NATIONAL INSTITUTE FOR HEALTH AND CARE EXCELLENCE

Proposed Health Technology Appraisal

Ibalizumab in combination with other antiretroviral treatment for multidrug-resistant HIV-1

Draft scope (pre-referral)

Draft remit/appraisal objective

To appraise the clinical and cost effectiveness of ibalizumab within its marketing authorisation for treating adults infected with multidrug resistant HIV-1 for whom it is not possible to construct a suppressive anti-viral regimen.

Background

HIV is a virus that causes HIV attacks the immune system destroying CD4 positive (CD4+) T cells, a type of white blood cell that is vital for fighting infections. The destruction of these cells leaves people living with HIV unable to fight off infections and some other diseases.

There are two main types of HIV. Most cases within the UK are from the HIV-1 type and it is considered more transmissible than HIV-2. An estimated 103,800 people live with HIV in the UK in 2018, of which 93% were diagnosed (95,500 diagnosed cases). Of these patients, 97% were receiving treatment (estimated 92,500) and 97% of these patients were virally suppressed (estimated 90,000)¹. Therefore, approximately 2500 diagnosed patients did not have a suppressive anti-viral regimen.

Current clinical management involves life-long antiretroviral treatment (ART), which stop the virus replicating in the body and destroying CD4+ T cells. There is no cure for HIV, but ART enables most people to live a long and healthy life with an undetectable viral load, which eliminates the risk of passing on the infection. ARTs are often used in combination to avoid the disease adapting and becoming resistant. Choice of ART combinations is complex and inividualised, often including consideration of contraindication, drug-drug interactions, tolerability, treatment history, drug resistance profile, adherence and future salvage regimens². ART requires a very high level of adherence (taking the required dose at the right time, ideally greater than 95%) to avoid drug resistance and increased viral load.

Etravirine in combination with other antiretroviral drugs is licensed for treating HIV-1 in antiretroviral treatment-experienced patients and enfuvirtide is licensed for people whose treatment is resistant to other standard ART regimens.

The technology

Ibalizumab (Trogarzo, Theratechnologies inc) is a monoclonal antibody that blocks HIV-1 from infecting CD4+ T-cells and preventing the viral transmission that occurs between HIV-1 virus to host cells and from infected host cell to uninfected host cells. It is administered by intravenous infusion every 2 weeks.

Ibalizumab has a marketing authorisation, in combination with other antiretrovirals, for the treatment of adults with multidrug resistant HIV-1 infection for whom it is not possible to construct a suppressive antiviral regimen.

Draft scope for the proposed appraisal of ibalizumab in combination with other antiretroviral treatment for multidrug-resistant HIV-1

Issue Date: June 2020 Page 1 of 4

Intervention	Ibalizumab with optimised background regimen of other ART
Population	People with multidrug resistant HIV-1 in for whom it is not possible to construct a suppressive anti-viral regimen
Comparators	 Optimised background regimen (established clinical management without ibalizumab) Enfuvirtide with optimised background regimen Etravirine with optimised background regimen
Outcomes	The outcome measures to be considered include: change in viral load CD4+ T-cell levels patients with viral suppression (undetectable viral load) adherence to treatment regimen mortality adverse effects of treatment health-related quality of life.
Economic analysis	The reference case stipulates that the cost effectiveness of treatments should be expressed in terms of incremental cost per quality-adjusted life year. The reference case stipulates that the time horizon for estimating clinical and cost effectiveness should be sufficiently long to reflect any differences in costs or outcomes between the technologies being compared. Costs will be considered from an NHS and Personal Social Services perspective.
Other considerations	Guidance will only be issued in accordance with the marketing authorisation. Where the wording of the therapeutic indication does not include specific treatment combinations, guidance will be issued only in the context of the evidence that has underpinned the marketing authorisation granted by the regulator.

Questions for consultation

Have all relevant comparators for ibalizumab been included in the scope?

What number of patients would be eligible for treatment with ibalizumab?

How should established clinical management without ibalizumab be defined?

Are the outcomes listed appropriate?

Are there any subgroups of people in whom ibalizumab is expected to be more clinically effective and cost effective or other groups that should be examined separately?

In what situations is ibalizumab expected to be used in clinical practice?

NICE is committed to promoting equality of opportunity, eliminating unlawful discrimination and fostering good relations between people with particular protected characteristics and others. Please let us know if you think that the proposed remit and scope may need changing in order to meet these aims. In particular, please tell us if the proposed remit and scope:

- could exclude from full consideration any people protected by the equality legislation who fall within the patient population for which ibalizumab is licensed;
- could lead to recommendations that have a different impact on people protected by the equality legislation than on the wider population, e.g. by making it more difficult in practice for a specific group to access the technology;
- could have any adverse impact on people with a particular disability or disabilities.

Please tell us what evidence should be obtained to enable the Committee to identify and consider such impacts.

Do you consider ibalizumab to be innovative in its potential to make a significant and substantial impact on health-related benefits and how it might improve the way that current need is met (is this a 'step-change' in the management of the condition)?

Do you consider that the use of ibalizumab can result in any potential significant and substantial health-related benefits that are unlikely to be included in the QALY calculation?

Please identify the nature of the data which you understand to be available to enable the Appraisal Committee to take account of these benefits.

To help NICE prioritise topics for additional adoption support, do you consider that there will be any barriers to adoption of this technology into practice? If yes, please describe briefly.

NICE intends to appraise this technology through its Single Technology Appraisal (STA) Process. We welcome comments on the appropriateness of appraising this topic through this process. (Information on the Institute's Technology Appraisal processes is available at http://www.nice.org.uk/article/pmg19/chapter/1-Introduction).
