ul> <li>Proportion of babies displaying an insecure attachment type (which includes ambivalent, avoidance, disorganised) when the baby is 12 to 18 months of age</li> </ul>
Important outcomes
<ul> <li>The nature of the early mother-baby relationship (based on the mother's subjective perception) when the baby is 12 to 18 months of age</li> <li>Social behaviour of the baby when the baby is 12 to 18 months of age</li> </ul>

#### 1 Methods and process

- 2 This evidence review was developed using the methods and process described in
- 3 Developing NICE guidelines: the manual 2014. Methods specific to this review
- 4 question are described in the review protocol in appendix A.
- 5 Declarations of interest were recorded according to NICE's 2014 conflicts of interest
- 6 policy until March 2018. From April 2018 until June 2019, declarations of interest
- 7 were recorded according to NICE's 2018 conflicts of interest policy. From July 2019
- 8 onwards, the declarations of interest were recorded according to NICE's 2019
- 9 conflicts of interest policy. Those interests declared before July 2019 were
- 10 reclassified according to NICE's 2019 conflicts of interest policy (see Register of
- 11 Interests).

#### 12 Clinical evidence

#### 13 Included studies

- 14 Four randomised controlled trials (RCTs) were included in this review (Guedeney
- 15 2013, Hans 2013, Kemp 2011, Walkup 2009). All studies compared different
- interventions: usual care plus the Parental Skills and Attachment in Early Childhood
- 17 versus usual care only (Guedeney 2013), community doula intervention versus
- 18 routine medical and social services (Hans 2013), a long-term nurse home visiting
- 19 program versus standard practice (Kemp 2011), and a paraprofessional-delivered,
- 20 home-visiting intervention versus breastfeeding/nutrition education program (Walkup
- 21 2009). In one study the population were African American women (Hans 2013) and in
- another young American Indian women (Walkup 2009).
- 23 The length of the interventions across the included studies differed greatly from 3
- 24 months (Hans 2013) to up to the child's 2<sup>nd</sup> birthday (Guedeney 2013, Kemp 2011).

- 1 The included studies are summarised in Table 2.
- 2 See the literature search strategy in appendix B and study selection flow chart in
- 3 appendix C.

#### 4 Excluded studies

- 5 Studies not included in this review with reasons for their exclusion are provided in
- 6 appendix K.

#### 7 Summary of studies included in the evidence review

8 Summaries of the studies that were included in this review are presented in Table 2.

#### 9 Table 2: Summary of included studies

	Denuistion		Outcomes
Study	Population	Intervention and comparison	Outcomes
	N. 440		
Guedeney	N=440 women	Intervention	The Alarm Distress Baby
2013	randomised to:	group:	Scale (ADBB) consisting of
D.O.T.	<ul> <li>Intervention</li> </ul>	Usual care and	8 items (assessed at 18 months of infant age):
RCT	n=222	assessment visits plus	- facial expression
_	Control	the Parental Skills and Attachment in Early	- eye contact
France	n=218	Childhood: Reducing	- general level of activity
		Mental Health Risks and	- self-stimulation gestures
	Median age	Promoting Resilience	- vocalizations
	for the whole	home visiting program	
	population: 22 years	(home-visiting, infant	<ul> <li>rapidity of response to stimulation</li> </ul>
	years	mental health promotion	- relationship with the
		program)	observer
		Control groups	- attractiveness to the
		Control group:	observer
		<ul> <li>Usual care and assessment visits at</li> </ul>	
		participants' homes	
		partiolpartic fromes	
		The intervention was	
		tailored to each family's	
		needs and consisted of	
		home visits during	
		pregnancy and up	
		to the child's second	
		birthday, with decreasing	
		frequency of visits over time: 6 visits during the	
		antenatal period, 8 in the	
		first 3 months' postpartum,	
		15 between the fourth and	
		twelfth months'	
		postpartum, and another	
		15 during the child's	
		second year of life,	
		resulting in a total	
		of 44 home visits	
		per family	

