

Chronic heart failure in adults: diagnosis and management

[B] Evidence review for medicines for heart failure with mildly reduced ejection fraction

NICE guideline NG106

Evidence review underpinning recommendations 1.5.1 to 1.5.2 in the NICE guideline

September 2025

Final

This evidence review was developed by NICE

Disclaimer

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the [Welsh Government](#), [Scottish Government](#), and [Northern Ireland Executive](#). All NICE guidance is subject to regular review and may be updated or withdrawn.

1 Chronic heart failure with mildly reduced left ventricular ejection fraction

1.1 Review question

Is it clinically- and cost-effective to use any of the following first-line medicines, alone or in combination, in adults with chronic heart failure with mildly reduced left ventricular ejection fraction:

- angiotension converting enzyme (ACE) inhibitor
- angiotensin-receptor blocker
- angiotensin receptor neprilysin inhibitor
- beta blocker
- mineralocorticoid receptor antagonist?

1.1.1 Introduction

Until 2014, there was a recurring question about the management of patients with heart failure whose left ventricular ejection fraction (LVEF) falls outside the classic definitions of heart failure with reduced ejection fraction (HFrEF) with LVEF $\leq 40\%$, and heart failure with preserved ejection fraction (HFpEF) with LVEF $\geq 50\%$. Those patients were not frequently included in randomised clinical trials of patients with heart failure. These patients were originally referred to as having heart failure with mid-range ejection fraction (HFmrEF). There was a call for developing an evidence-base for the management of these patients. A few years later, there was a move to modulate the name of HFmrEF to become heart failure with mildly reduced ejection fraction. Those with HFmrEF constitute the minority of patients with heart failure.

In the past 10-11 years, post hoc analyses of trials on patients with HFrEF and HFpEF which included patients with LVEF 41-49% have been conducted. In addition, trials were designed and conducted which, in the main, included patients with both HFmrEF and HFpEF. Therefore, to obtain evidence specifically related to patients with HFmrEF, post-hoc analyses were still needed.

The guidelines for treating these patients may remain at this stage reliant on the above types of what is ostensibly indirect evidence. There is a need to make sense of these analyses and appraise the clinical and cost effectiveness of these agents to enable the development of evidence-based guidelines.

1.1.2 Summary of the protocol

The protocol is summarised in Table 1. For full details see the review protocol in Appendix A.

Table 1: PICO characteristics of review question

Population	Adults diagnosed with chronic heart failure (CHF) due to left ventricular dysfunction with mildly reduced ejection fraction of 41-49% (HFmrEF)
Interventions	Pharmacological agents: • Angiotensin converting enzyme inhibitor (ACEI) • Angiotensin receptor-neprilysin inhibitor (ARNI; Sacubitril-Valsartan) • Angiotensin receptor antagonist / blocker (ARB) • Beta-adrenergic antagonist/blocker (BB) • Mineralocorticoid receptor antagonist (MRA)

	• Combinations of the above (e.g. ACEI/ARB/ARNI + BB + MRA) Background/concomitant treatment: studies in which participants are also receiving other pharmacological agents as background therapy (balanced between the randomised groups) will be included. This may include, for example, diuretics, statins, anticoagulants and anti-arrhythmics.
Comparisons	• Other active treatment alone or in combination • Placebo + usual CHF care or usual CHF care alone
Outcomes	• All-cause mortality [time-to-event (TTE)] • Cardiovascular mortality (TTE) • Health-related quality of life (Minnesota Living With Heart Failure (MLWHF), the Kansas City Cardiomyopathy Questionnaire (KCCQ), or any validated score (continuous – change score preferred over final value) • Unplanned hospitalisation or visits (HF-related) (TTE; including repeat events when reported) ○ all cause unplanned hospitalisation or visits will be included if HF-related is not reported in a study, but this will be downgraded for outcome indirectness Adverse events (recorded as the number of people with at least one event) • Withdrawal due to drug-related adverse events (dichotomous) • Acute kidney injury (AKI) – serum creatinine rise of $\geq 50\%$ over ≤ 7 days (dichotomous) • Hyponatraemia – serum sodium concentration < 135 mmol/L (dichotomous) • Hyperkalaemia – serum potassium concentration ≥ 5.5 mmol/L (dichotomous) • Falls (dichotomous) Timepoint: 12 months (pool all times ≥ 3 months)
Study design	• RCTs • Published systematic reviews of RCTs • Published network meta-analyses (NMAs) and individual participant data meta-analyses (IPDs).

ACEI: Angiotensin converting enzyme inhibitor; AKI: acute kidney injury; ARB: Angiotensin receptor antagonist / blocker; ARNI: Angiotensin receptor-neprilysin inhibitor; BB: beta-blocker; CHF: Chronic heart failure; HFmrEF: Chronic heart failure due to left ventricular dysfunction with mildly reduced ejection fraction of 41-49%; IPD: Individual participant data; KCCQ: Kansas City Cardiomyopathy Questionnaire; LVEF: Left ventricular ejection fraction; MLWHF: Minnesota Living With Heart Failure; MRA: Mineralocorticoid receptor antagonist; NMA: network meta-analysis; RCT: randomised controlled trial; TTE: Time-to-event.

Note: The thresholds for mildly reduced left ventricular ejection fraction were agreed with the committee during scoping of the guideline and confirmed at protocol development and are consistent with the published universal classification system (Bozkurt 2021).

1.1.3 Methods and process

This evidence review was developed using the methods and process described in [Developing NICE guidelines: the manual](#). Methods specific to this review question are described in the review protocol in [appendix A](#) and the methods document (report E).

Literature search methods

The searches for the effectiveness evidence were run on 11/02/2024 and re-run on 09/01/2025. The following databases were searched: Cochrane Database of Systematic Reviews (CDSR) (Wiley); Cochrane Central Register of Controlled Trials (CENTRAL) (Wiley); Embase (Ovid); MEDLINE ALL (Ovid); and Epistemonikos. Limits were applied to

remove animal studies, editorials, conference abstracts, empty registry entries and references not published in the English language. The National Guideline Centre (NGC) systematic review and randomised controlled trial search filters were used to limit to study types.

The searches for the cost effectiveness evidence (economic evaluations) were run on 12/02/2024 and re-run on 04/12/2024 and 13/01/2025. The following databases were searched: Embase (Ovid); MEDLINE ALL (Ovid); and INAHTA. Limits were applied to remove animal studies, editorials, conference abstracts, empty registry entries and references not published in the English language.

The searches for the cost effectiveness evidence (quality of life) were run on 25/07/2024 and re-run on 04/12/2024 and 13/01/2025. The following databases were searched: Embase (Ovid) and MEDLINE ALL (Ovid). Limits were applied to remove animal studies, editorials, conference abstracts, empty registry entries and references not published in the English language.

A NICE senior information specialist (SIS) conducted the searches. The MEDLINE strategy was quality assured by another NICE SIS. All translated search strategies were peer reviewed to ensure their accuracy. Both procedures were adapted from the [2015 PRESS Guideline Statement](#). Further details and full search strategies for each database are provided in Appendix B.

Review methods

Chronic heart failure is defined according to the following criteria:

- Symptoms (such as breathlessness, ankle swelling, and fatigue) with or without signs (such as elevated jugular venous pressure, pulmonary crackles, and peripheral oedema); and
- Elevated natriuretic peptide levels and/or objective evidence of pulmonary or systemic congestion on imaging (such as pleural effusions, pulmonary oedema, ascites, lung comets); and
- Outpatient or stabilised after hospital admission.

However, for the purposes of this review, trials were not excluded on the basis of lacking corroboratory evidence from natriuretic peptides or imaging as this would selectively exclude older trials.

Declarations of interest were recorded according to [NICE's conflicts of interest policy](#).

1.1.4 Effectiveness evidence

Included studies

One systematic review with an individual patient data (IPD) meta-analysis (Cleland 2018) and five randomised controlled trials (PEACE, CHARM, TOPCAT, FINEARTS-HF and PARAGON-HF) were included in the review; these are summarised in Table 2 below. Background information on the trials was provided by a further eight papers (Braunwald 2004, Pfeffer 1998, Pitt 2014, Swedberg 1999, Solomon 2019, Solomon 2024, Solomon 2024a and Vaduganathan 2024) and background information on the IPD meta-analysis was provided by Kotecha 2013.

Populations

Three of the studies (FINEARTS-HF, TOPCAT and PARAGON-HF) specified prior heart-failure hospitalisation or elevated natriuretic peptides within the trial inclusion criteria, in accordance with the universal definition of heart failure, while the remaining 3 studies did not. Additionally, five of the studies limited to symptomatic heart failure, while one trial (Alzahrani 2018) was in people with ischemic cardiomyopathy and mildly reduced ejection fraction without clear evidence of symptomatic heart failure. This was included in the absence of any directly applicable data for ACEI versus placebo, but downgraded for population indirectness.

The FINEARTS-HF trial included adults with mildly reduced or preserved ejection fraction, but for this review only the data for the mildly reduced ejection fraction subgroup were analysed, in accordance with the review protocol. [The preserved ejection fraction subgroup is included in review D.](#)

See also the study selection flow chart in Appendix C, study evidence tables in Appendix D, forest plots in Appendix E and GRADE tables in 0.

Interventions and comparisons

One systematic review with IPD meta-analysis compared beta-blockers with placebo. The PEACE RCT (Alzahrani 2018) compared ACE inhibitor with placebo. The CHARM RCT compared ARB (Lund 2018) with placebo. The TOPCAT (Solomon 2016) and FINEARTS-HF (Docherty 2024) RCTs compared MRA with placebo. No relevant clinical studies comparing ARNI with placebo were identified. There was also no evidence identified on combinations of these active interventions.

The only pharmacological agent versus pharmacological agent comparison identified in the evidence was ARNI versus ARB in the PARAGON-HF trial (Solomon 2020).

The PEACE study (Alzahrani 2018) used trandolapril, which has been considered an indirect intervention because it is an ACE inhibitor licensed for hypertension and prophylaxis after myocardial infarction in patients with left ventricular dysfunction, rather than CHF. Although finerenone (Docherty 2024) is an MRA currently unlicensed for CHF, it has been included in the evidence review based on the knowledge that this medicine is in the regulatory pipeline for licencing for CHF with mildly reduced and preserved ejection fraction.

Excluded studies

See the excluded studies list in Appendix J.

1.1.5 Summary of studies included in the effectiveness evidence

Table 2: Summary of studies included in the evidence review

Study	Intervention and comparison	Population	Outcomes	Comments
Beta blocker versus placebo				
Cleland 2018 [Kotecha 2013] IPD meta-analysis	Beta-blockers Vs Placebo	11 placebo-controlled trials that recruited >300 patients, with a follow-up of >6 months and reported on mortality. N=716 participants for subgroup with LVEF 40-49%	- All-cause mortality (TTE) - Cardiovascular mortality (TTE) - Unplanned hospitalisation, heart failure-related (cardiovascular hospitalisation) (TTE) Follow-up: median 1.3 years.	Individual patient level meta-analysis Outcome indirectness for cardiovascular hospitalisation – broader than heart-failure hospitalisation. Subgroups with atrial fibrillation and sinus rhythm reported separately (but pooled in our analysis)
ACEI versus placebo				
Alzahrani 2018 [Braunwald 2004, Pfeffer 1998] PEACE trial	ACEI (2mg trandolapril per day, titrated to 4mg after 6 months if 2mg tolerated) Background treatment: Beta-blockers 59% Vs Placebo	Participants with LVEF 40-50%, aged 50 years or older (pre-specified subgroup) N=2512 Multicentre study	- All-cause mortality (events) - Cardiovascular mortality (events) - Unplanned hospitalisation or visits, heart failure-related (hospitalisation for non-fatal congestive heart failure) (events) Follow-up: mean 4.7 years	Outcome indirectness – not TTE as specified in protocol Intervention indirectness – ACEI not licensed for CHF Population indirectness – ischemic cardiomyopathy and mildly reduced ejection fraction without clear

Study	Intervention and comparison	Population	Outcomes	Comments
	Background treatment: Beta-blockers 60%			evidence of symptomatic heart failure
	Run-in period: two weeks of 2mg trandolapril per day before randomisation.			
ARB versus placebo				
Lund 2018 [Swedberg 1999] CHARM	ARB (candesartan, titrated from 4 to 8 mg/day up to the target dose of 32 mg)	Men or women aged 18 years or older with symptomatic CHF according to NYHA class II-IV for ≥ 4 weeks before randomisation.	- All-cause mortality (TTE, unadjusted) - Cardiovascular mortality (TTE, unadjusted) - Unplanned hospitalisation of visits, heart failure-related (heart failure hospitalisation, TTE) and recurrent heart failure hospitalisation) (rate ratio, unadjusted)	Original CHARM study considered spectrum of LVEF, with HFmrEF as subgroup.
	Vs	N=1332 for subgroup of participants with LVEF 40-49%		
	Placebo	Multicentre study		
	Background treatment: ACEI 27%, beta-blocker 58% and MRA 11%		Follow-up: mean 2.9 years	
MRA versus placebo				
Docherty 2024 [Solomon 2024, Solomon 2024a, Vaduganathan 2024]	MRA (finerenone maximum dose of 20 mg or 40 mg/day).	Participants aged ≥ 40 years with CHF and LVEF $\geq 40\%$, NYHA II –IV, evidence of structural heart disease and elevated natriuretic peptides (NT-proBNP >300 pg/mL (or BNP >100 pg/mL) for patients in sinus rhythm or NT-proBNP >900 pg/mL (or BNP >300 pg/mL) for patients in atrial fibrillation)	- All-cause mortality (TTE, adjusted and events) - Cardiovascular mortality (TTE, adjusted and events) - Health-related quality of life [KCCQ-total symptom score), change score, continuous] - Unplanned hospitalisation or visits, heart failure-related (first worsening	Subgroup analysis of FINEARTS-HF, split by categories of LVEF
	Vs	N=2172 for subgroup with LVEF $<50\%$		
	Placebo			

Study	Intervention and comparison	Population	Outcomes	Comments
FINEARTS-HF	Background treatment: Beta-blocker 88%, ACEI 40%, ARB 28%, ARNI 16%, SGLT2i 16%	Multi-centre study	heart failure events) (TTE, adjusted and events) • Total repeat unplanned hospitalisation or visits, heart failure-related (total worsening heart failure events) (rate ratio) • Withdrawal due to drug-related adverse events (treatment discontinuation due to adverse event) (events) • Hyperkalaemia (events) Follow-up: median 2.6 years	
Solomon 2016 [Pitt 2014] TOPCAT	MRA (spironolactone titrated to 45 mg/day). Vs Placebo Background treatment: ACEI/ARB 88%, and beta-blockers 78%	Participants aged ≥ 50 years with at least one sign or symptom of CHF and LVEF $\geq 45\%$ and had a HF hospitalisation in last year or elevated BNP (BNP ≥ 100 pg/mL or NTproBNP ≥ 360 pg/mL). N=520 for subgroup with LVEF $< 50\%$ from Solomon 2016 paper. Multi-centre study	• All-cause mortality (TTE, adjusted) • Cardiovascular mortality (TTE, adjusted) • Unplanned hospitalisation or visits, heart failure-related (heart failure hospitalisation) (TTE, adjusted) Follow-up: median 3.4 years	
ARNI versus ARB				
Solomon 2020 [Solomon 2019] PARAGON-HF	ARNI (97 mg sacubitril/103mg valsartan twice daily as target dose). Background treatment (of total n): MRA 24.6%; beta-blocker 79.9%.	Participants aged ≥ 50 years with symptoms of CHF (NYHA functional class II to IV) and LVEF $\geq 45\%$. Hospitalisation for HF within 9 months prior to enrolment or an elevated NT-proBNP (> 300 pg/ml for patients not in AF or > 900 pg/ml for patients in AF) N=4821 randomised	• Cardiovascular mortality (TTE) • Unplanned hospitalisation of visits, heart failure-related (heart failure hospitalisation) (TTE) Follow-up: median 35 months	Data from PARAGON-HF and PARADIGM-HF combined in this analysis. However, note that the eligibility criteria for PARADIGM-HF mean that this subgroup data must come from

Study	Intervention and comparison	Population	Outcomes	Comments
	Vs	n=730 total for subgroup >40% to 50% LVEF (reported in Solomon 2020 paper)		PARAGON-HF so ARNI vs ARB.
	ARB (160mg valsartan twice daily)	Multi-centre study		Background treatment with ACEI or ARB (86%) before entry into the trial was discontinued before run-in period.
	Background treatment (of total n): MRA 27.1%; beta-blocker 79.5%.			

ACEI: Angiotensin converting enzyme inhibitor; AF: Atrial fibrillation; ARB: Angiotensin receptor antagonist / blocker; ARNI: Angiotensin receptor-neprilysin inhibitor; BNP: B-type natriuretic peptides; CHF: Chronic heart failure; HFmrEF: Chronic heart failure due to left ventricular dysfunction with mildly reduced ejection fraction of 41-49%; IPD: Individual participant data; KCCQ: Kansas City Cardiomyopathy Questionnaire; LVEF: Left ventricular ejection fraction; MRA: Mineralocorticoid receptor antagonist; NT-proBNP: N-terminal pro-B-type natriuretic peptide level; NYHA: New York Health Association; SGLT2i: Sodium-glucose co-transporter 2 inhibitors; TTE: Time-to-event.

Note: Background treatment per arm for the relevant subgroup was not reported in most studies so background treatment for the total subgroup or total n (whole study) reported instead.

See Appendix D for full evidence tables.

1.1.6 Summary of the effectiveness evidence

Table 3: Clinical evidence summary: Beta-blockers versus placebo

Outcomes	No of participants (studies) Follow-up	Certainty of the evidence (GRADE)	Relative effect (95% CI)	Anticipated absolute effects	
				Risk with placebo	Risk difference with beta blockers
All-cause mortality	716 (11 RCTs in an IPD meta-analysis) Follow-up: 1.3 years	⊕⊕○○ Low ^{a,b}	HR 0.79 (0.51 to 1.23)	Not estimable	
Cardiovascular mortality	716 (11 RCTs in an IPD meta-analysis) Follow-up: 1.3 years	⊕⊕○○ Low ^{a,b}	HR 0.60 (0.35 to 1.04)	Not estimable	
Unplanned hospitalisation, HF-related (cardiovascular hospitalisation)	709 (11 RCTs in an IPD meta-analysis) Follow-up: 1.3 years	⊕○○○ Very low ^{a,b}	HR 0.98 (0.73 to 1.33)	Not estimable	

CI: confidence interval; HF: Heart failure; IPD: Individual participant data; HR: Hazard ratio; RCT: Randomised controlled trial

a. Downgraded by 1 increment for risk of bias because of some concerns about identification of all relevant trials (no clear search strategy reported or available, and no flowchart to show assessment of papers against inclusion criteria).

b. Downgraded by 1 increment if the confidence interval crossed one MID or by 2 increments if the confidence interval crossed both MIDs (default MIDs=0.8 and 1.25 for dichotomous and time-to-event outcomes).

Table 4: Clinical evidence summary: ACEI versus placebo

Outcomes	No of participants (studies) Follow-up	Certainty of the evidence (GRADE)	Relative effect (95% CI)	Anticipated absolute effects	
				Risk with Placebo	Risk difference with ACEI
All-cause mortality	2512 (1 RCT) Follow-up: mean 4.7 years	⊕○○○ Very low ^{a,b}	RR 0.76 (0.60 to 0.98)	106 per 1,000	25 fewer per 1,000 (42 fewer to 2 fewer)
Cardiovascular mortality	2512 (1 RCT) Follow-up: mean 4.7 years	⊕○○○ Very low ^{a,b}	RR 0.80 (0.56 to 1.14)	53 per 1,000	11 fewer per 1,000 (23 fewer to 7 more)
Unplanned hospitalisation or visits, HF-related (hospitalisation for nonfatal congestive heart failure)	2512 (1 RCT) Follow-up: mean 4.7 years	⊕○○○ Very low ^{a,b}	RR 0.93 (0.63 to 1.38)	40 per 1,000	3 fewer per 1,000 (15 fewer to 15 more)

ACEI; Angiotensin converting enzyme inhibitor; CI: confidence interval; HF: Heart failure; IPD: Individual participant data; RCT: Randomised controlled trial; RR: Relative risk

a. Downgraded by 2 increments for indirectness: intervention indirectness due to the licenced indication being hypertension not CHF; outcome indirectness due to the outcome not being TTE as specified in the protocol;

population indirectness because the population included people with ischemic cardiomyopathy and mildly reduced ejection fraction without clear evidence of symptomatic heart failure.

b. Downgraded by 1 increment if the confidence interval crossed one MID or by 2 increments if the confidence interval crossed both MIDs (default MIDs=0.8 and 1.25 for dichotomous and time-to-event outcomes).

