

Draft for consultation

Osteoporosis: risk assessment

[B] Searching and analysis of electronic health records

NICE guideline

Evidence review underpinning recommendations for research in the NICE guideline

January 2026

Draft for Consultation

This evidence review was developed by NICE

Disclaimer

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the [Welsh Government](#), [Scottish Government](#), and [Northern Ireland Executive](#). All NICE guidance is subject to regular review and may be updated or withdrawn.

1. Searching and analysis of electronic health records

3 1.1. Review question: What is the clinical and cost- 4 effectiveness of searching and analysis of electronic 5 health records and social care records (including GP 6 practice lists) to facilitate identification of adults who 7 should be assessed for fragility fracture risk?

8 1.1.1. Introduction

9 Electronic health records (EHRs) and social care record databases contain information
10 collected from people under the care of a medical professional, service, or organisation.
11 Searching this data could facilitate identification of those patients at increased risk of fragility
12 fracture that should be assessed.

13 1.1.2. Summary of the protocol

14 For full details see the review protocol in Appendix A.

15 **Table 1: PICO characteristics of review question**

Population	Adults who are 50 years and older
Intervention	Searching and analysis of <ul style="list-style-type: none">• Electronic patient records• Social care record databases
Comparison	No searching and analysis
Outcomes	All outcomes are considered equally important for decision making and therefore have all been rated as critical: <ul style="list-style-type: none">• Number of people identified for further assessment• Number of people identified as needing treatment on the basis of further assessment• Fragility fracture• Generic health-related quality of life (continuous outcomes will be prioritised [validated measures]).<ul style="list-style-type: none">○ EQ-5D○ SF-6D○ SF-36○ SF-12○ Other utility measures (AQOL, HUI, 15D, QWB)• QUALEFFO-41 will be included for studies with vertebral fractures
Study design	Latest timepoint reported during study follow up <ul style="list-style-type: none">• Randomised controlled trials (RCTs)• Systematic review if robust methodological standard• Published NMAs and IPDs

1 **1.1.3. Methods and process**

2 This evidence review was developed using the methods and process described in
3 [Developing NICE guidelines: the manual](#). Methods specific to this review question are
4 described in the review protocol in Appendix A.

5 Declarations of interest were recorded according to [NICE's conflicts of interest policy](#).

6 **1.1.4. Effectiveness evidence**

7 **1.1.4.1. Included studies**

8 No relevant clinical studies comparing searching electronic patient or social care record
9 databases with no searching were identified.

10 See also the study selection flow chart in **Error! Reference source not found..**

11 **1.1.4.2. Excluded studies**

12 See the excluded studies list in Appendix J.

13 **1.1.5. Summary of studies included in the effectiveness evidence**

14 No included studies.

15 **1.1.6. Summary of the effectiveness evidence**

16 No evidence identified.

17 **1.1.7. Economic evidence**

18 For methods see the health economic review protocol in Appendix A.

19 **1.1.7.1. Included studies**

20 No health economic studies were included.

21 See also the health economic study selection flow chart in Appendix G.

22 **1.1.7.2. Excluded studies**

23 No relevant health economic studies were excluded due to assessment of limited
24 applicability or methodological limitations, as detailed in Appendix J.

25 **1.1.8. Summary of included economic evidence**

26 No health economic studies were included.

27 **1.1.9. Economic model**

28 This area was not prioritised for new cost-effectiveness analysis.

1 **1.2. The committee's discussion and interpretation of the** 2 **evidence**

3 **1.2.1. The outcomes that matter most**

4 The committee considered that the number of people identified for further assessment,
5 number of people identified as needing treatment on the basis of further assessment, fragility
6 fracture, and generic health related quality of life would be the most important outcomes for
7 this review. QUALEFFO-41 will be included for studies with vertebral fractures. All outcomes
8 were considered equally important for decision making and therefore were all rated as
9 critical.

10 No evidence was identified for any of the outcomes.

11 **1.2.2. The quality of the evidence**

12 No evidence was identified.

13 **1.2.3. Benefits and harms**

14 The committee agreed that without any evidence a recommendation could not be made on
15 searching electronic health records to identify people at risk of fragility fracture.

16 The committee discussed the importance of this question to help identify people in primary
17 care at risk of osteoporotic fractures that would otherwise have been missed. With limited
18 resources the use of searching electronic health records introduces an opportunity to
19 improve identification of people at risk and reduce fractures through treatment.

