Presentation: lower Non-pregnant women urinary tract Consider a back-up antibiotic infection prescription or immediate antibiotic, (UTI) noting that the evidence for backup antibiotics was from women not needing immediate treatment With all antibiotic prescriptions, advise: possible adverse effects of If urine sent for culture and antibiotics include diarrhoea and susceptibility, and antibiotic given: nausea review antibiotic choice when seeking medical help if symptoms results available, and worsen at any time, do not improve change antibiotic for pregnant Give advice within 48 hours of taking the women if bacteria resistant about managing antibiotic, or the person becomes change antibiotic for children symptoms with very unwell and young people, men and self-care With a back-up antibiotic non-pregnant women if bacteria prescription, also advise: resistant and symptoms · antibiotic is not needed not improving immediately Use a narrow spectrum antibiotic use prescription if no improvement when possible in 48 hours or symptoms worsen at any time Pregnant women, men, or children and young people under 16 • Send midstream urine for culture and susceptibility for pregnant women and men Send urine for culture and susceptibility or dipstick in line with the NICE guideline on urinary tract infection for under 16s Offer immediate antibiotic Assess and manage fever in under 5s in line with the NICE guideline on fever in under 5s

Refer to hospital if a person aged 16 or over has any symptoms or signs suggesting a more serious illness or condition (for example, sepsis)

Refer children and young people to

Refer children and young people to hospital in line with the NICE guideline on urinary tract infection in under 16s

Reassess at any time if symptoms worsen rapidly or significantly or do not improve in 48 hours of taking antibiotics, sending a urine sample for culture and susceptibility if not already done. Take account of:

- other possible diagnoses
- any symptoms or signs suggesting a more serious illness or condition
- previous antibiotic use, which may have led to resistance

i

Background

 Lower UTI (cystitis) is a bladder infection usually caused by bacteria travelling up to the urethra from the gastrointestinal tract

Self-care

- Advise paracetamol for pain or, if preferred and suitable, ibuprofen
- Advise drinking enough fluid to avoid dehydration
- No evidence found for cranberry products or urine alkalinising agents to treat lower UTI

Antibiotics

when considering antibiotics, take account of severity of symptoms, risk of complications, previous urine culture and susceptibility results, previous antibiotic use which may have led to resistant bacteria and local antimicrobial resistance data

Asymptomatic bacteriuria

- Asymptomatic bacteriuria is significant levels of bacteria in urine with no UTI symptoms
- Treated in pregnant women because risk factor for pyelonephritis and premature delivery
- Not screened for or treated in non-pregnant women, men, children or young people

Choice of antibiotic: non-pregnant women aged 16 years and over		
Antibiotic	Dosage and course length	
If there are symptoms of pyelonephritis (such as fever) or a complicated UTI, see the NICE guideline on acute pyelonephritis for antibiotic choices		
First choice		
Nitrofurantoin: if estimated glomerular filtration rate (eGFR) 45 ml/minute or more	100 mg modified-release twice a day (or if unavailable, 50 mg four times a day) for 3 days	
Trimethoprim: if low risk of resistance	200 mg twice a day for 3 days	
Second choice (no improvement in lower UTI symptoms on first choice taken for at least 48 hours, or when first choice not suitable)		
Nitrofurantoin: if eGFR 45 ml/minute or more and not first choice	100 mg modified-release twice a day (or if unavailable, 50 mg four times a day) for 3 days	
Pivmecillinam (a penicillin)	400 mg initial dose, then 200 mg three times a day for a total of 3 days	
Fosfomycin	3 g single-dose sachet	

Notes

For **all antibiotics**: See BNF for use and dosing in specific populations, for example, hepatic impairment, renal impairment and breast-feeding. Doses given are by mouth using immediate-release medicines, unless otherwise stated. Check any previous urine culture and susceptibility results and antibiotic prescribing and choose antibiotics accordingly.

Nitrofurantoin: See the MHRA advice on monitoring for pulmonary and hepatic adverse reactions to nitrofurantoin. May be used with caution if eGFR 30 to 44 ml/minute to treat uncomplicated lower UTI caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk (BNF, August 2018).

Trimethoprim: A lower risk of resistance may be more likely if not used in the past 3 months, previous urine culture suggests susceptibility (but this was not used), and in younger people in areas where local epidemiology data suggests resistance is low. A higher risk of resistance may be more likely with recent use and in older people in residential facilities.

