

## Postnatal care

### [A] Length of postpartum stay

*NICE guideline <TBC>*

*Evidence review*

*October 2020*

*Draft for consultation*

*These evidence reviews were developed by the National Guideline Alliance part of the Royal College of Obstetricians and Gynaecologists*

## **Disclaimer**

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the [Welsh Government](#), [Scottish Government](#), and [Northern Ireland Executive](#). All NICE guidance is subject to regular review and may be updated or withdrawn.

# 1 Length of postpartum stay

2 This evidence review supports recommendations 1.1.1 and 1.1.2.

## 3 Review question

4 This evidence report contains information on two review questions relating to length  
5 of postpartum stay:

- 6 • How does the length of postpartum stay affect women and their babies (single  
7 births)?
- 8 • How does the length of postpartum stay affect women and their babies (twins and  
9 triplets)?

## 10 Introduction

11 The length of time that women spend in postnatal wards following a normal delivery  
12 has progressively shortened. It is now usual for women to go home a few hours after  
13 delivery. While most women are keen to return home as soon as possible, there may  
14 be a risk of being discharged before they feel ready. The committee was also  
15 concerned that short stays might be associated with subsequent problems such as  
16 postpartum haemorrhage or infection, leading to some readmission to hospital and  
17 emotional upset to mothers, as well as additional health service costs. The aim of this  
18 review is to determine how length of postpartum stay impacts on the outcomes of  
19 women and babies and whether there is an optimal length of stay. In this review, the  
20 term 'discharge' is used to express the transfer of care from place of birth to the  
21 home setting.

## 22 Summary of the protocol

23 Please see Table 1 for a summary of the Population, Intervention, Comparison and  
24 Outcome (PICO) characteristics of this review.

### 25 Table 1: Summary of the protocol (PICO table)

<b>Population</b>	Pregnant women and women who have given birth vaginally to a healthy baby at term (or to healthy twins or triplets) in a hospital or standalone birth centre. All types of vaginal deliveries, including instrumental deliveries, will be considered.
<b>Intervention</b>	Early discharge defined as a shorter length of hospital stay than the comparator.
<b>Comparison</b>	Late discharge, defined as a length of hospital stay that is longer than the intervention.
<b>Outcomes</b>	<b>Critical</b> <ul style="list-style-type: none"><li>• maternal mortality</li><li>• neonatal mortality</li></ul> <b>Important</b> <ul style="list-style-type: none"><li>• proportion of women with unplanned attendance for complications related to childbirth or feeding (for example postpartum haemorrhage, retained products of conception, infection, postpartum psychosis) in the first six weeks after the birth</li><li>• proportion of women scoring above the cut-off score indicating probable depression or anxiety on a well-validated standardised</li></ul>

instrument at six to eight weeks, three months and six months after the birth. If data at 6 to 8 weeks is not available, use follow-ups between 3 and 5 weeks

- proportion of women breastfeeding (exclusively or partially) at six weeks, 12 weeks and six months after the birth. If data at 6 weeks is not available, use follow-ups between 3 and 8 weeks
- proportion of women satisfied with their postnatal care
- proportion of infants' unplanned attendance for neonatal morbidity (including jaundice, dehydration, infections or for feeding problems) within 28 days.

1 For further details see the review protocol in appendix A.

## 2 **Methods and process**

3 This evidence review was developed using the methods and process described in  
4 [Developing NICE guidelines: the manual 2014](#). Methods specific to this review  
5 question are described in the review protocol in appendix A.

6 Declarations of interest were recorded according to NICE's 2014 conflicts of interest  
7 policy until March 2018. From April 2018 until June 2019, declarations of interest  
8 were recorded according to NICE's 2018 conflicts of interest policy. From July 2019  
9 onwards, the declarations of interest were recorded according to NICE's 2019  
10 [conflicts of interest policy](#). Those interests declared before July 2019 were  
11 reclassified according to NICE's 2019 conflicts of interest policy (see Register of  
12 Interests).