Table 5: Clinical evidence summary: ARB versus placebo

Outcomes	No of participants (studies) Follow-up	Certainty of the evidence (GRADE)	Relative effect (95% CI)	Anticipated absolute effects (incidence rate)	
				Risk with Placebo	Risk difference with ARB
All-cause mortality	1332 (1 RCT) Follow-up: mean 2.9 years	⊕⊕○○ Low ^{a, b}	HR 0.79 (0.60–1.04)	60 per 1000 person years	12 fewer per 1000 person years ^c
Cardiovascular mortality	1332 (1 RCT) Follow-up: mean 2.9 years	⊕⊕○○ Low ^{a, b}	HR 0.81 (0.60–1.11)	48 per 1000 person years	9 fewer per 1000 person years ^c
Unplanned hospitalisation or visits, HF-related (heart failure hospitalisation)	1332 (1 RCT) Follow-up: mean 2.9 years	⊕⊕○○ Low ^{a, b}	HR 0.72 (0.55–0.95)	71 per 1000 person years	20 fewer per 1000 person years ^c
Repeat unplanned hospitalisation or visits, HF-related (recurrent heart failure hospitalisation)	1332 (1 RCT) Follow-up: mean 2.9 years	⊕⊕⊕○ Moderate ^a	Rate ratio 0.48 (0.33–0.70)	141 per 1000 person years	64 fewer per 1000 person years ^c

ARB: Angiotensin receptor antagonist / blocker; CI: confidence interval; HF: Heart failure; HR: Hazard ratio; RCT: Randomised controlled trial

a. Downgraded by 1 increment for risk of bias because of some concerns about reporting of randomisation method and not able to assess baseline characteristics.

b. Downgraded by 1 increment if the confidence interval crossed one MID or by 2 increments if the confidence interval crossed both MIDs (default MIDs=0.8 and 1.25 for dichotomous and time-to-event outcomes).

c. Absolute effect calculated from rate per 100 person years reported in the paper (not possible to estimate the variance).

Table 6: Clinical evidence summary: MRA versus placebo

Outcomes	No of participants (studies) Follow-up	Certainty of the evidence (GRADE)	Relative effect (95% CI)	Anticipated absolute effects	
				Risk with Placebo	Risk difference with MRA
All-cause mortality (HR)	2692 (2 RCTs) Follow-up: range 2.6 years to 3.4 years	⊕⊕○○ Low ^{a, b}	HR 0.91 (0.76 to 1.09)	Not estimable	

Outcomes	No of participants (studies) Follow-up	Certainty of the evidence (GRADE)	Relative effect (95% CI)	Anticipated absolute effects	
				Risk with Placebo	Risk difference with MRA
All-cause mortality (dichotomous)	2172 (1 RCT) Follow-up: median 32 months	⊕○○○ Very low ^{a,b,c}	RR 0.94 (0.79 to 1.13)	186 per 1,000	11 fewer per 1,000 (39 fewer to 24 more)
Cardiovascular mortality (HR)	2692 (2 RCTs) Follow-up: range 2.6 years to 3.4 years	⊕⊕○○ Low ^{a,b}	HR 0.81 (0.64 to 1.02)	Not estimable	
Cardiovascular mortality (dichotomous)	2172 (1 RCT) Follow-up: median 32 months	⊕○○○ Very low ^{a,b,c}	RR 0.85 (0.67 to 1.10)	110 per 1,000	17 fewer per 1,000 (36 fewer to 11 more)
Health-related quality of life (KCCQ-TSS change score; adjusted) Scale: 0 to 100, higher scores better	2172 (1 RCT) Follow-up: mean 12 months	⊕⊕⊕○ Moderate ^a	-	The mean health-related quality of life (KCCQ-TSS change score; adjusted) was 6.78	MD 1.39 higher (0.19 lower to 2.97 higher)
Unplanned hospitalisation or visits, HF-related (first worsening heart failure events; HR)	2692 (2 RCTs) Follow-up: range 2.6 years to 3.4 years	⊕⊕○○ Low ^{a,b}	HR 0.77 (0.64 to 0.93)	Not estimable	
Unplanned hospitalisation or visits, HF-related (first unplanned hospitalisation or visit - HF related; dichotomous)	2172 (1 RCT) Follow-up: median 32 months	⊕○○○ Very low ^{a,b,c}	RR 0.79 (0.66 to 0.94)	203 per 1,000	43 fewer per 1,000 (69 fewer to 12 fewer)
Repeat unplanned hospitalisation or visits, HF-related (total number of worsening heart failure events; rate ratio)	2172 (1 RCT) Follow-up: median 32 months	⊕⊕○○ Low ^{a,b}	Rate ratio 0.83 (0.65 to 1.05)	14.6 (12.5 to 17.0) per 100 person years ^e	2.8 less per 100 person years

Outcomes	No of participants (studies) Follow-up	Certainty of the evidence (GRADE)	Relative effect (95% CI)	Anticipated absolute effects	
				Risk with Placebo	Risk difference with MRA
Withdrawal due to drug-related adverse events (treatment discontinuation due to adverse event; dichotomous)	2170 (1 RCT) Follow-up: median 32 months	⊕○○○ Very low ^{a,b}	RR 1.02 (0.62 to 1.67)	28 per 1,000	1 more per 1,000 (11 fewer to 19 more)
Hyperkalaemia (dichotomous)	2098 (1 RCT) Follow-up: median 32 months	⊕⊕⊕○ Moderate ^a	RR 2.05 (1.58 to 2.65)	74 per 1,000	78 more per 1,000 (43 more to 122 more)

CI: confidence interval; HF: Heart failure; HR: Hazard ratio; KCCQ: Kansas City Cardiomyopathy Questionnaire total symptom score; MRA: Mineralocorticoid receptor antagonist; RCT: Randomised controlled trial; RR: Relative risk

a. Downgraded by 1 increment because of some concerns about risk of bias (protocol deviations in subgroup definitions of LVEF categories)

b. Downgraded by 1 increment for imprecision if the confidence interval crossed one MID and by 2 increments if the 95% confidence interval crossed two MIDs (0.8 and 1.25 for dichotomous and time-to-event outcomes; KCCQ TSS MID is 5)

c. Downgraded by 1 increment for outcome indirectness (dichotomous, not time-to-event).

Table 7: Clinical evidence summary: ARNI versus ARB

Outcomes	No of participants (studies) Follow-up	Certainty of the evidence (GRADE)	Relative effect (95% CI)	Anticipated absolute effects	
				Risk with ARB	Risk difference with ARNI
Cardiovascular mortality	730 (1 RCT) Follow-up: median 35 months	⊕⊕○○ Low ^a	HR 0.98 (0.66 to 1.46)	Not estimable	
Unplanned hospitalisation or visits, HF-related (total heart failure hospitalisations)	730 (1 RCT) Follow-up: median 35 months	⊕⊕⊕○ Moderate ^a	Rate ratio 0.73 (0.50 to 1.07)	Not estimable	

ARB: Angiotensin receptor antagonist / blocker; ARNI: Angiotensin receptor-neprilysin inhibitor; CI: confidence interval; HF: Heart failure; HR: Hazard ratio; RCT: Randomised controlled

a. Downgraded by 1 increment if the confidence interval crossed one MID or by 2 increments if the confidence interval crossed both MIDs (default MIDs=0.8 and 1.25 for dichotomous and time-to-event outcomes).

See Appendix F for full GRADE tables.

1.1.7 Economic evidence

A single search was performed to identify economic evaluations of relevance to any of the questions in this guideline update that had been published since the last guideline. See the health economic review protocol in Appendix A and the literature search strategy in Appendix

B. Further studies were sought through bibliography searching. A further 15 studies included previously in the guideline were re-assessed for applicability and quality.

Included studies

No health economic studies were included.

Excluded studies

Ten economic studies relating to this review question were identified but were excluded due to incorrect comparator and interventions. See Appendix JJ.2 for a list of excluded economic studies, with reason for exclusion.

See also the health economic study selection flow chart in Appendix G.

1.1.8 Summary of included economic evidence

No economic evidence was included.

1.1.9 Economic model

ARNI compared with ARB

A simple economic model was developed for this review question comparing ARNI versus ARB in people with mildly reduced EF. Health outcomes were valued in terms of quality adjusted life years (QALYs) estimated by weighting the years of life with a quality of life (utility) score, and the results were presented using incremental cost-effectiveness ratios (ICERs) that express the cost per QALY gained.

The cohort Markov model was developed with a cycle length of 3 months and a 3-year time horizon based on the duration of the PARAGON-HF clinical trial. All parameters related to treatment effect were taken from the PARGAGON-HF trial, restricted to the mildly reduced population where possible. However, for the hospitalisation baseline rates, data from the entire trial population was used as a stratification was not possible. The hazard ratio (HR) associated with mortality for ARNI compared with ARB was very close to 1 (HR: 0.98 (0.66 to 1.46)), so the committee concluded that there was no statistically significant effect on mortality. For this reason, the committee agreed that a shorter time horizon, based on the PARAGON-HF clinical trial, was appropriate to capture the benefits associated with both treatments. The model includes two health states alive and dead and included costs associated with treatment, titration, monitoring, hospitalisations and management of adverse events. QALYs were accrued by weighting the time spent in the alive state by the corresponding utility value for that state adjusted for the utility losses (disutilities) due to hospitalisations and adverse events associated with treatment. An annual utility decrement was also assumed. The analysis was conducted from the perspective of the NHS and Personal Social Services (PSS) in England.

All costs and QALYs were discounted at a rate of 3.5% per year in line with the NICE reference case. See Table 8 for the full list of parameters included within the economic model.

Table 8: model parameters

Parameter	Value	Reference
Baseline rates		
Annual mortality rate with ARB	0.032	Solomon et al 2020
Annual HF hospitalisation rate with ARB	0.139	PARAGON-HF, Solomon et al 2019
Treatment effect		

Parameter	Value	Reference
ARNI treatment effect – all-cause mortality	HR: 1	Assumption based on Solomon et al 2020
ARNI treatment effect – HF hospitalisation	HR: 0.73	Solomon et al 2020
Adverse events		
ARB – Hyperkalaemia 3-monthly rate	0.002	PARAGON-HF, Solomon et al 2019
ARB – Acute Kidney injury 3-monthly rate	0.004	PARAGON-HF, Solomon et al 2019
ARB – Hypotension 3-monthly rate	0.002	PARAGON-HF, Solomon et al 2019
ARB – UTI rate 3-monthly rate	0.002	PARAGON-HF, Solomon et al 2019
ARNI – Hyperkalaemia 3-monthly rate	0.001	PARAGON-HF, Solomon et al 2019
ARNI – Acute Kidney injury 3-monthly rate	0.003	PARAGON-HF, Solomon et al 2019
ARNI – Hypotension 3-monthly rate	0.002	PARAGON-HF, Solomon et al 2019
ARNI – UTI rate 3-monthly rate	0.002	PARAGON-HF, Solomon et al 2019
Unit costs		
ARB treatment	£5.17	NHS drug tariff and prescription cost analysis 2023/24
ARNI treatment	£298.59	NHS drug tariff and prescription cost analysis 2023/24
ARB initiation and titration	£270.76	PSSRU 2023, assuming GP initiation and 5 further titration visits with a Band 7 nurse, a blood test for renal function is assumed at every titration visit (NHS cost collection 2023/2024 weighted average of clinical biochemistry DAPS PATH04)
ARNI initiation and titration	£265.98	PSSRU 2023, assuming specialist initiation and two further visits with a band 7 nurse, a blood test for renal function is assumed at every titration visit (NHS cost collection 2023/2024 weighted average of clinical biochemistry DAPS PATH04)
Heart failure hospitalisation	£2,889	NHS cost collection 2023/2024. EB30A-E weighted average of long and short stay heart failure hospitalisation with and without complications
Hyperkalaemia	£151.24	PSSRU 2023, McMurray et al 2018 two additional GP visits and a blood test

Parameter	Value	Reference
Acute Kidney injury	£2,732.43	NHS cost collection 2023/2024, Tafazolli et al 2023 weighted average of long and short stay LA07H, LA07J-N, LA07P acute kidney injury
Hypotension	£176.20	NHS cost collection 2023/2024 McMurray et al 2018 (UK clinical opinion)
UTI	£74.10	PSSRU 2023, Committee feedback 15 minutes GP appointment
Quality of life		
ARB – EQ-5D at 8 months	-0.014	PARAGON-HF, Chandra et al 2022
ARNI – EQ-5D at 8 months	-0.005	PARAGON-HF, Chandra et al 2022
Annual utility decrement	0.008	NICE TA388 PARADIGM-HF
Hyperkalaemia utility decrement	0	Assumed aligns with Tafazolli et al 2023
Acute Kidney injury utility decrement	0.010	Tafazolli et al 2023, Emperor reduced clinical trial
Hypotension utility decrement	0.025	Tafazolli et al 2023, Emperor reduced clinical trial
UTI utility decrement	0	Tafazolli et al 2023, Sullivan et al 2016
Hospitalisation utility decrement	0.019	NICE TA773

ARB: Angiotensin receptor antagonist / blocker; ARNI: Angiotensin receptor-neprilysin inhibitor; EQ-5D: EuroQol-5 dimensions GP: General practitioner, HF: Heart failure; UTI: Urinary tract infection

The results found ARNI compared with ARB to have an ICER of £119,308 per QALY which is not considered cost effective at NICE's £20,000 per QALY gained threshold (Table 9). The committee anticipated that it was unlikely that ARNI could become cost effective even if further scenarios were tested or the time horizon increased.

Table 9: HFmrEF model results

Strategy	Mean cost per person	Mean QALYs per person	Incremental cost	Incremental QALYs	Incremental cost per QALY (i.e. ICER)	NHB at £20,000/QALY
ARB	£1,735	1.898	-	-	-	1.812
ARNI	£4,375	1.921	£2,640	0.022	£119,308	1.702

QALY: quality adjusted life year; ICER: incremental cost effectiveness ration, NHB: net health benefit

ACE inhibitors, ARB, beta-blockers and MRAs compared with no treatment

This area was not prioritised for new cost-effectiveness analysis. However, the guideline model used to evaluate medicines for heart failure with reduced ejection fraction was adapted to inform this question as sensitivity analyses. Model parameters unique to mildly reduced ejection fraction analysis can be found in Table 10. For other methods and parameters see the economic analysis report for chronic heart failure with reduced ejection fraction.

Table 10: Key model parameters

Parameter	Value	Source
All-cause mortality – Baseline rate per year –0-5 years	0.060	Guideline review (ARB vs placebo) – See Table 5
All-cause mortality – Hazard ratio (BB vs no medicine) – all years	0.79	Guideline review – see Table 3
All-cause mortality – Risk ratio (ACEI vs no medicine) – all years	0.76	Guideline review – see Table 4
All-cause mortality – Hazard ratio (ARB vs no medicine) – all years	0.79	Guideline review – see Table 5
All-cause mortality – Hazard ratio (MRA vs no medicine) – all years	0.91	Guideline review – see Table 6
Utility gain	Zero	Assumed for simplicity but likely to be some improvement
Hospitalisation for heart failure – Baseline rate - 0-5 years	0.071	Guideline review (ARB vs placebo) – See Table 5
Hospitalisation for heart failure - Hazard ratio (BB vs no medicine) – all years	0.98	Guideline review – see Table 3
Hospitalisation for heart failure – Risk ratio (ACEI vs no medicine) – all years	0.93	Guideline review – see Table 4
Hospitalisation for heart failure - Hazard ratio (ARB vs no medicine) – all years	0.72	Guideline review – see Table 5
Hospitalisation for heart failure - Hazard ratio (MRA vs no medicine) – all years	0.79	Guideline review – see Table 6
Cost per year (BB)	£12.50	NHS drug tariff – see Table 15
Cost per year (ACEI)	£21.86	NHS drug tariff – see Table 15
Cost per year (ARB)	£20.69	NHS drug tariff – see Table 15

Parameter	Value	Source
Cost per year (spironolactone)	£38.35	NHS drug tariff – see Table 15
Visits for initiation and titration BB	1 GP visit 4 GP nurse visits	Expert opinion – see Table 15
Visits for initiation and titration ACEI	1 GP visit 5 GP nurse visits	Expert opinion – see Table 15
Visits for initiation and titration ARB	1 GP visit 5 GP nurse visits	Expert opinion – see Table 15
Visits for initiation and titration MRA	1 GP visit 2 GP nurse visits	Expert opinion – see Table 15
Additional follow-up visits per year	zero	Expert opinion
Treatment escalation per year	zero	Assumed
Adverse events for BB, ACEI, ARB	Zero	Assumed zero due to lack of data

ACEI: Angiotensin converting enzyme inhibitor; ARB: Angiotensin receptor antagonist / blocker; BB: Beta-blocker; GP: General practitioner, MRA: Mineralocorticoid receptor antagonist;

Even assuming no gain in quality of life, the model suggests all treatments (beta-blockers, ACE inhibitors, ARBs and spironolactone) are likely to be highly cost-effective (see Table 11 and Table 12). It should be noted however that the ICERs associated with beta-blockers, ACE inhibitors and ARBs are an underestimate as they do not account for adverse events.

Table 11: Cost-effectiveness of beta-blockers, ACE inhibitors and ARB compared with no medicine for people with heart failure and mildly reduced ejection fraction

Strategy	Mean cost per person	Mean QALYs per person	Incremental cost vs No medicine	Incremental benefit vs No medicine	Incremental cost per QALY gained (i.e. ICER) vs No medicine	Net health benefit at £20,000/QALY
No medicine	£2,552	5.789	-	-	-	5.661
BB	£3,144	6.406	£592	0.616	£961	6.248

ICER: Incremental cost-effectiveness ratio; MRA: Mineralocorticoid receptor antagonist; QALY=quality-adjusted life-year

1.1.10 Unit costs

Relevant unit costs are provided below to aid consideration of cost effectiveness.

Table 13: Unit cost of selected medicines – NHS drug tariff (28th March 2025)

Class	Drug	Tablet s/pack	Price/ pack	Tablets per day	Cost per year at max dose	Dose	Indication	Proportion on each drug
ACEI	Enalapril maleate	28	£0.90	2	£23.48	Initially 2.5mg once daily, increased if tolerated to 10-20mg twice daily, dose to be increased gradually over 2-4 weeks	Heart failure	4.13%
ACEI	Ramipril	28	£0.79	2	£20.61	Initially 1.25mg once daily, increased if tolerated to 10mg daily in 1-2 divided doses, daily dose preferably taken in 2 divided doses, increase dose gradually at intervals of 1-2 weeks	Symptomatic heart failure (adjunct) (under close medical supervision)	63.91%
ACEI	Lisinopril	28	£2.16	1	£28.18	Initially 2.5mg once daily; increased in steps of up to 10mg at least every 2 weeks; maximum 35mg per day	Heart failure (adjunct) (under close medical supervision)	22.23%
ACEI	Perindopril-erbumine	30	£1.23	1	£14.98	Initially 2mg once daily for at least 2 weeks, dose to be taken in the morning, then increased if tolerated to 4mg once daily	Heart failure (adjunct) (under close medical supervision)	9.73%
ARB	Candesartan cilexetil	28	£1.24	1	£16.18	Initially 4mg once daily, increased to up to 32mg once daily, dose to be increased at intervals of at least 2 weeks to 'target' dose of 32mg once daily or to maximum tolerated dose	[Off-label For HFmrEF.] Heart failure with impaired left ventricular systolic function when ACE inhibitors are not tolerated Heart failure with impaired left ventricular systolic function in conjunction with	17.53%

Class	Drug	Tablet s/pack	Price/ pack	Tablets per day	Cost per year at max dose	Dose	Indication	Proportion on each drug
							an ACE inhibitor (under expert supervision)	
ARB	Losartan	28	£1.66	1	£21.65	Initially 12.5mg once daily, increased if tolerated to up to 150mg once daily, doses to be increased at weekly intervals	Chronic heart failure when ACE inhibitors are unsuitable or contra-indicated	82.47%
BB	Bisoprolol fumarate	28	£0.68	1	£8.87	Initially 1.25mg once daily for 1 week, dose to be taken in the morning, then increased if tolerated to 2.5mg once daily for 1 week, then increased if tolerated to 3.75mg once daily for 1 week, then increased if tolerated to 5mg once daily for 4 weeks, then increased if tolerated to 7.5mg once daily for 4 weeks, then increased if tolerated to 10mg once daily	Adjunct in heart failure	91.26%
BB	Carvedilol	28	£1.16	2	£30.26	Initially 12.5mg twice daily for 2 days, then increased to 25mg twice daily	Adjunct to diuretics, digoxin, or ACE inhibitors in symptomatic chronic heart failure	8.21%
BB	Nebivolol	28	£27.75	1	£361.99	Initially 1.25 mg once daily for 1-2 weeks, then increased if tolerated to 2.5mg once daily for 1-2 weeks, then increased if tolerated to 5mg once daily for 1-2 weeks, then increased if tolerated to 10mg once daily	Adjunct in stable mild to moderate heart failure	0.53%
MRA	Spironolactone	28	£2.94	1	£38.35	Initially 25mg once daily, then adjusted according to response to 50mg once daily	Moderate to severe heart failure (adjunct)	
MRA	Finerenone*	28	£36.68	2	£956.96	20mg once daily (CKD), 20mg or 40mg daily FINEARTS-HF trial dosage, cost based on 40mg	[Off-label for heart failure] Chronic kidney disease (stage 3 and 4 with	

Class	Drug	Tablet s/pack	Price/ pack	Tablets per day	Cost per year at max dose	Dose	Indication	Proportion on each drug
							albuminuria) associated with type 2 diabetes	
ARNI	Sacubitril with valsartan	56	£91.56	2	£1,194.37	Initially 24/26mg twice daily for 3-4 weeks, increased if tolerated to 49/51mg twice daily for 3-4 weeks, then increased if tolerated to 97/103mg twice daily	[Off-label For HFmrEF.] Symptomatic chronic heart failure with reduced ejection fraction (in patients not currently taking an ACE inhibitor or angiotensin II receptor antagonist, or stabilised on low doses of either of these agents)	
ARNI	Sacubitril with valsartan	56	£91.56	2	£1,194.37	Initially 49/51mg twice daily for 2-4 weeks, increased if tolerated to 97/103mg twice daily, consider a starting dose of 24/26mg if systolic blood pressure less than 110mmHg	[Off-label For HFmrEF.] Symptomatic chronic heart failure with reduced ejection fraction (in patients currently stabilised on an ACE inhibitor or angiotensin II receptor antagonist)	
SGLT2i	Dapagliflozin	28	£36.59	1	£477.30	10mg once daily	Symptomatic chronic heart failure	
SGLT2i	Empagliflozin	28	£36.59	1	£477.30	10mg once daily	Symptomatic chronic heart failure	

ACE: Angiotensin converting enzyme; ARB: Angiotensin receptor antagonist / blocker; ARNI: Angiotensin receptor-neprilysin inhibitor; BB: Beta-blocker; MRA: Mineralocorticoid receptor antagonist; SGLT2i: Sodium-glucose co-transporter 2 inhibitor

* The dose and price of finerenone is uncertain as the medicine is not licensed yet for this condition. This is expected to change when a license is granted for this indication. In the absence of economic evidence and given the differences in resource use for titration between treatments, the resource use associated with titration and one year of treatment was estimated to inform potential resource implications of any recommendation to be taken into consideration. The committee provided feedback on the expected resource use for treatment titration for each medicine to support the estimation of annual treatment costs. Data on resource use during the titration phase were collected from three GPs and four nurses. The total annual costs of treatments based on the mode (most common response), minimum and maximum number of visits reported are presented in Table 14.