Study	Population	Intervention and	Outcomes
		comparison	
Hans 2013 RCT US	N=248 women randomised to:  Intervention n=124  Control n=124  Age, mean (SD):  Intervention 18 (1.7)  Control 17.9 (1.7)	Intervention group:  Community doula intervention (weekly visits with participating women at their homes, clinics; doulas joined mothers during labour and birth)  Control group: Routine medical and social services  Doulas scheduled weekly visits with each woman in the intervention groups throughout her pregnancy and until 3 months post-partum	Mother-child interaction measured using the Parent–Child Observation Guide (PCOG) consisting of mother and child variables (assessed at 12 months of infant age):     mother variables (mother sensitive responsiveness, encouragement and guidance, mother prompt responsiveness to upset (for children who displayed upset))     child variables (positive involvement with mother, child displayed no uncomfortably long period of distress)
Kemp 2011 RCT Australia	N=208 women randomised to:  Intervention n=111  Control n=97  Age, mean (SD):  Intervention 27.6 (6.7)  Control 27.7 (5.9)	Intervention group:  • Long-term nurse home visiting program (visits by a child health nurse commencing at on average 26 (range 12- 40) weeks gestation and continuing to their child's second birthday)  Control group: • Standard practice  Women in the intervention group received an average of 16 (range 0–52) visits, each of 60–90 min duration, by a child health nurse commencing at on average 26 weeks gestation (range 12–40), and continuing to their child's second birthday	Mother-child interaction during free play measured using the National Institute for Child Health and Development scales of parent—child interaction consisting of 3 items (assessed at 18 months of baby age):     sensitive stimulating parenting     detached flat parenting     child engagement
Walkup 2009 RCT US	N=167 women randomised to:  Intervention n=81  Control n=86	Intervention group:  • Paraprofessional- delivered, home-visiting intervention (the Family Spirit intervention based on recommendations and standards	Social emotional problems and competencies of child measured using the Infant Toddler Social Emotional Assessment (ITSEA) consisting of 4 domains (assessed at 12 months of baby age):

Study	Population	Intervention and comparison	Outcomes
	Median age for the whole population: 18 years.	documented in the American Academy of Paediatrics' Caring for Your Baby and Child: Birth to Age 5. This includes developmentally timed prenatal and infant-care parenting lessons, family planning, substance abuse prevention, and problem-solving and coping-skills lesson)  Control group: Breastfeeding/nutrition education program (the curricular content included a previously developed breastfeeding/nutrition education program) (no more details given)  Mothers received home- visiting lessons from 28 weeks' gestation to 6 months postpartum	<ul> <li>externalising domain (includes activity/ impulsivity, aggression/ defiance, peer aggression</li> <li>internalising domain (includes depression/ withdraw, general anxiety, separation distress, inhibition to novelty)</li> <li>dysregulation domain (includes sleep, negative emotionality, eating, sensory sensitivity)</li> <li>competence domain (includes compliance, attention, imitation/play, mastery motivation, empathy, prosocial peer relations)</li> </ul>

- 1 ADBB: Alarm Distress Baby Scale; ITSEA: Infant Toddler Social Emotional Assessment; PCOG:
- 2 Parent-Child Observation Guide; RCT: randomised controlled trial; SD: standard deviation
- 3 See the full evidence tables in appendix D. No meta-analysis was conducted (and so
- 4 there are no forest plots in appendix E).

#### 5 Quality assessment of studies included in the evidence review

6 See the evidence profiles in appendix F.

#### 7 Economic evidence

#### 8 Included studies

- 9 A single economic search was undertaken for all topics included in the scope of this
- 10 guideline and additional economic searches were conducted that used search terms
- specific to this review question combined with a search filter for economic
- 12 evaluations but no economic studies were identified which were applicable to this
- 13 review question. See the literature search strategy in appendix B and economic study
- 14 selection flow chart in appendix G.

#### 15 Excluded studies

No economic studies were reviewed at full text and excluded from this review.

#### 1 Economic model

- 2 No economic modelling was undertaken for this review because the committee
- agreed that other topics were higher priorities for economic evaluation.

- 5 Clinical evidence statements
- 6 Mother's feelings towards the baby when the baby is 12 to 18 months of age
- 7 No evidence was identified for this outcome.

#### 8 Quality of mother-baby interaction when the baby is 12 to 18 months of age

- Moderate to low quality evidence from 1 RCT (N=248) showed no clinically important difference between the intervention of a community doula compared to routine medical and social services in mother-child interaction, measured using the Parent-Child Observation Guide at 12 months of baby age.
- Very low quality evidence from 1 RCT (N=208) showed no clinically important difference between long-term nurse home visiting programme and standard practice in mother-child interaction measured using the National Institute for Child Health and Development (NICHD) scales of parent—child interaction at 18 months of baby age.

# Proportion of babies displaying an insecure attachment type (which includes ambivalent, avoidance, disorganised) when the baby is 12 to 18 months of age

- Low and very low quality evidence from 1 RCT (N=440) showed no clinically important difference between the intervention of Parental Skills and Attachment in Early Childhood program and usual care neither in women with the prenatal depression scale score of >11 nor those women with the prenatal depression scale score of ≤11 in social withdrawal behaviour in babies, measured using the Alarm Distress Baby Scale at 18 months of baby age. Higher scores on the prenatal depression scale indicate higher levels of depressive symptoms.
- The nature of the early mother-baby relationship (based on the mother's subjective perception) when the baby is 12 to 18 months of age
- 31 No evidence was identified for this outcome.

