

# Economic plan

This plan identifies the areas prioritised for economic modelling. The final analysis may differ from those described below. The rationale for any differences will be explained in the guideline.

## 1 Guideline

Decision-making and mental capacity

## 2 Modelling question

<b>Review question by scope area</b>	What interventions, tools and approaches are effective and cost effective in supporting advance planning for decision-making for people who may lack mental capacity?
Population	Older people in their last year of life
Interventions and comparators considered for inclusion	Intervention: People are offered advance care planning Comparator: Standard care (people are not offered advance care planning)
Perspective	NHS and Personal Social Services (PSS)
Outcomes	Cost per quality-adjusted life year (QALY) from the perspective of the carer
Type of analysis	Cost-utility analysis (decision tree)
Issues to note	This model included health-related quality of life of carers as this was supported by more robust evidence.  No subgroup analysis could be carried out due to lack of data; it is likely that certain groups would benefit differently.