## 13 **Clinical evidence**

### 14 **Included studies**

15 Nine randomised controlled trials (RCTs) identified from a systematic review (Brown  
16 2002) on early postnatal discharge from hospital for healthy mothers and term infants  
17 were included in this review. The 9 studies compared early and late postnatal  
18 discharge (Boulvain 2004; Carty 1990; Gagnon 1997; Hellman 1962; Sainz Bueno  
19 2005; Smith-Hanrahan 1995; Waldenström 1987; Winterburn 2000; Yanover 1976).  
20 The timing of 'early' and 'late' discharge differed between the studies. The systematic  
21 review was used to extract relevant information on these 9 trials, but the original  
22 articles were also sought to extract additional information. For 1 study (Waldenström  
23 1987) 4 publications were included and for another study (Carty 1990) 2 publications  
24 were included. For the rest of the studies, 1 publication was included for each study.

25 All studies were designed to select women at low medical risk. All studies only  
26 included women with a vaginal birth, except for two studies (Boulvain 2004 and  
27 Winterburn 2000), which included a proportion of women with caesarean sections  
28 (11% and 19%, respectively). Three studies reported that all women had a singleton  
29 birth (Boulvain 2004, Gagnon 1997, Waldenström 1987). Five studies did not report  
30 whether women had singleton or multiple births (Carty 1990, Gagnon 1997, Hellman  
31 1962, Sainz Bueno 2005, Smith-Hanrahan 1995). One study reported that there were  
32 3 women with multiple births (Winterburn 2000). All studies recruited both  
33 primiparous and multiparous women except for 1 study that recruited first-time  
34 mothers (Winterburn 2000).

35 The included studies are summarised in Table 2.

1 See the literature search strategy in appendix B and study selection flow chart in  
2 appendix C.

### 3 Excluded studies

4 Studies not included in this review with reasons for their exclusion are provided in  
5 appendix K.

### 6 Summary of clinical studies included in the evidence review

7 Summaries of the studies that were included in this review are presented in Table 2.

8 **Table 2: Summary of included studies**

Study	Population	Intervention and Comparison	Outcomes
Boulvain 2004 RCT Switzerland	N=459 women randomised <ul style="list-style-type: none"> <li>• Early discharge: n=228</li> <li>• Late discharge: n=231</li> </ul> Minority of women had caesarean section (CS): early discharge: 24/228 (11%) had CS; late discharge: 27/231 (12%) had CS.	<ul style="list-style-type: none"> <li>• Early discharge: between 24 and 48 hours following vaginal births and between 72 and 84 hours after CS</li> <li>• Late discharge: 4 to 5 days following vaginal births and 6 to 7 days after CS</li> </ul> Both groups received minimum 2 nurse home visits and 10 phone calls; number and timing were determined by the family	<ul style="list-style-type: none"> <li>• Proportion of women readmitted within 6 weeks</li> <li>• Proportion of women with 1 or more visits to a gynaecologist during the first month</li> <li>• Proportion of women depressed at 28 days</li> <li>• Proportion of women breastfeeding at one month and at 6 months</li> <li>• Maternal dissatisfaction with postnatal care</li> <li>• Proportion of infants with 2 or more visits to a paediatrician during the first month</li> <li>• Proportion of infants readmitted within 8 weeks</li> </ul>
Carty 1990 RCT Canada	N=131 women randomised (189 women volunteered to take part in the study but 58 were later found to be not eligible or withdrew consent) <ul style="list-style-type: none"> <li>• Early discharge group 1: n=44</li> <li>• Early discharge group 2: n=49</li> <li>• Late discharge: n=38</li> </ul> Women with normal labour and vaginal birth	<ul style="list-style-type: none"> <li>• Early discharge group 1: 12 to 24 hours + 5 home visits post discharge</li> <li>• Early discharge group 2: 25 to 48 hours + 3 home visits post discharge</li> <li>• Late discharge: 4 days + 1 home visit post discharge</li> </ul> All women also received one home visit antenatally by a nurse.  Study nurses participated in two	<ul style="list-style-type: none"> <li>• Proportion of women readmitted within 6 weeks</li> <li>• Proportion of women with maternal problems requiring physician referral in the first 10 days</li> <li>• Proportion of women breastfeeding exclusively at 1 month</li> <li>• Proportion of infants requiring physician referrals for infant health issues in the first 10 days</li> </ul>

