Early and locally advanced breast cancer: diagnosis and management

Supplement 1: Health economics literature review

NICE guideline NG101 Evidence reviews July 2018

Final

Supplementary materials were developed by the National Guideline Alliance hosted by the Royal College of Obstetricians and Gynaecologists

Disclaimer

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the <u>Welsh Government</u>, <u>Scottish Government</u>, and <u>Northern Ireland Executive</u>. All NICE guidance is subject to regular review and may be updated or withdrawn.

Health economics literature review

A literature search was carried out across all guideline topics for any health economic studies relating to the management of early and invasive breast cancer. This supplement contains details of this evidence search and the systematic review process.

Information sources and eligibility criteria

The following databases were searched for economic evidence relevant to the PICO: MEDLINE, EMBASE, COCHRANE, NHS EED and HEED. Studies were selected for inclusion in the evidence review if the following criteria were met:

- both cost and health consequences of interventions reported (that is, true costeffectiveness analyses)
- conducted in an OECD country
- incremental results are reported or enough information is presented to allow incremental results to be derived
- studies that matched the population, interventions, comparators and outcomes specified in PICO
- studies that meet the applicability and quality criteria set out by NICE, including relevance to the NICE reference case and UK NHS.

Note that studies that measured effectiveness using quality of life based outcomes (for example, quality adjusted life years [QALYs]) were desirable but, where this evidence was unavailable, studies using alternative effectiveness measures (for example, life years) were considered.

Literature search strategies for health economic evidence

Database: Medline

Last searched on Epub Ahead of Print, In-Process & Other Non-Indexed Citations, Ovid MEDLINE(R) Daily and Ovid MEDLINE(R) 1946 to Present.

Date of last search: 29 September 2017.

Economic evidence study selection

The literature search results were screened by checking the titles and abstracts for relevance to the review question. The full articles of non-excluded studies were then obtained for appraisal and compared against the inclusion criteria specified above. Figure 1 shows the search results and study selection process.

9

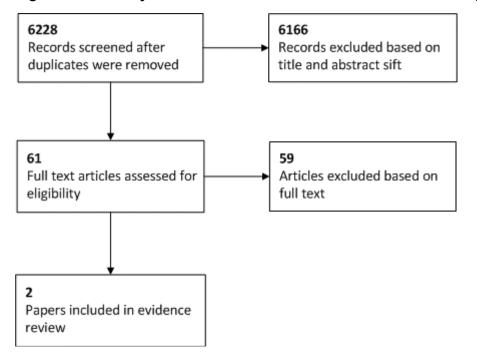

Figure 1: Summary of health-economic evidence search and sifting process

It can be seen that 6,228 possibly relevant papers were identified. Of these, 6,166 papers were excluded at the initial sifting stage based on the title and abstract while 61 full papers were obtained for appraisal. A further 59 papers were excluded based on the full text as they were not applicable to the PICO or did not include an incremental analysis of both costs and health effects. Therefore, 2 papers were included in the systematic review of the economic evidence; Erman 2014 and Shah 2013. Both studies included a cost-effectiveness analysis where effectiveness was measured using QALYs, that is a cost-utility analysis.

The identified studies were applicable to 2 review questions in the guideline. The applicable studies under each of these review questions are described below.

10

Economic evidence tables

 Table 1: Summary table showing the included health economic evidence for the optimal duration of adjuvant endocrine therapy for people with oestrogen-receptor positive breast cancer (review question 4.1, see evidence report [D] for full details)