#### 32 Social behaviour of the baby when the baby is 12 to 18 months of age

- Very low quality evidence from 1 RCT (N=167) showed a clinically important difference between the paraprofessional-delivered home visiting (Family Spirit) intervention compared to a breastfeeding/nutrition education program in the baby's social emotional problems and competencies in externalising domain suggesting fewer problems associated with activity/impulsivity, aggression/defiance and peer aggression in the intervention group, measured using the Infant Toddler Social Emotional Assessment at 12 months of baby age.
- Very low quality evidence from 1 RCT (N=167) showed no clinically important difference between the paraprofessional-delivered home visiting (Family Spirit) intervention compared to a breastfeeding/nutrition education program in the baby's social behaviour in the other domains such as internalising

domain (includes depression/ withdraw, general anxiety, separation distress, inhibition to novelty), dysregulation domain (includes sleep, negative emotionality, eating, sensory sensitivity) and competence domain (includes compliance, attention, imitation/play, mastery motivation, empathy, prosocial peer relations), measured using the Infant Toddler Social Emotional Assessment at 12 months of baby age.

#### 7 Economic evidence statement

8 No economic evidence was identified which was applicable to this review question.

#### 9 The committee's discussion of the evidence

#### 10 Interpreting the evidence

#### 11 The outcomes that matter most

- 12 This review focused on interventions aimed at promoting emotional attachment. The
- 13 committee firstly agreed that all outcomes needed to be assessed at 12 to 18 months
- of the babies age as the committee felt that this is the earliest age range when
- 15 emotional attachment can be appropriately measured.
- 16 The committee agreed that the critical outcomes were the mother's feelings towards
- the baby when the baby is 12 to 18 months of age, the quality of the mother-baby
- interactions when the baby is 12 to 18 months of age and the proportion of babies
- displaying an insecure attachment type when the baby is 12 to 18 months of age.
- 20 Important outcomes the committee were also interested in were the nature of the
- 21 early mother-baby relationship (based on the mother's subjective perception) when
- the baby is 12 to 18 months of age, the quality of the mother-baby interaction when
- the baby is 12 to 18 months of age and also the social behaviour of the bay with the
- baby is 12 to 18 months of age.

#### 25 The quality of the evidence

- The evidence was assessed using GRADE, the overall confidence in the review
- 27 findings ranged from very low to moderate.
- There were no serious concerns with the consistency of the evidence.
- 29 There were serious concerns with the indirectness for the outcomes from one study
- 30 (Walkip 2009). This study used the Infant Toddler Social Emotional Assessment
- 31 (ITSEA) as a proxy outcome for social behavior of the baby. In addition, this study
- 32 was conducted among young American indigenous women, and the intervention was
- 33 specifically tailored to reflect the local Native practices, making the study not very
- 34 applicable to the UK context. There was no concern about indirectness with other
- 35 outcomes.
- 36 With some outcomes, there was serious concerns with imprecision. Serious
- imprecision was detected by the 95% confidence interval crossing the minimally
- 38 important difference (MID) for continuous outcomes. For these outcomes default
- 39 MIDs were calculated as half the median standard deviation (SD) of the control
- 40 groups at baseline (or at follow-up if the SD is not available at baseline).
- There were very serious to serious concerns with the risk of bias for the included
- studies had high attrition bias, there was no information provided on how women
- 43 were randomised and either no information on assessor blinding to intervention

- 1 allocations or both assessors and participants were aware of their allocations
- 2 consequently increasing performance bias.

