

1 Appendix C: Review protocols, searches 2 and summary of modified GRADE [update 3 2014]

C.1 Review protocols

5 Table 1: Review question 1

| | Details |
|------------------------------|---|
| Review question | When should (and with what indications) patients with uninvestigated dyspepsia be referred for endoscopy for further investigation and review of treatment plan? |
| Objectives | To identify which patients with uninvestigated dyspepsia need endoscopy for further investigation, to review disease progression or to monitor treatment plan. (note: uninvestigated dyspepsia defined as those who have not had endoscopy before or those who have not had endoscopy within last 12 months) |
| Language | English only. |
| Study design | No restriction but exclude case series, case reports and qualitative studies. |
| Status | Published papers (full text only). |
| Population | <p><u>Include</u></p> <ul style="list-style-type: none">• Dyspepsia• Functional dyspepsia• GORD symptoms• Heartburn• Chest pain• Epigastric pain• Upper abdominal pain• Reflux• Hypergastrinaemia• Ulcer• persistent symptoms <p><u>Exclude</u></p> <ul style="list-style-type: none">• Patients <18 years• Endoscopically confirmed GORD, Ulcer dyspepsia, or confirmed functional dyspepsia at baseline <p>Previous endoscopy within 12 months.</p> |
| Intervention/ indications | <p><u>Include</u></p> <p>For 'endoscopy'</p> <ul style="list-style-type: none">• Endoscopy |

- Flexible endoscopy
- Gastroscopy
- Videoscopic.
- Natural Orifice endoscopy
- Upper gastrointestinal (GI) endoscopy
- high resolution endoscopy
- oesophago-gastro-duodenoscopy (OGD)

For 'signs, symptoms'

- Dyspepsia
- Functional dyspepsia
- GORD symptoms
- Heartburn
- Chest pain
- Epigastric pain
- Upper abdominal pain
- Reflux
- Hypergastrinaemia
- persistent symptoms
- 'signs and symptoms'
- 'severity'

For 'risk factors'

- Duration of symptoms (perhaps categorized)
- Previous Hiatus hernia / sliding hernia
- Eruption
- Widened gastro oesophageal junction
- 'Risk factors'
- Diet
- Smoking
- Alcohol consumption
- BMI / fat distribution / waist – hip ratio
- Age
- Sex
- Ethnicity
- Familial history
- Single nucleotide polymorphism SNP
- 'Nottingham scale'
- Previous / Paediatric reflux surgery

Note: Classification for 'signs & symptoms' and 'risk factors' may overlap

Exclude

- Endosonography/ultrasound
- Capsule endoscopy.

| | |
|--|---|
| Control | <ul style="list-style-type: none"> • No endoscopy • Delayed endoscopy |
| Outcomes | <ul style="list-style-type: none"> • Health related QOL (using disease specific tools) • Resolution of symptoms (Critical?) • Adverse events (Bleeding, oesophageal perforation, pneumothorax, anxiety) • Mortality • Medication use – frequency/dose • GP / hospital visits (resource use) • Change to diagnosis and subsequent management (Critical). • New diagnosis • Patient satisfaction/preferences. • |
| Other criteria for inclusion/exclusion of studies | <u>Include</u> <ul style="list-style-type: none"> • Patients with newly onset signs/symptoms • Primary care setting or patients referred to secondary care for endoscopy <u>Exclude</u> <ul style="list-style-type: none"> • Patients with previous Endoscopy within 1 year • Non English Language studies • Abstract only studies. • |
| Search strategies | No restriction but exclude case series, case reports and qualitative studies. |
| Review strategies | <ul style="list-style-type: none"> • The NICE methodology checklist for intervention or prognostic studies will be used as a guide to appraise the quality of individual studies • Data on all included studies will be extracted into evidence tables • Where statistically possible, a meta-analytical approach will be used to give an overall summary effect • All key outcomes from evidence will be presented in GRADE profiles or modified profiles and further summarized in evidence statements. |
| Identified key background studies | <p>Edenholm M et al (1985). Endoscopic findings in patients with ulcer-like dyspepsia. Scand J Gastroenterol Suppl. 1985;109:163-7</p> <p>Rabeneck L, Wristers K, Soucek J, et al (2003). Impact of upper endoscopy on satisfaction in patients with previously uninvestigated dyspepsia. Aliment Pharmacol Ther 2003;17:835-40.</p> |

