Final remit/evaluation objective
To appraise the clinical and cost effectiveness of tirzepatide within its marketing authorisation for treating type 2 diabetes.

Background
Diabetes mellitus is a chronic metabolic disorder characterised by elevated blood glucose levels (hyperglycaemia) resulting from a lack of the hormone insulin or resistance to its action. Type 2 diabetes results from reduced insulin secretion or reduced tissue sensitivity to insulin (known as insulin resistance)\(^1\). If not managed effectively, diabetes mellitus can lead to kidney failure, blindness, foot problems, and damage to the nervous system\(^2\). People with diabetes are also more at risk of cardiovascular disease\(^3\).

There were 3.3 million people in England with diagnosed diabetes mellitus in 2019, of which around 90% had type 2 diabetes\(^4\). However, an estimated 1 million further people have undiagnosed type 2 diabetes in the UK\(^5\). The UK prevalence of type 2 diabetes is rising, which has been linked to an increasing prevalence of obesity\(^6\). People from Black African, African Caribbean and South Asian family backgrounds are at a higher risk of developing type 2 diabetes from a younger age\(^6\).

NICE guideline 28 type 2 diabetes in adults: management recommends reinforcing advice on diet, lifestyle and adherence to drug treatment for all people with type 2 diabetes. If blood glucose levels are not controlled by diet and exercise alone:

- NICE guideline 28 recommends first-line drug treatment with standard release metformin. For people with chronic heart failure, cardiovascular disease or at high risk of cardiovascular disease, it recommends considering a selective sodium glucose-cotransporter 2 (SGLT2) inhibitor in addition to metformin.

- When metformin is contraindicated or not tolerated a dipeptidyl peptidase-4 (DPP-4) inhibitor, pioglitazone or a sulfonylurea is recommended. For people with chronic heart failure, cardiovascular disease or at high risk of cardiovascular disease, or for people who meet the criteria in NICE technology appraisal guidance 390, or TA572, an SGLT2 inhibitor is recommended.

When there is inadequate glycaemic control following first-line treatment, treatment is intensified:

- NICE guideline 28 recommends adding a DPP-4 inhibitor, pioglitazone or a sulfonylurea, or an SGLT2 inhibitor for people who meet the criteria in NICE technology appraisal guidance 315, TA572, TA288, or TA336.

If there is inadequate glycaemic control with dual therapy, treatment is intensified further:
• NICE guideline 28 recommends triple therapy by adding a DPP-4 inhibitor, pioglitazone or a sulfonylurea, or an SGLT2 inhibitor for people who meet the criteria in NICE technology appraisal guidance 315, TA418, TA336, or TA583, or starting insulin-based treatment.

• If metformin is contraindicated or not tolerated, NICE guideline 28 recommends insulin-based treatment.

• If triple therapy with metformin and 2 other oral drugs is not effective, not tolerated or contraindicated, NICE guideline 28 recommends switching one drug for a glucagon-like peptide-1 (GLP-1) mimetic for some groups of people.

The technology
Tirzepatide (brand name unknown, Eli Lilly) is a dual receptor agonist that acts at the receptors of both the GIP and GLP-1 hormones. These hormones act to stimulate insulin secretion. It is administered by subcutaneous injection.

Tirzepatide does not currently have a marketing authorisation in the UK for treating type 2 diabetes. It has been studied in clinical trials in people with type 2 diabetes alone or in combination with other antidiabetic agents.

</tbody>
</table>
| Outcomes | The outcome measures to be considered include:  
- HbA1c/glycaemic control  
- complications of diabetes, including cardiovascular, renal and eye  
- mortality  
- body mass index  
- frequency and severity of hypoglycaemia  
- changes in cardiovascular risk factors  
- adverse effects of treatment  
- health-related quality of life. |
| Economic analysis | The reference case stipulates that the cost effectiveness of treatments should be expressed in terms of incremental cost per quality-adjusted life year.  
If the technology is likely to provide similar or greater health benefits at similar or lower cost than technologies recommended in published NICE technology appraisal guidance for the same indication, a cost-comparison may be carried out.  
The reference case stipulates that the time horizon for estimating clinical and cost effectiveness should be sufficiently long to reflect any differences in costs or outcomes between the technologies being compared.  
Costs will be considered from an NHS and Personal Social Services perspective.  
The availability and cost of biosimilar and generic products should be taken into account. |
| Other considerations | Guidance will only be issued in accordance with the marketing authorisation. Where the wording of the therapeutic indication does not include specific treatment combinations, guidance will be issued only in the context of the evidence that has underpinned the marketing authorisation granted by the regulator. |