Study	Population	Intervention and Comparison	Outcomes
		weeks special training for the early discharge program.	
Gagnon 1997 RCT Canada	N=360 women randomised <ul style="list-style-type: none"> <li>• Early discharge: n=183 randomised, n=78 final number analysed</li> <li>• Late discharge: n=177 randomised, n=97 final number analysed</li> </ul> <p>Women with normal pregnancy (no medical conditions and no breech) and vaginal birth</p>	<ul style="list-style-type: none"> <li>• Early discharge at 6 to 36 hours + 1 home visit or phone call antenatally, 2 post discharge home visits and 2 phone calls</li> <li>• Late discharge: at 48 to 72 hours + follow-up as determined by physicians</li> </ul>	<ul style="list-style-type: none"> <li>• Proportion of women breastfeeding at 1 month</li> <li>• Infant health service contacts with health services at 1 month</li> </ul>
Hellman 1962 RCT US	N=2257 (the authors pre-specified a control sample of 10%) <ul style="list-style-type: none"> <li>• Early discharge: n=1941</li> <li>• Late discharge: n=316</li> </ul> <p>Women with vaginal live births.</p> <p>Baby gestation not specified, babies predominantly &gt;2500 g.</p>	<ul style="list-style-type: none"> <li>• Early discharge before 72 hours + 3 home visits post discharge</li> <li>• Late discharge: after 5 days + 2 visits post discharge</li> </ul> <p>Post discharge home visits were conducted by midwife for examination of mother and baby.</p>	<ul style="list-style-type: none"> <li>• Neonatal mortality</li> <li>• Proportion of women readmitted within 6 weeks</li> <li>• Proportion of women breastfeeding at 3 weeks</li> <li>• Proportion of infants readmitted within 8 weeks</li> </ul>
Sainz Bueno 2005 RCT Spain	N=430 women randomised <ul style="list-style-type: none"> <li>• Early discharge: n=213</li> <li>• Late discharge: n=217</li> </ul>	<ul style="list-style-type: none"> <li>• Early discharge &lt;24 hours + monitored at home for first 24 to 48 hours post discharge by qualified nurse</li> <li>• Late discharge: ≥48 hours</li> </ul>	<ul style="list-style-type: none"> <li>• Proportion probably depressed at 4 weeks</li> <li>• Proportion of women breastfeeding at 1 month, 3 months and 6 months</li> <li>• Proportion of women dissatisfied with postnatal care</li> <li>• Proportion of infants readmitted within 8 weeks</li> </ul>

Study	Population	Intervention and Comparison	Outcomes
	Primiparous and multiparous women with vaginal birth.  ≥37 week gestation with baby of appropriate weight for gestational age.	Women in both groups attended visit in clinic at 7 to 10 days postpartum	
Smith-Hanrahan 1995  RCT  Canada	N=125 randomised <ul style="list-style-type: none"> <li>• Early discharge: n=58</li> <li>• Late discharge: n=67</li> </ul> Vaginal births. No obstetrical complications and no infant complications.  Another adult present at home at least 12 hours per day for first two days post discharge was an inclusion criteria.	<ul style="list-style-type: none"> <li>• Early discharge: &lt;60 hours + usual visits + extra phone support. Early group received phone call from nurse within 24 hours of discharge leading to a decision to visit or continue to consult by phone; also received phone number to contact at any time. Followed by usual visits.</li> <li>• Late discharge: &gt;60 hours + usual visits. Usual visits were to paediatric office at 2 weeks and obstetric office at 6 weeks</li> </ul>	<ul style="list-style-type: none"> <li>• Proportion of women readmitted within 6 weeks</li> <li>• Proportion of women breastfeeding at 6 weeks</li> <li>• Proportion of infants readmitted within 8 weeks</li> </ul>
Waldenström 1987  RCT  Sweden	N=164 women randomised <ul style="list-style-type: none"> <li>• Early discharge: n=85 randomised, n=50 final number analysed</li> <li>• Late discharge: n=79 randomised, n=54 final number analysed</li> <li>• Vaginal births, singleton, pregnancy and birth free from significant complications,</li> </ul>	<ul style="list-style-type: none"> <li>• Early discharge: 24 to 48 hours + 1 antenatal nurse home visit, daily nurse home visits for 3 to 4 days post discharge, visit to hospital on day 5 for paediatric examination</li> <li>• Late discharge: &gt;48 hours + no visit post discharge</li> </ul>	<ul style="list-style-type: none"> <li>• Neonatal mortality</li> <li>• Proportion of women depressed at 6 weeks</li> <li>• Proportion of women breastfeeding at 2 and 6 months</li> <li>• Maternal dissatisfaction with care</li> <li>• Proportion of infants readmitted within 8 weeks</li> </ul>

