# Caesarean Section (update)

What are the risks and benefits of planned CS compared with planned vaginal birth for both women and babies?

Study details	Participants	Interventions	Outcomes	Results	Comments
<p><b>Authors</b> MacDorman,M.F., Declercq,E., Menacker,F., Malloy,M.H.</p> <p><b>Year of publication</b> 2008</p> <p><b>Country</b> USA</p> <p><b>Ref ID</b> 51996</p> <p><b>Design</b> Retrospective cohort study</p> <p><b>Aim of study</b> To examine infant and neonatal mortality by method of delivery for women with no documented antenatal risk for caesarean delivery</p>	<p><b>Inclusion Criteria</b> All women with singleton pregnancy, term (37 - 41 weeks), vertex birth and with no reported medical risk factors, placenta praevia or prior caesarean section</p> <p><b>Exclusion Criteria</b> Women with medical risk factors including anaemia, cardiac disease, acute or chronic lung disease, diabetes, genital herpes, chronic hypertension, pregnancy associated hypertension, eclampsia, hydraminous/oligohydraminos, hemogloninopathy, incompetent cervix, previous infants &gt;4000 g, previous preterm or small for gestational age infants, renal disease, rhesus sensitisation, uterine bleeding and other reported on the birth certificate.</p> <p><b>Demographics - Total</b></p>	<p><b>Experimental</b> Planned caesarean section</p> <p><b>Comparator</b> Planned vaginal birth (including CS with labour complications)</p> <p><b>Method</b> Neonatal mortality by mode of delivery examined in all US live births and infant deaths for 1999 to 2002 (based on the birth and death certificates). The study used an "intention to treat" methodology to examine neonatal mortality risk by mode of delivery for low risk women. Logistic regression analysis was used, controlling for maternal age, parity, race, education, smoking, infant gestational age and birth weight.</p>	<p><b>Maternal outcomes</b> Not reported</p> <p><b>Neonatal outcomes</b> Neonatal mortality</p> <p><b>Dichotomous</b></p> <p><b>Continuous</b></p>	<p><b>Outcomes</b> <u>Neonatal Mortality Rates (per 1000 live births)</u></p> <p><u>Planned Vaginal Birth</u></p> <p>Vaginal = 0.63</p> <p>Primary CS with labour complications = 1.69</p> <p>Total (Vaginal + Primary CS with labour complications) = 0.72</p> <p><u>Planned CS</u></p> <p>Primary CS with no labour complications = 1.73</p> <p><u>Neonatal mortality rate for planned CS (no complication) compared with planned vaginal birth :</u></p> <p>2.42</p> <p><u>Number of deaths</u></p> <p><u>Planned Vaginal Birth</u></p>	<p><b>Funding</b> Not reported</p> <p><b>Limitations</b> Data for the study was collected from birth certificates. There are concerns about poor reporting and the accuracy of reporting of specific data items on the birth certificates.</p> <p><b>Other information</b> The reason for the planned caesarean section was not reported</p>

	<p>Total = 8,026,415</p> <p>Planned vaginal delivery (including EmCS and assisted deliveries): n = 7,755,236</p> <p>Caesarean with no reported labour complications or procedures: n = 271,179</p>			<p>Actual vaginal birth = 4,500/7,138,068</p> <p>Primary CS with labour complications = 1,046/617,618</p> <p>Total (Vaginal birth + Primary CS with labour complications) = 5546/7,755,686</p> <p><u>Planned CS</u></p> <p>Primary CS with no labour complications = 469/271,179</p> <p><u>Adjusted OR (95% CI)</u></p> <p>* Model 1 (Dependent variable = total neonatal mortality)</p> <p>Planned Vaginal Birth = 1.00</p> <p>Planned CS with no labour complications = 2.34 (2.31 - 2.58)</p> <p>* Model 2 (Dependent variable = neonatal mortality excluding congenital anomalies)</p> <p>Planned Vaginal Birth = 1.00</p> <p>Planned CS with no labour complications = 1.93 (1.67 - 2.24)</p>

## Caesarean Section (update)

What is the accuracy of imaging techniques (colour-flow ultrasound and MRI) for diagnosis of a morbidly adherent placenta in pregnant women who have had a previous caesarean section and are currently diagnosed with placenta praevia?

## Caesarean Section (update)

Does a diagnosis of morbidly adherent placenta using imaging techniques lead to improved outcomes in pregnant women with a previous caesarean section who are currently diagnosed with placenta praevia?

## Caesarean Section (update)

What is the effectiveness of planned caesarean section compared with planned vaginal birth at the decreasing the mother to child transmission of the virus in pregnant women with HIV, for both low and higher viral load?