20 The committee discussed how primary care health record lists are already searched for
21 secondary prevention, but searching for primary prevention is not routinely done. Another
22 factor is that approximately only 50% of people who sustain a hip fracture have a history of
23 prior fragility fracture, so it is important opportunity to identify those that don't. The committee
24 identified a gap in the evidence and acknowledged the potential that research in this area
25 could inform future guidance.

26 **1.2.4. Cost effectiveness and resource use**

27 There were no published economic evaluations identified.

28 The committee noted that past and present methods for searching and analysing electronic
29 health records to identify people at risk of fragility fracture have tended to include manual
30 searches of electronic records. Costs will relate to the time taken to plan and execute the
31 searches. The committee highlighted that in the future technological advances could
32 potentially reduce the time required. However, there may be other associated costs such as
33 software licences or training for upskilling.

34 If a greater number of people are identified for treatment, costs related to searching and
35 analysing electronic health records may potentially be offset by downstream reductions in
36 fractures in terms of reduced fracture-related costs and increased population health.
37 However, no evidence was identified in the clinical review in relation to this. The committee
38 agreed that a research recommendation for this topic should be made.

1 **1.2.5. Other factors the committee took into account**

2 The committee acknowledged that there may be patient characteristics not yet accounted for
3 on the electronic health records. For example, it currently is not able to automatically identify
4 someone who has a biological risk that differs from the gender of which they identify.

5 The committee noted that people that are not registered with a GP and do not have an
6 electronic health record would not be picked up.

7 It was discussed that family history especially of hip fractures is poorly recorded which could
8 mean that these people are not identified by the searches.

9 **1.2.6. Recommendations supported by this evidence review**

10 This evidence review supports the recommendation for research on the clinical and cost-
11 effectiveness of searching and analysing electronic health records and social care records
12 (including GP practice lists) to help identify adults who should have a fragility fracture risk
13 assessment. No recommendations were made from this evidence review.

1 **1.3. References**

2 None.

Appendix A Review protocols

A.1 Review protocol for electronic health records for identifying adults for fragility fracture risk

Field	Content
Review title	Searching and analysis of electronic health records and social care records (including GP practice lists) to facilitate identification of adults who should be assessed for fragility fracture risk
Review question	What is the clinical and cost-effectiveness of searching and analysis of electronic health records and social care records (including GP practice lists) to facilitate identification of adults who should be assessed for fragility fracture risk?
Objective	This review looks at whether searching and analysis of electronic health records and social care records (including GP practice lists) are useful for identifying adults who should be assessed for fragility fracture risk.
Searches	<p>The following databases (from inception) will be searched:</p> <ul style="list-style-type: none">• Embase• MEDLINE <p>Searches will be restricted by:</p> <ul style="list-style-type: none">• English language studies• Human studies <p>Other searches:</p> <ul style="list-style-type: none">• Reference searching• Citation searching• Inclusion lists of systematic reviews

	<p>The searches may be re-run 6 weeks before the final committee meeting and further studies retrieved for inclusion if relevant.</p> <p>The full search strategies will be published in the final review.</p>
Condition or domain being studied	Osteoporosis or people at risk of fragility fracture.
Population	<p>Inclusion: Adults who are 50 years and older.</p> <p>Exclusion:</p> <ul style="list-style-type: none"> - children and young people less than 18 years. - Adults under 50 years old
Intervention	Searching and analysis of electronic patient record and social care record databases used to identify people who should be assessed for fragility fracture risk.
Comparison	No searching and analysis
Types of study to be included	<ul style="list-style-type: none"> • Randomised controlled trials. <p>For a systematic review to be included it must be conducted to the same methodological standard as NICE guideline reviews. If sufficient details are not provided to include a relevant systematic review, the review will only be used for citation searching.</p> <p>Published NMAs and IPDs will be considered for inclusion.</p> <p>Exclusion:</p> <ul style="list-style-type: none"> • Nonrandomised controlled trials • Case-control studies • Cross-sectional studies
Other exclusion criteria	Non-English language studies.