Study	Population	Intervention and Comparison	Outcomes
	gestational age >37 weeks		
Winterburn 2000 RCT UK	<p>N=255 women recruited, 248 completed the study</p> <ul style="list-style-type: none"> <li>• Early discharge: n=121 randomised (only 31 experienced a short stay, 90 went home late).</li> <li>• Late discharge: n=127 (107 experienced a long stay, 20 went home early)</li> </ul> <p>47/248 (19%) had CS.</p>	<ul style="list-style-type: none"> <li>• Early discharge: 6 to 48 hours after vaginal births</li> <li>• Late discharge: &gt;48 hours</li> </ul> <p>Both groups received midwife home visits to support breastfeeding (number of visits and over what time period not reported)</p>	<ul style="list-style-type: none"> <li>• Proportion of women breastfeeding at 1 month</li> </ul>
Yanover 1976 RCT US	<p>N=128 recruited and randomised. 40 did not complete participation.</p> <ul style="list-style-type: none"> <li>• Early discharge: n=44</li> <li>• Late discharge: n=44</li> </ul>	<ul style="list-style-type: none"> <li>• Early discharge: 12 to 48 hours postpartum. Prenatal early discharge preparation classes; daily home visits through 4th day postpartum; nursing staff was intensively trained</li> <li>• Late discharge: &gt;48 hours postpartum; prenatal education; paediatric visit at 2 weeks postpartum; obstetric visit at 6 weeks</li> </ul>	<ul style="list-style-type: none"> <li>• Proportion of women readmitted within 6 weeks</li> <li>• Proportion of infants readmitted within 8 weeks</li> </ul>

1 All times indicated in the table are postpartum, for example, at 2 weeks means 2 weeks postpartum.

2 CS: caesarean section; RCT: randomised controlled trial

3 See the full evidence tables in appendix D and the forest plots in appendix E.

#### 4 Quality assessment of studies included in the evidence review

5 See the evidence profiles in appendix F.

## 1 Economic evidence

### 2 Included studies

3 One economic study was identified which was relevant to this review (Petrou 2004).

4 A single economic search was undertaken for all topics included in the scope of this  
5 guideline. See the literature search strategy in appendix B and economic study  
6 selection flow chart in appendix G.

### 7 Excluded studies

8 Three studies were reviewed at full text and excluded from this review. Economic  
9 studies not included in this review are listed, and reasons for their exclusion are  
10 provided, in appendix K.

## 11 Summary of the study included in the economic evidence review

12 Petrou 2004 conducted a cost-minimisation analysis alongside a pragmatic RCT  
13 (Boulvain 2004; N=459) to assess the cost effectiveness of early postnatal discharge  
14 (scheduled for 24-48 hours after a vaginal delivery or 72-96 hours after a caesarean  
15 section) combined with home midwifery support compared with traditional postnatal  
16 discharge (scheduled for 4-5 days after a vaginal delivery or 6-7 days after a  
17 caesarean section) without subsequent home midwifery support unless clinically  
18 indicated for women who delivered a single infant at term following an uncomplicated  
19 pregnancy in a hospital in an urban area in Switzerland. The analysis adopted a  
20 societal perspective; direct costs were also analysed separately. The time horizon of  
21 cost measurement was from discharge from delivery suite and up to 28 days  
22 postpartum. Costs included hospital and community health and social services  
23 (postnatal care, hospital readmissions, outpatient care, community health and social  
24 care, costs borne by women and their informal carers, and productivity losses). Local  
25 prices were used.