Choice of antibiotic: children and young people under 16 years			
Antibiotic	Dosage and course length		
If there are symptoms of pyelonephritis (such as fever) or a complicated UTI, see the NICE guideline on acute pyelonephritis for antibiotic choices			
Refer children under 3 months to paediatric specialist and treat with intravenous antibiotics in line with the NICE guideline on fever in under 5s			
Children aged 3 months and over: first choice			
Trimethoprim: if low risk of resistance	3 to 5 months, 4 mg/kg (maximum 200 mg per dose) or 25 mg twice a day for 3 days 6 months to 5 years, 4 mg/kg (maximum 200 mg per dose) or 50 mg twice a day for 3 days 6 to 11 years, 4 mg/kg (maximum 200 mg per dose) or 100 mg twice a day for 3 days 12 to 15 years, 200 mg twice a day for 3 days		
Nitrofurantoin: if eGFR 45 ml/minute or more	3 months to 11 years, 750 micrograms/kg four times a day for 3 days 12 to 15 years, 50 mg four times a day or 100 mg modified-release twice a day for 3 days		
Children aged 3 months and over: second choice (worsening lower UTI symptoms on first choice taken for at least 48 hours or when first choice not suitable)			
Nitrofurantoin: if eGFR 45 ml/minute or more and not first choice	3 months to 11 years, 750 micrograms/kg four times a day for 3 days 12 to 15 years, 50 mg four times a day or 100 mg modified-release twice a day for 3 days		
Amoxicillin (only if culture results available and susceptible)	3 to 11 months, 125 mg three times a day for 3 days 1 to 4 years, 250 mg three times a day for 3 days 5 to 15 years, 500 mg three times a day for 3 days		
Cefalexin	3 to 11 months, 12.5 mg/kg or 125 mg twice a day for 3 days 1 to 4 years, 12.5 mg/kg twice a day or 125 mg three times a day for 3 days 5 to 11 years, 12.5 mg/kg twice a day or 250 mg three times a day for 3 days 12 to 15 years, 500 mg twice a day for 3 days		

Notes

For all antibiotics: See BNF for children (BNFC) for use and dosing in specific populations. Age bands apply to children of average size; in practice the prescriber will use these with other factors. Doses given are by mouth using immediate release medicines, unless otherwise stated. Check previous urine culture and susceptibility results and antibiotic prescribing. If receiving prophylactic antibiotics, treatment should be with a different antibiotic. If 2 or more antibiotics are appropriate, choose the one with the lowest acquisition cost. Some children may also be able to take a tablet or part-tablet, rather than a liquid formulation if the dose is appropriate.

Trimethoprim: A lower risk of resistance may be more likely if not used in the past 3 months, previous urine culture suggests susceptibility (but this was not used), and in younger people in areas where data suggests resistance is low. Risk of resistance may be higher with recent use and in older people in care homes.

Nitrofurantoin: See the MHRA advice on monitoring for pulmonary and hepatic adverse reactions to nitrofurantoin. May be used with caution if eGFR 30 to 44 ml/minute to treat uncomplicated lower UTI caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk (BNFC, August 2018).

Choice of antibiotic: pregnant women aged 12 years and over				
Antibiotic	Dosage and course length			
If there are symptoms of pyelonephritis (such as fever) or a complicated UTI, see the <u>NICE</u> <u>guideline on acute pyelonephritis</u> for antibiotic choices				
First choice for treating lower UTI				
Nitrofurantoin (avoid at term): if eGFR 45 ml/minute or more	100 mg modified-release twice a day (or if unavailable, 50 mg four times a day) for 7 days			
Second choice for treating lower UTI (no improvement in lower UTI symptoms on first choice taken for at least 48 hours or when first choice not suitable)				
Amoxicillin (only if culture results available and susceptible)	500 mg three times a day for 7 days			
Cefalexin	500 mg twice a day for 7 days			
Alternative second choices: consult local microbiologist; choose antibiotics based on culture				

Treating asymptomatic bacteriuria: choose from nitrofurantoin, amoxicillin or cefalexin based on

Choice of unusione. Hen aged to years and ever				
Antibiotic	Dosage and course length			
If there are symptoms of pyelonephritis (such as fever) or a complicated UTI, see the <u>NICE</u> <u>guideline on acute pyelonephritis</u> for antibiotic choices				
First choice				
Trimethoprim	200 mg twice a day for 7 days			
Nitrofurantoin: if eGFR 45 ml/minute or more	100 mg modified-release twice a day (or if unavailable, 50 mg four times a day) for 7 days			

Choice of antibiotic: men aged 16 years and over

Second choice (no improvement in UTI symptoms on first choice taken for at least 48 hours or when first choice not suitable): consider alternative diagnoses and follow recommendations in the NICE antimicrobial prescribing guidelines on acute pyelonephritis or acute prostatitis, basing antibiotic choice on recent culture and susceptibility results

Notes

and susceptibility results

recent culture and susceptibility results

For **all antibiotics**: See BNF for appropriate use and dosing in specific populations, for example, hepatic impairment and renal impairment. Doses given are by mouth using immediate-release medicines, unless otherwise stated. Check any previous urine culture and susceptibility results and antibiotic prescribing and choose antibiotics accordingly.

Nitrofurantoin: See the MHRA advice on monitoring for pulmonary and hepatic adverse reactions to nitrofurantoin. Avoid at term in pregnancy; may produce neonatal haemolysis (BNF, June 2018). Not recommended for men with suspected prostate involvement because it is unlikely to reach therapeutic levels in the prostate. May be used with caution if eGFR 30 to 44 ml/minute to treat uncomplicated lower UTI caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk (BNF, August 2018).
