National Institute for Health and Care Excellence

Draft for Consultation

Early and locally advanced breast cancer: diagnosis and management

[K] Evidence reviews for lifestyle

NICE guideline tbc Evidence reviews January 2018

Draft for Consultation

These evidence reviews were developed by the National Guideline Alliance hosted by the Royal College of Obstetricians and Gynaecologists

Disclaimer

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the <u>Welsh Government</u>, <u>Scottish Government</u>, and <u>Northern Ireland Executive</u>. All NICE guidance is subject to regular review and may be updated or withdrawn.

1 Lifestyle

- 2 This evidence report contains information on 1 review relating to lifestyle.
- 3 Review question 11.1 What lifestyle changes improve breast cancer-specific outcomes in
- 4 people treated for early and locally advanced breast cancer?

Review question 11.1 What lifestyle changes improve breast 2 cancer-specific outcomes in people treated for early and 3 locally advanced breast cancer?

Introduction

- 5 Survival rates in breast cancer are steadily improving thanks to earlier detection, better
- 6 diagnostics and treatments. However, data is now emerging regarding the impact of lifestyle7 choices on outcomes following treatment for breast cancer.
- 7 choices on outcomes following treatment for breast cancer.
- 8 Disease recurrence, survival and emotional well-being are all potentially affected by the
- 9 lifestyle choices and changes people make following treatment for breast cancer. It is
- 10 important that people can be advised and informed of the evidence-based benefits of lifestyle
- 11 changes. This information will support and empower people in making informed decisions to
- 12 support breast cancer survivorship, potentially improving disease specific outcome.
- 13 The aim of this review is to determine which lifestyle changes improve breast cancer-specific 14 outcomes and develop recommendations to guide discussion and advice.

1BICO table

16 See Table 1 for a summary of the population, intervention, comparison and outcome (PICO)

17 characteristics of this review.

18 Table 1: Summary of the protocol (PICO table)

| Population | Adults (18 or over) treated for invasive breast cancer (M0) and/or DCIS |
|--------------|--|
| Intervention | Lifestyle changes: Dietary Physical exercise Weight management Stress management Reduction in smoking Level of alcohol consumption |
| Comparison | No lifestyle changesEach otherCombinations of lifestyle changes |
| Outcome | Critical Overall survival Disease-free survival Important Intervention related morbidity Health related quality of life (HRQoL) |

19 DCIS, ductal carcinoma in-situ; HRQoL, Health related quality of life; M0, no distant metastases

20 For full details see review protocol in appendix A.

2Methods and process

- 22 This evidence review was developed using the methods and process described in
- 23 Developing NICE guidelines: the manual; see the methods chapter for further information.

1 Declarations of interest were recorded according to NICE's 2014 conflicts of interest policy.

Clinical evidence

Bncluded studies

- 4 Seven studies (number of participants, N=11,361) identified by literature search were
- 5 included in the review. These included 3 randomized controlled trials (RCTs; Anderson 2008;
- 6 Chlebowski 2006; Courneya 2014) and 4 cohort studies (Bertram 2011; Chen 2011;
- 7 Fentiman 2005 & Kwan2010). All 7 studies reported on disease free survival and 6 reported
- 8 on overall survival rate. None of the studies reported on intervention-related morbidities or
- 9 health related quality of life. Evidence from these studies are summarised in the clinical
- 10 GRADE evidence profiles below (Table 3 to Table 8).

11 See also the study selection flow chart in appendix C, forest plots in appendix E, and study 22 evidence tables in appendix D.