It was assumed that:

- SGLT2 inhibitors and ARNI are initiated at a cardiology outpatient appointment at a cost of £186 (NHS National cost collection 2023/24)
- Other medicines can be initiated by a GP (assuming a duration of 15 minutes) at a cost of £74.10 (PSSRU 2023)
- All other visits are by a Band 7 nurse assuming a cost of £37 based on a 30-minute visit (PSSRU 2023, Section 9.2)

In addition to the costs presented below, it was anticipated that tests for renal function and electrolytes would be undertaken for all treatments at baseline, after initiation and after each dose increase. These tests would then be repeated every 6 months, or every 3 months for people with chronic kidney disease (CKD), following treatment initiation and each subsequent dose increase.

Table 14: Annual costs associated with treatment and titration

Drug class	Drug name	Cost per year at max dose	Total number of visits for initiation and titration Mode (minimum, maximum)	Total cost of visits Mode (minimum, maximum)	Total annual costs Mode (minimum, maximum)
ACEI	Enalapril maleate	£23.48	6 (3, 10)	£259 (£148, £407)	£282 (£171, £430)
ACEI	Ramipril	£20.61	6 (3, 10)	£259 (£148, £407)	£280 (£169, £428)
ACEI	Lisinopril	£28.18	6 (3, 10)	£259 (£148, £407)	£287 (£176, £435)
ACEI	Perindopril-erbumine	£14.98	6 (3, 10)	£259 (£148, £407)	£274 (£163, £422)
ARB	Candesartan cilexetil	£16.18	6 (4, 10)	£259 (£185, £407)	£275 (£201, £423)
ARB	Losartan	£21.65	6 (4, 10)	£259 (£185, £407)	£281 (£207, £429)
BB	Bisoprolol fumarate	£8.87	5 (4, 5)	£222 (£185, £222)	£231 (£194, £231)
BB	Carvedilol	£30.26	5 (4, 5)	£222 (£185, £222)	£252 (£215, £252)
BB	Nebivolol	£361.99	5 (4, 5)	£222 (£185, £222)	£584 (£547, £584)
MRA	Spirolactone	£38.35	3 (2, 3)	£148 (£111, £148)	£186 (£149, £186)
MRA	Finerenone	£956.96	3 (2, 3)	£148 (£111, £148)	£1105 (£1068, £1105)
ARNI	Sacubitril with valsartan	£1,194.37	3 (3, 4)	£260 (£260, £297)	£1454 (£1454, £1491)
SGLT2	Dapagliflozin	£477.30	2 (1, 2)	£223 (£186, £223)	£700 (£663, £700)
SGLT2	Empagliflozin	£477.30	2 (1, 2)	£223 (£186, £223)	£700 (£663, £700)

ACEI: Angiotensin converting enzyme inhibitor; ARB: Angiotensin receptor antagonist / blocker; ARNI: Angiotensin receptor-neprilysin inhibitor; BB: Beta-blocker; MRA: Mineralocorticoid receptor antagonist; SGLT2i: Sodium-glucose co-transporter 2 inhibitor

* The dose and price of finerenone is uncertain as the medicine is not licensed yet for this condition. This is expected to change when a license is granted for this indication.

Table 15: Weighted average by treatment class

Drug class	Cost per year at max dose	Total number of visits for initiation and titration average (minimum, maximum)	Total cost of visit (minimum, maximum)	Total annual costs average (minimum, maximum)
ACEI	£21.86	6 (3, 10)	£259 (£148, £407)	£281 (£170, £429)
ARB	£20.69	6 (4, 10)	£259 (£185, £407)	£280 (£206, £428)
BB	£12.50	5 (4, 5)	£222 (£185, £222)	£235 (£198, £235)
ACE, BB and MRA (spironolactone)	£72.72	6 (3, 10)	£259 (£148, £407)	£332 (£221, £480)
ARB (losartan), BB and MRA (spironolactone)	£71.55	6 (4, 10)	£259 (£185, £407)	£331 (£257, £479)
ACEI and SGLT2i	£499.17	6 (3, 10)	£371 (£260, £519)	£870 (£759, £1018)

1.1.11 The committee's discussion and interpretation of the evidence

1.1.11.1 The outcomes that matter most

The committee considered the outcomes of all-cause mortality, cardiovascular mortality, health-related quality of life, unplanned hospitalisations or visits (HF-related) and specific adverse events: withdrawal due to drug-related adverse events, acute kidney injury, hyponatraemia, hyperkalaemia and falls. For the purposes of decision making, all outcomes were rated as critical. For this review there was no outcome data for some of the specific adverse events of interest: acute kidney injury, hyponatraemia and falls.

All-cause mortality, cardiovascular mortality and unplanned hospitalisations or visits (HF-related) were each preferred as time-to-event outcomes. However, the dichotomous data for these were also included, but downgraded for indirectness.

In some cases, reporting of effect sizes in the papers did not allow the calculation of anticipated absolute effects, for example when overall event rates were reported for a total subgroup (not per treatment group) or event rates were presented per 100 person years. In such instances the committee used the relative effects (hazard ratios) to inform their decision-making.

1.1.11.2 The quality of the evidence

Five comparisons were presented in the evidence, with four medicine classes compared with a placebo comparator (beta-blocker, ACE inhibitor, ARB and MRA), and a single between-medicine class comparison between ARNI and ARB. One study contributed to the evidence for each of the following comparisons: beta-blockers versus placebo; ACEI versus placebo; ARB versus placebo; and ARNI versus ARB. This comprised a total of three RCTs and one IPD meta-analysis. For the comparison of MRAs versus placebo, evidence was available from two RCTs; this is the only comparison where pooling of the data was conducted.

The findings in this evidence review are based on prespecified or post hoc subgroups of larger trials (and an IPD) that investigated pharmacological treatment for patients with a wider range of LVEF. In each case, a population subgroup was identified that met the study protocol definition of heart failure with mildly reduced ejection fraction (HFmrEF). Accordingly, the sample size of studies contributing evidence was often considerably smaller than that from the main trials. The committee discussed the appropriateness of using data from older trials, as patient context or care could have changed over time, but overall considered any changes to be minimal and so agreed that it was still appropriate to use such evidence.

Using GRADE criteria, the certainty of the evidence for all outcomes ranged from very low to moderate. Overall, evidence was downgraded most often for imprecision, which is to be expected with single studies using data from a smaller population subgroup. In some instances, downgrading also took account of outcome, population and intervention indirectness, and some concerns about risk of bias.

Evidence for outcomes for the comparison of beta-blockers versus placebo ranged from very low to low certainty due to some concerns about risk of bias of the IPD meta-analysis and imprecision. Evidence for all outcomes for the comparison of ACE inhibitor versus placebo were assessed as very low certainty. This is because of downgrading for population, outcome and intervention indirectness and for imprecision. For the comparison of ARB versus placebo, the certainty of the evidence was low to moderate. Downgrading was done to account for issues with risk of bias and imprecision. For the comparison of MRA versus placebo, the certainty of evidence was very low to moderate; downgrading was done to account for issues with risk of bias, imprecision and outcome indirectness. For the

comparison of ARNI versus ARB, certainty of evidence was low to moderate, with downgrading taking place due to imprecision only.

The committee commented on concerns about the quality of evidence from the TOPCAT trial as issues have been previously noted about substantial regional differences in patients recruited in the Russia/Georgia region, amongst whom there were very few patients admitted to hospital, raising concerns about whether they truly had heart failure. To address this, separate analyses using TOPCAT data from the Americas region only were also presented to the committee to inform their discussions. Pooled estimates based on TOPCAT Americas data (instead of all TOPCAT data for HFmrEF participants) together with FINEARTS-HF, did not substantially change the pooled estimate of effects on mortality and hospitalisation. However, the size of the subgroup of TOPCAT Americas data for HFmrEF participants was very small and therefore unreliable so has not been formally presented in the evidence review.

With an absence of current NICE recommendations on pharmacological treatment for patients with HFmrEF, the committee considered it important to make recommendations to address this gap. Although evidence from some of the trials had a small sample size and some uncertainty, the consistency in beneficial effects across outcomes supported decision making.

1.1.11.3 Benefits and harms

Beta-blocker vs placebo

Evidence for this comparison came from an IPD meta-analysis and did not enable absolute effects to be calculated. However, all HRs were <1 suggesting some benefit of beta-blockers on all-cause mortality (HR: 0.79, 95%CI 0.51 to 1.23), and cardiovascular mortality (HR: 0.60, 95%CI 0.35 to 1.04); however, the effect size for and unplanned hospitalisation (HF-related) was very small (HR: 0.98, 95%CI 0.73- 1.33). This pattern is consistent with the committee's observations in clinical practice, but the uncertainty in the estimates was noted.

The IPD meta-analysis reported results for participants with sinus rhythm and atrial fibrillation separately but these were pooled in our analyses as atrial fibrillation was not a pre-specified subgroup of interest in the protocol. However, the subgroups of participants with sinus rhythm and atrial fibrillation are visible in the forest plots because this data was extracted from the paper. The committee discussed the subgroups of participants with sinus rhythm and atrial fibrillation and concluded that the beneficial effect on mortality is more convincing in those with sinus rhythm, albeit that the atrial fibrillation group had a smaller sample size. The committee considered that the differential effects of beta-blockers in patients with HFmrEF with/without atrial fibrillation is well known, and that clinicians will adapt their use of this class of medicine to patients with HFmrEF accordingly. It was noted that beta-blockers would usually be prescribed to patients with atrial fibrillation for other reasons, but they would not impact mortality rate.

It was also noted that most of the participants analysed had heart failure with an ischaemic aetiology, which is the dominant cause of heart failure seen in practice. However, the recommendation was not restricted to those with CHF and ischaemic heart disease because, beta-blockers also have other plausible benefits including rhythm stability.

ACE inhibitor vs placebo

The evidence on ACE inhibitors showed a clinically important benefit for all-cause mortality (25 fewer deaths per 1000 in ACE inhibitor group) and cardiovascular mortality (11 fewer deaths per 1000 in ACE inhibitor group) and a consistent benefit, albeit smaller, for hospitalisations for HF (3 fewer per 1000 in the ACE inhibitor group).

Indirectness was noted as this study included people with ischemic heart failure and mildly reduced ejection fraction without clear evidence of symptomatic heart failure. This evidence was included in the absence of any directly applicable trial data, but the committee acknowledged the limitations of this data as the benefits may be due to the effectiveness of ACE inhibitor in the treatment of ischaemic heart disease rather than symptomatic heart failure. Nevertheless, in the experience of the committee, it is biologically plausible that this benefit can be extrapolated to those with symptomatic heart failure with mildly reduced ejection fraction based on the known benefit for chronic heart failure with reduced ejection fraction and the generalisability of this to the mildly reduced ejection fraction cohort, with some attenuation of effect expected. This recommendation is also in line with clinical practice, as ACE inhibitors are commonly used for patients with heart failure and mildly reduced ejection fraction.

Furthermore, the ACE inhibitor used in the study was trandolapril, which is not licensed for CHF in the UK but is used in other countries. The committee expected the effectiveness of other ACE inhibitors to be equivalent and for there to be a medicine class effect.

ARB vs placebo

The evidence showed clinically important benefits for all-cause mortality (32 fewer per 1000 in the ARB group), cardiovascular mortality (22 fewer per 1000 in the ARB group) and HF hospitalisation (45 per 1000 fewer and 6.4 fewer per 100 person years in the ARB group). The committee noted that ARBs in the larger trial on participants with a wider range of LVEF (reduced and preserved ejection fraction) did not decrease mortality. Therefore, the benefit on mortality seen in small HFmrEF subgroup might not be correct. Nevertheless, the clinically important benefit for HF hospitalisation seen in HFmrEF was considered sufficient to support a recommendation.

MRA vs placebo

The evidence showed clinically important benefits for all-cause mortality (11 fewer per 1000 in the MRA group), cardiovascular mortality (17 fewer per 1000 in the MRA group) and first HF hospitalisation or visit (43 fewer per 1000), when expressed as dichotomous events. For total repeat unplanned hospitalisations or visits, there was also a suggested benefit, though this was difficult to quantify as an absolute effect because the effect size was expressed as a rate ratio (2.8 less per 100 person years in the MRA group). When expressed as time-to-event data, the mortality and hospitalisation outcomes also suggested some clinical benefit as HRs were <1 (0.91 for all-cause mortality, 0.81 for cardiovascular mortality and 0.77 for first unplanned hospitalisation or visit, HF-related). The evidence showed no clinically important difference for health-related quality of life and treatment discontinuation due to adverse events. However, evidence for the adverse event hyperkalaemia showed a clinically important harm, with 78 more events per 1000.

The committee discussed the risk of hyperkalaemia in patients taking MRAs, in terms of the need for regular monitoring. It was felt that an increase in potassium levels is expected when taking MRAs, but hyperkalaemia is a greater risk if a patient also has chronic kidney disease. It was further noted that hyperkalaemia is asymptomatic until it becomes life threatening, so it is an important parameter to monitor after introduction of MRAs. Such monitoring is best left to clinical judgement as individual clinical situations impact on the frequency of monitoring and extent of risk. Overall, the committee considered potassium levels to be important to monitor, but that hyperkalaemia is not a harm that outweighs the clinically important benefit of MRAs on mortality and hospitalisation for HF. The committee also wanted to avoid clinicians stopping provision of MRAs unnecessarily, due to rigid restrictions on monitoring of potassium levels. Guiding principles on monitoring are provided in recommendations 1.7.6 to 1.7.9.

The committee expected a medicine class effect, despite evidence on two different MRAs, and decided not to make recommendations based on specific medicines or doses.

ARNI vs ARB

Although anticipated absolute effects were not available for the outcomes under this comparison, the rate ratio for total HF hospitalisations was 0.73 (95%CI 0.50 to 1.07), suggesting some benefit of ARNI over ARB. However, the HR for CV mortality was 0.98, suggesting no clear clinically important difference. The background treatment of patients when adding ARNI is an important consideration that impacts on the potential clinical effectiveness. It was noted that without a placebo comparison it is difficult to assess the effect of ARNI against other trial data as other comparisons were against a placebo. The committee agreed that there was some uncertainty about the clinical effectiveness of ARNI and required further information on cost-effectiveness.

Summary

The committee agreed that there was evidence to suggest a benefit of ACE inhibitors, ARBs, beta-blockers and MRA each compared to placebo in people with heart failure and mildly reduced ejection fraction for reducing heart failure hospitalisation, which is an indication of clinical deterioration of CHF, and possibly mortality. There was uncertainty in these effects due to the evidence being derived from subgroups of larger trials and having limited power to show a clear benefit, as well as the ACE inhibitor data being in an indirect population. However, the committee noted that the findings were in line with what they see in practice and are biologically plausible. It was agreed that as the left ventricular ejection fraction increases, the benefit of these interventions will decrease. The committee agreed to make a consider recommendation for these 4 classes of medicines so that clinicians can incorporate their use for people with chronic heart failure and mildly reduced ejection fraction when appropriate based on individual circumstances and preferences.

The committee discussed that clinical judgement should be exercised when deciding which medicine to use first, for example an ACE inhibitor may be used first if the person has diabetes mellitus or fluid overload. An ARB should be used if an ACE inhibitor cannot be tolerated, usually due to a persistent cough. Clinical judgement is also important when selecting individual medicines to use within a class of medicines, including consideration of differences in side effect profiles. Although not considered as part of this evidence review, the SGLT2 inhibitors dapagliflozin and empagliflozin should be recommended as options in accordance with the NICE technology appraisals ([TA902](#) and [TA929](#)).

1.1.11.4 Cost effectiveness and resource use

No published economic evidence was available for the committee to review. The committee considered the costs of the treatments which are within the scope of the review question.

Given the low acquisition costs of ACE inhibitor, ARB, beta-blocker and some MRAs, economic modelling for these treatments was not prioritised. However, given the differences in the number of monitoring visits required during titration, the resource use associated with treatment monitoring during the period of titration and the first year of treatment was calculated. These treatments were not compared with SGLT2 inhibitors or with each other; however, the costs of SGLT2 inhibitors were used as a benchmark, as dapagliflozin and empagliflozin are the only treatment options recommended by NICE for this population ([TA902](#) and [TA929](#)).

The cost of treatment was significantly lower with ACE inhibitor, ARB, beta-blockers and spironolactone than SGLT2 inhibitors. However, this lower cost does not apply to sacubitril/valsartan.

An original economic analysis was conducted that showed, ACE inhibitor, ARB, beta-blocker and spironolactone were highly cost-effective compared with no medicine using the trial evidence in people with mildly reduced ejection fraction in the economic model developed to evaluate medicines for people with reduced ejection fraction. This analysis was tentative, as some of the parameters came from a reduced ejection fraction population including demographics and longer-term outcomes. The ICERs for ACE inhibitor, ARB and beta-blocker were underestimated because these analyses did not capture adverse events. However, the committee concluded that they all of these medicines are likely to be cost-effective and so recommended them as options.

The committee considered that although beta-blockers, ACE inhibitor/ARB and MRA have not been previously recommended by NICE in this subpopulation, most people are prescribed a combination of these medicines if not contraindicated and depending on comorbidities. So, this is not expected to have a significant resource impact. Where there is an increase in prescribing there will be extra staff time involved for titration of treatments. However, there should also be a reduction in hospitalisation for heart failure.

MRAs

Some of the clinical evidence for MRAs was based on studies of finerenone. The committee discussed that the evidence supported a class effect; however, finerenone is associated with a high cost.

Finerenone is expected to have a more favourable side effect profile than spironolactone. The cost-effectiveness of finerenone for treating heart failure with preserved or mildly reduced ejection fraction will be formally assessed by NICE later in 2025.

ARNI

The committee wanted to consider cost-effectiveness modelling of ARNI for the treatment of people with HFmrEF. Although the drug has a high acquisition costs, potential cost savings from reductions in the numbers of hospitalisations were also taken into account. The committee reviewed the results of the economic model comparing ARNI with ARB alongside the clinical evidence for this population. The model showed that ARNI had an ICER over £100,000, which is substantially higher than NICE's £20,000 threshold.

The committee noted that, although the model assumed no difference in mortality between treatments, applying the modest trend observed in the trial (HR = 0.98) would still not result in an ICER below the £20,000 per QALY gained threshold. Given the high cost per QALY observed in the deterministic base-case analysis, additional scenario analyses were not conducted, as ARNI was unlikely to be cost-effective in this population. Consequently, the committee decided not to recommend ARNI for people with HFmrEF.

