Health Technology Evaluation

Pirtobrutinib for treating chronic lymphocytic leukaemia or small lymphocytic lymphoma after 1 or more BTK inhibitors [ID6269]

Final scope

Final remit/evaluation objective

To appraise the clinical and cost effectiveness of pirtobrutinib within its marketing authorisation for treating adults with chronic lymphocytic leukaemia or small lymphocytic lymphoma whose cancer has been previously treated with a BTK inhibitor.

Background

Chronic lymphocytic leukaemia (CLL) is the most common form of chronic leukaemia and is a type of cancer that affects the white blood cells. It tends to progress slowly over many years. The risk of developing CLL increases with age and is more common in men. CLL mostly affects older people and is rare in people 40 years of age and younger.¹⁻³ Around 3,900 people are diagnosed with CLL in the UK each year.²

In CLL, the material found inside some bones (bone marrow) produces too many white blood cells, called lymphocytes, that aren't fully developed and don't work properly. CLL usually progresses slowly, but over time people can develop anaemia, swollen lymph nodes, spleen enlargement and unexplained weight loss. People with CLL may live with a considerable burden of symptoms and an increased susceptibility to infection impacting on their quality of life, whether or not they have had treatment.¹ Small lymphocytic lymphoma (SLL) is considered the same condition as CLL, as most people with CLL or SLL have abnormal white blood cells in locations that overlap, including lymph nodes, spleen, blood and bone marrow.⁴

Treatment of CLL is complex and depends on several factors such as stage of disease, previous treatment, patient's age, symptoms, and general state of health. Many people with CLL will not have symptoms when they are first diagnosed and will have a period of active surveillance. When treatment is needed, most people will have a targeted treatment such as acalabrutinib, zanubrutinib, ibrutinib, or venetoclax. Some people may have chemoimmunotherapy. If the disease relapses, or is refractory to initial treatment, there are a number of further treatment options.³ Table 1 below summarises the treatment options which are currently available as routine practice in the NHS in England for relapsed or refractory CLL.

Table 1. Treatment options for relapsed or refractory CLL in NHS practice

NICE technology appraisal	Date	Treatment option for relapsed or refractory CLL	Population
TA931	November 2023	Zanubrutinib	relapsed or refractory CLL in adults

Final scope for the evaluation of pirtobrutinib for treating chronic lymphocytic leukaemia or small lymphocytic lymphoma after 1 or more BTK inhibitors [ID6269]

Issue Date: April 2025

TA796	June 2022	Venetoclax	<ul style="list-style-type: none"> people with a 17p deletion or TP53 mutation whose disease has progressed after a B-cell receptor pathway inhibitor or people without a 17p deletion or TP53 mutation whose disease has progressed after both chemo-immunotherapy and a B-cell receptor pathway inhibitor
TA689	April 2021	Acalabrutinib	previously treated CLL in adults
TA561	February 2019	Venetoclax with rituximab	people who have had at least 1 previous therapy
TA429	January 2017	Ibrutinib	people who have had at least 1 previous therapy
TA359	October 2015	Idelalisib with rituximab	people whose disease has been treated but has relapsed within 24 months
TA193	July 2010	Rituximab in combination with fludarabine and cyclophosphamide	<p>people with relapsed or refractory CLL except when the condition:</p> <ul style="list-style-type: none"> is refractory to fludarabine (that is, it has not responded to fludarabine or has relapsed within 6 months of treatment) or has previously been treated with rituximab, unless: <ul style="list-style-type: none"> - in the context of a clinical trial, at a dose lower than the dose currently licensed for chronic lymphocytic leukaemia or - in the context of a clinical trial, in combination with chemotherapy other than fludarabine and cyclophosphamide
TA29	September 2001	Fludarabine	people who have had to stop their first chemotherapy treatment

The technology

Pirtobrutinib (Jaypirca, Lilly) does not currently have a marketing authorisation in the UK for chronic lymphocytic leukaemia. It has been studied in a clinical trial, compared with idelalisib plus rituximab or bendamustine plus rituximab, in adults with CLL or SLL who have previously had treatment with at least 1 BTK inhibitor.

Intervention(s)	Pirtobrutinib
Population(s)	Adults with CLL or SLL whose cancer has been previously treated with a BTK inhibitor
Subgroups	Adults with CLL or SLL who have had at least two prior lines of therapy including a BTK inhibitor and BCL2 inhibitor
Comparators	<ul style="list-style-type: none">• Zanubrutinib• Acalabrutinib• Ibrutinib• Venetoclax (if disease has progressed after a B-cell receptor pathway inhibitor)• Venetoclax with rituximab• Idelalisib with rituximab• Best supportive care
Outcomes	<p>The outcome measures to be considered include:</p> <ul style="list-style-type: none">• overall survival• progression-free survival• response rate• time to next treatment• adverse effects of treatment• health-related quality of life.

Economic analysis	<p>The reference case stipulates that the cost effectiveness of treatments should be expressed in terms of incremental cost per quality-adjusted life year.</p> <p>The reference case stipulates that the time horizon for estimating clinical and cost effectiveness should be sufficiently long to reflect any differences in costs or outcomes between the technologies being compared.</p> <p>Costs will be considered from an NHS and Personal Social Services perspective.</p> <p>The availability of any commercial arrangements for the intervention, comparator and subsequent treatment technologies will be taken into account.</p> <p>The availability of biosimilar and generic products should be taken into account.</p>
Other considerations	<p>Guidance will only be issued in accordance with the marketing authorisation. Where the wording of the therapeutic indication does not include specific treatment combinations, guidance will be issued only in the context of the evidence that has underpinned the marketing authorisation granted by the regulator.</p>