1Excluded studies

14 Studies not included in this review with reasons for their exclusions are provided in appendix15 K.

1Summary of clinical studies included in the evidence review

17 Table 2 provides a brief summary of the included studies

18 Table 2: Summary of included studies

| | Additional inclusion/exclusion | |
|--------------------|---|--|
| Study | criteria | Intervention/ Comparison |
| Andersen 2008 | Age 20-85 years | Intervention arm: Stress management intervention: 26 sessions (39 therapy hours) over 12 months Control arm: Assessments only |
| Bertram 2011 | Breast carcinoma within the past 4 years | Exposure arm: Adherence to physical activity guidelines Control arm: Assessments only |
| Chen 2011 | Age 20-75 years | Exposure arm: 2.5 hours physical exercise per week and 8.3 MET-hours per week Control arm: Assessments only |
| Chlebowski 2006 | Baseline caloric intake from fat of ≥20% | Intervention arm: Counselling from registered dietitians to reduce fat intake, delivered over 8 biweekly individual sessions, followed by individual sessions every 3 months Control arm: Contact with dietician every three months |
| Courneya 2014 | No additional criteria | Intervention arm: Thrice a week exercise beginning 1–2 wk after starting chemotherapy and ending 3 wk after completing chemotherapy Control arm: Assessments only |
| Fentiman 2005 | No additional criteria | Exposure arm: Current smokers Control arm: Non-smokers |
| Kwan 2010 | Enrolment between 11 and 39 months post diagnosis | Exposure arm: Alcohol consumption >6g/day Control arm: No alcohol consumption |

19 MET, Metabolic equivalent of task; wk, week

20 See appendix D for full evidence tables.

Quality assessment of clinical studies included in the evidence review

2 The clinical evidence profile for this review question (lifestyle changes to improve breast

3 cancer-specific outcomes) is presented in Table 3 through to Table 8. The included evidence

4 was of moderate to very low quality. Main reasons for downgrading evidence was

5 inconsistency due to heterogeneity in outcomes, imprecision around the estimates due to a

6 small number of events and indirectness due to use of recurrence data instead of disease

7 free survival.

8 Table 3: Summary clinical evidence profile: Comparison 1. Stress management 9 intervention versus standard care

1**Economic evidence**

- 15 A systematic review of the economic literature was conducted but no relevant studies were
- 16 identified which were applicable to this review question. Economic modelling was not
- 17 undertaken for this question because other topics were agreed as higher priorities for

18 economic evaluation.

Evidence statements

Comparison 1. Stress management intervention versus standard care

Gritical outcomes

4 Overall survival

- 5 There is moderate quality evidence from 1 RCT (N=227) that stress management
- 6 intervention brings a clinically meaningful increase in overall survival at 11 years follow up
- 7 compared with no intervention for people with invasive breast cancer.

8 Disease free survival

- 9 There is low quality evidence from 1 RCT (N=227) that stress management intervention
- 10 brings a clinically meaningful increase in disease free survival at 11 years follow up
- 11 compared with no intervention for people with invasive breast cancer.

12mportant outcomes

13 Intervention related morbidity

14 • No evidence was found for this outcome.

15 Health-related quality of life

16 • No evidence was found for this outcome.

1Comparison 2. Physical activity intervention versus standard care

16ritical outcomes

19 Overall survival

- 20 There is very low quality evidence from 1 RCT(N=242) that physical activity intervention
- does not bring a clinically meaningful change in overall survival at 7.4 years follow up
- 22 compared with no intervention for people with invasive breast cancer.

23 Disease free survival

- 24 There is very low quality evidence from 1 RCT(N=242) that physical activity intervention
- 25 does not bring a clinically meaningful change in disease free survival at 7.4 years follow
- 26 up compared with no intervention for people with invasive breast cancer.

21*Important outcomes*

28 Intervention related morbidity

29 • No evidence was found for this outcome.

30 Health-related quality of life

31 • No evidence was found for this outcome.

Comparison 3. Physical activity versus standard care

Critical outcomes

3 Overall survival

- 4 There is very low quality evidence from 2 cohort studies (N=6872) that physical activity
- 5 brings a clinically meaningful increase in overall survival (4 to 7 years follow up) compared
- 6 with no physical activity for people with invasive breast cancer.

7 Disease free survival

- 8 There is very low quality evidence from 2 cohort studies (N=6872) that physical activity
- 9 brings a clinically meaningful increase in disease free survival (4 to 7 years follow up)
- 10 compared with no physical activity for people with invasive breast cancer.

1*Important outcomes*

12 Intervention related morbidity

13 • No evidence was found for this outcome.

14 Health-related quality of life

15 • No evidence was found for this outcome.

16omparison 4. Dietary intervention aimed at reducing fat intake versus standard care

1Critical outcomes

18 Overall survival

- 19 There is low quality evidence from 1 RCT (N=2437) that dietary intervention does not
- 20 bring a clinically meaningful change in overall survival at 5 years follow up compared with
- 21 no intervention for people with invasive breast cancer.

22 Disease free survival

- 23 There is moderate quality evidence from 1 RCT (N=2437) that dietary intervention brings
- a clinically meaningful increase in disease free survival at 5 years follow up compared with no intervention for people with invasive breast cancer.