1.1.11.5 Other factors the committee took into account

The committee emphasised the importance of not treating people based on LVEF alone. This is applicable to all types of heart failure affecting the left ventricle. It is essential that the complete phenotype of heart failure is determined and that the aetiology has been investigated. This requires excluding alternative or associated diagnoses such as pre-capillary pulmonary hypertension or hypertrophic cardiomyopathy, which would benefit from an alternative treatment pathway. It is also important in ascertaining the diagnosis that corroborating factors indicative of chronic heart failure, such as elevated natriuretic peptides and structural heart abnormalities are sought and confirmed.

In weighing up the evidence on ACE inhibitor or ARB versus placebo, the committee felt that clinical judgement would be important. Although the evidence reviewed suggests a greater benefit from ARB compared to placebo, than for ACE inhibitor compared to placebo, both show beneficial effects on outcomes. Therefore, a clinician can use their specialist

knowledge and judgement to decide the sequence of introduction of agents to the patient, and which agent should be chosen.

When deliberating the benefits and harms of MRAs, the committee discussed the requirements for monitoring of patients following the introduction of a new class of medicine. It was agreed that a 'one size fits all' recommendation for monitoring was not appropriate, because requirements vary according to the clinical situation. For example, patients with CKD may be more likely to experience an increase in serum potassium after starting MRAs, and so require more frequent monitoring; older patients with frailty may experience barriers to attending clinics for regular blood tests. Although the committee appreciated the value of clinical judgement to inform monitoring requirements, the committee agreed it is important to develop guiding principles to inform judgements on monitoring. Therefore, as part of this guideline update, the committee developed broad guidance on monitoring, that clinicians can be signposted to (see recommendations 1.7.6 to 1.7.9).

The committee noted a need to be pragmatic in making recommendations because the medicine classes under consideration are always prescribed in combination. With the evidence available it is not possible to tease out minor differences between medicine classes.

Despite the lack of direct evidence for ACE inhibitors, the committee noted that the ESC guidelines recommend this medicine class in those with heart failure and mildly reduced ejection fraction. This is based on the consideration that many will also have coronary artery disease, hypertension, or post-myocardial infarction left ventricular systolic dysfunction and so already be treated with an ACE inhibitor.

1.1.12 Recommendations supported by this evidence review

This evidence review supports recommendation 1.5.1 and 1.5.2.

Appendices

Appendix A Review protocols

A.1 Review protocol for medicines for chronic heart failure with mildly reduced left ventricular ejection fraction

Field	Content
Review title	Pharmacological treatment of chronic heart failure with mildly reduced ejection fraction (HFmrEF).
Review question	Is it clinically- and cost-effective to use any of the following first-line pharmacological interventions, alone or in combination, in adults with chronic heart failure with mildly reduced left ventricular ejection fraction: • ACE inhibitor • angiotensin-receptor blocker • angiotensin receptor neprilysin inhibitor • beta blocker • mineralocorticoid receptor antagonist
Objective	The current recommendations in NG106 do not cover people with mildly reduced ejection fraction, but new evidence is emerging that the use of the 'four pillars' may be appropriate in this group of patients who have traditionally been treated as HFpEF (i.e., co-morbidities and diuretics only). Therefore, the aim of this review is to update the recommendations on pharmacological management for people with chronic heart failure and mildly reduced ejection fraction.
Searches	The following databases will be searched: • Cochrane Central Register of Controlled Trials (CENTRAL) • Cochrane Database of Systematic Reviews (CDSR) • Embase • MEDLINE • Epistemonikos Searches will be restricted by:

Field	Content
	• Date limitations – from date of searches in CG5, 2003 • English language studies • Human studies Other searches: Inclusion lists of relevant systematic reviews Medline search strategy to be quality assured using the PRESS evidence-based checklist (see methods chapter for full details). The searches may be re-run 6 weeks before the final committee meeting and further studies retrieved for inclusion if relevant.
Condition or domain being studied	Chronic heart failure with mildly reduced ejection fraction
Population	Inclusion: Adults diagnosed with heart failure due to left ventricular dysfunction with mildly reduced ejection fraction. Studies including an indirect population (for example mixed HFmrEF and HFpEF) will only be included if ≥80% match the protocol criteria or there are subgroup data for the protocol population. Ongoing treatment after discharge for an acute episode of heart failure will be included. Exclusion: • Children • Acute heart failure in hospital • Heart failure with preserved EF (normal EF, diastolic dysfunction) • Heart failure due to right heart dysfunction (e.g., pre-capillary pulmonary hypertension and primary right ventricular cardiomyopathies) • High output heart failure • Adult congenital heart disease • Primary heart valve disease • Acute MI (within 3 months of the event)

Field	Content
	• Treatment with chemotherapy
Intervention	Inclusion Pharmacological agents alone or in combination: • Angiotensin converting enzyme (ACE) inhibitor • Angiotensin receptor-neprilysin inhibitor (ARNI; Sacubitril-Valsartan) • Angiotensin receptor antagonist / blocker (ARB) • Beta-adrenergic antagonist/blocker (BB) • Mineralocorticoid receptor antagonist (MRA) • Combinations of the above (e.g. ACE-I/ARB/ARNI + BB + MRA) Mode of delivery: oral. Analysis groupings: a class effect will be assumed. Background/concomitant treatment: studies in which participants are also receiving other pharmacological agents as background therapy (balanced between the randomised groups) will be included. This may include, for example, diuretics, statins, anticoagulants, and anti-arrhythmics. Studies will be included, but downgraded for indirectness if >20% of participants are also receiving therapies initiated by a specialist as part of their 'standard care' (e.g., ivabradine, hydralazine-nitrate, vericiguat) Exclusion • SGLT2 inhibitors are excluded because there are relevant technology appraisals in this population that will be incorporated in the guideline. • Calcium channel blockers are excluded because they are not used in current practice. • Medicines to manage oedema (except as background treatment), for example: ○ loop diuretics ○ thiazide diuretics • The following therapies (except as background treatment): ○ Digoxin

Field	Content
	○ Ivabradine ○ Hydralazine-Nitrate ○ Omecamtiv mecarbil ○ Vericiguat ● Medicines to manage comorbidities (except as part of background treatment): ○ Anticoagulants ○ Anti-arrhythmics
Comparator	Other active treatment alone or in combination Placebo + usual CHF care or usual CHF care alone
Types of study to be included	Inclusion: ● RCTs ● Published systematic reviews of RCTs ● Published network meta-analyses (NMAs) and individual participant data meta-analyses (IPDs). Exclusion: ● Cross-over RCTs ● Non-randomised studies Note: Post hoc subgroup analyses from RCTs may have to be considered for inclusion if there is insufficient evidence from prespecified analyses.
Other exclusion criteria	Non-English language studies. Conference abstracts will be excluded as it is expected there will be sufficient full text published studies available.
Context	This review will partially update NICE guideline NG106.
Primary outcomes (critical outcomes)	All outcomes are considered equally important for decision making and therefore have all been rated as critical: ● All-cause mortality (time-to-event) ● CV mortality (time-to-event) ● Health-related quality of life (Minnesota Living With Heart Failure (MLWHF), the Kansas City Cardiomyopathy Questionnaire (KCCQ), or any validated score (continuous – change score preferred over final value) ● Unplanned hospitalisation or visits (HF-related) (time-to-event; including repeat events when reported)

Field	Content
	○ all cause unplanned hospitalisation or visits will be included if HF-related is not reported in a study, but this will be downgraded for outcome indirectness Adverse events (recorded as the number of people with at least one event, not the total number of events) • Withdrawal due to drug-related adverse events (dichotomous) • Acute Kidney Injury – serum creatinine rise of $\geq 50\%$ over ≤ 7 days (dichotomous) • Hyponatraemia – serum sodium concentration < 135 mmol/L (dichotomous) • Hyperkalaemia – serum potassium concentration ≥ 5.5 mmol/L (dichotomous) • Falls – (dichotomous) Time points for analysis: 12 months (pool all times ≥ 3 months, taking the closest to 12 months follow-up time from each study if multiple time points are reported) Exclude if follow-up < 3 months The COMET database was searched for relevant core outcome sets and one consensus document published in 2013 was identified, which was used to inform the GC discussions on protocol outcomes (https://onlinelibrary.wiley.com/doi/epdf/10.1093/eurjhf/hft095). Indirect outcome definitions • If continuous data are not available, dichotomous outcome data for quality of life scales will be accepted but downgraded for outcome indirectness. For KCCQ this should be based on the threshold of an improvement of 5 points, which is the accepted MID. Only one threshold will be reported per study. • Adverse events that are similar to the protocol definitions will be considered for inclusion and, if sufficiently similar, will be included but downgraded for outcome indirectness.
Data extraction (selection and coding)	EndNote will be used for reference management, sifting, citations and bibliographies. All references identified by the searches and from other sources will be uploaded into EPPI reviewer and de-duplicated. 10% of the abstracts will be reviewed by two reviewers, with any disagreements resolved by discussion or, if necessary, a third independent reviewer. The full text of potentially eligible studies will be retrieved and will be assessed in line with the criteria outlined above. A standardised form will be used to extract data from studies (see Developing NICE guidelines: the manual section 6.4). 10% of all evidence reviews are quality assured by a senior research fellow. This includes checking:

Field	Content
	• papers were included /excluded appropriately • a sample of the data extractions • correct methods are used to synthesise data • a sample of the risk of bias assessments Disagreements between the review authors over the risk of bias in particular studies will be resolved by discussion, with involvement of a third review author where necessary.
Risk of bias (quality) assessment	Risk of bias will be assessed using the appropriate checklist as described in Developing NICE guidelines: the manual. • Systematic reviews: Risk of Bias in Systematic Reviews (ROBIS) • Randomised Controlled Trial: Cochrane RoB (2.0)
Strategy for data synthesis	• Pairwise meta-analyses will be performed using Cochrane Review Manager (RevMan5). Fixed-effects (Mantel-Haenszel) techniques will be used to calculate risk ratios for the binary outcomes where possible. Continuous outcomes will be analysed using an inverse variance method for pooling weighted mean differences. • For time-to-event outcomes, if sufficient information is provided, hazard ratios will be reported but dichotomous data will also be extracted. Only one measure will be considered for decision making. This will be agreed with the committee taking into account the proportion of studies that report sufficient data to calculate the risk ratio and the hazard ratio, in order to maximise the available pooled data. If there are differences in effect estimates between the two measures, potential reasons for this will be considered in the interpretation of the evidence. • Heterogeneity between the studies in effect measures will be assessed using the I^2 statistic and visually inspected. An I^2 value greater than 40% will be considered indicative of substantial heterogeneity. Sensitivity analyses will be conducted based on pre-specified subgroups using stratified meta-analysis to explore the heterogeneity in effect estimates. If this does not explain the heterogeneity, the results will be presented pooled using random-effects. • GRADEpro will be used to assess the quality of evidence for each outcome, taking into account individual study quality and the meta-analysis results. The 4 main quality elements (risk of bias, indirectness, inconsistency and imprecision) will be appraised for each outcome. Publication bias will be considered with the guideline committee, and if suspected will be tested for when there are more than 5 studies for that outcome. • The risk of bias across all available evidence was evaluated for each outcome using an adaptation of the 'Grading of Recommendations Assessment, Development and Evaluation (GRADE) toolbox' developed by the international GRADE working group http://www.gradeworkinggroup.org/ • Where meta-analysis is not possible, data will be presented and quality assessed individually per outcome. • WinBUGS will be used for network meta-analysis, if possible given the data identified.

Field	Content															
Analysis of sub-groups	Subgroups that will be investigated if heterogeneity is present: • Renal function (Abnormal (EGFR < 30mL/min); Normal (EGFR 30-60mL/min; >60mL/min)) • Age (18-75 years; Over 75 years) • Ethnicity (Afro-Caribbean; south Asian; Caucasian; other)

Conflicts of interest	All guideline committee members and anyone who has direct input into NICE guidelines (including the evidence review team and expert witnesses) must declare any potential conflicts of interest in line with NICE's code of practice for declaring and dealing with conflicts of interest. Any relevant interests, or changes to interests, will also be declared publicly at the start of each guideline committee meeting. Before each meeting, any potential conflicts of interest will be considered by the guideline committee Chair and a senior member of the development team. Any decisions to exclude a person from all or part of a meeting will be documented. Any changes to a member's declaration of interests will be recorded in the minutes of the meeting. Declarations of interests will be published with the final guideline.		

Field	Content
Collaborators	Development of this systematic review will be overseen by an advisory committee who will use the review to inform the development of evidence-based recommendations in line with section 3 of Developing NICE guidelines: the manual . Members of the guideline committee are available on the NICE website: https://www.nice.org.uk/guidance/indevelopment/gid-ng10405
Other registration details	NA
Reference/URL for published protocol	https://www.nice.org.uk/guidance/indevelopment/gid-ng10405/documents
Dissemination plans	NICE may use a range of different methods to raise awareness of the guideline. These include standard approaches such as: notifying registered stakeholders of publication publicising the guideline through NICE's newsletter and alerts issuing a press release or briefing as appropriate, posting news articles on the NICE website, using social media channels, and publicising the guideline within NICE.
Keywords	Heart failure; pharmacological; four pillars; ACE inhibitors; sacubitril valsartan; beta-blockers; mineralocorticoid receptor antagonists; SGLT2 inhibitors.
Details of existing review of same topic by same authors	NA
Current review status	☐ Ongoing
	☒ Completed but not published
	☐ Completed and published
	☐ Completed, published and being updated
	☐ Discontinued

A.2 Health economic review protocol

Table 1616: Health economic review protocol

	All questions – health economic evidence
Objectives	To identify health economic studies relevant to any of the review questions.
Search criteria	Populations, interventions and comparators must be as specified in the clinical review protocol above. Studies must be of a relevant health economic study design (cost–utility analysis, cost-effectiveness analysis, cost–benefit analysis, cost–consequences analysis, comparative cost analysis). Studies must not be a letter, editorial or commentary, or a review of health economic evaluations. (Recent reviews will be ordered although not reviewed. The bibliographies will be checked for relevant studies, which will then be ordered.) Unpublished reports will not be considered unless submitted as part of a call for evidence. Studies must be in English.
Search strategy	A health economic study search will be undertaken using population-specific terms and a health economic study filter – see appendix B below. For questions being updated, the search will be run from December 2017, which was the cut-off date for the searches conducted for NICE guideline NG106.
Review strategy	Studies not meeting any of the search criteria above will be excluded. Studies published before 2010, abstract-only studies and studies from non-OECD countries or the USA will also be excluded. Studies published after 2010 that were included in the previous guideline will be reassessed for inclusion and may be included or selectively excluded based on their relevance to the questions covered in this update and whether more applicable evidence is also identified. Each remaining study will be assessed for applicability and methodological limitations using the NICE economic evaluation checklist which can be found in appendix H of Developing NICE guidelines: the manual (2014).{NICE2014} Inclusion and exclusion criteria If a study is rated as both ‘Directly applicable’ and with ‘Minor limitations’ then it will be included in the guideline. A health economic evidence table will be completed and it will be included in the health economic evidence profile.

	All questions – health economic evidence
	If a study is rated as either 'Not applicable' or with 'Very serious limitations' then it will usually be excluded from the guideline. If it is excluded then a health economic evidence table will not be completed and it will not be included in the health economic evidence profile. If a study is rated as 'Partially applicable', with 'Potentially serious limitations' or both then there is discretion over whether it should be included. Where there is discretion The health economist will make a decision based on the relative applicability and quality of the available evidence for that question, in discussion with the guideline committee if required. The ultimate aim is to include health economic studies that are helpful for decision-making in the context of the guideline and the current NHS setting. If several studies are considered of sufficiently high applicability and methodological quality that they could all be included, then the health economist, in discussion with the committee if required, may decide to include only the most applicable studies and to selectively exclude the remaining studies. All studies excluded on the basis of applicability or methodological limitations will be listed with explanation in the excluded health economic studies appendix below. The health economist will be guided by the following hierarchies. Setting: UK NHS (most applicable). OECD countries with predominantly public health insurance systems (for example, France, Germany, Sweden). OECD countries with predominantly private health insurance systems (for example, Switzerland). Studies set in non-OECD countries or in the USA will be excluded before being assessed for applicability and methodological limitations. Health economic study type: Cost–utility analysis (most applicable). Other type of full economic evaluation (cost–benefit analysis, cost-effectiveness analysis, cost–consequences analysis). Comparative cost analysis. Non-comparative cost analyses including cost-of-illness studies will be excluded before being assessed for applicability and methodological limitations. Year of analysis: The more recent the study, the more applicable it will be.

	All questions – health economic evidence
	Studies published in 2010 or later (including any such studies included in the previous guideline) but that depend on unit costs and resource data entirely or predominantly from before 2010 will be rated as 'Not applicable'. Studies published before 2010 (including any such studies included in the previous guideline) will be excluded before being assessed for applicability and methodological limitations. Quality and relevance of effectiveness data used in the health economic analysis: The more closely the clinical effectiveness data used in the health economic analysis match with the outcomes of the studies included in the clinical review the more useful the analysis will be for decision-making in the guideline.

Appendix B Literature search strategies

Chronic heart failure with mildly reduced left ventricular ejection fraction

Background and development

Search design and peer review

A NICE Senior Information Specialist (SIS) conducted the literature searches for the evidence review.

The principal search strategies were developed in MEDLINE (Ovid interface) and adapted, as appropriate, for use in the other sources listed in the protocol, taking into account their size, search functionality and subject coverage.

The MEDLINE strategies below were quality assured (QA) by a trained NICE SIS. All translated search strategies were peer reviewed by another SIS to ensure their accuracy. Both procedures were adapted from the Peer Review of Electronic Search Strategies Guideline Statement (for further details see: McGowan J et al. [PRESS 2015 Guideline Statement](#). *Journal of Clinical Epidemiology*, 75, 40-46).

This search report is based on the requirements of the PRISMA Statement for Reporting Literature Searches in Systematic Reviews (for further details see: Rethlefsen M et al. [PRISMA-S](#). *Systematic Reviews*, 10(1), 39).

Review management

The search results were managed in EPPI-Reviewer v5. Duplicates were removed in EPPI-R5 using a two-step process. First, automated deduplication is performed using a high-value algorithm. Second, manual deduplication is used to assess "low-probability" matches. All decisions made for the review can be accessed via the deduplication history.

Prior work

The search terms for the population and intervention were compared to the searches for previous NICE guidance (including [NG106](#) and [CG5](#)). Modifications were made to these original search strategies for the specifications in the review protocol.

Search limits and other restrictions

Formats

Limits were applied in adherence to standard NICE practice (as set out in the [Identifying the evidence chapter](#) of the manual) and the eligibility criteria listed in the review protocol to exclude:

- Animal studies
- Editorials, letters, news items and commentaries
- Conference abstracts and posters

- Registry entries for ongoing clinical trials or those that contain no results
- Theses and dissertations
- Papers not published in the English language.

The limit to remove animal studies in the searches was the standard NICE practice, which has been adapted from:

Dickersin K, Scherer R & Lefebvre C. (1994) [Systematic reviews: identifying relevant studies for systematic reviews](#). *BMJ*, 309(6964), 1286.

Date limits

A date limit of 1st October 2002 to current was applied, as stated in the review protocol from when searches were conducted for [CG5](#).

Search filters and classifiers

Effectiveness searches

The National Guideline Centre (NGC) systematic review and randomised controlled trial search filters were applied in MEDLINE and Embase.

Cost effectiveness searches

The following search filters were applied to the search strategies in MEDLINE and Embase to identify cost-effectiveness studies:

Glanville J et al. (2009) [Development and Testing of Search Filters to Identify Economic Evaluations in MEDLINE and EMBASE](#). Alberta: Canadian Agency for Drugs and Technologies in Health (CADTH)

Note: Several modifications have been made to these filters over the years that are standard NICE practice.

The National Guideline Centre (NGC) Quality of Life filter was applied in MEDLINE and Embase strategies.

Key decisions

The effectiveness search strategy was developed to find evidence for the specified population and intervention. The search covers two review protocols.

The cost-effectiveness searches used population only terminology.

Searches were adapted to suit different database functionality and were re-run as originally written.

