[E] Ovulation induction strategies for hypogonadotropic hypogonadism

NICE guideline NGXXX

Evidence reviews underpinning recommendations 1.5.1 and 1.5.2 in the NICE guideline

September 2025

Draft for consultation

This evidence review was developed by NICE

#### **Disclaimer**

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the <u>Welsh Government</u>, <u>Scottish Government</u>, and <u>Northern Ireland Executive</u>. All NICE guidance is subject to regular review and may be updated or withdrawn.

## Ovulation induction strategies for hypogonadotropic hypogonadism

### 3 Review question

- 4 What is the clinical and cost effectiveness of ovulation induction strategies for people with a
- 5 health-related female factor fertility problem associated with hypogonadotropic
- 6 hypogonadism?

### 7 Introduction

- 8 Ovulation requires the action of the following cascade of hormones: gonadotrophin-releasing
- 9 hormone from the hypothalamus acts on the pituitary gland leading to the release of the
- 10 gonadotrophins, luteinising hormone and follicle-stimulating hormone. These in turn act on
- the ovaries promoting the processes that lead to the release of an egg.
- 12 Defects at any level in this cascade can lead to reduced or absent ovulation, causing
- subfertility. If this occurs due to a defect at the level of the hypothalamus or pituitary gland,
- 14 the condition is called hypogonadotropic hypogonadism. This failure of the hypothalamic-
- pituitary axis can result from a congenital defect or acquired causes including surgery, injury,
- tumour, infection, radiation, excessive weight loss and excessive exercise.
- 17 Based on the principle that a condition caused by a lack of hormones can be treated by
- hormone replacement, the treatment for hypogonadotropic hypogonadism can include
- replacement of the gonadotrophin-releasing hormone, gonadotrophins or, if applicable, by
- 20 reducing excessive exercise and normalising weight where those are thought to be the
- 21 cause. In recent years, the use of recombinant luteinising hormone and follicle-stimulating
- 22 hormone has increased.
- Therefore, aim of this review was to identify if there is new evidence for the optimal ovulation
- 24 induction treatments in female factor fertility problem associated with hypogonadotropic
- 25 hypogonadism.

### 26 Summary of the protocol

- 27 See Table 1: Summary of the protocol (PICO table)
- 28 for a summary of the Population, Intervention, Comparison and Outcome (PICO)
- 29 characteristics of this review.

### 1 Table 1: Summary of the protocol (PICO table)

Population	Inclusion:
	People with a health-related female factor fertility problem associated with hypogonadotropic hypogonadism
	Exclusion:  People presenting with primary or secondary amenorrhea due to other
	causes will not be included in this review.
	If some, but not all, of a study's participants are eligible for the review, then a study will be included if at least 80% of its participants are eligible
	for this review
Intervention	<ul> <li>Interventions aimed at normalising weight and/or promoting exercise</li> <li>Pulsatile gonadotrophin-releasing hormone (GnRH) ('GnRH pump')</li> <li>Gonadotrophins</li> </ul>
	Studies will be included that use ovulation induction strategies followed by natural intercourse, timed intercourse, or intrauterine insemination. Studies in people undergoing IVF/ICSI will be excluded from this review.
Comparison	Trials comparing at least 2 of the above interventions
	No treatment
Outcome	Placebo     Critical
Outcome	<ul> <li>Live birth (as defined by study, risk of bias assessments will reflect where this is not defined as a live birth to include a gestational age of ≥ 20 weeks; multiple births will be counted as 1 live birth event)</li> </ul>
	<ul> <li>Clinical pregnancy (as defined by study, risk of bias assessments will reflect where this is not defined as an ultrasound scan that has shown at least 1 fetal heartbeat)</li> </ul>
	The primary unit of analysis will be cumulative rates (of each outcome) per woman randomised
	Important
	Miscarriage (loss of a baby before 24 weeks gestational age)
	<ul> <li>Multiple gestation (defined as an ultrasound scan that has shown at least 2 fetal heartbeats)</li> </ul>
CnDU: considerania hermane	Ovarian Hyperstimulation Syndrome (OHSS)      All partial translations and the interest of the state of

- 2 GnRH: gonadotropin hormone-releasing hormone; ICSI: intracytoplasmic sperm injection; IVF: in vitro fertilisation; OHSS: ovarian hyperstimulation syndrome.
- 4 For further details see the review protocol in appendix A.

### 5 Methods and process

- 6 This evidence review was developed using the methods and process described in
- 7 Developing NICE guidelines: the manual. Methods specific to this review question are
- 8 described in the review protocol in appendix A and the methods document (supplementary
- 9 document 1).
- 10 Declarations of interest were recorded according to NICE's conflicts of interest policy.