6 **Table 2: Review question 2**

| | Details |
|--|----------------|
|--|----------------|

| | |
|--------------------------------------|---|
| Review question | What characteristics/symptoms of GORD or symptoms suggestive of GORD indicate endoscopy to exclude Barrett's oesophagus? |
| Objectives | To determine which risk factors are associated with development of Barrett's oesophagus in order to stratify which patients should be prioritized for endoscopy. Risk factors will encompass signs and symptoms. |
| Language | English only. |
| Study design | No restriction but exclude case series, case reports and qualitative studies. |
| Status | Published papers (full text only). |
| Population | <p>Adults (18 years and older)</p> <p><u>Include</u></p> <ul style="list-style-type: none"> • Histological confirmed Barrett's oesophagus • Metaplasia/specialised intestinal metaplasia • Dysplasia (high and low grade) • Columnar epithelium <p><u>Exclude</u></p> <ul style="list-style-type: none"> • Existing/prevalent cancer • Neoplasia • Patients with previous surgery. Laparoscopic, or endoscopic treatment for Barrett's oesophagus • Barrett's oesophagus diagnosed on endoscopic appearance alone. |
| Intervention/ indications | <p><u>Include</u></p> <ul style="list-style-type: none"> • Duration of symptoms (perhaps categorized) • Hiatus hernia / sliding hernia • Eruption • Symptoms (chest pain, heartburn, GORD) • Severity • Widened gastro oesophageal junction • 'Risk factors' • Signs • Diet • Smoking • Alcohol consumption • BMI / fat distribution / waist – hip ratio • Age • Sex • Ethnicity • Familial history • Single nucleotide polymorphism SNP • 'Nottingham scale' |

| | |
|----------------|---|
| | <ul style="list-style-type: none">• Previous / Paediatric reflux surgery <p><u>Exclude</u></p> <ul style="list-style-type: none">• 24 hr pH monitoring• Bilitec• Previous Endoscopy• Histology• Biochemical markers (FASN enzyme, activated apoptotic naive and memory T cells, serum gastrin level, keratin 7 (KRT7), keratin 20 (KRT20), caudal type homeobox 2 (CDX2), mucin 2 oligomeric mucus/gel-forming (MUC2), tumor protein p53 (TP53) etc)• Other factor requiring endoscopy / biopsy to assess. |
| Control | Not applicable to prevalence question |

| | |
|--|---|
| Outcomes | <ul style="list-style-type: none"> • Proportion with positive diagnosis of Barrett's oesophagus • Size/length of Barrett's oesophagus. |
| Other criteria for inclusion/exclusion of studies | <p><u>Include</u></p> <ul style="list-style-type: none"> • Studies that report outcomes in multivariate analysis • Prospective studies <p>(Note: Due to the limited volume of prospective studies, the GDG later agreed to drop down the hierarchy of evidence and to include retrospective studies as well).</p> <p><u>Exclude</u></p> <ul style="list-style-type: none"> • Studies analyzed using univariate analysis only • Prevalence studies for existing carcinoma • Studies reporting outcomes of treatment for Barrett's oesophagus • Surveillance of patients with Barrett's oesophagus for progression • Population screening studies. |
| Search strategies | Systematic reviews and primary prognostic studies. |
| Review strategies | <ul style="list-style-type: none"> • Study quality will be evaluated using the NICE prognostic checklist • Data on all included studies will be extracted into evidence tables • Where statistically possible, a meta-analytical approach will be used to give an overall summary effect • All key outcomes from evidence will be presented in GRADE profiles or modified profiles and further summarized in evidence statements. |