Effectiveness searches

Appendix D Effectiveness evidence

Alzahrani, 2018

Bibliographic Reference Alzahrani, Talal; Tiu, John; Panjra, Gurush; Solomon, Allen; The effect of angiotensin-converting enzyme inhibitors on clinical outcomes in patients with ischemic cardiomyopathy and midrange ejection fraction: a post hoc subgroup analysis from the PEACE trial.; Therapeutic advances in cardiovascular disease; 2018; vol. 12 (no. 12); 351-359

Study details

Secondary publication of another included study- see primary study for details	None
Other publications associated with this study included in review	Braunwald 2004, Pfeffer 1998
Trial name / registration number	PEACE trial
Study location	Not specified
Study setting	Multicentre setting
Study dates	Not specified
Sources of funding	No specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

Inclusion criteria	Patients with a left ventricular EF between 40-50% Inclusion criteria from Braunwald, 2004: Age 50 years or older Coronary artery disease documented by at least one of the following: Myocardial infarction at least 3 months before enrolment Coronary-artery bypass grafting or percutaneous transluminal coronary angioplasty at least 3 months before enrolment Obstruction of $\geq 50\%$ of the luminal diameter of at least one native vessel on coronary angiography Left ventricular ejection fraction $> 40\%$ on contrast or radionuclide ventriculography or echocardiography, a qualitatively normal left ventriculogram, or the absence of left ventricular wall-motion abnormalities on echocardiography Toleration of the medication and successful completion of the run-in phase, with $\geq 80\%$ compliance with the medication
Exclusion criteria	Exclusion criteria from Braunwald, 2004: Current use or a current condition requiring use of an ACE inhibitor or a contraindication to ACE inhibitors Current use of an angiotensin II-receptor antagonist Hospitalization for unstable angina within the preceding 2 months Valvular heart disease deemed to require surgical intervention Coronary-artery bypass grafting or percutaneous transluminal angioplasty within the preceding 3 months Planned elective coronary revascularization Serum creatinine > 2.0 mg/dl ($177 \mu\text{mol/litre}$) Serum potassium > 5.5 mmol/litre

Chronic heart failure: evidence review for medicines for heart failure with mildly reduced left ventricular ejection fraction [September 2025]

	Limited change of 5 year survival Psychosocial condition precluding long-term adherence Unable or unwilling to give consent Female sex and of childbearing potential and not using contraception Current use in a research trial of medication not approved by the U.S. Food and Drug Administration or the Health Protection Branch of the Canadian Department of National Health and Welfare
Recruitment / selection of participants	Potentially eligible subjects participated in a two-week run-in phase during which they were requested to take trandolapril at a dose of 2mg per day. Consenting patients who successfully completed the run-in phase were randomly assigned to receive either trandolapril or a matching placebo. (Recruitment information from Braunwald, 2004)
Intervention(s)	Patients were initially started on 2mg/day of trandolapril, which was then increased to 4mg/day for those who tolerated the 2mg after 6 months. Background treatment: Beta-blockers 59%
Comparator	Placebo Background treatment: Beta-blockers 60%
Population subgroups	The patients with a left ventricular EF between 40-50% were the pre-specified subgroup from the primary study in the PEACE trial (Braunwald, 2004)
Number of participants	2512 participants
Duration of follow-up	Total of 7 years of follow-up (mean 4.7 years)
Indirectness	Yes- intervention indirectness due to indication for patients with ischemic cardiomyopathy. Trandolapril is indicated for hypertension.

Chronic heart failure: evidence review for medicines for heart failure with mildly reduced left ventricular ejection fraction [September 2025]

	Events data -outcome indirectness as not TTE
Method of analysis	Intention-to-treat analysis was used.
Additional comments	Related studies: <i>Braunwald 2004 (primary paper; 15357561)</i> <i>Pfeffer 1998 (study design paper; 15357561)</i> Canadian Cardiovascular Society functional classification (% of patients): Class I: Trandolapril= 72.13% Placebo= 74.62% Class II: Trandolapril = 17.83% Placebo= 16.13% Class III: Trandolapril = 8.76% Placebo= 8.06% Class IV: Trandolapril= 1.29% Placebo= 1.19%

Study arms

ACE-inhibitor (trandolapril) (N = 1247)

Patients were initially started on 2mg/day of trandolapril and were then increased to 4mg/day for those who tolerated 2 mg dose after 6 months.
Background treatment: Beta-blockers 59%

Placebo (N = 1265)

Chronic heart failure: evidence review for medicines for heart failure with mildly reduced left ventricular ejection fraction [September 2025]

Background treatment: Beta-blockers 60%

Study Characteristics

Chronic heart failure: evidence review for medicines for heart failure with mildly reduced left ventricular ejection fraction [September 2025]

Study design	Systematic review with IPD meta-analysis
Search details: dates and databases searched	Data request to trialists December 2010. Studies identified by the BB-HF group: The BB-HF group is a collaborative, multinational effort to combine individual data from the major randomized controlled trials (RCTs) investigating the use of betablockers in chronic HF. The group consists of the leading investigators of these trials and international experts, with the support of the four pharmaceutical companies that have marketed beta-blockers in HF (AstraZeneca, GlaxoSmithKline, Merck Serono and Menarini). A standardized data request form was generated to obtain IPD from each eligible trial. At the time of this publication, individual data on 15,922 participants (representing 10 of the 11 trials) have been received by the coordinating center, the Clinical Trials and Evaluation Unit, Royal Brompton & Harefield NHS Trust/Imperial College London. To ensure a complete assessment of the evidence, published or unpublished RCTs were identified through computer aided searches (for example, Medline and Current Contents), scrutiny of reference lists of trials, trials registries, meeting abstracts, review articles and discussion with members of the collaborative group and with the pharmaceutical manufacturers.
Sources of funding	Menarini Farmaceutica Internazionale provided an unrestricted research grant for administrative costs; GlaxoSmithKline provided data extraction support; and IRCCS San Raffaele a collaborative research grant.
Study and participant inclusion criteria	Only unconfounded (in which one treatment group differed from another only by the beta-blocker therapy of interest) placebo-controlled trials were eligible that recruited >300 patients, with a planned follow-up of >6 months and explicit reporting of mortality. All trials had appropriate ethical approval. Trials must include patients with documented symptomatic HF. Study included all patients with baseline LVEF and an electrocardiogram (ECG) that showed either sinus rhythm or AF/atrial flutter (for the purposes of this report, reference to AF therefore includes atrial flutter). Due to demonstration of an interaction of treatment effect with heart rhythm, 7 patients with sinus rhythm and AF were analysed separately.

Study and participant exclusion criteria	See above
Intervention(s)	Beta-blockers (no further details supplied)
Comparator(s)	Placebo
Number of studies included in the systematic review	11 studies
Studies from the systematic review that are relevant for use in the current review	In this analysis, the baseline value of LVEF recorded in individual patient case report forms or core laboratory assessment was used, which in some patients was above the entry criterion according to that particular study. LVEF was analysed as a continuous variable to model interactions with outcomes, and classified as <20%, 20–25%, 26–34%, 35–39%, 40–49%, and ≥50%, as well as <40%, 40–49%, ≥50% to align with guideline phenotypes.
Studies from the systematic review that are not relevant for use in the current review	None
Analysis methods	All analyses followed the principle of intention-to-treat. Patients were classified by heart rhythm and LVEF. Outcomes were analysed using a Cox proportional hazards regression model, stratified by study. This is a one-stage fixed effects approach and assumes that all trials are estimating a common treatment effect with baseline hazards that vary across studies.

Study arms

Beta-blockers (N = 716)

Chronic heart failure: evidence review for medicines for heart failure with mildly reduced left ventricular ejection fraction [September 2025]

716 = total n for subgroup LVEF 40-49%. NR per arm

Placebo (N = 716)

716 = total n for subgroup LVEF 40-49%. NR per arm

Outcomes

Study timepoints

1.3 year (Median FUP)

Contrast outcomes

Outcome	Beta-blockers vs Placebo, 1.3 year, N2 = NR, N1 = NR
All cause mortality (n=716)	
Sinus rhythm n=570 Hazard ratio/95% CI	0.59 (0.34 to 1.03)
Atrial fibrillation n=146 Hazard ratio/95% CI	1.3 (0.63 to 2.67)
CV mortality (cardiovascular death)	

Outcome	Beta-blockers vs Placebo, 1.3 year, N2 = NR, N1 = NR
Sinus rhythm n=570 Hazard ratio/95% CI	0.48 (0.24 to 0.97)
Atrial fibrillation n=146 Hazard ratio/95% CI	0.86 (0.36 to 2.03)
Unplanned hospitalisation HF-related (cardiovascular hospitalisation)	
Sinus rhythm n=566 Hazard ratio/95% CI	0.95 (0.68 to 1.32)
Atrial fibrillation n=143 Hazard ratio/95% CI	1.15 (0.57 to 2.32)

Chronic heart failure: evidence review for medicines for heart failure with mildly reduced left ventricular ejection fraction [September 2025]

Section	Question	Answer
Use of a systematic review	Is the IPD meta-analysis part of a systematic review?	Yes, and a pre-specified protocol is available (<i>More details in Kotecha et al (2013)</i>)
Identification of eligible studies	Were All Eligible Trials Identified?	Unclear (<i>Brief description of search of electronic databases but no flowchart showing assessment of papers identified and considered for inclusion. No detailed search strategy available.</i>)
Ability to obtain IPD data	Were IPD Obtained from Most Trials?	Probably yes (<i>No issues reported on gaining access to IPD data</i>)
IPD data integrity	Was the Integrity of the IPD Checked?	Yes (<i>All data were cross-checked across different trial databases and compared with published reports. Discrepancies, inconsistencies, and incomplete data were checked against original case report forms and trial documentation to ensure IPD integrity. All 11 trial databases were then harmonized according to the standardized data request form to match patient characteristics and outcomes across all trials.</i>)
Planned analyses	Were the Analyses Prespecified in Detail?	Yes (<i>See Kotecha 2013 (design and rationale paper)</i>)
Assessment of risk of bias of the included studies	Was the risk of bias of included trials assessed?	Yes (<i>Using Cochrane RoB tool</i>)
Methods of analysis	Were the methods of analysis appropriate overall?	Probably yes (<i>One-stage model and regression model considering participant characteristics</i>)

Section	Question	Answer
Reporting standards	Does any report of the results adhere to the Preferred Reporting Items for a Systematic review and Meta-analysis of IPD (The PRISMA-IPD Statement)?	Yes (<i>Paper states reports according to PRISMA-IPD statement</i>)
Overall judgement of study quality	What is the overall judgement of study quality?	Moderate (<i>Most aspects of IPD conduct high quality but some concerns about identification of all relevant trials (no clear search strategy reported or available, and no flowchart to show assessment of papers against inclusion criteria).)</i>)
Overall judgement of study quality	Directness	Directly applicable

Chronic heart failure: evidence review for medicines for heart failure with mildly reduced left ventricular ejection fraction [September 2025]

Trial name / registration number	FINEARTS-HF: NCT04435626.
Study type	Randomised controlled trial (RCT) RCT: pre-specified subgroup
Study location	654 sites across 37 countries in North America, South America, Europe, Asia and Australasia
Study setting	Hospitalised, recently hospitalised or ambulatory
Study dates	September 2020 to June 2024
Sources of funding	Industry: Bayer
Inclusion criteria	Key inclusion criteria were: • age >40 years, • symptomatic heart failure in New York Heart Association (NYHA) functional class II-IV, • treatment with a diuretic for >30 days before randomization, • a left ventricular ejection fraction (LVEF) >40% with evidence of structural heart disease (either left atrial enlargement or left ventricular hypertrophy) measured within 12 months of screening, • elevated natriuretic peptide levels: NT-proBNP >300 pg/mL [or BNP >100 pg/mL] for patients in sinus rhythm; or NT-proBNP >900 pg/mL [or BNP >300 pg/mL] for patients in atrial fibrillation). Other details • Both ambulatory and hospitalized patients were eligible. • Patients with prior LVEF <40% with subsequent improvement to ≥40% were also eligible for enrolment provided that ongoing heart failure symptoms were present and all other inclusion criteria were satisfied.
Exclusion criteria	Key exclusion criteria were: • eGFR <25 ml/min/1.73 m², • serum/plasma potassium >5.0 mmol/L at screening or randomisation,

Chronic heart failure: evidence review for medicines for heart failure with mildly reduced left ventricular ejection fraction [September 2025]

	• symptomatic hypotension with mean systolic blood pressure <90 mmHg at screening or randomisation • MRA use 30 days prior to randomisation • cardiogenic shock
Recruitment / selection of participants	Patients could be enrolled irrespective of clinical care setting (whether hospitalized, recently hospitalized, or ambulatory). The proportion of patients without a recent worsening HF event within 3 months of randomisation was capped globally at approximately 50% of the original planned sample size.
Intervention(s)	Finerenone 10, 20 or 40 mg based on eGFR. Starting dose was selected based on baseline eGFR. Participants with an eGFR ≤ 60 ml/min/1.73 m² started 10 mg once daily with a maximum maintenance dose of 20 mg once daily, whereas participants with an eGFR > 60 ml/min/1.73 m² started 20 mg once daily with a maximum maintenance dose of 40 mg once daily. Up-titration to the maximum tolerated dose if potassium < 5.0 mmol/L and eGFR decrease $< 30\%$
Comparator	Matching placebo
Population subgroups	Prespecified analyses according to LVEF categories ($< 50\%$, ≥ 50 to $< 60\%$, and $\geq 60\%$) with LVEF available in $> 99\%$ of participants
Number of participants	Subgroup $< 50\% = 2172$ (36% of total participants)
Duration of follow-up	The median duration of follow-up was 32 months in the overall population
Indirectness	None (to be licenced for this population)
Method of analysis	ITT

Study arms

MRA (finerenone) (N = 1093)

Study details

Chronic heart failure: evidence review for medicines for heart failure with mildly reduced left ventricular ejection fraction [September 2025]

Secondary publication of another included study- see primary study for details	None
Other publications associated with this study included in review	Swedberg, 1999
Trial name / registration number	CHARM Alternative: NCT00634400 CHARM Added: NCT00634309 CHARM Preserved: NCT00634712
Study location	Not specified. (Participants were from 26 countries- Swedberg, 1999)
Study setting	Not specified
Study dates	Not specified
Sources of funding	The CHARM Programme was funded and sponsored by AstraZeneca. L.H.L. was supported by grants for a broad HFpEF research program from the Swedish Research Council (grant 2013-23897-104604-23), the Swedish Heart Lung Foundation (grant 20150063) and the Stockholm County Council (grants 20090556 and 20110120).
Inclusion criteria	(Identified from Swedberg, 1999) Men or women aged 18 years or older with symptomatic chronic heart failure according to NYHA class II-IV for ≥ 4 weeks before randomisation. Documentation of LVEF has to be performed by either contrast ventriculography, radionuclide ventriculography, or quantitative echocardiography within the previous 6 months. The most recent measure was used.

	In patients with LVEF >40% and not treated with an ACE-inhibitor: patients should have a history of hospitalisation for a cardiac reason and no current treatment, or continued need for treatment with an ACE inhibitor.
Exclusion criteria	(Identified from Swedburg, 1999) • Current serum-creatinine ≥ 265 mmol/L (≥ 3 mg/dL) • Current serum-potassium ≥ 5.5 mmol/L (≥ 5.5 mEq/L) • Or history of marked ACE inhibitor-induced hyperkalaemia resulting in either a serum-potassium greater than or equal to 6.0 mmol/L (≥ 6.0) or a life-threatening adverse event • Known bilateral renal artery stenosis • current symptomatic hypotension • Persistent systolic or diastolic hypertension • Stroke • Acute myocardial infarction • Open heart surgery within the last 4 weeks • Previous heart transplant or heart transplant expected to be performed within the next 6 months • Presence of any noncardiac disease (e.g. cancer) that is likely to significantly shorten life expectancy to less than 2 years
Recruitment / selection of participants	(Identified from Swedburg, 1999) Participants are a part of the Candesartan in Heart Failure- Assessment of Reduction in Mortality and Morbidity (CHARM) programme. All symptomatic CHF patients will be eligible regardless of LV function and tolerability of ACE inhibitors.
Intervention(s)	Candesartan, titrated from 4 to 8 mg/day up to the target dose of 32 mg Background treatment: ACEI 27%, beta-blocker 58% and MRA 11%

Comparator	Placebo Background treatment: ACEI 27%, beta-blocker 58% and MRA 11%
Population subgroups	Not specified
Number of participants	1322 participants with ejection fraction between 40-49%
Duration of follow-up	Mean follow-up= 2.9 years
Indirectness	None
Method of analysis	Not specified

Study arms

Study details

Secondary publication of another included study- see primary study for details	None
Other publications associated with this study included in review	Pitt 2014
Trial name / registration number	TOPCAT/NCT00094302
Study type	Randomised controlled trial (RCT)
Study location	Americas, Republic of Georgia and Russia 'Americas' defined as the United States, Canada, Argentina, and Brazil.
Study setting	Study centres

Study dates	Not specified
Sources of funding	This work was funded by the National Heart, Lung, and Blood Institute and National Institute of Health (contract HHSN268200425207C).
Inclusion criteria	Aged 50 years or older With at least one sign and one symptom of heart failure Controlled blood pressure Serum potassium level of <5.0 mmol/L
Exclusion criteria	(Exclusion criteria information from Desai, 2011) Severe systemic illness with life expectancy < 3 years from randomisation. Severe chronic obstructive pulmonary disease (e.g. requiring home oxygen or chronic oral steroid therapy) Known restrictive/ infiltrative cardiomyopathy, hypertrophic cardiomyopathy, or constrictive pericarditis Hemodynamically significant valvular heart disease (e.g. valvular disease anticipated to require surgical correction during the trial) Atrial fibrillation with a resting heart rate >90 beat/min Systolic blood pressure >160 mm Hg History of hyperkalaemia (≥ 5.5 mmol/L within the last 6 months or ≥ 5.0 mmol/L in the last 2 weeks) Severe renal dysfunction, defined as eGFR <30 mL/min per 1.73m² or serum creatinine ≥ 2.5 mg/dL Myocardial infarction, coronary artery bypass graft surgery, or stroke within 90 days before randomisation, percutaneous coronary intervention within 30 days before randomisation Use of aldosterone antagonist or potassium sparing diuretic within 14 days before randomisation

Recruitment / selection of participants	Participants (LVEF $\geq 45\%$) who had either had a hospitalisation within the past year for which heart failure was a major component or had an elevated natriuretic peptide level (BNP >150 or NT-proBNP >360).
Intervention(s)	Spironolactone (titrated to 45 mg/day if tolerated)
Comparator	Placebo
Population subgroups	Study population is divided by ejection fraction: EF $<50\%$ (N= 520), EF 50-54.99% (N=712), EF 55-59.99% (N=879), EF $\geq 60\%$ (N=1333)
Number of participants	520
Duration of follow-up	3.4 years (median)
Method of analysis	Intention to treat (from Desai, 2011)
Additional comments	The primary endpoint was a composite of cardiovascular death, aborted cardiac arrest, or hospitalisation for heart failure

Study arms

MRA (spironolactone) (N = 520)

Ejection fraction $<50\%$ N=520 for total subgroup (not available per arm)

Placebo (N = 520)

Total N for both arms= 520

Chronic heart failure: evidence review for medicines for heart failure with mildly reduced left ventricular ejection fraction [September 2025]

Characteristics

Study-level characteristics

Study details

Secondary publication of another included study- see primary study for details	Parent study (used as background for Solomon 2020)
Other publications associated with this study included in review	Solomon 2020
Trial name / registration number	PARAGON-HF; NCT01920711
Study location	848 centres in 43 countries
Study setting	NR
Study dates	From July 18, 2014, through December 16, 2016, we screened 10,359 patients were screened.

Sources of funding	Novartis
Inclusion criteria	1. Written informed consent must be obtained before any assessment is performed 2. ≥ 50 years of age, male or female 3. LVEF $\geq 45\%$ by echocardiography during the screening epoch, or within 6 months prior to screening visit (any local LVEF measurement made using echocardiography only) 4. Symptom(s) of HF requiring treatment with diuretic(s) for at least 30 days prior to screening visit 5. Current symptom(s) of HF (NYHA functional class II to IV) at screening visit 6. Structural heart disease evidenced by at least 1 of the following echocardiography findings (any local measurement made during the screening epoch or within the 6 months prior to screening visit): a) LA enlargement defined by at least 1 of the following: LA width (diameter) ≥ 3.8 cm or LA length ≥ 5.0 cm or LA area ≥ 20 cm² or LA volume ≥ 55 ml or LA volume index ≥ 29 ml/m² b) LVH defined by septal thickness or posterior wall thickness ≥ 1.1 cm 7. Patients with at least 1 of the following: a) HF hospitalization (defined as HF listed as the major reason for hospitalization) within 9 months prior to screening visit and NT-proBNP >200 pg/ml for patients not in AF or >600 pg/ml for patients in AF on screening ECG, or b) NT-proBNP >300 pg/ml for patients not in AF or >900 pg/ml for patients in AF on the screening visit ECG
Exclusion criteria	1. Any prior echocardiographic measurement of LVEF $<40\%$ 2. Acute coronary syndrome (including MI), cardiac surgery, other major cardiovascular surgery, or urgent PCI within the 3 months prior to visit 1 or an elective PCI within 30 days prior to visit 1 3. Any clinical event within the 6 months prior to visit 1 that could have reduced the LVEF (e.g., MI, CABG), unless an echocardiographic measurement was performed after the event confirming the LVEF to be $\geq 45\%$ 4. Current acute decompensated HF requiring augmented therapy with diuretic agents, vasodilator agents, and/or inotropic drugs 5. Patients who require treatment with 2 or more of the following: an ACEI, an ARB, or a renin inhibitor 6. History of hypersensitivity to any of the study drugs or to drugs of similar chemical classes 7. Patients with a known history of angioedema 8. Probable alternative diagnoses that in the opinion of the investigator could account for the patient's HF symptoms (i.e., dyspnea, fatigue), such as significant pulmonary disease (including primary pulmonary hypertension), anaemia, or obesity. Specifically, patients with the following are excluded: a) Severe pulmonary disease including COPD (i.e., requiring home oxygen, chronic nebulizer therapy, or chronic oral steroid therapy or hospitalized for pulmonary decompensation within 12 months) or b) Haemoglobin <10 g/dl, or c) Body mass index >40 kg/m² 9. Patients with any of the following: a) SBP ≥ 180 mm Hg at visit 1, or b) SBP >150 mm Hg and <180 mm Hg at visit 1 unless the patient is receiving 3 or more antihypertensive drugs. Antihypertensive drugs include but are not limited to a thiazide or other diuretic, MRA, ACEI, ARB, beta blocker, and calcium channel blocker, or c) SBP <110 mm Hg at visit 1, or d) SBP <100 mm Hg or symptomatic hypotension as determined by the investigator at visit 103 or visit 199/201 10. Use of other investigational drugs at the time of enrolment, or within 30 days or 5 half-lives of enrolment, whichever is longer 11. Patients with history of any dilated cardiomyopathy, including peripartum cardiomyopathy, chemotherapy-induced cardiomyopathy, or viral myocarditis 12.