#### 3 Benefits and harms

- 4 Although some evidence was identified, mainly of low quality, the interventions
- 5 generally did not seem to have an effect on outcomes measuring emotional
- 6 attachment. Only one study (Walkup 2009) reported a clinically important
- 7 improvement in externalising behaviour domain at 12 months of age following the
- 8 intervention. The committee noted that assessing externalising behaviours (for
- 9 example aggression) at 12 months of age is challenging and perhaps not much can
- 10 be read into this result alone. More importantly, this study was conducted among a
- very specific population group, among young (mean age 18 years) American
- indigenous women and the intervention was specifically tailored to reflect the local
- 13 Native practices. Therefore, the committee agreed the results would not be
- 14 applicable to the UK population.
- 15 Given that lack of evidence on effective interventions for promoting emotional
- attachment, the recommendations were based on the committee's knowledge and
- 17 experience. The evidence review sought to find evidence about interventions to
- promote bonding and emotional attachment between the mother and the baby
- because mother is usually the primary caregiver of the baby. However, the
- 20 committee agreed that the recommendations would apply to both parents (or who
- 21 ever are the primary caregivers of the baby) because it was considered important
- that these issues are discussed with not just the mother but also other primary
- caregivers (often the father) who are developing a relationship with the baby.
- 24 The committee discussed that the importance of emotional attachment and bonding
- is well documented in the wider literature. All babies are born with an innate potential
- 26 to develop an attachment to their caregiver(s) and how this can be modified by the
- 27 quality, intensity and responsivity of the care provided. The security of this
- attachment forms the building blocks for the baby's socioemotional development.
- 29 Disruptions in attachment (so-called insecure attachment styles) can lead to long
- 30 term difficulties in the baby's development, causing significant psychological.
- 31 behavioural and functional impairment in later life. Bonding, on the other hand, refers
- to the positive relationship and connection that the mother (or another primary
- 33 caregiver) forms with the baby. Bonding and emotional attachment are therefore
- 34 closely linked.
- The committee discussed how parents should be aware about the importance of
- 36 bonding and emotional attachment in the antenatal period and to have discussions
- 37 about ways to promote emotional attachment by bonding with their baby in both the
- 38 antenatal and postnatal period. Emotional attachment could be promoted through
- 39 spending 'high-quality' alone time with the baby, skin-to-skin contact and
- 40 encouraging positive interactions, reacting and responding to babies' cues in a
- 41 minimally stressful, calm, quiet and distraction-free environment with no set agendas.
- The committee agreed that parents should be encouraged to value this type of time
- 43 spent with the baby. The committee also discussed how it can be important for the
- 44 woman's partner (or whoever supports her) to also be aware of the importance of
- 45 emotional attachment so that they can support the woman, includingly helping with
- other tasks that would otherwise prevent the woman for spending this time with her
- 47 baby for example by offering to help with domestic chores or other childcare
- 48 demands.
- The committee discussed how both the birth and caring for a newborn baby are
- 50 major life events that are typically normalised in society as being everyday events,

32

33

37

1 however, there are various reasons why this period can be overwhelming and challenging, which in turn may have an impact on developing emotional attachment. 2 3 The most important thing promoting emotional attachment is the wellbeing of the 4 caregiver. The committee wanted to ensure that healthcare professionals have 5 discussions with parents about what to expect and the potentially challenging 6 aspects of the postnatal period. Such information would encompass the physical and 7 emotional recovery from the birth, the challenges of baby feeding, the demands of 8 parenthood, and to highlight the inevitable challenge of coping with sleep-deprivation 9 which is a subjectively unpleasant and stressful state. Traumatic birth or birth 10 complications can also bring further challenges the postnatal period which could impact bonding and emotional attachment. Parents may need to be reminded that 11 12 everything may not go according to plan and that the experience will inevitably 13 comprise an array of very intense emotions which is universal to all new parents and 14 represents an expected adjustment period. Parents may need encouragement that 15 these feelings are normal, that they can ask for help and that there is additional 16 support available to them. Preparing, informing and encouraging women of these 17 changes will hopefully improve their own sense of well-being, which in turn will

encourage the natural development of emotional attachment.

The committee discussed how particular groups of parents may be more susceptible to challenges in bonding and developing emotional attachment and may need more support. The committee were aware of longitudinal observational studies showing that often how one reacts to one's child might be similar to how one was reacted to as a child. Therefore, parents who have been through the care system or who have experienced adverse childhood events might need more support in developing bonding and emotional attachment. Furthermore, some parents with complex social needs, which might include people needing a high level of support with many aspects of their daily life due an illness, disability, broader life circumstances or a combination of these, may have need additional support with bonding with their baby.

The committee discussed the harms that could potentially result from these recommendations are small and will be outweighed by the improvement in the emotional attachment between the mother and the baby. The main harm considered would be the additional pressure and anxiety parents may face striving to achieve emotional attachment and finding the time to spend one-to-one time with their baby.

34 The committee acknowledged the need for research in this area, particularly 35 research exploring longer term outcomes. However, the committee were aware of at 36 least 4 concurrent longitudinal studies currently being conducted in the UK. The committee considered that this research would likely provide valuable evidence for 38 future updates and so did not make their own research recommendation in order to prioritise other topics. The committee particularly emphasised the importance of 39 40 exploring intergenerational impact on bonding and emotional attachment.

#### Cost-effectiveness and resource use 41

No economic evidence is available for this review question. The committee agreed 42 43 that providing information and support to mothers to enhance emotional attachment 44 with their babies should be part of the routine postnatal care contacts. There may be minor resource implications relating to the time spent by the health professionals on 45 providing such information and support, however, the anticipated emotional benefits 46 for mothers and babies are expected to outweigh related costs. Therefore, the 47 48 committee agreed that the recommendations ensure efficient use of healthcare 49 resources.

#### 1 Other factors the committee took into account

- The committee noted during protocol development that certain subgroups of women and health care professionals may require special consideration:
  - young women (19 years or under)
  - women with physical and cognitive disabilities
  - women who had difficulty accessing postnatal care services.
- A stratified analysis was therefore predefined in the protocol based on these
- 8 subgroups. However, considering the lack of evidence for these sub-groups, the
- 9 committee agreed not to make separate recommendations and that the
- 10 recommendations they did make should apply universally.