26mportant outcomes

27 Intervention related morbidity

28 • No evidence was found for this outcome.

29 Health-related quality of life

30 • No evidence was found for this outcome.

3Comparison 5. Smokers versus non-smokers

3@ritical outcomes

33 Overall survival

- 34 There is very low quality evidence from 1 cohort study (N=166) that smoking status does
- not bring a clinically meaningful change in overall survival at 11 years follow up compared
- 36 with no intervention for people with invasive breast cancer.

1 Disease free survival

- 2 There is very low quality evidence from 1 cohort study (N=166) that smoking status does
- 3 not bring a clinically meaningful change in disease free survival at 11 years follow up
- 4 compared with no intervention for people with invasive breast cancer.

Important outcomes

6 Intervention related morbidity

7 • No evidence was found for this outcome.

8 Health-related quality of life

9 • No evidence was found for this outcome.

1Comparison 6. Alcohol versus no alcohol

1**Critical outcomes**

12 Overall survival

13 • No evidence was found for this outcome.

14 Disease free survival

- 15 There is very low quality evidence from 1 cohort study (N=1417) that consuming ≥6
- 16 gm/day of alcohol brings clinically meaningful decrease in disease free survival at 7.4
- 17 years follow up compared with no drinking for people with invasive breast cancer.

1Bmportant outcomes

19 Intervention related morbidity

20 • No evidence was found for this outcome.

21 Health-related quality of life

22 • No evidence was found for this outcome.

2**Recommendations**

24 K1. Advise people with breast cancer that the following are associated with a lower risk of 25 recurrence:

- 26 a healthy lifestyle
- achieving and maintaining a healthy weight (see the NICE guidelines on preventing
 excess weight gain and obesity) and
- 29 regular physical activity (see the NICE guideline on physical activity for adults)
- 30 K2. Advise people with breast cancer that alcohol intake below 5 units per week is 31 associated with a lower risk of recurrence.

3Rationale and impact

3Why the committee made the recommendations

There was evidence that both dietary changes (reducing fat intake and maintaining a healthyweight) and physical activity increase survival in people with invasive breast cancer.

- 1 There was some evidence that cancer recurrence is more likely in people who drink more
- 2 than 3 or 4 alcoholic drinks per week or 6 g of alcohol per day. This equates to approximately
- 3 5 units of alcohol per week.

Impact of the recommendations on practice

- 5 The committee discussed that many NHS services would already be advising people with
- 6 breast cancer about the importance of a healthy lifestyle, and how they can make lifestyle
- 7 changes to reduce the risk of recurrence. The committee agreed that these
- 8 recommendations will help to direct conversations towards effective lifestyle changes. There
- 9 will be no impact on resources because these discussions were already happening, and

10 most of the lifestyle changes will be 'self-care' and implemented by patients themselves.

1The committee's discussion of the evidence

12hterpreting the evidence

1**The outcomes that matter most**

14 Since this review question was about lifestyle interventions to improve breast cancer specific

15 outcomes, disease free survival and overall survival were considered as most important and

16 were included as critical outcomes. Health-related quality of life (HRQoL) and intervention-

17 related morbidities were considered important outcomes. There was no evidence for health

18 related quality of life or intervention related morbidities.

197 *The quality of the evidence*

20 The quality of evidence for this review was assessed using GRADE. For the comparison

21 stress management intervention versus no intervention, the evidence was moderate to low

22 quality due to imprecision because of small number of events and indirectness due to

23 inclusion of relapse free survival events instead of disease free survival events.

For the comparison of physical activity intervention versus standard care, the evidence from one randomized controlled trial was very low quality due to imprecision because of small number of wide confidence intervals and indirectness due to two different types of physical activity groups in intervention group. For this comparison, evidence from two cohort studies

28 was of very low quality. The evidence was downgraded due observational study design, 29 inconsistency due to l² of 89% and indirectness due to inclusion of some stage 3b cases in

30 one study.

31 The evidence for comparison dietary intervention aimed at reducing fat intake versus

32 standard care was moderate to low quality. The main reasons for downgrading evidence was33 risk of bias and imprecision due to wide confidence interval.

34 The evidence for comparisons smoking versus no smoking and alcohol consumption

35 compared to no alcohol drinking was very low quality. The reason for downgrading for the

36 comparison smoking versus no smoking was observational study design, imprecision due to

37 small number of events, wide confidence intervals and indirectness due to inclusion of distant

38 relapse free survival data for disease free survival. The main reason for downgrading39 evidence for the comparison of alcohol versus no alcohol was indirectness, as recurrence

40 was reported instead of disease free survival, and also as this was an observational study.