26 The RCT on which the cost-minimisation analysis was based had not shown any  
27 statistically significant difference between the two strategies in the pre-specified  
28 clinical or psychosocial outcomes, which comprised the proportion of women  
29 continuing breastfeeding beyond 28 days postpartum, the total duration of  
30 breastfeeding, the women's satisfaction with the care received by themselves and  
31 their infants, as well as maternal and neonatal safety.

32 The number of post-discharge midwifery contacts was higher in the earlier discharge  
33 group (mean 4.7, standard deviation [SD] 2.3) compared with the traditional  
34 discharge group (mean 1.8, SD 2.1), leading to a significantly higher community care  
35 cost for the early discharge group. On the other hand, as expected, the cost of  
36 planned postnatal hospital care (that is, pre-discharge) was significantly lower in the  
37 earlier discharge group compared with the traditional discharge group. Costs of  
38 hospital readmissions and outpatient visit costs did not differ significantly between  
39 the two groups. Earlier discharge was found to be overall significantly less costly than  
40 traditional discharge in terms of both societal and direct costs, and therefore it was  
41 the dominant option as the two options had similar effects. Results were robust to  
42 25% changes in staff costs, a 20% change in occupied bed-days, a 30% change in  
43 community service utilisation, and the use of 95% confidence interval (CI) of levels of  
44 home midwifery support. The study is partially applicable to the NICE decision-  
45 making context as it was conducted in Switzerland, where routine practice, resource  
46 use and unit costs may be different from the UK. It also needs to be noted that 11%  
47 of women in the study had a caesarean section, and therefore they were different

1 from the population in the guideline review question. The study is characterised by  
2 minor limitations.

3 See the economic evidence table in appendix H and the economic evidence profile in  
4 appendix I.

## 5 **Economic model**

6 No economic modelling was conducted for these review questions because there  
7 was no adequate evidence to suggest significant differences between early and late  
8 discharge in terms of unplanned attendances for women and babies, and therefore  
9 no major resource implications were anticipated to be related to these review  
10 questions.

## 11 **Evidence statements**

### 12 **Clinical evidence statements**

#### 13 ***Comparison 1. Discharge at 12 to 24 hours versus 25 to 48 hour***

##### 14 **Critical outcomes**

##### 15 **Maternal mortality**

16 No evidence was identified for this outcome.

##### 17 **Neonatal mortality**

18 No evidence was identified for this outcome.

##### 19 **Important outcomes**

##### 20 **Proportion of women with unplanned attendance for complications related to** 21 **childbirth or feeding**

- 22 • Very low quality evidence from 1 RCT (N=93 women and their babies) found no  
23 clinically significant difference in the proportion of women requiring physician  
24 referral within 10 days postpartum between women discharged early (12 to 24  
25 hours + 5 home visits post discharge) and women discharged late (25 to 48 hours  
26 + 3 home visits post discharge). All women also received 1 home visit antenatally  
27 by a nurse.

##### 28 **Proportion of women scoring above the cut-off score indicating probable** 29 **depression or anxiety**

30 No evidence was identified for this outcome.

##### 31 **Proportion of women breastfeeding**

32 No evidence was identified for this outcome.

##### 33 **Proportion of women satisfied with their postnatal care**

34 No evidence was identified for this outcome.

##### 35 **Proportion of infants' unplanned attendance for neonatal morbidity**

36 No evidence was identified for this outcome.

1 **Comparison 2. Discharge at <24 hours versus >48 hours**

2 **Critical outcomes**

3 **Maternal mortality**

4 No evidence was identified for this outcome.

5 **Neonatal mortality**

6 No evidence was identified for this outcome.

7 **Important outcomes**

8 **Proportion of women with unplanned attendance for complications related to**  
9 **childbirth or feeding**

- 10 • Very low quality evidence from 1 RCT (N=430 women and their babies) found no  
11 clinically significant difference in the proportion of women readmitted within 6  
12 weeks between women discharged early (<24 hours + monitored at home for first  
13 24 to 48 hours post discharge by qualified nurse) and women discharged late  
14 (≥48 hours). Women in both groups attended a visit in a clinic at 7 to 10 days  
15 postpartum.