	Evidence of right-sided HF in the absence of left-sided structural heart disease 13. Known pericardial constriction, genetic hypertrophic cardiomyopathy, or infiltrative cardiomyopathy 14. Clinically significant congenital heart disease that could be the cause of the patient's symptoms and signs of HF 15. Presence of hemodynamically significant valvular heart disease in the opinion of the investigator 16. Stroke, transient ischemic attack, carotid surgery, or carotid angioplasty within the 3 months prior to visit 1 17. Coronary or carotid artery disease or valvular heart disease likely to require surgical or percutaneous intervention during the trial 18. Life-threatening or uncontrolled dysrhythmia, including symptomatic or sustained ventricular tachycardia and AF or atrial flutter with a resting ventricular rate >110 beats per minute 19. Patients with a cardiac resynchronization therapy device 20. Patients with prior major organ transplant or intent to transplant (i.e., on transplant list) 21. Any surgical or medical condition that in the opinion of the investigator may place the patient at higher risk from his/her participation in the study or is likely to prevent the patient from complying with the requirements of the study or completing the study 22. Any surgical or medical condition that might significantly alter the absorption, distribution, metabolism, or excretion of study drugs, including but not limited to any of the following: any history of pancreatic injury, pancreatitis, or evidence of impaired pancreatic function/injury within the past 5 years 23. Evidence of hepatic disease as determined by any 1 of the following: SGOT (AST) or SGPT (ALT) values exceeding 3 the upper limit of normal, bilirubin >1.5 mg/dl at visit 1 24. Patients with 1 of the following: a) eGFR <30 ml/min/1.73 m² as calculated by the Modification in Diet in Renal Disease formula at visit 1, or b) eGFR <25 ml/min/1.73 m² at visit 103 or visit 199/201, or c) eGFR reduction >35% (compared with visit 1) at visit 103 or visit 199/201 25. Presence of known functionally significant bilateral renal artery stenosis 26. Patients with either of the following: a) Serum potassium >5.2 mmol/l (mq/l) at visit 1 b) Serum potassium >5.4 mmol/l (mq/l) at visit 103 or visit 199/201 27. History or presence of any other disease with a life expectancy of <3 years 28. History of noncompliance to medical regimens and patients who are considered potentially unreliable 29. History or evidence of drug or alcohol abuse within the past 12 months 30. Persons directly involved in the execution of this protocol 31. History of malignancy of any organ system (other than localized basal or squamous cell carcinoma of the skin or localized prostate cancer), treated or untreated, within the past 5 years, regardless of whether there is evidence of local recurrence or metastases 32. Pregnant or nursing (lactating) women, where pregnancy is defined as the state of a female after conception and until the termination of gestation, confirmed by a positive human chorionic gonadotropin laboratory test 33. Women of child-bearing potential, defined as all women physiologically capable of becoming pregnant, unless they are using highly effective methods of contraception during dosing and for 7 days off study drug
Recruitment / selection of participants	Eligible patients entered the initial single-blind run-in phase and received valsartan 40 mg or 80 mg twice daily for one to two weeks. If started on 40 mg twice daily, the dose was increased to 80 mg twice daily after one week. If patients tolerated valsartan according to prespecified criteria, they were switched to sacubitril/valsartan 49/51mg twice daily for 2 to 4 weeks. Those who tolerated sacubitril/valsartan at this dose were eligible for randomization.

Intervention(s)	ARNI - sacubitril–valsartan (target dose, 97 mg of sacubitril with 103 mg of valsartan twice daily)
Comparator	ARB - valsartan (target dose, 160 mg twice daily)
Population subgroups	Not relevant (study info used as background for Solomon 2020)
Number of participants	4822 randomised
Duration of follow-up	Median duration of follow-up was 35 months (interquartile range, 30 to 41) in each group.
Indirectness	
Method of analysis	ITT The primary efficacy outcome was evaluated with the use of the semiparametric proportional rates method of Lin et al. and a joint gamma frailty model stratified according to geographic region. Ghosh–Lin and Kaplan–Meier curves were used to show the cumulative recurrent and first events, respectively.
Additional comments	

Study arms

ARNI (sacubitril/valsartan) (N = 2419)

Target dose, 97 mg of sacubitril with 103 mg of valsartan twice daily. Background treatment: ACEI or ARB 86.2%; MRA 24.6%; beta-blocker 79.9%. n=12 removed from study due to issues at one site with GCP, leaving n=2407

ARB (valsartan) (N = 2403)

Chronic heart failure: evidence review for medicines for heart failure with mildly reduced left ventricular ejection fraction [September 2025]

Valsartan target dose, 160 mg twice daily Background treatment: ACEI or ARB 86.4%; MRA 27.1%; beta-blocker 79.5%. n=14 removed from study due to issues at one site with GCP, leaving n=2389

Other publications associated with	

this study included in review	
Trial name / registration number	NCT01920711 (PARAGON-HF), NCT01035255 (PARADIGM-HF).
Study location	Multi-centre studies
Study setting	
Study dates	PARAGON-HF: From July 18, 2014, through December 16, 2016, we screened 10,359 patients were screened. PARADGM-HF: From December 8, 2009, through November 23, 2012, a total of 10,521 patients at 1043 centres in 47 countries entered the run-in period.
Sources of funding	Novartis funded both PARAGON-HF and PARADIGM-HF
Inclusion criteria	Entry criteria in both trials were largely similar except for age (≥ 18 years for PARADIGM-HF and ≥ 50 years for PARAGON-HF), and LVEF, which was required to be $\leq 40\%$ in PARADIGM-HF and $\geq 45\%$ in PARAGON-HF. Both trials required patients to have signs or symptoms of HF (New York Heart Association II to IV functional class), to have been on diuretic therapy in the month before enrolment, and to have elevation in natriuretic peptides. In PARADIGM-HF, B-type natriuretic peptide (BNP) were required to be $\geq 150\text{pg/mL}$ or N-terminal proBNP (NT-proBNP) $\geq 600\text{pg/mL}$ ($\geq 100\text{pg/mL}$ or $\geq 400\text{pg/mL}$, respectively, if hospitalized in the previous year). In PARAGON-HF, NT-proBNP $> 300\text{pg/mL}$ ($> 900\text{pg/mL}$ if in atrial fibrillation on screening electrocardiogram) was required. If patients were hospitalized for HF within 9 months, NT-proBNP $> 200\text{pg/mL}$ (or $> 600\text{pg/mL}$ for atrial fibrillation) was required. In PARAGON-HF, patients were further required to have evidence of structural heart disease, evidenced by left atrial enlargement or left ventricular hypertrophy
Exclusion criteria	See Solomon 2019 for exclusion criteria of PARAGON-HF
Recruitment / selection of participants	NR

Intervention(s)	ARNI Sacubitril/valsartan 97/103mg twice daily
Comparator	ARB Valsartan 160mg twice daily
Number of participants	730 for subgroup of interest
Duration of follow-up	The median follow-up in PARAGON-HF was 35 months
Indirectness	Results reported here for subgroup with >40% to 50% LVEF (n=730)
Method of analysis	Data were collected in both trials to allow for assessment of both time to first event and recurrent event end points. Treatment effects comparing sacubitril/valsartan to the active RAS comparator (enalapril or valsartan) were assessed within each category for the primary outcome and its components using Cox proportional hazards models and expressed as hazard ratios (HR).

NOTE: Data from PARAGON-HF and PARADIGM-HF combined in this analysis. However, note that the eligibility criteria for PARADIGM-HF mean that relevant subgroup data must come from PARAGON-HF so ARNI V ARB, FUP 35 months.

Appendix F GRADE tables

Table 17: Clinical evidence profile: Beta-blockers versus placebo

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	Beta blockers	placebo	Relative (95% CI)	Absolute (95% CI)		
All-cause mortality (follow-up: 1.3 years)												
11	randomised trials	serious ^a	not serious	not serious	very serious ^b	none	716		HR 0.79 (0.51 to 1.23)	Not estimable	 Low	CRITICAL
Cardiovascular mortality (follow-up: 1.3 years)												
11	randomised trials	serious ^a	not serious	not serious	serious ^b	none	716		HR 0.60 (0.35 to 1.04)	Not estimable	 Low	CRITICAL
Unplanned hospitalisation, HF-related (cardiovascular hospitalisation) - total (follow-up: 1.3 years)												
11	randomised trials	serious ^a	not serious	not serious	very serious ^b	none	709		HR 0.98 (0.73 to 1.33)	Not estimable	 Very low	CRITICAL

CI: confidence interval; HF: Heart failure; IPD: Individual participant data; HR: Hazard ratio

a. Downgraded by 1 increment for risk of bias because of some concerns about identification of all relevant trials (no clear search strategy reported or available, and no flowchart to show assessment of papers against inclusion criteria).

b. Downgraded by 1 increment if the confidence interval crossed one MID or by 2 increments if the confidence interval crossed both MIDs (default MIDs=0.8 and 1.25 for dichotomous and time-to-event outcomes).

Table 18: Clinical evidence profile: ACEI versus placebo

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	ACEI	Placebo	Relative (95% CI)	Absolute (95% CI)		
All-cause mortality (follow-up: mean 4.7 years)												
1	randomised trials	not serious	not serious	very serious ^a	serious ^b	none	101/1247 (8.1%)	134/1265 (10.6%)	RR 0.76 (0.60 to 0.98)	25 fewer per 1,000 (from 42 fewer to 2 fewer)	 Very low	CRITICAL
Cardiovascular mortality (follow-up: mean 4.7 years)												
1	randomised trials	not serious	not serious	very serious ^a	serious ^b	none	53/1247 (4.3%)	67/1265 (5.3%)	RR 0.80 (0.56 to 1.14)	11 fewer per 1,000 (from 23 fewer to 7 more)	 Very low	CRITICAL
Unplanned hospitalisation or visits, HF-related (hospitalisation for nonfatal congestive heart failure) (follow-up: mean 4.7 years)												
1	randomised trials	not serious	not serious	very serious ^a	very serious ^b	none	47/1247 (3.8%)	51/1265 (4.0%)	RR 0.93 (0.63 to 1.38)	3 fewer per 1,000 (from 15 fewer to 15 more)	 Very low	CRITICAL

ACEI; Angiotensin converting enzyme inhibitor; CI: confidence interval; HF: Heart failure; RR: Relative risk

a. Downgraded by 2 increments for indirectness: intervention indirectness due to the intervention indication for hypertension; outcome indirectness due to the outcome not being TTE as specified in the protocol; population indirectness because the population included people with ischemic cardiomyopathy and mildly reduced ejection fraction without clear evidence of symptomatic heart failure.

b. Downgraded by 1 increment if the confidence interval crossed one MID or by 2 increments if the confidence interval crossed both MIDs (default MIDs=0.8 and 1.25 for dichotomous and time-to-event outcomes).

Table 19: Clinical evidence profile: ARB versus placebo

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	ARB	Placebo	Relative (95% CI)	Absolute (95% CI)		
All-cause mortality (follow-up: mean 2.9 years)												
1	randomised trials	serious ^a	not serious	not serious	serious ^b	none	667 participants	665 participants	HR 0.79 (0.60 to 1.04)	1.2 fewer per 100 person years ^c	⊕⊕○○ Low	CRITICAL
Cardiovascular mortality (follow-up: mean 2.9 years)												
1	randomised trials	serious ^a	not serious	not serious	serious ^b	none	667 participants	665 participants	HR 0.81 (0.60 to 1.11)	0.9 fewer per 100 person years ^c	⊕⊕○○ Low	CRITICAL
Unplanned hospitalisation or visits, HF-related (heart failure hospitalisation) (follow-up: mean 2.9 years)												
1	randomised trials	serious ^a	not serious	not serious	serious ^b	none	667 participants	665 participants	HR 0.72 (0.55 to 0.95)	2.0 fewer per 100 person years ^c	⊕⊕○○ Low	CRITICAL
Repeat unplanned hospitalisation or visits, HF-related (recurrent heart failure hospitalisation) (follow-up: mean 2.9 years)												

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	ARB	Placebo	Relative (95% CI)	Absolute (95% CI)		
1	randomised trials	serious ^a	not serious	not serious	not serious	none	667 participants	665 participants	Rate ratio 0.48 (0.33 to 0.70)	6.4 fewer per 100 person years ^c	 Moderate	CRITICAL

ARB: Angiotensin receptor antagonist / blocker; CI: confidence interval; HF: Heart failure; HR: Hazard ratio

a. Downgraded by 1 increment for risk of bias because of some concerns about reporting of randomisation method and not able to assess baseline characteristics.

b. Downgraded by 1 increment if the confidence interval crossed one MID or by 2 increments if the confidence interval crossed both MIDs (default MIDs=0.8 and 1.25 for dichotomous and time-to-event outcomes).

c. Absolute effect calculated from rate per 100 person years reported in the paper (not possible to estimate the variance).

Table 20: Clinical evidence profile: MRA versus placebo

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	MRA	Placebo	Relative (95% CI)	Absolute (95% CI)

---	-------------------	----------------------	-------------	-------------	-------------	------	------------------	----------------	----------------------------------	--	--	----------

CI: confidence interval; HF: Heart failure; HR: Hazard ratio; KCCQ: Kansas City Cardiomyopathy Questionnaire total symptom score; MRA: Mineralocorticoid receptor antagonist; RR: Relative risk

a. Downgraded by 1 increment because of some concerns about risk of bias (protocol deviations in subgroup definitions of LVEF categories)

b. Downgraded by 1 increment for imprecision if the confidence interval crossed one MID and by 2 increments if the 95% confidence interval crossed two MIDs (0.8 and 1.25 for dichotomous and time-to-event outcomes; KCCQ TSS MID is 5)

c. Downgraded by 1 increment for outcome indirectness (dichotomous, not time-to-event).

d. Absolute effect calculated from rate per 100 person years reported in the paper (not possible to estimate the variance).

Table 21: Clinical evidence profile: ARNI versus ARB

Certainty assessment							Nº of patients		Effect		Certainty	Importance
Nº of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	ARNI	ARB	Relative (95% CI)	Absolute (95% CI)		

Cardiovascular mortality (follow-up: median 35 months)

1	randomised trials	not serious	not serious	not serious	very serious ^a	none	730		HR 0.98 (0.66 to 1.46)	Not estimable	 Low	CRITICAL
---	-------------------	-------------	-------------	-------------	---------------------------	------	-----	--	----------------------------------	----------------------	--	----------

Unplanned hospitalisation or visits, Hf-related (total HF hospitalisations) (follow-up: median 35 months)

1	randomised trials	not serious	not serious	not serious	serious ^a	none	730		Rate ratio 0.73 (0.50 to 1.07)	Not estimable	 Moderate	CRITICAL
---	-------------------	-------------	-------------	-------------	----------------------	------	-----	--	--	----------------------	---	----------

ARB: Angiotensin receptor antagonist / blocker; ARNI: Angiotensin receptor-neprilysin inhibitor; CI: confidence interval; HF: Heart failure; HR: Hazard ratio

a. Downgraded by 1 increment if the confidence interval crossed one MID or by 2 increments if the confidence interval crossed both MIDs (default MIDs=0.8 and 1.25 for dichotomous and time-to-event outcomes).

Appendix G Economic evidence study selection

Figure 24: Flow chart of health economic study selection for the guideline

* Non-relevant population, intervention, comparison, design or setting; non-English language

**1 study was identified that met both the HFrEF and HFmrEF population criteria

*** the same 10 studies were reviewed for both the HFmrEF and HFpEF populations

Appendix H Economic evidence tables

No Economic studies were included for this review question.

Appendix I Health economic model

This health economic modelling is reported in the main text – see 1.1.9 Economic model.

Appendix J Excluded studies

J.1 Clinical evidence studies

Table 22: Studies excluded from the clinical review

Study	Exclusion reason
(1993) Effect of ramipril on mortality and morbidity of survivors of acute myocardial infarction with clinical evidence of heart failure. The Acute Infarction Ramipril Efficacy (AIRE) Study Investigators. Lancet (London, England) 342(8875): 821-828	- Population not relevant to this review protocol <i>Acute MI</i>
(1994) A randomized trial of beta-blockade in heart failure. The Cardiac Insufficiency Bisoprolol Study (CIBIS). CIBIS Investigators and Committees. Circulation 90(4): 1765-1773	- Comparator in study does not match that specified in this review protocol <i>HFrEF: not combination treatment in control group</i>
(1995) Effects of carvedilol, a vasodilator-beta-blocker, in patients with congestive heart failure due to ischemic heart disease. Australia-New Zealand Heart Failure Research Collaborative Group. Circulation 92(2): 212-218	- Comparator in study does not match that specified in this review protocol <i>HFrEF: not combination treatment in control group</i>
(1996) Effectiveness of spironolactone added to an angiotensin-converting enzyme inhibitor and a loop diuretic for severe chronic congestive heart failure (the Randomized Aldactone Evaluation Study [RALES]). The American journal of cardiology 78(8): 902-907	- Comparator in study does not match that specified in this review protocol <i>HFrEF: no combination treatment in control group</i>
(1996) New beta blocker reduces heart failure mortality by two-thirds. Geriatrics 51(1): 16-19	- Publication type not relevant to review protocol <i>Commentary article</i>
(1997) Randomised, placebo-controlled trial of carvedilol in patients with congestive heart failure due to ischaemic heart disease. Australia/New Zealand Heart Failure Research Collaborative Group. Lancet (London, England) 349(9049): 375-380	- Population not relevant to this review protocol <i>HFrEF: not combination treatment</i>
(1997) The effect of digoxin on mortality and morbidity in patients with heart failure. The New England journal of medicine 336(8): 525-533	- Study does not contain an intervention relevant to this review protocol <i>HFrEF: digoxin</i>
(1999) Effect of metoprolol CR/XL in chronic heart failure: Metoprolol CR/XL Randomised Intervention Trial in Congestive Heart Failure (MERIT-HF). Lancet (London, England) 353(9169): 2001-2007	- Comparator in study does not match that specified in this review protocol <i>HFrEF: no combination treatment in control group</i>
(1999) The Cardiac Insufficiency Bisoprolol Study II (CIBIS-II): a randomised trial. Lancet (London, England) 353(9146): 9-13	- Comparator in study does not match that specified in this review protocol <i>HFrEF: not combination treatment in control group</i>

Study	Exclusion reason
(2000) Effects of metoprolol CR in patients with ischemic and dilated cardiomyopathy : the randomized evaluation of strategies for left ventricular dysfunction pilot study. Circulation 101(4): 378-384	- Comparator in study does not match that specified in this review protocol <i>Results include events in 2 randomisation periods with different interventions that cannot be analysed separately</i>
(2024) The efficacy of dapagliflozin in a hierarchical kidney outcome in heart failure. Nature Medicine 30(5): 1253	- Not a peer-reviewed publication
. Eichhorn EJ, Domanski MJ et al. (2001) A trial of the beta-blocker bucindolol in patients with advanced chronic heart failure. The New England journal of medicine 344(22): 1659-1667	- Study does not contain an intervention relevant to this review protocol <i>Bucindolol</i>
. Yusuf S, Pitt B et al. (1991) Effect of enalapril on survival in patients with reduced left ventricular ejection fractions and congestive heart failure. The New England journal of medicine 325(5): 293-302	- Study does not contain an intervention relevant to this review protocol <i>HFrEF: not combination treatment</i>
Abdin, Amr, Kondo, Toru, Bohm, Michael et al. (2024) Effects of dapagliflozin according to QRS duration across the spectrum of left ventricular ejection fraction: An analysis of DAPA-HF and DELIVER. European journal of heart failure 26(9): 1952-1963	- Population not relevant to this review protocol <i>Combination of 2 trials with preserved and reduced EF</i> - Study does not contain any outcome data relevant to this review protocol <i>Does not contain extra outcomes to those in main DAPA-HF trial and excludes patients with a paced rhythm and cardiac resynchronization therapy</i>
Abdulla, Jawdat, Burchardt, Hans, Z Abildstrom, Steen et al. (2003) The angiotensin converting enzyme inhibitor trandolapril has neutral effect on exercise tolerance or functional class in patients with myocardial infarction and reduced left ventricular systolic function. European heart journal 24(23): 2116-22	- Population not relevant to this review protocol <i>Acute MI</i>
Abedi, Farshad, Mohammadpour, Amir Hooshang, Ghavami, Vahid et al. (2024) The effects of empagliflozin on ventricular arrhythmias in heart failure patients with an implantable cardioverter-defibrillator: a double-blind randomized controlled trial. Naunyn-Schmiedeberg's archives of pharmacology 397(12): 10191-10201	- Study does not contain any outcome data relevant to this review protocol
Abraham, William T, Lindenfeld, JoAnn, Ponikowski, Piotr et al. (2021) Effect of empagliflozin on exercise ability and symptoms in heart failure patients with reduced and preserved ejection fraction, with and without	- Population not relevant to this review protocol <i>Reduced LVEF</i>