Study details	Participants	Interventions	Outcomes	Results	Comments
<p><b>Authors</b> Islam,S., Oon,V., Thomas,P.</p> <p><b>Year of publication</b> 2010</p> <p><b>Country</b> UK</p> <p><b>Ref ID</b> 53216</p> <p><b>Design</b> Retrospective cohort study</p> <p><b>Aim of study</b> To investigate the maternal outcome of planned vaginal birth as well as the rate of MTCT</p>	<p><b>Inclusion Criteria</b> HIV infected women opting for planned vaginal birth. The offer of the option of vaginal birth was based upon viral load &lt; 50 cells/ml around 36 weeks gestation</p> <p><b>Exclusion Criteria</b> Not reported</p> <p><b>Demographics - Total Population:</b> n=144 HIV infected women attending for antenatal care between June 2004 and June 2006</p>	<p><b>Experimental Intervention</b>  n= 23/144 selected to have elective vaginal birth and the rest n=121/144 opted for elective caesarean section.</p> <p><b>Methods</b>  The maternal viral load obtained closest to birth and up to 7 days postpartum was recorded.</p> <p>All babies had antiretroviral therapy and none were breast fed. However, in 256 cases information about DDI was not provided; therefore n = 1,511 emergency caesarean section included. Data for the study was obtained from the Medical Birth Registry of Norway (MBRN) that routinely collects information about all deliveries.</p>	<p>A registration form was designed for the study. The form gave detailed information about medical and obstetric history, complications during the pregnancy, the operation, and perinatal events. The clinicians filled in the form for every emergency caesarean section done and the MBRN entered the information into the database. The clinician that reported the data was directly involved in the decision making process for the emergency operation.</p> <p>Women in the two groups (acute and urgent) were comparable in age, BMI, parity and also in neonatal birth weight and gestational age.</p> <p>For each caesarean section, the clinicians specified the indication by ticking a list of 31 pre-specified indications. Fetal distress, abruptio placentae and umbilical cord prolapse were statistically significantly higher than any other indication listed in the form.</p>	<p><u>Decision to delivery intervals (DDI) related to NICU admission</u></p> <p>Total number of cases n = 1,480 (Preterm n = 284 Term n = 1,200)</p> <p><u>Transfers to NICU (preterm) :</u></p> <p>ALL = 85.8 %</p> <p>DDI &lt; 15 min (total cases n = 39/41) = 97.4 %</p> <p>DDI 16 - 30 min (total cases n = 38/54) = 84.3%</p> <p>DDI 31 - 60 min (total cases n = 70/86) = 82.9%</p> <p>DDI &gt; 60 min (total cases n = 86/103) = 84.3%</p> <p>p = ns</p> <p><u>Transfers to NICU (term ≥ 37 weeks) total n = 1200 :</u></p> <p>ALL: 21.9 %</p> <p>DDI &lt; 15 min (total cases n = 70/242) = 29.0 %</p> <p>DDI 16-30 min (total cases n = 87/382) = 23.4%</p>	<p><b>Limitations</b></p> <p><b>Other information</b> All CS performed &lt; 8 hours after the decision for operation were classified as emergency.</p> <p>Emergency sections were divided into acute (those that were performed as quickly as possible after decision was made), and urgent (the decision triggered a set of particularly speedy preparation procedures)</p>

## Caesarean Section (update)

What is the effectiveness of antibiotics given prior to clamping of the cord compared to antibiotics given after clamping of the cord during a planned or emergency caesarean section?

## Caesarean Section (update)

What are the risks and benefits of planned caesarean section compared with planned vaginal birth for both women and babies in women who have had a previous caesarean section?

				<p>(95% CI 0.13 to 0.38)</p> <p>Heterogeneity <math>I^2 = 75.4\%</math>; <math>p &lt; 0.001</math></p> <p>RR 1.01 (95% CI 0.84 to 1.22)</p> <p><u>Term only n=3 studies:</u></p> <p>Total n = 422/383242</p> <p><u>ERCD:</u></p> <p>n = 248/227479</p> <p>Hysterectomy rate = 0.16% (95% CI 0.07% to 0.36%)</p> <p>Heterogeneity <math>I^2 = 97.3\%</math>, <math>p = 0.672</math></p> <p><u>TOL:</u></p> <p>n = 174/155763</p> <p>Hysterectomy rate = 0.14% (95% CI 0.08% to 0.22%)</p> <p>Heterogeneity <math>I^2 = 85.2\%</math>, <math>p = 0.001</math></p> <p>RR 0.97 (95% CI 0.804 to 1.184)</p> <p><u>Rate of hysterectomy in women with multiple CS (n = 7 studies)</u></p> <p>One study reported women</p>	
--	--	--	--	---	--