Study details	Treatment strategies	Study population, design and data sources	Results	Comments
Shah 2013 Country: United States of America (USA) Type of economic analysis: Cost-utility analysis Source of funding: Not reported.	Accelerated partial breast radiotherapy (APBRT) techniques were compared against whole beam radiotherapy (WBRT) techniques. Various APBRT and WBRT techniques were considered: APBRT techniques 3D Conformal radiotherapy (CT) Intensity modulated radiotherapy (IMRT) Single lumen (SL) Multi lumen (ML) Interstitial WBRT techniques 3D Conformal radiotherapy (CT) Intensity modulated radiotherapy (CT)	 Population characteristics: Women with invasive early stage (breast cancer. Modelling approach: Cost-efficacy analysis and cost-utility analysis (results reported here reflect cost-utility analysis). Source of base-line and effectiveness data: Matched pair analyses of cohort data for patients treated with APBI and WBI was used to inform analysis. It was assumed that WBI and APBI effectiveness was the same regardless of technique. WBI effectiveness was based on data from traditional techniques (2D and 3D CRT) and this was extended to newer techniques (IMRT). APBI effectiveness was based on data from interstitial technique and it was assumed to be equivalent to all other APBI techniques (based on a trail which found no difference in outcome between techniques). Source of cost data: 	APBRT techniques compared against WBRT - 3D CRT Mean (and incremental) cost per patient WBRT - 3D CRT: \$11,726 APBRT - 3D CRT: \$6,578 (-\$5,148) APBRT - 3DCRT: \$6,578 (-\$5,148) APBRT - MRT: \$10,547 (-\$1,179) APBRT -SL: \$12,602 (\$876) APBRT -ML: \$16,439 (\$4,713) APBRT -Interstitial: \$11,765 (\$39) - Mean (and incremental) QALYs per patient: WBRT - 3D CRT: 10.84 QALYS APBRT - 3DCRT: 10.91 QALYS (0.07 QALYS) APBRT -IMRT: 10.91 QALYS (0.07 QALYS) APBRT -SL: 10.91 QALYS (0.07 QALYS) APBRT -ML: 10.91 QALYS (0.07 QALYS)	Perspective:Multiple perspectives were considered as various costs were included. Results reported here focus on reimbursement costs and therefore reflect the US health care payer perspective.Currency:US dollars (\$)Cost year:2011.Time horizon:Not reportedDiscounting:Not reported.

Study details	Treatment strategies	Study population, design and data sources	Results	Comments
		Costs were based on reimbursement costs from Medicare schedules for each treatment technique. Costs associated with recurrence and distant disease were sourced from a published cost analysis. Follow-up costs were not considered in the analysis because of the similarity in follow-up between treatment strategies. In some scenarios, non-medical costs were incorporated based on costs from a previous analysis. Source of QoL data: QoL values were sourced from a previous cost-effectiveness analysis. QoL values were applied for three health states (no recurrence, recurrence and distant metastases).	APBRT –Interstitial: 10.91 QALYs (0.07 QALYs) ICERs: APBRT – 3DCRT: Dominant APBRT –IMRT: Dominant APBRT –IMRT: Dominant APBRT –SL: \$12,514 per QALY APBRT –ML: \$67,329 per QALY APBRT –Interstitial: \$557 per QALY APBRT –Interstitial: \$557 per QALY APBRT techniques compared against WBRT – IMRT: Mean (and incremental) cost per patient WBRT – SL: \$20,637 APBRT – 3DCRT: \$6,578 (-\$14,059) APBRT –IMRT: \$10,547 (-\$10,090) APBRT –SL: \$12,602 (-\$8,035) APBRT –ML: \$16,439 (-\$4,198) APBRT –Interstitial: \$11,765 (-\$8,872) - Mean (and incremental) QALYS per patient: WBRT – IMRT: 10.84 QALYS	the UK context since it considered the US health care system. Limitations: Serious limitations were identified in the analysis. Most notably, uncertainty around the base case estimates was not assessed as no deterministic or probabilistic sensitivity analyses were conducted. Also the modelled time horizon was not clear and the discount rate was not reported (possible that no discount rates were used). Other comments: Incremental costs and QALYs were not reported in the study. Incremental values above have therefore been estimated as the difference between the absolute values reported in the study. Note also that the study presents costs under numerous scenarios. The costs presented

Study details	Treatment strategies	Study population, design and data sources	Results	Comments
-			APBRT – 3DCRT: 10.91 QALYs (0.07 QALYs)	above are for reimbursement costs only as it was thought
			APBRT –IMRT: 10.91 QALYs (0.07 QALYs)	to best reflect the third party perspective (other scenarios reported in
			APBRT –SL: 10.91 QALYs (0.07 QALYs)	the analysis included 'non-medical' costs
			APBRT –ML: 10.91 QALYs (0.07 QALYs)	which possibly include costs more applicable
			APBRT –Interstitial: 10.91 QALYs (0.07 QALYs)	to the societal perspective).
			ICERs:	
			APBRT – 3DCRT: Dominant	
			APBRT -IMRT: Dominant	
			APBRT –SL: Dominant	
			APBRT –ML: Dominant	
			APBRT –Interstitial: Dominant	
			Subgroup analysis:	
			Not conducted.	
			Sensitivity analysis:	
			No deterministic or probabilistic sensitivity analyses were conducted.	

Economic evidence

Included studies

Erman 2014