### 1 Effectiveness evidence

### 2 Included studies

- 3 One randomised controlled trial (RCT) was included for this review (Carone 2012). This RCT
- 4 compared highly purified human menopausal gonadotropin (hMG-HP) to human recombinant
- 5 follicle stimulation hormone (r-hFSH) plus human recombinant luteinizing hormone (r-hLH)
- 6 for people with hypogonadotropic hypogonadism.
- 7 The included study is summarised in Table 2.
- 8 See the literature search strategy in appendix B and study selection flow chart in appendix C.

### 9 Excluded studies

- 10 Studies not included in this review are listed, and reasons for their exclusion are provided in
- 11 appendix J.

17

18

### 12 Summary of included studies

13 Summary of the study that was included in this review is presented in Table 2.

### 14 Table 2: Summary of included studies

Carone 2012 N=35 <u>hMG-HP</u> <u>r-hF3</u>	parison Outcomes Comments
hypogonadotropic anovulation (diagnosed with hypogonadotropic hypogonadism according to a negative P4 challenge test)  Mean (SD) age in years: 30.39 (15.26)  HP daily, as and 150 IU FSH + 150 IU LH like activity  Participants received gonadotropin treatment for ovulation was single induced by a single administration of hCG on the day after the last hMG-HP when the leading follicle meal	andotropin ment for days and ation secondary amenorrhea  Participants were treated for 1 cycle (series A). Those who did not become pregnant during the first cycle were optionally treated for a further 1 or 2 aveles (series a).

FSH: follicle stimulating hormone; hCG: human chorionic gonadotrophin; hMG-HP: highly purified human menopausal gonadotropin; IU: international unit; LH: luteinizing hormone; NR: not reported; RCT: randomis

menopausal gonadotropin; IU: international unit; LH: luteinizing hormone; NR: not reported; RCT: randomised controlled trial; r-hFSH/r-hLH: human recombinant follicle stimulating hormone/human recombinant luteinizing

hormone; SD: standard deviation; WHO: world health organisation.

- 1 See the full evidence tables in appendix D. No meta-analysis was conducted (and so there
- 2 are no forest plots in appendix E).

### 3 Summary of the evidence

- 4 Low quality evidence from 1 randomised clinical trial (RCT) showed no clinically important
- 5 difference in live birth in people with hypogonadotropic hypogonadism taking highly purified
- 6 human menopausal gonadotropin (hMG-HP) compared to human recombinant follicle
- 7 stimulation hormone (r-hFSH)/human recombinant luteinizing hormone (r-hLH). However,
- 8 this outcome was only reported at the end of the first cycle (series A).
- 9 Low or very low quality evidence from the same RCT showed a higher rate of clinical
- pregnancy for people receiving r-hFSH/r-hLH compared to hMG-HP at the end of the first
- 11 cycle (series A) and all cycles combined (series A, B and C) when the outcome was both
- 12 analysed according to the number of participants and the number of cycles. No clinically
- important differences between groups were shown in clinical pregnancy when the outcome
- was analysed at the end of the second cycle (series B) and the third cycle (series C),
- indicating that the differences between groups were largely driven by the first cycle (very low
- 16 quality evidence).
- 17 Very low quality evidence showed no clinically important differences were in miscarriage,
- multiple gestation, or ovarian hyperstimulation syndrome in people taking hMG-HP compared
- 19 to r-hFSH/r-hLH.
- 20 See appendix F for full GRADE tables.

### 21 Economic evidence

- A total of 133 studies were identified in the health economic literature search for this review
- 23 question. After duplicates were removed, 104 studies were screened on title and abstract. Of
- these 104 studies, 103 were excluded and one was included in this evidence review.

### 25 Included studies

- One economic study was identified which was relevant to this question (Papaleo 2014).
- 27 See the literature search strategy in appendix B and economic study selection flow chart in
- 28 appendix G.

### 29 Excluded studies

- 30 Economic studies not included in this review are listed, and reasons for their exclusion are
- 31 provided in appendix J.

### 32 Summary of included economic evidence

33 See Table 3 for the economic evidence profile of the included study.

Table 3: Economic evidence profile of ovulation induction strategies for people with a health-related female factor fertility problem associated with hypogonadotropic hypogonadism?

	accounted man hypogenium pro hypogenium man h						
				Incremental			
						Cost	
Study	Limitations	Applicability	Other comments	Costs	Effect	effectivenss	Uncertainty
Papaleo 2014	Potentially serious limitations <sup>1,2,3,4</sup>	Partially applicable <sup>5,6</sup>	Study employed a Markov decision-analytic model with a time horizon of 3 treatment cycles (<1 year)	€733	0.337 Clinical pregnancies <sup>7</sup>	€2,007 per additional clinical pregnancy	Probabilistic sensitivity analysis suggested recombinant gonadotrophin therapy was likely to be more costly and more effective than urinary gonadotrophin therapy

<sup>&</sup>lt;sup>1</sup> Healthy live birth rather than clinical pregnancy is true outcome of interest as a clinical pregnancy does not equate to a live birth