4Benefits and harms

42 The committee discussed that there is evidence that engaging in physical activity and

43 maintaining a healthy weight are associated with improved disease-free survival in people

44 with invasive breast cancer. The evidence for a dietary intervention was a reduced fat diet

1 that led to weight loss, and the committee agreed that the benefit was likely to be due to 2 weight loss, and not the low fat diet *per se.*

3 Evidence from one cohort study showed higher recurrence events for those adults with

4 invasive breast cancer consuming greater than 3-4 alcohol drinks per week or 6g of alcohol

5 per day. The committee discussed that this translates to approximately 5 units of alcohol per

6 week and agreed that people with breast cancer should be advised that alcohol intake less

7 than this limit is associated with a lower risk of recurrence.

8 The committee also discussed that there can also be general physical and mental health 9 benefits with healthier lifestyle with potential of improvement in health related quality of life 10 and reduced rates of depression in those who undertake regular exercise.

Although there was no evidence regarding clinically meaningful change in breast cancer
outcomes from smoking, the committee agreed that doctors will raise smoking cessation with
smokers as usual practice.

14 The committee discussed that potential harms from the recommendations could be people

15 feeling guilty or stigmatised if recurrence is seen as their fault for not being healthier. Another

16 potential harm discussed by the committee was the potential decrease in health-related

17 quality of life (HRQoL) if people have to adjust their lifestyles (drinking less alcohol, taking

18 more exercise) to fit with the advice.

19 There was evidence that the stress management intervention improves disease free survival

20 and overall survival in people with invasive breast cancer. However, no separate

21 recommendation was made for this intervention as stress management was already included

22 in the recommendations on the provision of information and psychological support.

2Gost effectiveness and resource use

A systematic review of the economic literature was conducted but no relevant studies were identified which were applicable to this review question.

26 The committee discussed that there could be potential increase in uptake of weight reduction

27 and alcohol reduction services and possibly exercise classes, but these may also be

28 accessed by many people on a 'self-help' basis and so may not increase costs to the NHS.

29 The committee also discussed that there may be a reduction in the cost to the NHS as a

30 result of reduced breast cancer recurrence and associated management. There could be

31 further cost savings as a result of people being generally healthier with a healthy weight

32 which should result in a reduction in the rate of other comorbidities such as cardiovascular

33 disease and diabetes.

3@ther factors the committee took into account

35 The committee were aware of a NICE alcohol and breast cancer fact sheet which provided

36 similar advice. However, the fact sheet was aimed at preventing breast cancer, and the

37 committee therefore did not feel it was relevant to a population who already had a diagnosis

38 of breast cancer and therefore did not cross-refer to it in their recommendations. However,

39 they were also aware of a NICE guideline on obesity, which defined healthy weight ranges,

40 and so cross-referred to this instead of defining a healthy weight in their recommendations,

41 and a NICE guideline on physical activity.

1 Appendices

Appendix A – Review protocols

Review protocol for 11.1 What lifestyle changes improve breast cancer-specific outcomes in people treated for early and 4 locally advanced breast cancer?

| Field (based on PRISMA-P) | Content |
|---|--|
| Review question | What lifestyle changes improve breast cancer-specific outcomes in people treated for early and locally advanced breast cancer? |
| Type of review question | Intervention review |
| Objective of the review | The aim of this review is to determine which lifestyle changes improve breast cancer-specific outcomes and develop recommendations for patient discussion and advice. |
| Eligibility criteria – population/disease/condition/issue/domain | Adults (18 or over) treated for invasive breast cancer (M0) and/or DCIS |
| Eligibility criteria – intervention(s)/exposure(s)/prognostic factor(s) | Lifestyle changes: Dietary Physical exercise Weight management Stress management Reduction in smoking Level of alcohol consumption |
| Eligibility criteria – comparator(s)/control or reference (gold) standard | No lifestyle changes Each other Combinations of lifestyle changes |
| Outcomes and prioritisation | Critical (up to 3 outcomes) Overall survival (MID: any statistically significant difference) Disease-free survival (MID: any statistically significant difference) |