Study	Exclusion reason
type 2 diabetes . European heart journal 42(6): 700-710	
Abuelazm, Mohamed, Badr, Amr, Turkmani, Mustafa et al. (2024) The efficacy and safety of new potassium binders on renin-angiotensin-aldosterone system inhibitor optimization in heart failure patients: a systematic review and meta-analysis . ESC heart failure 11(1): 28-43	- Systematic review does not contain a protocol intervention <i>Mixed LVEF: MRA combined with new potassium binders</i>
Adamo, M., Pagnesi, M., Mebazaa, A. et al. (2023) NT-proBNP and high intensity care for acute heart failure: the STRONG-HF trial . European Heart Journal 44(31): 2947-2962	- Secondary publication of an included study that does not provide any additional relevant information <i>HFrEF: STRONG-HF Sub-study exploring NT-proBNP at baseline</i>
Adamopoulos C, Ahmed A, Fay R et al. (2009) Timing of eplerenone initiation and outcomes in patients with heart failure after acute myocardial infarction complicated by left ventricular systolic dysfunction: insights from the EPHEsus trial . European journal of heart failure 11(11): 1099-1105	- Study design not relevant to this review protocol <i>Post hoc analysis based on median time-to-randomisation after AMI</i> - Population not relevant to this review protocol <i>Acute MI</i>
Adamou, Anastasia, Chlorogiannis, David Dimitris, Kyriakoulis, Ioannis G et al. (2024) Sodium-glucose cotransporter-2 inhibitors in heart failure patients across the range of body mass index: a systematic review and meta-analysis of randomized controlled trials . Internal and emergency medicine 19(2): 565-573	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>2 of 3 included RCTS are reduced LVEF. Both already included in analyses (DAPA-HF and Emperor-reduced)</i>
Adamson, Carly, Docherty, Kieran F, Heerspink, Hiddo J L et al. (2022) Initial Decline (Dip) in Estimated Glomerular Filtration Rate After Initiation of Dapagliflozin in Patients With Heart Failure and Reduced Ejection Fraction: Insights From DAPA-HF . Circulation 146(6): 438-449	- Study design not relevant to this review protocol <i>Post hoc analysis</i>
Adamson, Carly, Jhund, Pardeep S, Docherty, Kieran F et al. (2021) Efficacy of dapagliflozin in heart failure with reduced ejection fraction according to body mass index . European journal of heart failure 23(10): 1662-1672	- Secondary publication of an included study that does not provide any additional relevant information <i>Paper has been cross-referenced with parent paper. Secondary analysis of DAPA-HF. No additional outcomes reported.</i>
Addo, Basilio, Agyeman, Walter, Ibrahim, Sammudeen et al. (2024) Dapagliflozin in Heart Failure: A Comprehensive Meta-analysis on Functional Capacity, Symptoms, and Safety Outcomes . American journal of cardiovascular drugs : drugs, devices, and other interventions 24(6): 753-773	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>No additional studies identified. Amiguet, 2023 not listed in the references (LVEF fits definition for HFrEF); post hoc subanalysis of included study. Ibrahim, 2020 not picked up in the search</i>

Study	Exclusion reason
	(LVEF fits definition for HFrEF; but acute HF in hospital).
Adji, A.S., Billah, A., Baraja, A. et al. (2022) A Systematic Review and Meta-analysis of Randomized Placebo-controlled Trials 1 Year after Starting Sodium-glucose Transporter-2 Inhibitors in Heart Failure Patients with Reduced Ventricular Ejection Fraction. Open Access Macedonian Journal of Medical Sciences 10: 1-6	- Systematic review does not contain sufficient detail for included studies: used as source of primary studies <i>Insufficient information regarding risk of bias assessment.</i>
Adji, Arga Setyo; Widjaja, Jordan Steven; de Liyis, Bryan Gervais (2024) Effectiveness and safety of mineralocorticoid receptor antagonists in heart failure patients with and without diabetes: a systematic review and meta-analysis. The Egyptian heart journal : (EHJ) : official bulletin of the Egyptian Society of Cardiology 76(1): 150	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>Systematic Review checked for references but no extra studies identified.</i>
Afshani, Mohammad Reza, Torfi, Ekhlas, Akiash, Nehzat et al. (2024) Effect of empagliflozin on left ventricular volumes in type 2 diabetes or prediabetes heart failure patients with reduced ejection fraction. Acta cardiologica 79(4): 419-425	- Comparator in study does not match that specified in this review protocol <i>Background treatment (to specify the comparator of interest) is not reported adequately in the paper</i>
Agostoni P, Magini A, Andreini D et al. (2005) Spironolactone improves lung diffusion in chronic heart failure. European heart journal 26(2): 159-164	- Population not relevant to this review protocol <i>Mixed LVEF not matching either reduced or mildly reduced ejection fraction definitions</i>
Agusti, Antonia, Bonet, Sara, Arnau, Josep Maria et al. (2003) Adverse effects of ACE inhibitors in patients with chronic heart failure and/or ventricular dysfunction : meta-analysis of randomised clinical trials. Drug safety 26(12): 895-908	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>Population does not meet protocol definition of HF, no information on LVEF status or background treatment of studies.</i>
Ahmed, Aymen, Ahmed, Warda, Arshad, Muhammad Sameer et al. (2023) Meta-Analysis Evaluating Risk of Hyperkalemia Stratified by Baseline MRA Usage in Patients with Heart Failure Receiving SGLT2 Inhibitors. Cardiovascular drugs and therapy	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>3 included trials are a mix of HFrEF and HFpEF populations.</i>
Akbulut, Mehmet, Ozbay, Yilmaz, Ilkay, Erdogan et al. (2003) Effects of spironolactone and metoprolol on QT dispersion in heart failure. Japanese heart journal 44(5): 681-92	- Study does not contain any outcome data relevant to this review protocol
Albalushi, S., Zarif, A., Karaduman, S. et al. (2023) Effectiveness of SGLT2 inhibitor therapy in treatment of Heart failure: A Meta-Analysis. MedRxiv	- Not a peer-reviewed publication <i>Article specified as 'not peer reviewed.'</i>

Study	Exclusion reason
with severe congestive heart failure . Circulation 99(8): 990-992	<i>HFrEF: not combination treatment in control group</i>
Hansen, Morten Rix, Hrobjartsson, Asbjorn, Videbaek, Lars et al. (2020) Postponement of Death by Pharmacological Heart Failure Treatment: A Meta-Analysis of Randomized Clinical Trials . The American journal of medicine 133(6): e280-e289	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>Includes Ivabradine as a drug treatment</i>
Harrington, Josephine, Fonarow, Gregg C, Khan, Muhammad Shahzeb et al. (2023) Medication-Attributable Adverse Events in Heart Failure Trials . JACC. Heart failure 11(4): 425-436	- Review article but not a systematic review
Hasan, Mohammed Tarek, Awad, Ahmed K, Shih, Mohamed et al. (2023) Meta-Analysis on the Safety and Efficacy of Sodium Glucose Cotransporters 2 Inhibitors in Patients With Heart Failure With and Without Diabetes . The American journal of cardiology 187: 93-99	- Systematic review indirectly matches the review protocol: used as source of primary studies
Haseeb, Muhammad Talha, Nouman Aslam, Muhammad, Avanteeka, Fnu et al. (2023) Comparison of Efficacy and Safety of Angiotensin Receptor-Neprilysin Inhibitors in Patients With Heart Failure With Reduced Ejection Fraction: A Meta-Analysis . Cureus 15(3): e36392	- Systematic review does not contain sufficient detail for included studies: used as source of primary studies <i>Insufficient detail provided</i>
Hassan, Waleed, Nila, Shamima A, Ahmed, Muneeb et al. (2024) Comparative Efficacy and Long-Term Outcomes of Beta-Blockers Alone or in Combination With Angiotensin-Converting Enzyme (ACE) Inhibitors in Chronic Heart Failure: A Systematic Review . Cureus 16(11): e74329	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>Mixed LVEF, no additional studies identified</i>
Hawkins, Nathaniel M, MacDonald, Michael R, Petrie, Mark C et al. (2009) Bisoprolol in patients with heart failure and moderate to severe chronic obstructive pulmonary disease: a randomized controlled trial . European journal of heart failure 11(7): 684-90	- Study does not contain any outcome data relevant to this review protocol
He, Yong-Ming, Yang, Xiang-Jun, Zhao, Xin et al. (2012) beta-Blockers in heart failure: benefits of beta-blockers according to varying male proportions of study patients . Clinical cardiology 35(8): 505-11	- Systematic review in area where more recent reviews are available <i>Publication from 2012</i>
He, Zheng, Sun, Yun, Gao, Hui et al. (2015) Efficacy and safety of supramaximal titrated inhibition of renin-angiotensin-aldosterone system in idiopathic dilated cardiomyopathy . ESC heart failure 2(4): 129-138	- Comparator in study does not match that specified in this review protocol <i>HFrEF: not combination treatment</i>

Study	Exclusion reason
He, Zhiyu, Yang, Lin, Nie, Yutong et al. (2021) Effects of SGLT-2 inhibitors on health-related quality of life and exercise capacity in heart failure patients with reduced ejection fraction: A systematic review and meta-analysis. International journal of cardiology 345: 83-88	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>1 of included studies does not meet definition of rEF but there is a QoL reported for relevant 6 studies only. Supplementary material not accessible to assess study quality information</i>
Heidenreich, P.A., Bozkurt, B., Aguilar, D. et al. (2022) 2022 AHA/ACC/HFSA Guideline for the Management of Heart Failure. Journal of Cardiac Failure 28(5): e1-e167	- Publication type not relevant to review protocol <i>Clinical guideline</i>
Heran, Balraj S, Musini, Vijaya M, Bassett, Ken et al. (2012) Angiotensin receptor blockers for heart failure. The Cochrane database of systematic reviews: cd003040	- Systematic review in area where more recent reviews are available <i>Searches conducted in 2010</i>
Herlitz, J, Wikstrand, J, Denny, M et al. (2002) Effects of metoprolol CR/XL on mortality and hospitalizations in patients with heart failure and history of hypertension. Journal of cardiac failure 8(1): 8-14	- Study does not contain any outcome data relevant to this review protocol
Hernandez, Adrian V, Pasupuleti, Vinay, Scarpelli, Nancy et al. (2023) Efficacy and safety of sacubitril/valsartan in heart failure compared to renin-angiotensin-aldosterone system inhibitors: a systematic review and meta-analysis of randomised controlled trials. Archives of medical science : AMS 19(3): 565-576	- Population not relevant to this review protocol <i>Acute MI and range of chronic HF</i>
Hey, C.Y., Barra, S., Duehmke, R. et al. (2022) An updated systematic review on heart failure treatments for patients with renal impairment: the tide is not turning. Heart Failure Reviews 27(5): 1761-1777	- Review article but not a systematic review <i>Not a systematic review- articles from selected studies</i>
Hirai, R.; Hirai, T.; Fendler, T. (2020) Dapagliflozin improves cardiovascular outcomes in patients with heart failure and reduced ejection fraction. Journal of Clinical Outcomes Management 27(4): 159-160	- Publication type not relevant to review protocol <i>Commentary on an abstract</i>
Hjalmarson, A and Fagerberg, B (2000) MERIT-HF mortality and morbidity data. Basic research in cardiology 95suppl1: I98-103	- Comparator in study does not match that specified in this review protocol <i>HFrEF: not combination treatment</i>
Hjalmarson, A, Goldstein, S, Fagerberg, B et al. (2000) Effects of controlled-release metoprolol on total mortality, hospitalizations, and well-being in patients with heart failure: the Metoprolol CR/XL Randomized Intervention Trial in congestive heart failure (MERIT-HF). MERIT-HF Study Group. JAMA 283(10): 1295-302	- Comparator in study does not match that specified in this review protocol <i>HFrEF: no combination treatment in control group</i>

Study	Exclusion reason
Hole, Torstein, Froland, Gisle, Gullestad, Lars et al. (2004) Metoprolol CR/XL improves systolic and diastolic left ventricular function in patients with chronic heart failure. Echocardiography (Mount Kisco, N.Y.) 21(3): 215-23	- Study does not contain any outcome data relevant to this review protocol
Hori, Masatsugu, Kitabatake, Akira, Tsutsui, Hiroyuki et al. (2005) Rationale and design of a randomized trial to assess the effects of beta-blocker in diastolic heart failure: Japanese Diastolic Heart Failure Study (J-DHF). Journal of cardiac failure 11(7): 542-7	- Publication type not relevant to review protocol <i>Protocol for RCT</i>
Hori, Masatsugu, Sasayama, Shigetake, Kitabatake, Akira et al. (2004) Low-dose carvedilol improves left ventricular function and reduces cardiovascular hospitalization in Japanese patients with chronic heart failure: the Multicenter Carvedilol Heart Failure Dose Assessment (MUCHA) trial. American heart journal 147(2): 324-30	- Population not relevant to this review protocol <i>Patients who had ischemic and nonischemic cardiomyopathy with stable symptoms</i>
Houghton, A R, Harrison, M, Cowley, A J et al. (2000) Combined treatment with losartan and an ACE inhibitor in mild to moderate heart failure: results of a double-blind, randomized, placebo-controlled trial. American heart journal 140(5): e25	- Population not relevant to this review protocol <i>LVEF not clearly reported</i>
Houghton, AR; Harrison, M; Cowley, AJ (1999) Haemodynamic, neurohumoral and exercise effects of losartan vs. captopril in chronic heart failure: results of an ELITE trial substudy. Evaluation of Losartan in the Elderly. European journal of heart failure 1(4): 385-393	- Study does not contain an intervention relevant to this review protocol <i>Intervention is a monotherapy</i>
Houghton, T; Freemantle, N; Cleland, JG (2000) Are beta-blockers effective in patients who develop heart failure soon after myocardial infarction? A meta-regression analysis of randomised trials. European journal of heart failure 2(3): 333-340	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>SR of trials for MI - some of the studies included a number of studies have no patients with HF</i>
Hryniewicz, Katarzyna, Dimayuga, Clarito, Hudaihed, Alhakam et al. (2005) Inhibition of angiotensin-converting enzyme and phosphodiesterase type 5 improves endothelial function in heart failure. Clinical science (London, England : 1979) 108(4): 331-8	- Comparator in study does not match that specified in this review protocol <i>Comparison was PDE5 inhibitor</i>
Hu, Li-jun, Chen, Yun-qing, Deng, Song-bai et al. (2013) Additional use of an aldosterone antagonist in patients with mild to moderate chronic heart failure: a systematic review and meta-analysis. British journal of clinical pharmacology 75(5): 1202-12	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>Includes quasi RCTs</i>
Huang, Pingping, Song, Qingya, Wang, Yifei et al. (2022) Effect of arotinolol on chronic heart	- Systematic review does not contain a protocol intervention

Study	Exclusion reason
failure: A systematic review and meta-analysis of randomized controlled trials. <i>Frontiers in cardiovascular medicine</i> 9: 1071387	
Huang, Yun, Fang, Chongbo, Zhang, YuYu et al. (2023) Effectiveness and safety of angiotensin receptor-neprilysin inhibitor and sodium-glucose cotransporter-2 inhibitors for patients with heart failure with reduced ejection fraction: a meta-analysis. <i>Journal of cardiovascular medicine (Hagerstown, Md.)</i> 24(2): 123-131	- Systematic review does not contain sufficient detail for included studies: used as source of primary studies
Hundertmark, Moritz J, Adler, Amanda, Antoniadou, Charalambos et al. Cardiovascular therapy and prevention (russian federation) 21(10): 33-40	- Study not reported in English <i>Non-English language study (Russian)</i>
Poole-Wilson, Philip A, Cleland, John G F, Di Lenarda, Andrea et al. (2002) Rationale and design of the carvedilol or metoprolol European trial in patients with chronic heart failure: COMET . European journal of heart failure 4(3): 321-9	- Comparator in study does not match that specified in this review protocol <i>Within-class comparison</i>
Poole-Wilson, Philip A, Swedberg, Karl, Cleland, John G F et al. (2003) Comparison of carvedilol and metoprolol on clinical outcomes in patients with chronic heart failure in the Carvedilol Or Metoprolol European Trial (COMET): randomised controlled trial . Lancet (London, England) 362(9377): 7-13	- Comparator in study does not match that specified in this review protocol <i>Within-class comparison</i>
Pozzi, A, Cirelli, C, Merlo, A et al. (2023) Adverse effects of sodium-glucose cotransporter-2 inhibitors in patients with heart failure: a systematic review and meta-analysis . Heart failure reviews	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>Background treatment not specified. Comparator was placebo.</i>
Preiss, David, van Veldhuisen, Dirk J, Sattar, Naveed et al. (2012) Eplerenone and new-onset diabetes in patients with mild heart failure: results from the Eplerenone in Mild Patients Hospitalization and Survival Study in Heart Failure (EMPHASIS-HF) . European journal of heart failure 14(8): 909-15	- Secondary publication of an included study that does not provide any additional relevant information
Prisant, L Michael, Thomas, Kevin L, Lewis, Eldrin F et al. (2008) Racial analysis of patients with myocardial infarction complicated by heart failure and/or left ventricular dysfunction treated with valsartan, captopril, or both . Journal of the American College of Cardiology 51(19): 1865-71	- Population not relevant to this review protocol <i>Acute MI</i>
Prochaska, Jurgen H, Junger, Claus, Schulz, Andreas et al. (2023) Effects of empagliflozin on left ventricular diastolic function in addition to usual care in individuals with type 2 diabetes mellitus-results from the randomized, double-blind, placebo-controlled EmDia trial . Clinical	- Study does not contain any outcome data relevant to this review protocol

Study	Exclusion reason
research in cardiology : official journal of the German Cardiac Society 112(7): 911-922	
Qin, Hailun, Dewan, Pooja, Santema, Bernadet T et al. (2024) Achieved dose and treatment discontinuation of candesartan in men and women with chronic heart failure: data from CHARM. ESC heart failure 11(4): 1880-1887	- Comparator in study does not match that specified in this review protocol <i>Pooled CHARM-added (which meets our protocol) with CHARM-alternative (which doesn't meet out protocol as it was ARB vs placebo with <50% on background BB)</i>
Qin, Jianbin, Wang, Weijian, Wei, Ping et al. (2022) Effects of sacubitril-valsartan on heart failure patients with mid-range ejection fractions: A systematic review and meta-analysis. Frontiers in pharmacology 13: 982372	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>The systematic review included cohort studies and the follow-up period was variable (with no noted restrictions)</i>
Qin, S, Zhang, Z, Shi, J et al. (2021) Efficacy of sacubitril valsartan in treatment of chronic cardiac insufficiency. Drug evaluation research 44(6): 1270-1274	- Study not reported in English <i>Non-English language study (Chinese)</i>
Qiu, Mei; Ding, Liang-Liang; Zhou, Hai-Rong (2021) Factors affecting the efficacy of SGLT2is on heart failure events: a meta-analysis based on cardiovascular outcome trials. Cardiovascular diagnosis and therapy 11(3): 699-706	- Systematic review does not contain a protocol intervention <i>Includes studies of SGLT2i (not licensed in the UK), mixture of studies with rEF and pEF, population does not meet protocol.</i>
Qu, Wei; Li, Xia; Yu, Zhuxian (2019) The curative effect of carvedilol combined with conventional therapy in treatment of chronic heart failure. Pakistan journal of pharmaceutical sciences 32(3special): 1427-1430	- Study does not contain any outcome data relevant to this review protocol <i>Quality of life is reported, but it is not clear if a validated measure was used and if final values were reported.</i>
Radack, K and Deck, C (1991) Beta-adrenergic blocker therapy does not worsen intermittent claudication in subjects with peripheral arterial disease. A meta-analysis of randomized controlled trials. Archives of internal medicine 151(9): 1769-76	- Population not relevant to this review protocol <i>Peripheral arterial disease</i>
Rambarat, Paula and Newby, L Kristin (2024) RAS blocker effects on first HF hospitalization or CV death does not differ in Black and non-Black patients with HFrEF. Annals of internal medicine 177(10): jc112	- Review article but not a systematic review
Ramires, F J, Mansur, A, Coelho, O et al. (2000) Effect of spironolactone on ventricular arrhythmias in congestive heart failure secondary to idiopathic dilated or to ischemic cardiomyopathy. The American journal of cardiology 85(10): 1207-11	- Study does not contain any outcome data relevant to this review protocol
Rector, Thomas S, Carson, Peter E, Anand, Inder S et al. (2012) Assessment of long-term effects of irbesartan on heart failure with	- Population not relevant to this review protocol