7 **Table 3: Review question 3**

| | Details |
|---------------------------------|---|
| Review question | Which patient characteristics/clinical indicators/criteria indicate referral of a patient with dyspepsia, heartburn, or confirmed GORD managed in primary care to a consultant led medical or surgical service (specialist services)? |
| Objectives | To provide guidance to primary care providers as to how to select which patients require referral for specialist services. |
| Language | English only. |
| Study design | No restriction (but will exclude case series, case reports, narrative review and qualitative study). |
| Status | Published papers (full text only). |
| Population | <p>Adults (18 years and older)</p> <p><u>Include*</u></p> <ul style="list-style-type: none"> • GORD/GERD • Dyspepsia (investigated/uninvestigated dyspepsia, non-ulcer dyspepsia, functional dyspepsia) • Peptic ulcer disease • Heartburn • Reflux <p>(*populations covered – based on CG17 plus functional dyspepsia)</p> <p>PLUS other search terms</p> <ul style="list-style-type: none"> • New onset symptoms (while on medication) • Persistent symptoms >1 month • Refractory • Symptomatic • Treatment failure • Long term self-care >10 years • Failed on trial of PPI and <i>H pylori</i> test and treat. |
| Intervention/indications | <p><u>Include (search terms)</u></p> <ul style="list-style-type: none"> • Specialist • Consultant • Gastroenterologist |

| | |
|----------------|---|
| | <ul style="list-style-type: none">• Upper GI surgery• Complications• Refractory• Escalate• Referral• Expert• Secondary• Tertiary• Hospital• Outpatient• Investigations <p><u>Exclude</u></p> <ul style="list-style-type: none">• Primary care• GP• Endoscopy. |
| Control | N/A |

| | |
|--|---|
| Outcomes | <u>Critical</u> <ul style="list-style-type: none"> • Health related QOL • Resolution/improvement of Symptoms / VAS • Patient satisfaction <u>Important</u> <ul style="list-style-type: none"> • Medication use/dose • GP/Hospital visits • Heartburn (% of days free). • |
| Other criteria for inclusion/exclusion of studies | <u>Include</u> <ul style="list-style-type: none"> • Any study illustrates 'who' (patient characteristic, clinical indicators, criteria) should be managed outside primary care that resulted in better patient outcomes. <u>Exclude</u> <ul style="list-style-type: none"> • Studies where the healthcare structure is considerably different to the UK where upwards referral for specialist treatment is not comparable. • |
| Search strategies | No restriction on study design (but will exclude case series, case reports, narrative review and qualitative study). |
| Review strategies | <ul style="list-style-type: none"> • An appropriate NICE methodology checklist will be used as a guide to appraise the quality of individual studies, or a checklist adapted from other published source will be used • Data on all included studies will be extracted into evidence tables • All key outcomes from evidence will be presented in GRADE profiles or modified profiles and further summarized in evidence statements • Narrative/qualitative synthesis of evidence may be required. • |
| Identified key background studies | <u>Systematic reviews</u> None indentified <u>Studies</u> van Bommel MJJ (2001). Consultations and referrals for dyspepsia in general practice—a one year database survey. Postgrad Med J 2001;77:514-518 Jones RH (1993). Problems with implementing guidelines: a randomised controlled trial of consensus management of dyspepsia. Qual Health Care 1993;2:217-221 Flaming RD (2010). Different characteristics of patients with gastro-oesophageal reflux disease on their path through healthcare: a population follow-up study. European Journal of Gastroenterology & Hepatology May 2010 - Volume 22 - Issue 5 - pp 578-582 Gerson LB (2011). Development of a refractory gastro-oesophageal reflux score using an administrative claims database. Alimentary Pharmacology & Therapeutics 34(5):555-67, 2011 Sep. |