# Appendices

# 2 Appendix A – Review protocol

- 3 Review protocol for review question: What interventions in the postnatal period are effective at promoting emotional
- 4 attachment?

5 Table 3: Review protocol

Table 5: Review protocol	
Field (based on PRISMA-P)	Content
Review question	What interventions in the postnatal period are effective at promoting emotional attachment?
Type of review question	Intervention
Objective of the review	This review aims to determine what interventions in the postnatal period (defined as up to 8 weeks) are effective at promoting emotional attachment between mother and baby.
Eligibility criteria – population/disease/condition/issue/do	Women who have given birth at term to a healthy baby, from the birth of the baby to 8 weeks after birth.
main	Babies being taken into care, women with a mental health problem and women with alcohol and drug misuse will be excluded from this review
	Reasons:
	<ul> <li>NICE guideline on antenatal and postnatal mental health (CG192) covers women with depression, anxiety disorders, eating disorders, drug- and alcohol-use disorders and severe mental illness, and has a section titled "The mother-baby relationship".</li> </ul>
	<ul> <li>Women with alcohol and drug misuse are usually cared for by specialist teams and this guideline covers routine care.</li> </ul>
	<ul> <li>NICE guideline on children's attachment (NG26) covers the attachment needs of babies being taken into care).</li> </ul>
Eligibility criteria – intervention(s)	Intervention 1. Provision of information (verbally, electronically or on paper), for example, handing out a leaflet about the following topics:
	skin-to-skin contact
	cuddling the baby

	<ul> <li>talking to the baby</li> <li>massaging the baby</li> <li>being responsive to cues or small signals the baby may send</li> <li>copying the baby's noises and gestures</li> <li>providing comfort when the baby is upset</li> <li>getting enough sleep and having support</li> <li>Intervention 2. Skills training (for example, teaching mothers how to massage babies or role modelling by a healthcare professional during home visits.)</li> <li>Only interventions initiated within the first 8 weeks after birth will be included.</li> <li>Skin-to-skin contact right after birth will not be covered as this is covered by the NICE guideline on intrapartum care for healthy women and babies (CG190) and by the NICE guideline on caesarean section (CG132).</li> </ul>
Eligibility criteria – comparator(s)	Comparator 1. Standard care or different information packets. Modalities of information (for example, oral versus written) will be not be compared.  Comparator 2. Standard care or different educational intervention  Intervention 1 will be compared to comparator 1, intervention 2 will be compared with comparator 2. Data permitting, interventions 1 and 2 will be compared against each other.
Outcomes and prioritisation	<ul> <li>Critical outcomes:</li> <li>Mother's feelings towards the baby when the baby is 12 to 18 months of age (default MIDs)</li> <li>Quality of mother-baby interaction when the baby is 12 to 18 months of age (default MIDs)</li> <li>Proportion of babies displaying an insecure attachment type (which includes ambivalent, avoidance, disorganised) when the baby is 12 to 18 months of age (default MIDs)</li> <li>Important outcomes:</li> <li>The nature of the early mother-baby relationship (based on the mother's subjective perception) when the baby is 12 to 18 months of age (default MIDs)</li> </ul>

	• Social behaviour of the baby when the baby is 12 to 18 months of age (default MIDs)  When choosing between proportions and mean scores, outcome measures that allow us to carry out a meta-analysis with the highest number of studies will be prioritised. If meta-analysis is not possible, for example due to the heterogeneity of the interventions, the choice between using proportions or mean scores will be made for each scale based on the way in which most studies report the data. Please note that if the proportions in different studies are based on different cut-off scores, this will not be considered as presenting the outcomes in the same way.  If the number of studies is the same for proportions with a specific cut-off score and for mean scores, proportions will be prioritised.
	proportions, the rationale for using a specific cut-off score, as provided in the paper, will be discussed within the technical team, and if needed with members of the committee, and the most appropriate rationale will be selected
Eligibility criteria – study design	<ul> <li>Published full text papers only</li> <li>Systematic review of RCTs</li> <li>RCTs</li> <li>Only if RCTs unavailable or there is limited data to inform decision making: prospective or retrospective comparative cohort studies if at least 100 mother-baby pairs in each arm</li> <li>Prospective study designs will be prioritised over retrospective study designs</li> <li>Conference abstracts will not be considered</li> </ul>
Other inclusion exclusion criteria	Studies from low- and middle-income countries will be excluded Date: published from 2000. Practice has changed since 2000 and anything published before this is unlikely to be relevant.
Proposed sensitivity/sub-group analysis, or meta-regression	<ul> <li>Groups that will be reviewed and analysed separately:</li> <li>young women (19 years or under)</li> <li>women with physical or cognitive disabilities</li> <li>women who have difficulty accessing postnatal care services, for example social circumstances, language, cultural or life-style barriers</li> </ul>