16 **Proportion of women scoring above the cut-off score indicating probable**  
17 **depression or anxiety**

- 18 • Low quality evidence from 1 RCT (N=430 women and their babies) found no  
19 clinically significant difference in the proportion of women probably depressed  
20 between women discharged early (<24 hours + monitored at home for first 24 to  
21 48 hours post discharge by qualified nurse) and women discharged late (≥48  
22 hours). Women in both groups attended a visit in a clinic at 7 to 10 days  
23 postpartum.

24 **Proportion of women breastfeeding**

- 25 • Low quality evidence from 1 RCT (N=430 women and their babies) found no  
26 clinically significant difference in the proportion of women breastfeeding at 1  
27 month between women discharged early (<24 hours + monitored at home for first  
28 24 to 48 hours post discharge by qualified nurse) and women discharged late  
29 (≥48 hours). Women in both groups attended a visit in a clinic at 7 to 10 days  
30 postpartum. Low quality evidence from the same study found a clinically  
31 significant higher proportion of women breastfeeding at 12 weeks in the early  
32 discharge group compared to the late discharge group. Very low quality evidence  
33 from the same study also found that there may be a clinically significant higher  
34 proportion of women breastfeeding at 6 months in the early discharge group  
35 compared to the later discharge group, however there is some uncertainty in the  
36 effect estimate.

37 **Proportion of women dissatisfied with their postnatal care**

- 38 • Low quality evidence from 1 RCT (N=297 women and their babies) found a  
39 clinically significant lower proportion of women dissatisfied with postnatal care in  
40 the early discharge group (<24 hours + monitored at home for the first 24 to 48  
41 hours post discharge by qualified nurse) compared to the late discharge group  
42 (≥48 hours). Women in both groups attended a visit in a clinic at 7 to 10 days  
43 postpartum.

44 **Proportion of infants' unplanned attendance for neonatal morbidity**

- 1 • Very low quality evidence from 1 RCT (N=430 women and their babies) found no  
2 clinically significant difference in health service consultations for neonate  
3 pathology in the first 28 days between the group discharged early (<24 hours +  
4 monitored at home for first 24 to 48 hours post discharge by qualified nurse) and  
5 the group discharged late (≥48 hours). Both groups attended a visit in a clinic at 7  
6 to 10 days postpartum.  
7
- 8 • Very low quality evidence from 1 RCT (N=430 women and their babies) found no  
9 clinically significant difference in the proportion of infants readmitted within 8  
10 weeks between women discharged early (<24 hours + monitored at home for first  
11 24 to 48 hours post discharge by qualified nurse) and women discharged late  
12 (≥48 hours). Women in both groups attended a visit in a clinic at 7 to 10 days  
13 postpartum.

### 14 **Comparison 3. Discharge at 6 to 36 hours versus 48 to 72 hours**

#### 15 **Critical outcomes**

##### 16 **Maternal mortality**

17 No evidence was identified for this outcome.

##### 18 **Neonatal mortality**

19 No evidence was identified for this outcome.

#### 20 **Important outcomes**

##### 21 **Proportion of women with unplanned attendance for complications related to** 22 **childbirth or feeding**

23 No evidence was identified for this outcome.

##### 24 **Proportion of women scoring above the cut-off score indicating probable** 25 **depression or anxiety**

26 No evidence was identified for this outcome.

##### 27 **Proportion of women breastfeeding**

- 28 • Very low quality evidence from 1 RCT (N=175 women and their babies) found a  
29 clinically significant higher proportion of women breastfeeding at one month in the  
30 group discharged early (at 6 to 36 hours + 1 home visit or phone call antenatally,  
31 2 post discharge home visits and 2 phone calls) compared to those discharged  
32 late (at 48 to 72 hours + follow-up as determined by physicians).