Context	All healthcare settings where electronic patient records and social care records are used.
Primary outcomes (critical outcomes)	<p>All outcomes are considered equally important for decision making and therefore have all been rated as critical:</p> <ul style="list-style-type: none"> • Number of people identified for further assessment • Number of people identified as needing treatment on the basis of further assessment • Fragility fracture • Generic health-related quality of life (continuous outcomes will be prioritised [validated measures]). The hierarchy for extracting will be as follows, if measures higher on hierarchy are reported others will not be: <ul style="list-style-type: none"> ◦ EQ-5D ◦ SF-6D ◦ SF-36 ◦ SF-12 ◦ Other utility measures (AQOL, HUI, 15D, QWB) • QUALEFFO-41 will be included for studies with vertebral fractures <p>Latest timepoint reported during study follow up</p>
Data extraction (selection and coding)	<p>All references identified by the searches and from other sources will be uploaded into EPPI R5 and de-duplicated.</p> <p>Titles and abstracts of the retrieved citations will be screened to identify studies that potentially meet the inclusion criteria outlined in the review protocol.</p> <p>Dual sifting will be performed on at least 10% of records; 90% agreement is required. Disagreements will be resolved via discussion between the two reviewers, and consultation with senior staff if necessary.</p>

	<p>Full versions of the selected studies will be obtained for assessment. Studies that fail to meet the inclusion criteria once the full version has been checked will be excluded at this stage. Each study excluded after checking the full version will be listed, along with the reason for its exclusion.</p> <p>A standardised form will be used to extract data from studies. The following data will be extracted: study details (reference, country where study was carried out, type and dates), participant characteristics, inclusion and exclusion criteria, details of the interventions if relevant, setting and follow-up, relevant outcome data, and source of funding. One reviewer will extract relevant data into a standardised form, and this will be quality assessed by a senior reviewer.</p>
Risk of bias (quality) assessment	<p>Risk of bias will be assessed using the appropriate checklist as described in Developing NICE guidelines: the manual.</p> <ul style="list-style-type: none"> • For intervention reviews: <ul style="list-style-type: none"> ◦ Systematic reviews: Risk of Bias in Systematic Reviews (ROBIS) ◦ Randomised Controlled Trial: Cochrane RoB (2.0) • 10% of all evidence reviews are quality assured by a senior research fellow. This includes checking: <ul style="list-style-type: none"> • papers were included /excluded appropriately • a sample of the data extractions • correct methods are used to synthesise data • a sample of the risk of bias assessments <p>Disagreements between the review authors over the risk of bias in particular studies will be resolved by discussion, with involvement of a third review author where necessary.</p>
Strategy for data synthesis	<p>Pairwise meta-analyses will be performed using Cochrane Review Manager (RevMan5). Fixed-effects (Mantel-Haenszel) techniques will be used to calculate risk ratios for the binary outcomes where possible. Continuous outcomes will be analysed using an inverse variance method for pooling weighted mean differences.</p> <p>Heterogeneity between the studies in effect measures will be assessed using the I^2 statistic and visually inspected. An I^2 value greater than 50% will be considered indicative of substantial heterogeneity. Sensitivity analyses will be conducted based on pre-specified subgroups using stratified meta-analysis to explore the</p>

	<p>heterogeneity in effect estimates. If this does not explain the heterogeneity, the results will be presented pooled using random effects.</p> <p>GRADEpro will be used to assess the quality of evidence for each outcome, taking into account individual study quality and the meta-analysis results. The 4 main quality elements (risk of bias, indirectness, inconsistency, and imprecision) will be appraised for each outcome. Publication bias is tested for when there are more than 5 studies for an outcome.</p> <p>The risk of bias across all available evidence will be evaluated for each outcome using an adaptation of the 'Grading of Recommendations Assessment, Development and Evaluation (GRADE) toolbox' developed by the international GRADE working group http://www.gradeworkinggroup.org/</p> <p>Where meta-analysis is not possible, data will be presented and quality assessed individually per outcome.</p>
Analysis of sub-groups	<p>Subgroups that will be investigated if heterogeneity is present:</p> <ul style="list-style-type: none"> - 65 years and over compared to under 65 years
Type and method of review	<p><input checked="" type="checkbox"/> Intervention</p> <p><input type="checkbox"/> Diagnostic</p> <p><input type="checkbox"/> Prognostic</p> <p><input type="checkbox"/> Qualitative</p> <p><input type="checkbox"/> Epidemiologic</p> <p><input type="checkbox"/> Service Delivery</p> <p><input type="checkbox"/> Other (please specify)</p>

Review team members	From NICE: Carlos Sharpin [Guideline lead] Clare Jones [Senior technical analyst] Annette Chalker [Technical analyst] Qudsia Malik [Technical analyst] Kate Lovibond [Health economic advisor]		