2

<sup>&</sup>lt;sup>2</sup> Probabilistic sensitivity analysis undertaken but parameters for distributions not specified

<sup>&</sup>lt;sup>3</sup> Industry funded

<sup>&</sup>lt;sup>4</sup> The analysis may not have included all relevant comparators and therefore the evaluation only assesses the relative cost-effectiveness of the 2 interventions studied and not whether they represent a cost-effective use of resources more generally

<sup>&</sup>lt;sup>5</sup> Setting was Italian National Health Service and a cost year of 2013

<sup>&</sup>lt;sup>6</sup> QALYs not used to quantify health benefits and no cost-effectiveness threshold available for the outcome of clinical pregnancy

<sup>&</sup>lt;sup>7</sup> Clinical pregnancy, as defined by the study, is defined as falling pregnant within the study time horizon

### 1 Economic model

- 2 No economic modelling was undertaken for this review because the committee agreed that
- 3 other topics were higher priorities for economic evaluation as the population covered by this
- 4 review is relatively small and it was not anticipated that recommendations would have a
- 5 significant resource impact.

### 6 Unit costs

Resource	Unit costs	Source
Pergoveris: 150 IU r-hFSH + 75 IU r-hLH	£72.35	BNF Accessed 01/09/2023
Menopur: hMG-HP (150 IU)	£36.04	BNF Accessed 01/09/2023

### 7 The committee's discussion and interpretation of the evidence

#### 8 The outcomes that matter most

- 9 Live birth and clinical pregnancy rates were prioritised as critical outcomes by the committee.
- They were selected as the best indicators of fertility and were specified in the core outcome
- 11 set for fertility research (Duffy 2020).
- 12 Miscarriage, multiple gestation, and ovarian hyperstimulation syndrome (OHSS) were
- identified as important outcomes by the committee. Miscarriage was prioritised as an
- 14 important outcome as it provides meaningful information about the success of a pregnancy
- and can have a significant impact on the woman's psychological and physical health. Multiple
- 16 gestation was prioritised as an important outcome as it can arise due to ovulation induction
- 17 leading to the release of multiple eggs and results in a riskier pregnancy and birth for the
- mother and baby. The committee prioritised OHSS as an important outcome as it can occur
- in people undergoing ovulation induction, resulting in significant pain, and in severe cases
- 20 the need for additional treatment and hospitalisation.

### 21 The quality of the evidence

- The quality of the evidence was assessed with GRADE and rated as low and very low
- 23 quality.

31

- 24 The evidence was downgraded for risk of bias (due to lack of information about concealment
- of the allocation sequence, absence of any blinding, and only participants who were
- 26 unsuccessful in the first cycle and wished to continue with treatment were included in
- 27 subsequent cycle analyses). The evidence was also downgraded for imprecision due to the
- 28 95% confidence interval crossing one or two thresholds for minimally important difference
- and due to a low number of events (less than 150). The evidence was not downgraded for
- indirectness, inconsistency, or publication bias.

#### Benefits and harms

- 32 The committee discussed the evidence for highly purified human menopausal gonadotropin
- 33 (hMG-HP) compared to human recombinant follicle stimulation hormone (r-hFSH) plus
- human recombinant luteinizing hormone (r-hLH) and noted there was no important difference
- in live births in people with hypogonadotropic hypogonadism. The committee agreed that live
- 36 birth was the most reliable and accurate indicator of fertility and so this indicated a lack of
- 37 difference between the two preparations.

- 1 The committee discussed the higher rate of clinical pregnancy for those receiving r-hFSH/r-
- 2 hLH compared to hMG-HP at the end of the first cycle (series A) and all cycles combined
- 3 (series A, B and C) when this outcome was analysed according to the number of participants
- 4 and number of cycles. However, they noted that the study was very small and was
- 5 conducted in Italy where the use of r-hFSH/r-hLH may be more common in clinical practice
- 6 than in the United Kingdom, where other formulations of gonadotrophins (such as hMG-HP)
- 7 are used more frequently. Based on this evidence the committee agreed that it was not
- 8 appropriate to recommend one gonadotrophin preparation over another.
- 9 The committee noted the absence of any RCT evidence comparing gonadotrophins to
- placebo or no treatment for ovulation induction for people with hypogonadotropic
- 11 hypogonadism but emphasised that the chances of pregnancy without treatment would be
- 12 negligible, as ovulation is required for a spontaneous pregnancy to occur. The committee
- highlighted that it is standard good clinical practice to offer gonadotrophins to people with
- 14 hypogonadotropic hypogonadism to address the absent or decreased function of the gonads
- and made a recommendation in line with this. The committee agreed to leave the choice of
- 16 gonadotrophin preparation and delivery format as a decision to be made by individual
- 17 clinicians or centres.
- 18 The committee noted the absence of any eligible evidence on interventions aimed at
- 19 normalising weight and/or exercise. Based on their clinical knowledge and experience, the
- 20 committee agreed that increasing body weight for those with a low body mass index (BMI)
- and moderating exercise levels for those who undertake high levels of exercise, would
- improve the chance of regular ovulation, conception, and an uncomplicated pregnancy for
- people with hypogonadotropic hypogonadism and agreed to retain the recommendation from
- the previous guideline. The BMI cut-offs in the previous guideline were modified in line with
- current National Health Service (NHS) definitions of a healthy BMI which is between 18.5 and 24.9 kg/m<sup>2</sup>. The committee discussed whether to make a research recommendation
- 27 and 24.5 kg/m. The dominited dispussed whether to make a research recommendation
- 27 relating to weight and exercise but agreed that this was standard clinical practice and further
- research was unlikely to change practice, so did not prioritise this topic for a research
- 29 recommendation.
- The committee discussed that people who struggle to gain weight on their own may benefit
- 31 from professional dietary support. However, in the absence of any evidence specific to this
- 32 population and considering lengthy waiting times to see dieticians, the committee agreed that
- it was not appropriate to strengthen this recommendation beyond the offering of advice. They
- noted that there was advice on the NHS website about healthy ways to gain weight and so
- 35 cross-referred to this.