8 **Table 4: Review question 4**

| | Details |
|----------------------------------|--|
| Review question | What is the clinical effectiveness of PPIs in patients with severe erosive reflux disease? i) to control / reduce oesophagitis ii) as maintenance therapy. |
| Objectives | To compare different PPIs to see which is the most effective to reduce symptoms and reflux exposure. |
| Language | English only. |
| Study design | Systematic reviews/meta-analysis, RCTs (blind or open-label). |
| Status | Published papers (full text only). |
| Population | i) Adults (18 years and older) with endoscopically confirmed severe erosive reflux disease / GORD, and oesophagitis ii) Adults (18 years and older) with healed severe erosive reflux disease / GORD, and oesophagitis <u>Include</u> <ul style="list-style-type: none"> Los Angeles classification grade C or D, Savary-Miller grade 3 or 4 <u>Exclude</u> <ul style="list-style-type: none"> Los Angeles classification grade A or B. Savary-Miller grade 1 or 2 (not severe) or grade 5 (existing Barrett's oesophagus). |
| Intervention/ indications | To compare all PPIs vs Placebo or one another <u>Include</u> <ul style="list-style-type: none"> Omeprazole Rabeprazole (sodium) Lansoprazole Esomeprazole Pantoprazole <u>Exclude</u> <ul style="list-style-type: none"> Dexlansoprazole – not licensed in UK H₂RAs (exclude from decision data set, but possibly use in comparison dataset in network analysis). |
| Control | <ul style="list-style-type: none"> Placebo H₂RA Existing self-care (Each of the interventions listed in interventions box above will be |

| | |
|--|--|
| | compared to one another also). |
| Outcomes | <ul style="list-style-type: none"> • Endoscopic appearance/chance in LA grade/resolution of oesophagitis (dichotomous) • Health related QOL scales • Acid exposure time (% time <pH4 on 24 hour monitoring) • Progression to Barrett's oesophagus or carcinoma • Adverse events (headache, diarrhoea, nausea, drug interactions, metallic taste, rash) • Mortality • Hypergastro-anaemia. |
| Other criteria for inclusion/exclusion of studies | <p><u>Include</u></p> <ul style="list-style-type: none"> • Studies comparing the above listed treatment regimens • >30-days follow-up period <p><u>Exclude</u></p> <ul style="list-style-type: none"> • Non-randomised studies, observational studies; and studies not published full-text (i.e. conference abstracts); or systematic reviews that contain any of these types of studies • Studies with mixed populations (i.e. some patients within the study population who are not grade C or D) will only be included if outcomes are clearly separated for these groups • <7 days regimens • <30 day follow up • Studies assessing pharmacological therapies other than, PPIs • Studies using unlicensed drugs in both / all arms of the trial • Dose ranging studies • Studies which consider PPI plus alginate vs PPI alone. |
| Search strategies | Systematic reviews/meta-analysis, RCTs, quasi-RCTs. |
| Review strategies | <ul style="list-style-type: none"> • The NICE methodology checklist for RCTs will be used as a guide to appraise the quality of individual studies • Data on all included studies will be extracted into evidence tables • Where statistically possible, a meta-analytical approach will be used to give an overall summary effect (including the possibility of a network meta-analysis) • All key outcomes from evidence will be presented in GRADE profiles or modified profiles and further summarised in evidence statements • Sub group analyses will be undertaken for different dose and duration of treatment, and for populations with a definitive grade of oesophagitis C or D vs non definitive populations. |
| Identified key background studies | <p><u>Systematic reviews</u></p> <p>Edwards SJ et al (2006). Systematic review: proton pump inhibitors (PPIs) for the healing of reflux oesophagitis – a comparison of esomeprazole and other PPIs. Alimentary Pharmacology & Therapeutics 2006 24: 743-750</p> |

2.2.2.1 Identification of evidence for clinical questions

- 30 The searches were conducted between November 2011 and May 2013. The aim of the
31 searches was to identify evidence for each of the clinical questions being asked.
- 32 The MEDLINE search strategies are presented below. These were translated for use in all of
33 the other databases.