	Muksitur Rahman [Health economist] Sarah Glover [Information specialist]
Funding sources/sponsor	Development of this systematic review is being funded by NICE.
Conflicts of interest	All guideline committee members and anyone who has direct input into NICE guidelines (including the evidence review team and expert witnesses) must declare any potential conflicts of interest in line with NICE's code of practice for declaring and dealing with conflicts of interest. Any relevant interests, or changes to interests, will also be declared publicly at the start of each guideline committee meeting. Before each meeting, any potential conflicts of interest will be considered by the guideline committee Chair and a senior member of the development team. Any decisions to exclude a person from all or part of a meeting will be documented. Any changes to a member's declaration of interests will be recorded in the minutes of the meeting. Declarations of interests will be published with the final guideline.
Collaborators	Development of this systematic review will be overseen by an advisory committee who will use the review to inform the development of evidence-based recommendations in line with section 3 of Developing NICE guidelines: the manual . Members of the guideline committee are available on the NICE website. https://www.nice.org.uk/guidance/indevelopment/GID-NG10216

A.2 Health economic review protocol

Review question	All questions – health economic evidence
Objectives	To identify health economic studies relevant to any of the review questions in the guideline update.
Search criteria	<ul style="list-style-type: none"> • Populations, interventions, and comparators must be as specified in the clinical review protocol above. • Studies must be of a relevant health economic study design (cost–utility analysis, cost-effectiveness analysis, cost–benefit analysis, cost–consequences analysis, comparative cost analysis). • Studies must not be a letter, editorial or commentary, or a review of health economic evaluations. (Recent reviews will be ordered although not reviewed. The bibliographies will be checked for relevant studies, which will then be ordered.) • Unpublished reports will not be considered unless submitted as part of a call for evidence. • Studies must be in English.
Search strategy	<p>A global health economic study search will be undertaken for the guideline update using population-specific terms and a health economic study filter – see Appendix B below.</p> <p>Note that this guideline is being consulted on in two parts, but the health economic search covered the full guideline health economic review.</p>
Review strategy	<p>Studies not meeting any of the search criteria above will be excluded. Studies published before 2009 (including those included in the previous guideline), abstract-only studies and studies from non-OECD countries or the USA will also be excluded.</p> <p>Studies published 2009 onwards that were included in the previous guideline will be reassessed for inclusion and may be included or selectively excluded based on their relevance to the questions covered in this update and whether more applicable evidence is also identified.</p> <p>Each remaining study will be assessed for applicability and methodological limitations using the NICE economic evaluation checklist which can be found in appendix H of Developing NICE guidelines: the manual.</p> <p>Inclusion and exclusion criteria</p> <ul style="list-style-type: none"> • If a study is rated as both 'Directly applicable' and with 'Minor limitations' then it will be included in the guideline. A health economic evidence table will be completed, and it will be included in the health economic evidence profile. • If a study is rated as either 'Not applicable' or with 'Very serious limitations' then it will usually be excluded from the guideline. If it is excluded, then a health economic evidence table will not be completed, and it will not be included in the health economic evidence profile. • If a study is rated as 'Partially applicable,' with 'Potentially serious limitations' or both then there is discretion over whether it should be included. <p>Where there is discretion</p> <p>The health economist will make a decision based on the relative applicability and quality of the available evidence for that question, in discussion with the guideline committee if required. The ultimate aim is to include health economic studies that are helpful for decision-making in the context of the guideline and the current NHS setting. If several studies are considered of sufficiently high applicability and methodological quality that they could all be included, then the health economist, in discussion with the committee if required, may decide to include only the most applicable studies and to selectively exclude the remaining studies. All studies</p>

excluded on the basis of applicability or methodological limitations will be listed with explanation in the excluded health economic studies appendix below.

The health economist will be guided by the following hierarchies.

Setting:

- UK NHS (most applicable).
- OECD countries with public health insurance systems (for example, France, Germany, Sweden).
- OECD countries with predominantly private health insurance systems (for example, Switzerland).
- Studies set in non-OECD countries or in the USA will be excluded before being assessed for applicability and methodological limitations.

Health economic study type:

- Cost–utility analysis (most applicable).
- Other type of full economic evaluation (cost–benefit analysis, cost-effectiveness analysis, cost–consequences analysis).
- Comparative cost analysis.
- Non-comparative cost analyses including cost-of-illness studies will be excluded before being assessed for applicability and methodological limitations.

Year of analysis:

- The more recent the study, the more applicable it will be.
- Studies published in 2009 or later (including any such studies included in the previous guideline) but that depend on unit costs and resource data entirely or predominantly from before 2009 will be rated as ‘Not applicable’.
- Studies published before 2009 (including any such studies included in the previous guideline) will be excluded before being assessed for applicability and methodological limitations.

Quality and relevance of effectiveness data used in the health economic analysis:

- The more closely the clinical effectiveness data used in the health economic analysis match with the outcomes of the studies included in the clinical review the more useful the analysis will be for decision-making in the guideline.