38

- The committee agreed that the previous guideline recommendations on monitoring ovulation
- induction during gonadotrophin therapy were still relevant and did not require changes.

### Cost effectiveness and resource use

- The committee discussed one study (Papaleo 2014) which found, using a Markov decision
- analytic approach, that the incremental cost-effectiveness ratio (ICER) of human
- 41 recombinant follicle stimulation hormone (r-hFSH) relative to human recombinant luteinizing
- 42 hormone (r-hLH) was €2,007 per clinical pregnancy. Although the committee noted that there
- was no cost-effectiveness threshold for such an outcome, they thought in the context of
- 44 assisted reproductive technology, more generally, that this would represent a cost-effective
- 45 use of resources if taken at face value. However, the committee noted that the study was
- rated as only partially applicable and as having serious limitations. They also noted that the
- 47 primary purpose of the review had not been to compare different gonadotrophin
- 48 preparations, and they did not think cost-effective recommendations could be made, based
- 49 on this analysis.
- 50 The committee noted that it is standard good clinical practice to offer gonadotrophins to
- 51 people with hypogonadotropic hypogonadism to address the absent or decreased function of

- 1 the gonads. The committee therefore made a recommendation aligning to best clinical
- 2 practice noting that the chances of pregnancy without treatment would be close to zero.
- 3 It is possible there may be a small increase in costs for the NHS if there is an increased
- 4 uptake in the number of people receiving gonadotropins. However, hypogonadotropic
- 5 hypogonadism is a relatively rare condition, and only a small proportion of this population will
- 6 be looking to conceive. Therefore, as the cost of treatment is between £36.04 and £72.35 –
- 7 any increased uptake of gonadotropins for people with hypogonadotropic hypogonadism is
- 8 unlikely to lead to a significant resource impact.

### 9 Recommendations supported by this evidence review

10 This evidence review supports recommendations 1.5.1 and 1.5.2.

### Appendices

### 2 Appendix A Review protocols

- 3 Review protocol for review question: What is the clinical and cost effectiveness of ovulation induction strategies for
- 4 people with a health-related female factor fertility problem associated with hypogonadotropic hypogonadism?

### 5 Table 4: Review protocol

ID	Field	Content
0.	PROSPERO registration number	CRD42023454807
1.	Review title	Clinical and cost effectiveness of ovulation induction strategies for people with a health-related female factor fertility problem associated with hypogonadotropic hypogonadism
2.	Review question	What is the clinical and cost effectiveness of ovulation induction strategies for people with a health-related female factor fertility problem associated with hypogonadotropic hypogonadism?
3.	Objective	To determine the clinical and cost effectiveness of ovulation induction strategies for people with a health-related female factor fertility problem associated with hypogonadotropic hypogonadism
4.	Searches	The following databases will be searched (from 2011 [the date of the last search for the NICE Fertility guideline] to the date of the search):  Clinical searches  Cochrane Central Register of Controlled Trials (CENTRAL)  Cochrane Database of Systematic Reviews (CDSR)  Embase  MEDLINE ALL  Epistemonikos
		Searches will be restricted by:

ID	Field	Content
		<ul> <li>English language</li> <li>Human studies</li> <li>The guideline committee will decide whether and when to re-run the searches before final submission of the review to retrieve further studies for inclusion.</li> <li>The full search strategies for MEDLINE database will be published in the final review.</li> </ul>
5.	Condition or domain being studied	Treatments for female factor fertility problems associated with hypogonadotropic hypogonadism
6.	Population	<ul> <li>Inclusion:</li> <li>People with a health-related female factor fertility problem associated with hypogonadotropic hypogonadism Exclusion:</li> <li>People presenting with primary or secondary amenorrhea due to other causes will not be included in this review.</li> <li>If some, but not all, of a study's participants are eligible for the review, then a study will be included if at least 80% of its participants are eligible for this review.</li> </ul>
7.	Interventions	<ul> <li>Interventions aimed at normalising weight and/or promoting exercise</li> <li>Pulsatile gonadotrophin-releasing hormone (GnRH) ('GnRH pump')</li> <li>Gonadotrophins</li> <li>Studies will be included that use ovulation induction strategies followed by natural intercourse, timed intercourse, or intrauterine insemination. Studies in people undergoing IVF/ICSI will be excluded from this review.</li> </ul>
8.	Comparators	<ul> <li>Trials comparing at least 2 of the above interventions</li> <li>No treatment</li> <li>Placebo</li> </ul>
9.	Types of study to be included	<ul> <li>Include published full-text papers:</li> <li>Systematic reviews of RCTs</li> <li>RCTs* (individual or cluster)</li> <li>If no RCT evidence:         <ul> <li>Quasi-randomised controlled trials (experimental studies using a non-randomly assigned control group design with matched comparison or another method of controlling for confounding variables)</li> </ul> </li> </ul>

ID	Field	Content
		*Cross-over RCTs will be included but only where data can be extracted for the end of the first phase
10.	Other exclusion criteria	Other exclusion criteria:
		<ul> <li>Language limitations: non-English-language papers will be excluded (unless data can be obtained, and risk of bias assessed, from an existing systematic review)</li> </ul>
		<ul> <li>Conference abstracts, dissertations and unpublished data will not be included unless the data can be extracted (and risk of bias assessed) from elsewhere (for instance, from an existing systematic review)</li> </ul>
11.	Context	This guidance will update and replace the following NICE guideline: Fertility problems: assessment and treatment (last updated 2017; CG156)
12.	Primary outcomes (critical outcomes)	<ul> <li>Live birth (as defined by study, risk of bias assessments will reflect where this is not defined as a live birth to include a gestational age of ≥ 20 weeks; multiple births will be counted as 1 live birth event)</li> </ul>
		<ul> <li>Clinical pregnancy (as defined by study, risk of bias assessments will reflect where this is not defined as an ultrasound scan that has shown at least 1 fetal heartbeat)</li> </ul>
		The primary unit of analysis will be cumulative rates (of each outcome) per woman randomised
13.	Secondary outcomes	Miscarriage (loss of a baby before 24 weeks gestational age)
	(important outcomes)	Multiple gestation (defined as an ultrasound scan that has shown at least 2 fetal heartbeats)
		Ovarian Hyperstimulation Syndrome (OHSS)
14.	Data extraction (selection and coding)	All references identified by the searches and from other sources will be uploaded into EPPI and de-duplicated. Titles and abstracts of the retrieved citations will be screened to identify studies that potentially meet the inclusion criteria outlined in the review protocol.
		Dual sifting will be performed on at least 10% of records; 90% agreement is required. Disagreements will be resolved via discussion between the reviewers, and consultation with senior staff if necessary.
		Full versions of the selected studies will be obtained for assessment. Studies that fail to meet the inclusion criteria once the full version has been checked will be excluded at this stage. Each study excluded after checking the full version will be listed, along with the reason for its exclusion. A standardised form will be used to extract data from studies. The following data will be extracted: study details (reference, country where study was carried out, type and dates), participant characteristics, inclusion and exclusion criteria, details of the interventions, setting and follow-up,

ID	Field	Content
		relevant outcome data and source of funding. One reviewer will extract relevant data into a standardised form, and this will be quality assessed by a senior reviewer.
15.	Risk of bias (quality)	Quality assessment of individual studies will be performed using the following checklists:
	assessment	ROBIS tool for systematic reviews
		Cochrane RoB tool v.2
		The quality assessment will be performed by one reviewer and this will be quality assessed by a senior reviewer.
16.	Strategy for data synthesis	Depending on the availability of the evidence, the findings will be summarised narratively or quantitatively. Where there is available data, meta-analyses will be conducted using Cochrane Review Manager software, and data will be presented as risk ratios or odds ratios (all included outcomes are dichotomous outcomes). It is considered likely that a random-effects model will be used for meta-analyses (based on assumptions about methodological diversity of studies). Funnel plot asymmetry (relationship between the magnitude of the effect estimate and study size) will be considered (for meta-analyses that include at least 10 studies), and where asymmetry is indicated a fixed-effects model will be conducted (and both random-effects and fixed-effects analyses will be presented) or sensitivity analyses excluding small studies will be considered.
		Heterogeneity in the effect estimates of the individual studies will be assessed using the I2 statistic. Alongside visual inspection of the point estimates and confidence intervals, I2 values of greater than 50% and 80% will be considered as significant and very significant heterogeneity, respectively. Heterogeneity will be explored as appropriate using sensitivity analyses and pre-specified subgroup analyses.
		The confidence in the findings across all available evidence will be evaluated for each outcome using an adaptation of the 'Grading of Recommendations Assessment, Development and Evaluation (GRADE) toolbox' developed by the international GRADE working group: <a href="http://www.gradeworkinggroup.org/">http://www.gradeworkinggroup.org/</a>
		Importance and imprecision of findings will be assessed against minimally important differences (MIDs). The following MIDs will be used: <ul> <li>Live birth: statistical significance</li> <li>Dichotomous outcomes (other than live birth): 0.8 and 1.25 for all other relative dichotomous outcomes</li> </ul>
17.	Analysis of sub-groups	Evidence will be sub-grouped by the following:
		Age (based on the mean age reported in the study):