Study	Exclusion reason
preserved ejection fraction as measured by the minnesota living with heart failure questionnaire in the irbesartan in heart failure with preserved systolic function (I-PRESERVE) trial. Circulation. Heart failure 5(2): 217-25	<i>Less than 80% trial population had HFmrEF (majority HFPeF)</i>
Rector, TS, Johnson, G, Dunkman, WB et al. (1993) Evaluation by patients with heart failure of the effects of enalapril compared with hydralazine plus isosorbide dinitrate on quality of life. V-HeFT II. The V-HeFT VA Cooperative Studies Group. Circulation 87(6suppl): vi71	- Comparator in study does not match that specified in this review protocol <i>Hydralazine and isosorbide dinitrate</i>
Refsgaard, Jens, Thomsen, Claus, Andreasen, Frederik et al. (2002) Carvedilol does not alter the insulin sensitivity in patients with congestive heart failure. European journal of heart failure 4(4): 445-53	- Study does not contain any outcome data relevant to this review protocol <i>Reports insulin sensitivity</i>
Reis, Joao, Teixeira, Ana Rita, Goncalves, Antonio Valentim et al. (2022) Dapagliflozin Impact on the Exercise Capacity of Non-Diabetic Heart Failure with Reduced Ejection Fraction Patients. Journal of clinical medicine 11(10)	- Population not relevant to this review protocol <i>Comprised of a population with mixed EF status</i>
Remme, Willem J, Cleland, John G, Erhardt, Leif et al. (2007) Effect of carvedilol and metoprolol on the mode of death in patients with heart failure. European journal of heart failure 9(11): 1128-35	- Comparator in study does not match that specified in this review protocol <i>Within-class comparison</i>
Remme, Willem J, Riegger, Guenter, Hildebrandt, Per et al. (2004) The benefits of early combination treatment of carvedilol and an ACE-inhibitor in mild heart failure and left ventricular systolic dysfunction. The carvedilol and ACE-inhibitor remodelling mild heart failure evaluation trial (CARMEN). Cardiovascular drugs and therapy 18(1): 57-66	- Comparator in study does not match that specified in this review protocol <i>Comparator not dual therapy</i>
Remme, Willem J, Torp-Pedersen, Christian, Cleland, John G F et al. (2007) Carvedilol protects better against vascular events than metoprolol in heart failure: results from COMET. Journal of the American College of Cardiology 49(9): 963-71	- Comparator in study does not match that specified in this review protocol <i>Within-class comparison</i>
Remme, WJ (2001) The Carvedilol and ACE-Inhibitor Remodelling Mild Heart Failure Evaluation trial (CARMEN)--rationale and design. Cardiovascular drugs and therapy / sponsored by the International Society of Cardiovascular Pharmacotherapy 15(1): 69-77	- Comparator in study does not match that specified in this review protocol <i>HFmrEF: not combination treatment</i>
Requena-Ibanez, Juan Antonio, Santos-Gallego, Carlos G, Rodriguez-Cordero, Anderly et al. (2021) Mechanistic Insights of Empagliflozin in Nondiabetic Patients With HFrEF: From the EMPA-TROPISM Study. JACC. Heart failure 9(8): 578-589	- Study does not contain any outcome data relevant to this review protocol

Study	Exclusion reason
Reyaz, Ibrahim, Kaur, Avneet, Saad, Moyal Z et al. (2023) Comparison of Outcomes Between Sacubitril/Valsartan and Enalapril in Patients With Heart Failure: A Systematic Review and Meta-Analysis. Cureus 15(11): e48623	- Systematic review does not contain sufficient detail for included studies: used as source of primary studies <i>Insufficient reporting of study characteristics and no risk of bias assessment</i>
Riegger, G A, Bouzo, H, Petr, P et al. (1999) Improvement in exercise tolerance and symptoms of congestive heart failure during treatment with candesartan cilexetil. Symptom, Tolerability, Response to Exercise Trial of Candesartan Cilexetil in Heart Failure (STRETCH) Investigators. Circulation 100(22): 2224-30	- Study does not contain an intervention relevant to this review protocol <i>Monotherapy only</i>
Rindone, Joseph P and Mellen, Chadwick K (2024) Sacubitril/valsartan compared to equivalent/sub-equivalent dose angiotensin receptor blocker or angiotensin-converting enzyme inhibitor in heart failure with reduced ejection fraction: a meta-analysis of randomized trials. European journal of clinical pharmacology 80(8): 1113-1120	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>Checked this SR - no studies identified</i>
Rivera-Martinez, Juan Carlos, Sabina, Michael, Khanani, Ageel et al. (2025) Effect of Finerenone in Cardiovascular and Renal Outcomes: A Systematic Review and Meta-analysis. Cardiovascular drugs and therapy	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>Checked and no extra studies identified</i>
Rogers JK, McMurray JJ, Pocock SJ et al. (2012) Eplerenone in patients with systolic heart failure and mild symptoms: analysis of repeat hospitalizations. Circulation 126(19): 2317-2323	- Population not relevant to this review protocol <i>Reduced LVEF</i>
Rogers, Jennifer K, Pocock, Stuart J, McMurray, John J V et al. (2014) Analysing recurrent hospitalizations in heart failure: a review of statistical methodology, with application to CHARM-Preserved. European journal of heart failure 16(1): 33-40	- Population not relevant to this review protocol <i>Participants with LVEF >40%. No subgroup data for HFmrEF</i>
Rohde, Luis E, Claggett, Brian L, Wolsk, Emil et al. (2021) Cardiac and Noncardiac Disease Burden and Treatment Effect of Sacubitril/Valsartan: Insights From a Combined PARAGON-HF and PARADIGM-HF Analysis. Circulation. Heart failure 14(3): e008052	- Data not reported in an extractable format or a format that can be analysed <i>Pooled analysis of two trials, one HFrEF and one HFmrEF</i>
Rossignol P, Dobre D, McMurray JJ et al. (2014) Incidence, determinants, and prognostic significance of hyperkalemia and worsening renal function in patients with heart failure receiving the mineralocorticoid receptor antagonist eplerenone or placebo in addition to optimal medical therapy: results from the Eplerenone in Mild Patients Hospitalization and	- Secondary publication of an included study that does not provide any additional relevant information <i>EMPHASIS-HF: post hoc analysis of hyperkalaemia occurrence based on baseline characteristics</i>

Study	Exclusion reason

(2020) Associations of Left Ventricular Structure and Function With Blood Pressure in Heart Failure With Preserved Ejection Fraction: Analysis of the TOPCAT Trial. <i>Journal of the American Heart Association</i> 9(15): e016009	- Population not relevant to this review protocol <i>Less than 80% of the population matches either protocol</i>
Weir, R A P, McMurray, John J V, Puu, Margareta et al. (2008) Efficacy and tolerability of adding an angiotensin receptor blocker in patients with heart failure already receiving an angiotensin-converting inhibitor plus aldosterone antagonist, with or without a beta blocker. Findings from the Candesartan in Heart failure: Assessment of Reduction in Mortality and morbidity (CHARM)-Added trial. <i>European journal of heart failure</i> 10(2): 157-63	- Publication type not relevant to review protocol <i>Subgroup by baseline background treatment</i>

Study	Exclusion reason
White, Harvey D, Aylward, Philip E G, Huang, Zhen et al. (2005) Mortality and morbidity remain high despite captopril and/or Valsartan therapy in elderly patients with left ventricular systolic dysfunction, heart failure, or both after acute myocardial infarction: results from the Valsartan in Acute Myocardial Infarction Trial (VALIANT). <i>Circulation</i> 112(22): 3391-9	- Population not relevant to this review protocol <i>Acute MI</i>
White, Michel, Lepage, Serge, Lavoie, Joel et al. (2007) Effects of combined candesartan and ACE inhibitors on BNP, markers of inflammation and oxidative stress, and glucose regulation in patients with symptomatic heart failure. <i>Journal of cardiac failure</i> 13(2): 86-94	- Population not relevant to this review protocol <i>Reduced LVEF</i>
Whorlow, S L and Krum, H (2000) Meta-analysis of effect of beta-blocker therapy on mortality in patients with New York Heart Association class IV chronic congestive heart failure. <i>The American journal of cardiology</i> 86(8): 886-9	- Systematic review indirectly matches the review protocol: used as source of primary studies - Systematic review does not contain sufficient detail for included studies: used as source of primary studies
Wijkman, Magnus O, Claggett, Brian, Vaduganathan, Muthiah et al. (2022) Effects of sacubitril/valsartan on glycemia in patients with diabetes and heart failure: the PARAGON-HF and PARADIGM-HF trials. <i>Cardiovascular diabetology</i> 21(1): 110	- Study does not contain any outcome data relevant to this review protocol
Wikstrand, J (2000) MERIT-HF--description of the trial. <i>Basic research in cardiology</i> 95suppl1: 190-7	- Comparator in study does not match that specified in this review protocol <i>HFrEF: not combination treatment</i>
Wikstrand, J, Wedel, H, Castagno, D et al. (2014) The large-scale placebo-controlled beta-blocker studies in systolic heart failure revisited: results from CIBIS-II, COPENICUS and SENIORS-SHF compared with stratified subsets from MERIT-HF. <i>Journal of internal medicine</i> 275(2): 134-43	- Study does not contain an intervention relevant to this review protocol <i>HFrEF: not combination therapy</i>
Wiley, G. and Cole, C. (2004) Candesartan reduces cardiovascular death in CHF patients on ACE inhibitor. <i>Journal of Family Practice</i> 53(2): 93-94	- Publication type not relevant to review protocol <i>Commentary/ summary of CHARM-Added trial</i>
Willenheimer, Ronnie, Erdmann, Erland, Follath, Ferenc et al. (2004) Comparison of treatment initiation with bisoprolol vs. enalapril in chronic heart failure patients: rationale and design of CIBIS-III. <i>European journal of heart failure</i> 6(4): 493-500	- Study does not contain an intervention relevant to this review protocol <i>The intervention is a monotherapy followed by both arms receiving the same therapies.</i>

Study	Exclusion reason
Willenheimer, Ronnie, Helmers, Claes, Pantev, Emil et al. (2002) Safety and efficacy of valsartan versus enalapril in heart failure patients. International journal of cardiology 85(23): 261-70	- Population not relevant to this review protocol <i>Mixed LVEF; mean not reported</i>
Willenheimer, Ronnie, van Veldhuisen, Dirk J, Silke, Bernard et al. (2005) Effect on survival and hospitalization of initiating treatment for chronic heart failure with bisoprolol followed by enalapril, as compared with the opposite sequence: results of the randomized Cardiac Insufficiency Bisoprolol Study (CIBIS) III. Circulation 112(16): 2426-35	- Comparator in study does not match that specified in this review protocol <i>Order of introducing beta blocker and ACEI</i>
Wisnibaugh, T, Katz, I, Davis, J et al. (1993) Long-term (3-month) effects of a new beta-blocker (nebivolol) on cardiac performance in dilated cardiomyopathy. Journal of the American College of Cardiology 21(5): 1094-1100	- Study does not contain an intervention relevant to this review protocol <i>HFrEF: not combination treatment</i>
Witchitz, S, Cohen-Solal, A, Dartois, N et al. (2000) Treatment of heart failure with celiprolol, a cardioselective beta blocker with beta-2 agonist vasodilatory properties. The CELICARD Group. American journal of cardiology 85(12): 1467-1471	- Study does not contain an intervention relevant to this review protocol <i>Unlicensed beta blockers</i>
Wiviott, SD, Raz, I, Bonaca, MP et al. (2019) Dapagliflozin and Cardiovascular Outcomes in Type 2 Diabetes. The New England journal of medicine 380(4): 347-357	- Population not relevant to this review protocol <i>Diabetes, not chronic heart failure (LVEF not reported for CHF subgroup outcomes)</i>
Wiviott, Stephen D, Raz, Itamar, Bonaca, Marc P et al. (2018) The design and rationale for the Dapagliflozin Effect on Cardiovascular Events (DECLARE)-TIMI 58 Trial. American heart journal 200: 83-89	- Population not relevant to this review protocol <i>People with type 2 diabetes with ASCVD or risk factors for ASCVD. A proportion could have heart failure.</i>
Wong, M, Staszewsky, L, Latini, R et al. (2002) Valsartan benefits left ventricular structure and function in heart failure: val-HeFT echocardiographic study. Journal of the American College of Cardiology 40(5): 970-975	- Study does not contain any outcome data relevant to this review protocol
Wu, Z., Cui, W., Li, G. et al. (2024) Effect of sacubitril and valsartan combined with conventional therapy on patients with heart failure. Tropical Journal of Pharmaceutical Research 23(9): 1541	- Data not reported in an extractable format or a format that can be analysed <i>Poorly reported. no LVEF entry criterion; insufficient detail on background treatment; FUP not reported</i>
Xiang, Boyang, Zhang, Ruiqi, Wu, Xiaoguang et al. (2022) Optimal Pharmacologic Treatment of Heart Failure With Preserved and Mildly Reduced Ejection Fraction: A Meta-analysis. JAMA network open 5(9): e2231963	- Systematic review does not contain a protocol population <i>NMA pools preserved and mildly reduced LVEF</i>

Study	Exclusion reason
Xiang, Boyang; Yu, Zongliang; Zhou, Xiang (2021) Comparative Efficacy of Medical Treatments for Chronic Heart Failure: A Network Meta-Analysis. <i>Frontiers in cardiovascular medicine</i> 8: 787810	- Systematic review does not contain sufficient detail for included studies: used as source of primary studies <i>Network meta analysis, which did not include all recent trials and included some interventions not relevant to the protocol. Drug class comparisons look relevant but a 50% threshold used to identify concomitant drugs.</i>
Xie, Liang, Li, Shengnan, Yu, Xiaojin et al. (2024) DAHOS Study: Efficacy of dapagliflozin in treating heart failure with reduced ejection fraction and obstructive sleep apnea syndrome - A 3-month, multicenter, randomized controlled clinical trial. <i>European journal of clinical pharmacology</i> 80(5): 771-780	- Population not relevant to this review protocol <i>Considered for exclusion but participants have sleep apnea as well as CHF. QoL outcomes likely affected by the sleep apnea. Excluded after consultation with topic advisor.</i>
Xin, Yan-Guo, Chen, Xin, Zhao, Yi-Nan et al. (2019) Outcomes of spironolactone treatment in patients in Northeast China suffering from heart failure with mid-range ejection fraction. <i>Current medical research and opinion</i> 35(4): 561-568	- Study design not relevant to this review protocol <i>Retrospective cohort study</i>
Yabe, Daisuke, Shiki, Kosuke, Homma, Gosuke et al. (2023) Efficacy and safety of the sodium-glucose co-transporter-2 inhibitor empagliflozin in elderly Japanese adults (≥ 65 years) with type 2 diabetes: A randomized, double-blind, placebo-controlled, 52-week clinical trial (EMPA-ELDERLY). <i>Diabetes, obesity & metabolism</i> 25(12): 3538-3548	- Population not relevant to this review protocol <i>Type 2 diabetes and CHF not specified</i>
Yamamoto, Kazuhiro, Origasa, Hideki, Hori, Masatsugu et al. (2013) Effects of carvedilol on heart failure with preserved ejection fraction: the Japanese Diastolic Heart Failure Study (J-DHF). <i>European journal of heart failure</i> 15(1): 110-8	- Population not relevant to this review protocol <i>Preserved LVEF</i>
Yan, Qingkai, Chen, Xinrao, Yu, Changqing et al. (2024) Long-term surrogate cardiovascular outcomes of SGLT2 inhibitor empagliflozin in chronic heart failure: a systematic review and meta-analysis. <i>BMC cardiovascular disorders</i> 24(1): 663	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>Checked and no further studies identified</i>
Yan, Yuling, Liu, Bin, Du, Jun et al. (2021) SGLT2i versus ARNI in heart failure with reduced ejection fraction: a systematic review and meta-analysis. <i>ESC heart failure</i> 8(3): 2210-2219	- Systematic review indirectly matches the review protocol: used as source of primary studies <i>Mix of HFrEF and HFpEF participants, intervention on drug and inappropriate follow-up period.</i>
Yang, Da-Ya, He, Xin, Liang, Hui-Wei et al. (2019) Comparative outcomes of heart failure among existent classes of anti-diabetic agents: a network meta-analysis of 171,253 participants	- Study does not contain an intervention relevant to this review protocol <i>Diabetic drugs for people with T2DM.</i>

Study	Exclusion reason
from 91 randomized controlled trials. Cardiovascular diabetology 18(1): 47	
Yang, Hua-Rong, Xu, Xiao-di, Shaikh, Abdul Sami et al. (2023) Efficacy and Safety of Sacubitril/Valsartan Compared With ACEI/ARB on Health-Related Quality of Life in Heart Failure Patients: A Meta-Analysis. The Annals of pharmacotherapy 57(8): 907-917	- Population not relevant to this review protocol <i>Subgroup analysis was by HFpEF and HFrEF but EF was not defined. The background treatment was unclear.</i>
Yang, Mingming, Henderson, Alasdair D, Talebi, Atefeh et al. (2024) Effect of Finerenone on the KCCQ in Patients With HFmrEF/HFpEF: A Prespecified Analysis of FINEARTS-HF. Journal of the American College of Cardiology	- Secondary publication of an included study that does not provide any additional relevant information
Yang, Pingping, Shen, Wen, Chen, Xi et al. (2019) Comparative efficacy and safety of mineralocorticoid receptor antagonists in heart failure: a network meta-analysis of randomized controlled trials. Heart failure reviews 24(5): 637-646	- Population not relevant to this review protocol <i>Population does not meet either specified protocol (ejection fraction less than or equal to 45%).</i>
Yang, S and Wang, D (2022) Effects of sakubitril valsartan combined with dagliflozin in the treatment of patients with HFrEF and the effect on serum cTn I and BNP levels. Chinese journal of clinical pharmacology and therapeutics 27(9): 1010-1015	- Study not reported in English <i>Not reported in English (Chinese)</i>
Yang, Zhao, Ma, Huayu, Yin, Delu et al. (2024) Impact of Sacubitril/Valsartan on Cardiac Structure and Blood Levels of miRNA-328 and NT-proBNP in Patients with CHD and Chronic Heart Failure. Alternative therapies in health and medicine	- Secondary publication of an included study that does not provide any additional relevant information <i>Secondary paper: no extra information</i>
Yasumura, Yoshio, Miyatake, Kunio, Okamoto, Hiroshi et al. (2004) Rationale for the use of combination angiotensin-converting enzyme inhibitor and angiotensin II receptor blocker therapy in heart failure. Circulation journal : official journal of the Japanese Circulation Society 68(4): 361-6	- Study does not contain any outcome data relevant to this review protocol
Yoshihara, Fumiki, Imazu, Miki, Hamasaki, Toshimitsu et al. (2018) An Exploratory Study of Dapagliflozin for the Attenuation of Albuminuria in Patients with Heart Failure and Type 2 Diabetes Mellitus (DAPPER). Cardiovascular drugs and therapy 32(2): 183-190	- Population not relevant to this review protocol <i>Unable to allocate to HFrEF or HFmEF based on inclusion criteria and baseline characteristics.</i>
Yoshihara, Fumiki, Imazu, Miki, Sakuma, Ichiro et al. (2023) DAPagliflozin for the attenuation of albuminuria in Patients with hEaRt failure and type 2 diabetes (DAPPER study): a multicentre, randomised, open-label, parallel-group, standard treatment-controlled trial. EClinicalMedicine 66: 102334	- Population not relevant to this review protocol <i>People with preserved ejection fraction (based on baseline characteristics)</i>

Study	Exclusion reason
Young, James B, Dunlap, Mark E, Pfeffer, Marc A et al. (2004) Mortality and morbidity reduction with Candesartan in patients with chronic heart failure and left ventricular systolic dysfunction: results of the CHARM low-left ventricular ejection fraction trials. Circulation 110(17): 2618-26	- Study does not contain an intervention relevant to this review protocol <i>Patients received monotherapy whilst not clear if 80% patients received approved background therapy</i>
Yu, Li-Tian, Zhu, Jun, Tan, Hui-Qiong et al. (2011) Telmisartan, ramipril, or both in high-risk Chinese patients: analysis of ONTARGET China data. Chinese medical journal 124(12): 1763-8	- Population not relevant to this review protocol <i>Mixture of high risk patients - not necessarily with HF. No details given on EF status</i>
Yu, Yu-Ling, Siwy, Justyna, An, De-Wei et al. (2024) Urinary proteomic signature of mineralocorticoid receptor antagonism by spironolactone: evidence from the HOMAGE trial. Heart (British Cardiac Society) 110(19): 1180-1187	- Population not relevant to this review protocol <i>At risk of CHF</i>
