

Transcervical ultrasound-guided radiofrequency ablation for symptomatic uterine fibroids

Information for the public

Published: 31 March 2021

www.nice.org.uk

There is not enough evidence about how well this procedure works. So it can only be done with special arrangements. This means you will have regular appointments afterwards to check how well it is working or if it has caused problems.

Uterine fibroids are non-cancerous growths on the inside or outside of the womb (uterus). In this procedure, a device is put into the vagina and inserted into the womb through the cervix (transcervical). It uses ultrasound to help locate the fibroid, then delivers heat (radiofrequency) energy to destroy it (ablation). The aim is to shrink the fibroid and reduce symptoms.

The [NHS website](#) may have information on your condition and treatment options.

Is this procedure right for me?

You should be included in [making decisions about your care](#).

Your healthcare professionals should explain the risks and benefits of this procedure and how it is done. They should discuss your options and listen carefully to your views and concerns. They should offer you more information about the procedure. Your family or carers can be involved if you want or need them to be.

You will be asked to decide whether you agree (consent) to have the procedure. Find out more about [giving consent to treatment on the NHS website](#).

Some questions to think about

- How many appointments will I need?
- What are the possible benefits? How likely am I to get them?
- What are the risks or side effects? How likely are they?
- Will I have to stay in hospital?
- What happens if it does not work or something goes wrong?
- What happens if I do not want the procedure?
- Are other treatments available?