Fertility problems: evidence reviews for ovulation induction strategies for hypogonadotropic hypogonadism DRAFT [September 2025]

ID	Field	Content					
		o ≤35 years					
		o >35 years					
		should differe consid	Where evidence is subgrouped the committee will consider on a case-by-case basis if separate recommendations should be made for distinct groups. Separate recommendations may be made where there is evidence of a differential effect of interventions in distinct groups. If there is a lack of evidence in one group, the committee will consider, based on their experience, whether it is reasonable to extrapolate and assume the interventions will have similar effects in that group compared with others.

### 7 Study details

6

Country where study was carried out	Italy
Study type	Randomised controlled trial (RCT)
Study dates	July 2008 and November 2011
Inclusion criteria	<ul> <li>All participants with:</li> <li>WHO type I hypogonadotropic anovulation (diagnosed with hypogonadotropic hypogonadism according to a negative P4 challenge test)</li> <li>serum LH&lt;1.2 IU/I and FSH&lt;5 IU/I</li> <li>transvaginal ultrasound showing a uterus with a midline echo</li> <li>no ovarian tumor or cyst and ≤13 small follicles (mean diameter ≤10mm) on the largest section through each ovary</li> <li>a bone mineral index between 18.4 and 31.4</li> </ul>

Fertility problems: evidence reviews for ovulation induction strategies for hypogonadotropic hypogonadism DRAFT [September 2025]

no systemic disease
Most participants had primary amenorrhea (85.7%) while 5 participants (14.3%) had secondary amenorrhea
Not reported
highly purified human menopausal gonadotropin (hMG-HP)
human recombinant FSH (r-hFSH)/human recombinant LH (r-hLH)
Primary infertility: number (%)
hMG-HP: 16 (88)
r-hFSH/r-hLH: 15 (88)
Age, years: Mean (SEM)
hMG-HP: 30.22 (3.64)
r-hFSH/r-hLH: 30.58 (3.77)
BMI, kg/m2: Mean (SEM)
hMG-HP: 25.42 (3.35)
r-hFSH/r-hLH: 23.48 (3.61)
P4, nmol/l: Mean (SEM)
hMG-HP: 0.48 (0.16)
r-hFSH/r-hLH: 0.41 (0.19)

Fertility problems: evidence reviews for ovulation induction strategies for hypogonadotropic hypogonadism DRAFT [September 2025]

Intervention(s)/control	highly purified human menopausal gonadotropin (hMG-HP)
	150 IU hMG-HP daily, as 150 IU FSH + 150 IU LH like activity
	human recombinant FSH (r-hFSH)/human recombinant LH (r-hLH)
	150 IU r-hFSH and 75 IU r-hLH daily
	The FSH daily dose was fixed at 150 IU based upon clinical experience to ensure that all participants would be above their threshold needs.
	Both groups: participants received gonadotropin treatment for a maximum of 16 d and ovulation was induced by a single administration of hCG [10000 IU (IBSA)] on the day after the last hMG-HP or r-hFSH/r-hLH when the leading follicle had reached a mean diameter of ≥17 mm.
	Participants were initially treated for one cycle (series A) and, if consent was given, participants who did not become pregnant during the first cycle were treated for a further optional one cycle (series B) or two series (series C) of cycles, with the same criteria of randomization, that is maintaining the same treatment as the previous cycle.
Duration of follow-up	Follow-up at the end of each cycle (series A, series B, and series C)
Sources of funding	Sponsored by Centro Riproduzione e Andrologia
Sample size	Total participant population, N=35 participants
	hMG-HP: n=18
	r-hFSH/r-hLH: n=17
	Series A participant population, N=35 participants
	hMG-HP: n=18
	r-hFSH/r-hLH: n=17

Series B participant population, N=21 participants			
hMG-HP: n=14			
r-hFSH/r-hLH: n=7			
Series C participant population, N=14 participants			
hMG-HP: n=11			
r-hFSH/r-hLH: n=3			

1

- 2 Study arms
- 3 **hMG-HP (N = 18)**
- 4 highly purified human menopausal gonadotropin (hMG-HP)
- 5 **r-hFSH/r-hLH (N = 17)**
- 6 human recombinant FSH (r-hFSH) plus human recombinant LH (r-hLH)