	In the presence of heterogeneity, the following subgroups will be considered for sensitivity analysis:  • women with history of maltreatment / domestic violence  Statistical heterogeneity will be assessed by visually examining the forest plots and by calculating the I2 inconsistency statistic (with an I2 value of more than 50% indicating considerable heterogeneity).  Potential confounders:  • age  • educational level  • employment condition  • income  • receiving support for baby care and domestic work  • single parent families  • sex of the baby
Selection process – duplicate screening/selection/analysis	Review questions selected as high priorities for health economic analysis (and those selected as medium priorities and where health economic analysis could influence recommendations) will be subject to dual weeding and study selection; any discrepancies above 10% of the dual weeded resources will be resolved through discussion between the first and second reviewers or by reference to a third person. This review question was not prioritised for health economic analysis and so no formal dual weeding, study selection (inclusion/exclusion) or data extraction into evidence tables will be undertaken. (However, internal (NGA) quality assurance processes will include consideration of the outcomes of weeding, study selection and data extraction).
Data management (software)	Pairwise meta-analyses will be performed using Cochrane Review Manager (RevMan5). 'GRADEpro' will be used to assess the quality of evidence for each outcome.
Information sources – databases and dates	The following databases will be searched:  CCRCT  CDSR  DARE  Embase  EMCare

	<ul> <li>HTA Database</li> <li>MEDLINE and MEDLINE IN-PROCESS</li> </ul> Searches will be restricted by: <ul> <li>Date limitations: 2000 to 4th December 2019</li> <li>English language</li> <li>RCTs</li> </ul>
	<ul><li>Systematic reviews</li><li>Other searches:</li><li>Inclusion lists of systematic reviews</li></ul>
Identify if an update	This guideline will update the NICE guideline on postnatal care up to 8 weeks after birth. All reviews are being conducted afresh. However the following recommendations on emotional attachment were included in CG37 (2006):
	<ul><li>1.4.5 Assessment for emotional attachment should be carried out at each postnatal contact.</li><li>[2006]</li><li>1.4.6 Home visits should be used as an opportunity to promote parent- or mother-to-baby</li></ul>
	emotional attachment. [2006]  1.4.7 Women should be encouraged to develop social networks as this promotes positive mother–baby interaction. [2006]
	1.4.8 Group based parent-training programmes designed to promote emotional attachment and improve parenting skills should be available to parents who wish to access them. [2006] 1.4.9 Healthcare providers should offer fathers information and support in adjusting to their new role and responsibilities within the family unit. [2006]
	Note that the committee will not be able to update recommendation 1.4.9 (which will be stood down together with all recommendations from the 2006 version of CG37) because father-child attachment is excluded from this review question.
Author contacts	National Guideline Alliance <a href="https://www.nice.org.uk/guidance/indevelopment/gid-ng10070">https://www.nice.org.uk/guidance/indevelopment/gid-ng10070</a>

Highlight if amendment to previous protocol	For details please see section 4.5 of <u>Developing NICE guidelines: the manual</u>
Search strategy – for one database	For details please see appendix B of the guideline
Data collection process – forms/duplicate	A standardised evidence table format will be used, and published as appendix D (clinical evidence tables) or H (economic evidence tables) of the guideline.
Data items – define all variables to be collected	For details please see evidence tables in appendix D (clinical evidence tables) or H (economic evidence tables) of the guideline.
Methods for assessing bias at outcome/study level	Standard study checklists were used to critically appraise individual studies. For details please see section 6.2 of <a href="Developing NICE guidelines: the manual">Developing NICE guidelines: the manual</a>
	The risk of bias across all available evidence was evaluated for each outcome using an adaptation of the 'Grading of Recommendations Assessment, Development and Evaluation (GRADE) toolbox' developed by the international GRADE working group <a href="http://www.gradeworkinggroup.org/">http://www.gradeworkinggroup.org/</a>
Criteria for quantitative synthesis (where suitable)	For details please see section 6.4 of <u>Developing NICE guidelines: the manual</u>
Methods for analysis – combining studies and exploring (in)consistency	For details please see Supplement 1.
Meta-bias assessment – publication bias, selective reporting bias	For details please see section 6.2 of <u>Developing NICE guidelines: the manual</u> .
Assessment of confidence in cumulative evidence	For details please see sections 6.4 and 9.1 of <u>Developing NICE guidelines: the manual</u>
Rationale/context – Current management	For details please see the introduction to the evidence review in the guideline.
Describe contributions of authors and guarantor	A multidisciplinary committee developed the guideline. The committee was convened by The National Guideline Alliance and chaired by Dr David Jewell in line with section 3 of <a href="Developing NICE guidelines: the manual">Developing NICE guidelines: the manual</a> .
	Staff from The National Guideline Alliance undertook systematic literature searches, appraised the evidence, conducted meta-analysis and cost-effectiveness analysis where appropriate, and drafted the guideline in collaboration with the committee. For details please see the methods chapter of the guideline.