				<p>with <math>\geq 1</math> prior caesarean were significantly more likely to require hysterectomy (odds ratio 7.9; 95 percent CI: 5.8 to 10.7). Similarly, another study noted an increased risk for hysterectomy with primary caesarean (odds ratio 7.13; 95 percent CI: 3.71 to 13.7). The risk of peripartum hysterectomy for women with <math>\geq 2</math> prior caesareans was significantly higher (odds ratio 18.6; 95 percent CI: 7.67 to 45.4) than for women with one prior caesarean delivery (odds ratio 2.14; 95 percent CI: 1.37 to 3.33). Hysterectomy rates in one study for women undergoing a primary caesarean were 0.062%, and increased with one prior caesarean delivery to 0.735%. Women with <math>\geq 1</math> prior caesarean had a hysterectomy rate of 1.08%, these rates were statistically significant. One study compared women undergoing a second caesarean versus women with two or more prior caesareans. The rate of hysterectomy increased from 0.2% (1/491) to 1.1% (3/277) in the multiple caesarean group, but the</p>	
--	--	--	--	---	--

				<p>result was not statistically significant. One study found a similar rate of hysterectomy in women with four or more prior caesareans of 1.1% (2/170). One study noted increasing incidence of hysterectomy with increasing number of caesareans from 0.65, 0.42, 0.90, 2.41, 3.49, and 8.99% with zero to five or more prior caesareans, respectively. Women with five or more prior caesareans were 15 times more likely to require hysterectomy (odds ratio 15.2; 95 percent CI: 6.9 to 33.5), these results were statistically significant.</p> <p>Repeat caesarean section (RCD):</p> <p>One previous CS = OR 0.7 to 2.14</p> <p>One and more CS = OR 1.4 to 7.9</p> <p>Two or more CS = OR 3.8 to 18.6</p> <p><u>Infection</u></p> <p><u>All GAs n = 10 studies:</u></p>	
--	--	--	--	--	--

				<p>Studies reported endometritis or chorioamniotitis and wound infection</p> <p><u>ERCD:</u></p> <p>Infection rate = 32 per 1000 (95% CI 13 - 73)</p> <p>Heterogeneity <math>I^2 = 99.4\%</math>, <math>p &lt; 0.001</math></p> <p><u>TOL:</u></p> <p>Infection rate = 46 per 1000 (95% CI 15 - 135)</p> <p>Heterogeneity <math>I^2 = 99.7\%</math>, <math>p &lt; 0.001</math></p> <p><u>Term studies = not reported</u></p> <p><u>Multiple CS (RCD)</u></p> <p>All GAs n = 4 studies:</p> <p>There was no uniform definition of infection. One US study reported an incidence of "febrile morbidity" of 19.2% (163/847) for women undergoing RCD, but the authors did not define febrile morbidity. Similarly, another study noted 14.1% of women with three or more prior cesareans had postoperative infections (odds ratio 0.9; 95%</p>	
--	--	--	--	---	--

				<p>CI: 0.5 to 1.8), but the criteria for infection were not defined. Urinary tract infection (UTI) and upper respiratory tract infection (URI) were used by one study to describe postoperative infectious complications. One study defined postpartum endometritis clinically on the absence of findings consistent with an extrauterine source. There was a statistically significant increase in endometritis with multiple caesareans (<math>p &lt; 0.001</math>). Based on these studies the risk of postoperative infection with multiple CSs remains unclear.</p> <p><u>Multiple CS (RCD)</u></p> <p><u>Wound infection</u></p> <p>All GAs n = 4 studies:</p> <p>One study reviewed wound infection and wound dehiscence and found no statistically significant change with multiple caesareans (<math>p = 0.09</math> and <math>0.18</math>, respectively). Similarly, another study found no correlation between number of caesareans and wound problems.</p> <p><u>Surgical injury:</u></p>	
--	--	--	--	---	--

				<p><u>All GAs n = 7 studies:</u></p> <p>Four studies (4) from same cohort of patients (reported differently on surgical injury rates). None found a significant difference between ERCD and TOL for the rate of surgical injury.</p> <p><u>Multiple CS n= 2 studies</u></p> <p>Both studies evaluated bladder injuries. One found 1.6% of women with two or more prior caesareans had a bladder injury (4/250). Another study noted less than 0.3% of women with less than three prior caesareans experienced a bladder injury compared with 4.5% of women with five or more prior caesareans. This trend was statistically significant at <math>p &lt; 0.001</math>. The risk of bowel and ureteral injury with increasing number of caesareans was also statistically significant, although overall incidence was less than 1.2%.</p> <p><u>Mean length of hospital stay (days)</u></p> <p><u>All GAs n = 8 studies:</u></p>