1 **Appendix B Literature search strategies**

2 The literature searches for this review are detailed below and complied with the methodology
3 outlined in [Developing NICE guidelines: the manual](#) (NICE2014). For more information,
4 please see the Methodology review published as part of the accompanying documents for
5 this guideline.

6 **B.1.1 Clinical search literature search strategy**

7 Searches were constructed using a PICO framework where population (P) terms were
8 combined with Intervention (I) and in some cases Comparison (C) terms. Outcomes (O) are
9 rarely used in search strategies as these concepts may not be indexed or described in the
10 title or abstract and are therefore difficult to retrieve. Search filters were applied to the search
11 where appropriate.

12 What is the clinical and cost-effectiveness of searching and analysis of electronic health
13 records and social care records (including GP practice lists) to facilitate identification of
14 adults who should be assessed for fragility fracture risk?

16 **Table 2: Database parameters, filters and limits applied**

B.1.2 Health Economics literature search strategy

2 Health economic evidence was identified by conducting searches using terms for a
3 population at risk of fragility fracture. The following databases were searched: NHS
4 Economic Evaluation Database (NHS EED - this ceased to be updated after 31st March
5 2015), Health Technology Assessment database (HTA - this ceased to be updated from 31st
6 March 2018) and The International Network of Agencies for Health Technology Assessment
7 (INAHTA). Searches for recent evidence were run on Medline and Embase from 2014
8 onwards for health economics.

9
**Table 3: Database parameters, filters and limits applied for population at risk of
10 fragility fracture**

Database	Dates searched	Search filters and limits applied
Medline (OVID)	Health Economics 1 January 2014 – 22 August 2025	Health economics studies Exclusions (animal studies, letters, comments, editorials, case studies/reports) English language
Embase (OVID)	Health Economics 1 January 2014 – 22 August 2025	Health economics studies Exclusions (animal studies, letters, comments, editorials, case studies/reports, conference abstracts) English language
NHS Economic Evaluation Database (NHS EED) (Centre for Research and Dissemination - CRD)	Inception – 31 st March 2015	
Health Technology Assessment Database (HTA) (Centre for Research and Dissemination – CRD)	Inception – 31 st March 2018	
The International Network of Agencies for Health Technology Assessment (INAHTA)	Inception - 22 August 2025	English language

1 J.2 Health Economic studies

2 If any published health economic studies relevant to this question met the inclusion criteria
 3 (relevant population, comparators, economic study design, published 2009 or later and not
 4 from non-OECD country or USA) but were excluded following appraisal of applicability and
 5 methodological quality they are listed below with reasons. See the health economic protocol
 6 for more details.

7 None.
 8

1

2 **Appendix K Recommendation for research**

3 What is the clinical and cost-effectiveness of searching and analysing electronic health
4 records and social care records (including GP practice lists) to help identify adults who
5 should have a fragility fracture risk assessment?

6 **K.1.1 Why this is important**

7 Fracture risk is currently assessed opportunistically for primary prevention. The committee
8 discussed that osteoporosis is likely significantly underdiagnosed with a significant proportion
9 of this population having not ever had a fracture. The committee discussed how primary care
10 health record lists are already searched for secondary prevention, but searching for primary
11 prevention is not routinely done. Electronic health records and social care records contain
12 information that could be used to identify patients at high risk of fracture. A study is needed
13 to determine if using these records would help identify people in primary care at risk of
14 osteoporotic fractures that would have otherwise been missed. This is important to reduce
15 number of fractures and related morbidity through assessment and treatment.

16 **K.1.2 Rationale for the recommendation for research**

Importance to 'patients' or the population	New evidence could provide effective ways to identify people at risk of osteoporotic fractures that could subsequently be offered treatment. This would improve patients' quality of life whilst reducing fractures and related morbidity.
Relevance to NICE guidance	High: the research is essential to inform future updates of key recommendations in the guidance. It will help reduce geographical variability.
Relevance to the NHS	The aim would be to identify people in primary care at risk of fragility fracture who may need treatment to reduce the risk of fractures or subsequent fractures.
National priorities	High relevance to the NICE guideline for Osteoporosis. Consistent with 10-year plan to move from analogue to digital, move management into the community and focus on prevention.
Current evidence base	There is no evidence for this question and therefore research is required.
Equality considerations	People without electronic health records or not registered with a GP may not be addressed by this question. Electronic health records would increase opportunity to identify at risk patients that do not attend GP surgeries. High risk patients might not attend GPs for example due to frailty or mobility problems.

17