##### 33 **Proportion of women satisfied with their postnatal care**

34 No evidence was identified for this outcome.

##### 35 **Proportion of infants' unplanned attendance for neonatal morbidity**

- 36 • Very low quality evidence from 1 RCT (N=175 women and their babies) found no  
37 clinically significant difference in the number of health service contacts at 1 month  
38 between the group discharged early (at 6 to 36 hours + 1 home visit or phone call  
39 antenatally, 2 post discharge home visits and 2 phone calls) and those  
40 discharged late (at 48 to 72 hours + follow-up as determined by physicians).

1 **Comparison 4. Discharge at  $\leq 48$  hours versus  $>48$  hours**

2 **Critical outcomes**

3 **Maternal mortality**

4 No evidence was identified for this outcome.

5 **Neonatal mortality**

- 6 • Very low quality evidence from 1 RCT (N=104 women and their babies) found no  
7 neonatal deaths in the group discharged early (24 to 48 hours + 1 antenatal  
8 nurse home visit, daily nurse home visits for 3 to 4 days post discharge, visit to  
9 hospital on day 5) and the group discharged late ( $>48$  hours + no visit post  
10 discharge).

11 **Important outcomes**

12 **Proportion of women with unplanned attendance for complications related to**  
13 **childbirth or feeding**

- 14 • Very low quality evidence from 2 RCTs (N=192) found no clinically significant  
15 difference in the proportion of women readmitted within 6 weeks between women  
16 discharged early ( $\leq 48$  hours + home visits post discharge) and women  
17 discharged late ( $>48$  hours and no home visits post discharge).

18 **Proportion of women scoring above the cut-off score indicating probable**  
19 **depression or anxiety**

20 No evidence was identified for this outcome.

21 **Proportion of women breastfeeding**

- 22 • Very low quality evidence from 2 RCTs (n=349 women and their babies) found no  
23 clinically significant difference in the proportion of women breastfeeding in the  
24 first 8 weeks between women discharged early ( $\leq 48$  hours + home visits post  
25 discharge) and women discharged late ( $>48$  hours; one study: no visit post  
26 discharge, one study: midwife home visits to support breastfeeding).  
27  
28 • Very low quality evidence from 1 RCT (N=108 women and their babies) found no  
29 clinically significant difference in the proportion of women breastfeeding at 6  
30 months between women discharged early (24 to 48 hours + 1 antenatal nurse  
31 home visit, daily nurse home visits for 3 to 4 days post discharge, visit to hospital  
32 on day 5) and women discharged late ( $>48$  hours + no visit post discharge).

33 **Proportion of women dissatisfied with their postnatal care**

- 34 • Moderate quality evidence from 1 RCT (N=104 women and their babies) found a  
35 clinically significant lower proportion of women dissatisfied with postnatal care in  
36 the group discharged early (24 to 48 hours + 1 antenatal nurse home visit, daily  
37 nurse home visits for 3 to 4 days post discharge, visit to hospital on day 5)  
38 compared to those discharged late ( $>48$  hours + no visit post discharge).

39 **Proportion of infants' unplanned attendance for neonatal morbidity**

- 40 • Very low quality evidence from 2 RCTs (N=192) found no clinically significant  
41 difference in the proportion of infants readmitted within 8 weeks between women  
42 discharged early ( $\leq 48$  hours + home visits post discharge) and women  
43 discharged late ( $>48$  hours and no home visits post discharge).

1 **Comparison 5. Discharge at <60 hours versus >60 hours**

2 **Critical outcomes**

3 **Maternal mortality**

4 No evidence was identified for this outcome.

5 **Neonatal mortality**

6 No evidence was identified for this outcome.

7 **Important outcomes**

8 **Proportion of women with unplanned attendance for complications related to**  
9 **childbirth or feeding**

- 10 • Moderate quality evidence from 1 RCT (N=81 women and their babies) found no  
11 women readmitted within 6 weeks among women discharged early (<60 hours +  
12 extra phone support leading to a decision to visit or continue to consult by phone  
13 + usual visits) and women discharged late (>60 hours + usual visits). Usual visits  
14 were to paediatric office at 2 weeks and obstetric office at 6 weeks.