7

#### 8 Outcomes

Outcome	hMG-HP, N = 18	r-hFSH/r-hLH, N = 17
Live birth (Series A) Defined in the study as live birth	n = 4; % = 22	n = 9; % = 53
No of events		

Outcome	hMG-HP, N = 18	r-hFSH/r-hLH, N = 17
Clinical pregnancy total/ participant Defined in the study as pregnancy No of events	n = 10; % = 55.56	n = 15; % = 88.23
Clinical pregnancy/cycle (Series A) No of events	n = 4; % = 22.22	n = 10; % = 58.82
Clinical pregnancy/cycle (Series B) No of events	n = 4; % = 28.57	n = 4; % = 57.14
Clinical pregnancy/cycle (Series C) No of events	n = 2; % = 18.18	n = 1; % = 33.33
Clinical pregnancy total/cycle (Series A, B and C) No of events	n = 10; % = 23.3	n = 15; % = 55.6
Miscarriage total/ participant  Defined in the study as abortion  No of events	n = 1; % = 5.55	n = 1; % = 5.88
Miscarriage/cycle (Series A) No of events	n = 0; % = 0	n = 1; % = 5.88
Miscarriage/cycle (Series B) No of events	n = 1; % = 7.14	n = 0; % = 0

Outcome	hMG-HP, N = 18	r-hFSH/r-hLH, N = 17
Miscarriage/cycle (Series C)	n = 0; % = 0	n = 0; % = 0
No of events		
Miscarriage total/cycle (Series A, B and C)	n = 1; % = 2.32	n = 1; % = 3.7
No of events		
Multiple gestation total/ participant Defined in the study as multiple pregnancy	n = 3; % = 16.67	n = 2; % = 11.76
No of events		
Multiple gestation/cycle (Series A)	n = 1; % = 5.55	n = 2; % = 11.11
No of events		
Multiple gestation/cycle (Series B)	n = 1; % = 7.14	n = 0; % = 0
No of events		
Multiple gestation/cycle (Series C)	n = 1; % = 9.09	n = 0; % = 0
No of events		
Multiple gestation total/cycle (Series A, B and C)	n = 3; % = 6.98	n = 2; % = 7.41
No of events		
Ovarian Hyperstimulation Syndrome Defined in the study as mild or moderate OHSS	n = 0; % = 0	n = 0; % = 0
No of events		

- 1 Live birth (Series A) Polarity Higher values are better
- 2 Clinical pregnancy (Series A, B and C) Polarity Higher values are better
- 3 Miscarriage (Series A, B and C) Polarity Lower values are better
- 4 Multiple gestation (Series A, B and C) Polarity Lower values are better
- 5 Ovarian Hyperstimulation Syndrome Polarity Lower values are better

#### 7 Critical appraisal – Cochrane RoB 2

6

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns (There is no information about concealment of the allocation sequence, although baseline differences observed between intervention groups appear to be compatible with chance)
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns (It is likely that participants, carers, or people delivering the interventions were aware of intervention groups during the trial. No deviations from intended interventions arose because of the trial context however only participants who were unsuccessful in the first cycle and wished to continue with treatment were included in subsequent cycle analyses)
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low (Outcome data were available for all, or nearly all, randomized participants)
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low (The method of measuring the outcome was not inappropriate and the measurement or ascertainment of the outcome did not differ between intervention groups. It is unlikely that the assessment of the outcome could not have been influenced by knowledge of the intervention received.)
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low (The data were analysed in accordance with a pre-specified plan that was finalised before unblinded outcome data were available for analysis and the result being assessed is unlikely to have been selected, based on the results,

Section	Question	Answer
		from multiple eligible outcome measurements within the outcome domain. The reported outcome data are unlikely to have been selected, based on the results, from multiple eligible analyses of the data.)
Overall bias and Directness	Risk of bias judgement	Some concerns (The study is judged to raise some concerns in two domains (Bias arising from the randomisation process and bias for deviations from the intended interventions, the effect of assignment to intervention) for this result, but not to be at high risk of bias for any domain.)
Overall bias and Directness	Overall Directness	Directly applicable
Overall bias and Directness	Risk of bias variation across outcomes	None

RCT: randomised controlled trial; RoB: risk of bias

# 1 Appendix E Forest plots

- 2 Forest plots for review question: What is the clinical and cost effectiveness of ovulation induction strategies for people with
- 3 a health-related female factor fertility problem associated with hypogonadotropic hypogonadism?
- 4 No meta-analysis was conducted for this review question and so there are no forest plots.

### Appendix F GRADE tables

GRADE tables for review question: What is the clinical and cost effectiveness of ovulation induction strategies for people with a health-related female factor fertility problem associated with hypogonadotropic hypogonadism?

