

Appendix C1a Economic plan - Short

Guideline

Decision making and mental capacity

List of modelling questions

Review question(s) by scope area	1a) What interventions, tools and approaches are effective and cost-effective in supporting advance planning for decision-making for people who may lack mental capacity?
Population	Older people in their last year of life
Interventions and comparators considered for inclusion	Intervention: People are offered advance care planning Comparator: Standard care (people are not offered advance care planning)
Perspective	NHS and Personal Social Services (PSS)
Outcomes	Health-related quality of life measured in quality-adjusted life years (QALYs) from the perspective of the carer
Type of analysis	Cost utility; decision-analytic modelling; probabilistic and one-way sensitivity analysis
Issues to note	This model included health-related quality of carers as this was supported by more robust evidence; no sub group analysis could be carried out due to lack of data but it is likely that certain groups benefit differently