34 Review question 1:

35 What is the diagnostic utility of non-urgent endoscopy in patients with signs and symptoms of
36 dyspepsia or GORD?

37 Database: Ovid MEDLINE(R) <1946 to May Week 1 2013> (update search conducted on 11
38 December 2013)

152 C.3 Summary of the modified GRADE approach

1522 For the review questions [2014 update]:
1523 Review question 1: When should (and with what indications) patients with uninvestigated
1524 dyspepsia be referred for endoscopy for further investigation and review of treatment plan?
1525 Review question 2: Which risk factors indicate endoscopy in order to exclude Barrett's
1526 oesophagus?
1527 Review question 3: Which patient characteristics/clinical indicators/criteria indicate referral of
1528 a patient with dyspepsia, heartburn, or confirmed GORD managed in primary care to a
1529 consultant led medical or surgical service (specialist services)?
1530 For the above three review questions [2014 update], a modified-GRADE approach was used
1531 for critical appraisal and evidence synthesis to aid decision making. The criteria used in the
1532 modified-GRADE approach were adapted from the Hayden et al. (2006) QUIPS checklist for
1533 prognostic study (link for the Guideline Manual 2012).
1534 The methodology of the modified-GRADE approach was as follows:
1535 Quality appraisal using modified-GRADE approach
1536 The Grading of Recommendations Assessment, Development and Evaluation (GRADE) is a
1537 common, sensible and transparent approach to grading quality of evidence which was
1538 developed by experts internationally. Over 70 international guidance developing
1539 organisations have endorsed the use of GRADE, including NICE, SIGN, NHS Quality
1540 Improvement Scotland, Cochrane Collaboration, WHO, BMJ Clinical Evidence, Agency for
1541 Healthcare Research and Quality (AHRQ) and many others.
1542 GRADE was originally developed for grading quality of intervention and diagnostic accuracy
1543 study only. However, for the purpose of this particular review question on risk factors, the
1544 GRADE criteria were modified and adapted by using the Hayden et al. (2006) checklist for
1545 prognostic study (NICE Guideline Manual, 2012). The modified-GRADE criteria were used to
1546 appraise the quality of individual studies, as well as the quality of individual risk factors
1547 across different studies. The rationales for downgrading the evidence based on the five
1548 modified-GRADE criteria were explicitly reported using 'footnote' for each modified-GRADE
1549 profile.

- 1550 Summary of the modified-GRADE approach:
- 1551 Section 1: Outcome vs individual study, and meta-analysis
- 1552 In GRADE approach for intervention question, the quality of evidence on each outcome is assessed according to the impact of the risk of bias from the study to that particular outcome.
- 1553 If there is more than one study that reported such outcome, the overall judgement of the quality for that outcome across different studies will be made.
- 1556 This is because in the same intervention study (e.g. RCT), there may be different levels or magnitude of the impact of the risk of bias on different outcomes measured in the same study. For example, in a single-blinded RCT (assessor-blinded only) on antibiotics for infected wound, the risk of bias for patient-reported pain of the wound (outcome 1) would be different compared to bacteria eradication rate (based on histology) (outcome 2) due to the single-blinded design of the study.
- 1562 In prognostic study (or clinical prediction model), these varying degrees of risk of bias in a study do not apply same as in an intervention study. This is because in a multivariate regression model (MRM), the sources of the risk of bias commonly came from how the data of the individual risk factors or predictors was collected as a whole in a study, and what kinds of adjustment were made in the MRM regarding baseline confounders and covariates.
- 1563 Hence, the risk of bias in a study would have impacted the MRM as whole (i.e. all risk factors or predictors entered in the MRM equally). Therefore, the quality of an individual study would apply across to all risk factors or predictors in that particular individual study.
- 1570 Due to the varying methods used in different studies (e.g. different multivariate regression models in different studies used different dependent variables as risk factors or predictors, used different covariates, adjusted for different confounding factors), in other words, there are no two exactly identical multivariate regression models that could be pooled in its entirety. The only approach to conduct meta-analysis is to obtain IPD data from each study and then re-run a single MRM using all the IPD data from all included studies. This would be outside the development timeframe of this guideline.
- 1577 Therefore, no meta-analysis was conducted to combine individual risk factors or predictors across different MRMs in different studies. Nevertheless, if there are more than one included studies for a particular risk factor or predictor, the evidence would be presented based on individual risk factors or predictors across different studies to aid discussion and decision making. Otherwise, the evidence would be presented as individual studies.
- 1582 Section 2: Criteria and downgrading
- 1583 There are four quality categories in GRADE, namely 'High', 'Moderate', 'Low' and 'Very low'. For prognostic study (or clinical prediction model), case control or cross-sectional study was considered as appropriate study designs and hence under the modified-GRADE approach, these two study designs would start from 'High' quality (or high 'confidence' in the effect estimates). Then the evidence would be downgraded based on the following modified framework:

| GRADE criteria | Hayden (2006) QUIPS criteria, plus other statistical rules | Downgrading |
|----------------|--|--|
| Risk of bias | <ol style="list-style-type: none">1) Prospective study.2) Important potential confounders are appropriately accounted for, limiting potential bias with respect to the prognostic factor of interest.* <p>Note*: To adjust potential confounders that are not</p> | <p>Downgrade 1 level if either (1) or (2) or both were not satisfied</p> <p>If there are more than one included studies,</p> |

| | | |
|-----------------------------|--|--|
| | part of the independent variables (risk factors) being studied. | downgrade 1 level if either (1) or (2) or both were not satisfied in >50% of the included studies. |
| Indirectness | <ul style="list-style-type: none"> 1) The study sample represents the population of interest with regard to key characteristics, sufficient to limit potential bias to the results. 2) The prognostic factor of interest is adequately measured in study participants, sufficient to limit potential bias. 3) The outcome of interest is adequately measured in study participants, sufficient to limit potential bias. | <ul style="list-style-type: none"> i) Downgrade 1 level if either (1) or (2) or (3) were not satisfied. ii) Downgrade 2 levels if more than 2 criteria were not satisfied. <p>If there are more than one included studies, downgrade 1 level if >50% of the included studies been downgraded due to i).</p> <p>If there are more than one included studies, downgrade 2 levels if >50% of the included studies been downgraded due to ii).</p> |
| Inconsistency | <ul style="list-style-type: none"> 1) Same direction of effect estimates across all different studies. 2) Overlaps of 95%CI. | Downgrade 1 level if either (1) or (2) or both were not satisfied. Note: this criterion is not applicable to single study. |
| Imprecision | <p>The statistical analysis is appropriate for the design of the study, limiting potential for the presentation of invalid results (i.e. multivariate analysis - logistic regression model):</p> <ul style="list-style-type: none"> 1) Model diagnostics: Assumption of normality (1a); Multicollinearity (1b); Goodness-of-fit (1c). 2) Reproducibility (validation) . | <ul style="list-style-type: none"> i) Downgrade 1 level if either (1) or (2) was not satisfied. ii) Downgrade 2 levels if both (1) and (2) were not satisfied. <p>If there are more than one included studies, downgrade 2 levels if >50% of the included studies been downgraded due to i) or ii).</p> |
| Other considerations | <ul style="list-style-type: none"> 1) Loss to follow-up is unrelated to key characteristics (that is, the study data adequately represent the sample), sufficient to limit potential bias. | Downgrade 1 level if (1) was not satisfied. If there are more than one included studies, downgrade 1 level if >50% of the included studies been downgraded. |

- 1590 For the quality appraisal for individual studies for review question 2, please see below. For
1591 the full modified-GRADE profiles, please also see appendix F.
- 1592 [Note: For review question 1, since only 2 studies were included and hence the 2 individual
1593 studies were discussed in the Full guideline chapter; for review question 3, no study
1594 identified that met the inclusion criteria].
- 1595 Table below shows review question 2: Quality appraisal of individual studies – Modified
1596 GRADE – Criteria adapted from the Hayden et al (2006) checklist.
- 1597

| | •Prospective (1) •Important potential confounders are appropriately accounted for, limiting potential bias with respect to the prognostic factor of interest. (2)* <u>Note*</u> : To adjust potential confounders that are not part of the independent variables (risk factors) being studied. | •The study sample represents the population of interest with regard to key characteristics, sufficient to limit potential bias to the results. (1) •The prognostic factor of interest is adequately measured in study participants, sufficient to limit potential bias. (2) •The outcome of interest is adequately measured in study participants, sufficient to limit potential bias. (3) | •Same direction of effect estimates across different studies. (1) •Overlaps of 95%CI (2) | The statistical analysis is appropriate for the design of the study, limiting potential for the presentation of invalid results (i.e. multivariate analysis - logistic regression model): • Model diagnostics: Assumption of normality (1a); Multicollinearity (1b); Goodness-of-fit (1c). • Reproducibility (validation) (2) | •Loss to follow-up is unrelated to key characteristics (that is, the study data adequately represent the sample), sufficient to limit potential bias. (1) | |