Table 5: Evidence profile for comparison between highly purified human menopausal gonadotropin (hMG-HP) and human recombinant

follicle stimulating hormone/human recombinant luteinizing hormone (r-hFSH/r-hLH)

	Quality assessment			No of participants		Effect		Quality	Importance

Table 7: Excluded studies and reasons for their exclusion							
Study	Code [Reason]						
Al-Inany, HG, Youssef, MA, Ayeleke, RO et al. (2016) Gonadotrophin-releasing hormone antagonists for assisted reproductive technology. Cochrane Database of Systematic Reviews	- Study does not contain an intervention relevant to this review protocol  Subfertile couples undergoing controlled ovarian hyperstimulation as part of an IVF or ICSI programme using GnRH antagonists or long-course GnRH agonist protocols for the prevention of premature LH surges						
Astrid EP, Cantineau, Mirjam J, Janssen, Ben J, Cohlen et al. (2014) Synchronised approach for intrauterine insemination in subfertile couples. Cochrane Database of Systematic Reviews 12(12): cd006942	- Population not relevant to this review protocol The study does not appear to include people with a health-related female factor fertility problem associated with hypogonadotropic hypogonadism: subfertile couples where intrauterine insemination is the first treatment option such as unexplained subfertility, male subfertility, mild endometriosis, cervical hostility and cycle disturbances						
Bayram, N.; van Wely, M.; Van der Veen, F. (2003) Pulsatile gonadotrophin releasing hormone for ovulation induction in subfertility associated with polycystic ovary syndrome.  Cochrane Database of Systematic Reviews 2010(11): cd000412	- Population not relevant to this review protocol The study does not appear to include people with a health-related female factor fertility problem associated with hypogonadotropic hypogonadism: subfertile participants s with anovulation and polycystic ovary syndrome						
Chen, D, Shen, X, Fu, Y et al. (2020) Pregnancy Outcomes Following Letrozole Use in Frozen- thawed Embryo Transfer Cycles: A Systematic Review and Meta-analysis. Geburtshilfe und Frauenheilkunde 80(8): 820-833	- Study does not contain an intervention relevant to this review protocol The study examines the clinical efficacy of letrozole for endometrial preparation prior to frozen-thawed embryo transfer						
D'Angelo, Arianna; Amso, Nazar N; Hassan, Rudaina (2017) Coasting (withholding gonadotrophins) for preventing ovarian hyperstimulation syndrome. Cochrane Database of Systematic Reviews 5: cd002811	- Study does not contain an intervention relevant to this review protocol  The study examines withholding gonadotrophins (coasting) on the prevention of ovarian hyperstimulation syndrome in assisted reproduction cycles and trials that explored ovulation induction treatment without in vitro fertilisation or intra-cytoplasmic sperm injection were excluded						
Eftekhar, M. and Tabibnejad, N. (2021) Recombinant luteinizing hormone supplementation in assisted reproductive technology: a review of literature. Middle East Fertility Society Journal 26(1): 37	- Study design not relevant to this review protocol  The study is a literature review which narratively examines the effect of recombinant luteinizing hormone supplementation						
Ghobara, T; Gelbaya, TA; Ayeleke, RO (2017)  Cycle regimens for frozen-thawed embryo	- Study does not contain an intervention relevant to this review protocol						

Study	Code [Reason]
<u>transfer.</u> The Cochrane database of systematic reviews 7: cd003414	The study examines the safety of natural cycle frozen-thawed embryo transfer (FET), hormone therapy cycle FET and ovulation induction cycle FET, and compares subtypes of these regimens
Humaidan, P., Chin, W., Rogoff, D. et al. (2017)  Efficacy and safety of follitropin alfa/lutropin alfa in ART: a randomized controlled trial in poor ovarian responders. Human Reproduction 32(3): 544-555	- Study does not contain an intervention relevant to this review protocol  Participants were women undergoing IVF and/or ICSI and were randomised to undergo controlled ovarian stimulation with r-hFSH/r-hLH or r-hFSH
Huseyin, Kiyak, Berk, Bulut, Tolga, Karacan et al. (2019) Management of ovulation induction and intrauterine insemination in infertile patients with hypogonadotropic hypogonadism. Journal of gynecology obstetrics and human reproduction 48(10): 833-838	- Study design not relevant to this review protocol  Non randomised study
Ly, Nathalie; Dubreuil, Sophie; Touraine, Philippe (2022) Normal-high IGF-1 level improves pregnancy rate after ovarian stimulation in women treated with growth hormone replacement therapy. Endocrine connections 11(12)	- Study design not relevant to this review protocol  Non randomised study
White, Davinia M, Hardy, Kate, Lovelock, Suzannah et al. (2018) Low-dose gonadotropin induction of ovulation in anovulatory women: still needed in the age of IVF. Reproduction (Cambridge, England) 156(1): f1-f10	- Study design not relevant to this review protocol  Non randomised study

#### **Excluded economic studies**

No economic evidence was identified and then excluded for this review.