Sources of funding/support	The National Guideline Alliance is funded by NICE and hosted by The Royal College of Obstetricians and Gynaecologists
Name of sponsor	The National Guideline Alliance is funded by NICE and hosted by The Royal College of Obstetricians and Gynaecologists
Roles of sponsor	NICE funds The National Guideline Alliance to develop guidelines for those working in the NHS, public health, and social care in England
PROSPERO registration number	This protocol has not been registered in PROSPERO

CDSR: Cochrane Database of Systematic Reviews; CENTRAL: Cochrane Central Register of Controlled Trials; DARE: Database of Abstracts of Reviews of Effects; GRADE: Grading of Recommendations Assessment, Development and Evaluation; HTA: Health Technology Assessment; MID: minimally important difference; NGA: National Guideline Alliance; NICE: National Institute for Health and Care Excellence; RCT: randomised controlled trial; RoB: risk of bias; SD: standard deviation

At 18 month follow-up, n=90/222 and n=62/218 were included in the analysis.  Characteristics Age (median): 22.3 years; Participants with less than 12 years of schooling: 307 (83.9%); 99 (27.1%) declared that they were planning to bring up their child without the child's father.	Interventions Intervention group: In addition to usual care and assessment visits, families received the Parental Skills and Attachment in Early Childhood: Reducing Mental Health Risks and Promoting Resilience (The Competences parentales et Attachement dans la Petite Enfance: Diminution des risques lies aux troubles de sante mentale et Promotion de la resilience (CAPEDP)) home visiting program. It is as an evidence-based, home-visiting, infant	Details Randomisation After completing baseline screening and informed consent procedures, participants were randomly and alternatively assigned to either the intervention or the usual care group using a computer-generated randomisation sequence, stratified by recruitment centre, with random block sizes of 2, 4, or 6 participants. Concealment Investigators, psychologists performing the CAPEDP intervention, and participants were blinded to assignment before, but not after randomisation.	Results  The Alarm Distress Baby Scale (ADBB) at child age 18 months in women with Edinburgh Postnatal Depression Scale Score >11 or ≤11 (mean (SD))*: Intervention Group/EPDS>11 (n=3 8): 3.3 (3.9) Intervention Group/EPDS≤11 (n=52): 2 (2.6) Control Group/EPDS>11 (n=27): 3.3 (4.5) Control Group/EPDS≤11 (n=35): 4.1 (4.7) *Edinburgh Postnatal Depression Scale	Limitations Risk of bias assessed with Cochrane risk of bias tool for randomised trials  Selection Bias: Low risk  Performance Bias: High risk (investigators, psychologists performing the intervention and participants were blinded to assignment before, but not after randomisation)  Detection Bias: low risk  Attrition Bias: High risk (data at 18 months was available for n=90 (40.5%) in the intervention group and for n=62 (28%) in the

Study details	Participants	Interventions	Methods	Outcomes and Results	Comments
Country/ies where the study was carried out  France  Study type RCT  Aim of the study To measure the impact of the intervention on children's sustained social withdrawal behaviour at 18 months of age.  Study dates Not reported  Source of funding Not reported	Inclusion criteria Young mothers (<26 years of age) and primiparous, with sufficient fluency in French to be able to understand the informed consent procedure, and had at least one of three additional risk criteria concerning their future child's mental health: planning to raise the child alone, low socioeconomic status (defined as receiving welfare benefits, or being close to the poverty threshold, that is with an income of ≤800 euros per month), and having less than 12 years of schooling.  Exclusion criteria Not reported	mental health promotion program carried out in France. The intervention was conducted by a team of supervised psychologists with specific training on working alliance skills, early child development, attachment issues, and health promotion and prevention during pregnancy. Mothers were recruited in 10 public hospital maternity wards. The intervention was manualised and tailored to each family's needs. It consisted of home visits during pregnancy and up to the child's second birthday, with decreasing frequency of visits over time: 6 visits during the antenatal period, 8 in the first 3 months' postpartum, 15 between the fourth and twelfth months' postpartum, and another 15 during the	Outcome assessors were blinded to assignment, and no investigators, psychologists, or participants had any knowledge of aggregate outcomes at any point during the course of the study. Psychologists who assessed the families were not involved in any aspect of care and had no knowledge of the family's group assignment. group.  Outcomes The Alarm Distress Baby Scale (ADBB) The scale consists of 8 items and aims to assess prolonged reactions of social withdrawal in infants. The 8 items are: facial expression, eye contact, general level of activity, self-stimulation gestures, vocalizations, rapidity of response to stimulation, relationship with the observer, and attractiveness to the observer. Each item is rated on a scale of 0 (no	was used to assess prenatal depression. Total scores range from 0 to 30; higher scores indicate higher levels of depressive symptoms. A cut-off score of >11 was chosen by the authors because it had good sensitivity (0.80) and specificity (0.80).	comparison group; reasons for attrition: no evaluation visit during the first year, refusal after inclusion, missing data, excluded (baby deceased or medical interruption of pregnancy), included wrongly, lost consent forms, moved away; mothers with a greater number of risk factors for later infant mental health problems were significantly more likely to dropout of the program, with comparable dropout rates in the intervention and the comparison groups)