| Field (based on PRISMA-P) | Content |
|---|--|
| | Important but not critical Intervention related morbidity (MID: any statistically significant difference) HRQOL (MID: values from the literature where available; GRADE default value for FACT-B endocrine scale) 5 year follow-up periods will be prioritised when multiple follow-up periods are reported MID values from the literature: HRQOL: FACT-G total: 3-7 points FACT-B total: 7-8 points TOI (trial outcome index) of FACT-B: 5-6 points BCS of FACT-B: 2-3 points WHOQOL-100: 1 point |
| Eligibility criteria – study design | Systematic reviews/meta-analyses of RCTs RCTs Prospective observational non-randomised trials |
| Other inclusion exclusion criteria | Foreign language studies, conference abstracts, and narrative reviews will not routinely be included. Studies to be excluded if they don't report DFS. |
| Proposed sensitivity/sub-group analysis, or meta-regression | Invasive breast cancerDCIS |
| Selection process – duplicate screening/selection/analysis | Sifting, data extraction, appraisal of methodological quality and GRADE assessment will be performed by the reviewing team. Quality control will be performed by the senior systematic reviewer. Dual sifting will be performed on at least 10% of records and where possible all records as study design is not limited to RCTs and studies will be excluded if they do not include DFS, which may be difficult to determine from the abstract; 90% agreement is required and any discussions will be resolved through discussion and consultation with senior staff where necessary. |

| Field (based on PRISMA-P) | Content |
|---|---|
| Data management (software) | Study sifting and data extraction will be undertaken in STAR. Data extraction will be undertaken in Microsoft Excel. |
| | Pairwise meta-analyses will be performed using Cochrane Reviewer Manager (RevMan 5). GRADEpro will be used to assess the quality of evidence for each outcome. |
| Information sources – databases and dates | In anticipation of the large number of studies in this area, a date limit of 2000 (which will include all the modern trials) will be imposed if the size of the search results is unmanageable within the available time frame. |
| | The following key databases will be searched: Cochrane Library (CDSR, DARE, CENTRAL, HTA) through Wiley, Medline & Medline in Process and Embase through OVID. Additionally Web of Science may be searched and consideration will be given to subject-specific databases and used as appropriate. |
| Identify if an update | N/A |
| Author contacts | For authors please see the guideline in development web site. |
| Highlight if amendment to previous protocol | For details please see Section 4.5 of Developing NICE guidelines: the manual |
| Search strategy | For details please see appendix B. |
| Data collection process – forms/duplicate | A standardised evidence table format will be used, and published as appendix D (clinical evidence tables) or appendix H (economic evidence tables). |
| Data items – define all variables to be collected | For details please see evidence tables in appendix D (clinical evidence tables) or appendix H (economic evidence tables). |
| Methods for assessing bias at outcome/study level | Standard study checklists were used to critically appraise individual studies. For details please see Section 6.2 of Developing NICE guidelines: the manual |
| | The risk of bias across all available evidence was evaluated for each outcome using an adaptation of the 'Grading of Recommendations Assessment, Development and Evaluation (GRADE) toolbox' developed by the international GRADE working group http://www.gradeworkinggroup.org/ |
| Criteria for quantitative synthesis | For details please see Section 6.4 of Developing NICE guidelines: the manual |
| Methods for quantitative analysis – combining studies and exploring (in)consistency | For details please see the methods chapter. |

| Field (based on PRISMA-P) | Content |
|---|--|
| Meta-bias assessment – publication bias, selective reporting bias | For details please see Section 6.2 of Developing NICE guidelines: the manual. |
| Confidence in cumulative evidence | For details please see sections 6.4 and 9.1 of Developing NICE guidelines: the manual |
| Rationale/context – what is known | For details please see the introduction to the evidence review in the full guideline. |
| Describe contributions of authors and guarantor | A multidisciplinary committee developed the guideline. The committee was convened by the NGA and chaired by Dr Jane Barrett in line with section 3 of Developing NICE guidelines: the manual. |
| | Staff from NGA undertook systematic literature searches, appraised the evidence, conducted meta-analysis and cost-effectiveness analysis where appropriate, and drafted the guideline in collaboration with the committee. For details please see the methods chapter of the full guideline. |
| Sources of funding/support | NGA is funded by NICE and hosted by the Royal College of Obstetricians and Gynaecologists. |
| Name of sponsor | NGA is funded by NICE and hosted by the Royal College of Obstetricians and Gynaecologists. |
| Roles of sponsor | NICE funds NGA to develop guidelines for the NHS in England. |