Study details	Participants	Interventions	Methods	Outcomes and Results	Comments
		child's second year of life, resulting in a total of 44 home visits per family.  Comparison group: Usual care and assessment visits at participant's home across the study period.  All families, whether they were in the intervention group or in the control group, could access usual care.	unusual behaviour) to 4 (very unusual behaviour), resulting in 0 as the minimum and 32 as the maximum ADBB total score; the higher the ADBB score, the greater the signs of social withdrawal shown by the infant.  Statistical analysis  Modified intention to treat principle (in participants with at least one evaluation visit during the first year)  Follow-up  At 18 months postpartum		
Full citation  Hans, S. L., Thullen, M., Henson, L. G., Lee, H., Edwards, R. C., Bernstein, V. J., Promoting Positive Mother-Infant Relationships: A Randomized Trial of Community Doula Support For Young Mothers, Infant Mental Health Journal, 34, 446-457, 2013		Interventions Intervention group: The program was established 1 year in advance of the planned start of the study to ensure that services were being appropriately delivered before the beginning of the study. 4 African American doulas worked in the program. The doulas each had previous experience as helpers, through	Details Randomisation Immediately following completion of the baseline interview, participants were randomly assigned to either intervention or control groups. Randomisation took place in blocks of 4, 6, or 8 (with equal numbers to intervention and comparison group within a block) to ensure balanced numbers in the 2 groups throughout the study period. Randomisation was done	Results Parent-child interaction assessed using The Parent-Child Observation Guide (PCOG) at child-age 12 months*: Mother Variables (mean (SD)): Mother sensitive responsiveness: Doula group (n=107): 7.75 (1.56) Control group (n=112): 7.65 (1.44)	Limitations Risk of bias assessed with Cochrane risk of bias tool for randomised trials Selection Bias: Low risk Performance Bias: Low risk Detection Bias: Low risk Attrition Bias: High risk (data at 12 months was available for n=107 (86%) in the intervention group

CI: confidence interval; MD: mean difference; MID: minimally important difference

<sup>1</sup> Edinburgh Postnatal Depression Scale (EPDS) was used to assess prenatal depression. Total scores range from 0 to 30; higher scores indicate higher levels of depressive symptoms. A cut-off score of >11 was chosen by the authors because it has a good sensitivity (0.80) and specificity (0.80).

2 The quality of the evidence was downgraded by 2 levels because of high performance bias as investigators, psychologists performing the intervention and participants were blinded to assignment before but not after the randomisation; also high attrition bias as data at 18 month follow-up was available for n=90 (40.5%) in the intervention group and for n=62 (28%) in the comparison group; reasons for attrition: no evaluation visit during the first year, refusal after inclusion, missing data, excluded (baby deceased or medical interruption of pregnancy, included wrongly, lost consent forms, moved away; mothers with a greater number of risk factors for later infant mental health problems were significantly more likely to dropout of the program, with comparable dropout rates in the intervention and the comparison groups.

3 The quality the evidence was downgraded by 1 level due to serious imprecision as 95% CI crosses 1 MID for continuous outcomes (+/- 2.4).

#### Table 7: Clinical evidence profile for comparison of a long-term nurse home visiting program versus standard practice

			Quality ass	essment			No of parti	cipants		Effect			
No of studies	Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	Long-term nurse home visiting program	Standard practice	Relative (95% CI)	Absolute	Quality	Importance	

<sup>1</sup> The quality of the evidence was downgraded by 1 level because of high attrition bias: data at 12 month follow-up was available for n=107 (86%) in the intervention group and for n=112 (90%) in the comparison group; attrition was related to the inability to locate mothers, some declined to participate in follow-up interviews, few babies die due to sudden infant death syndrome, and some mothers lost custody of their children because of child endangerment; sample retention was not statistically different between the 2 trial groups.

<sup>2</sup> Only parents whose children cried were coded on this scale.

<sup>3</sup> The quality the evidence was downgraded by 1 level due to serious imprecision as 95% CI crosses 2 MIDs for continuous outcomes (+/- 0.25).

r VERY LOW	_
er VERY LOW