15 **Proportion of women scoring above the cut-off score indicating probable**  
16 **depression or anxiety**

17 No evidence was identified for this outcome.

18 **Proportion of women breastfeeding**

- 19 • Low quality evidence from 1 RCT (N=81 women and their babies) found no  
20 clinically significant difference in the proportion of women breastfeeding at 6  
21 weeks between women discharged early (<60 hours + extra phone support  
22 leading to a decision to visit or continue to consult by phone + usual visits) and  
23 women discharged late (>60 hours + usual visits). Usual visits were to paediatric  
24 office at 2 weeks and obstetric office at 6 weeks.

25 **Proportion of women satisfied with their postnatal care**

26 No evidence was identified for this outcome.

27 **Proportion of infants' unplanned attendance for neonatal morbidity**

- 28 • Moderate quality evidence from 1 RCT (N=81 women and their babies) found no  
29 infants readmitted within 8 weeks among women discharged early (<60 hours +  
30 extra phone support leading to a decision to visit or continue to consult by phone  
31 + usual visits) and women discharged late (>60 hours + usual visits). Usual visits  
32 were to paediatric office at 2 weeks and obstetric office at 6 weeks.

33 **Comparison 6. Discharge at 12 to 24 hours versus 4 days**

34 **Critical outcomes**

35 **Maternal mortality**

36 No evidence was identified for this outcome.

37 **Neonatal mortality**

38 No evidence was identified for this outcome.

1 **Important outcomes**

2 **Proportion of women with unplanned attendance for complications related to**  
3 **childbirth or feeding**

- 4 • Very low quality evidence from 1 RCT (N=82 women and their babies) found no  
5 clinically significant difference in the proportion of women requiring physician  
6 referral within 10 days between women discharged early (12 to 24 hours + 5  
7 home visits post discharge) and women discharged late (4 days + 1 home visit  
8 post discharge). All women also received one home visit antenatally by a nurse.

9 **Proportion of women scoring above the cut-off score indicating probable**  
10 **depression or anxiety**

11 No evidence was identified for this outcome.

12 **Proportion of women breastfeeding**

13 No evidence was identified for this outcome.

14 **Proportion of women satisfied with their postnatal care**

15 No evidence was identified for this outcome.

16 **Proportion of infants' unplanned attendance for neonatal morbidity**

17 No evidence was identified for this outcome.

18 **Comparison 7. Discharge at  $\leq 48$  hours versus 4 to 5 days**

19 **Critical outcomes**

20 **Maternal mortality**

21 No evidence was identified for this outcome.

22 **Neonatal mortality**

23 No evidence was identified for this outcome.

24 **Important outcomes**

25 **Proportion of women with unplanned attendance for complications related to**  
26 **childbirth or feeding**

- 27 • Very low quality evidence from 1 RCT (N=459 women and their babies) found  
28 that there may be a clinically significant lower proportion of women with one or  
29 more visits to a gynaecologist in first month in the group discharged early (24 to  
30 48 hours following vaginal births and 72 to 84 hours after CS) compared to  
31 women discharged late (4 to 5 days following vaginal births and 6 to 7 days after  
32 CS), however there is uncertainty around the effect estimate. Both groups  
33 received minimum 2 nurse home visits and 10 phone calls; number and timing  
34 were determined by the family.
- 35
- 36 • Very low quality evidence from 1 RCT (N=87 women and their babies) found no  
37 clinically significant difference in the proportion of women requiring physician  
38 referral within 10 days between women discharged early (25 to 48 hours + 3  
39 home visits post discharge) and women discharged late (4 days + 1 home visit  
40 post discharge). All women also received one home visit antenatally by a nurse.
- 41

- 1 • Very low quality evidence from 2 RCTs (n=590 women and their babies) found no  
2 clinically significant difference in the proportion of women readmitted within 6  
3 weeks between women discharged early ( $\leq 48$  hours plus home visits post  
4 discharge) and women discharged late (4 to 5 days plus home visits post  
5 discharge).

6 **Proportion of women scoring above the cut-off score indicating probable**  
7 **depression or anxiety**

- 8 • Very low quality evidence from 1 RCT (N=459 women and their babies) found no  
9 clinically significant difference in the proportion of women probably depressed  
10 between women discharged early (24 to 48 hours following vaginal births and 72  
11 to 84 hours after CS) and women discharged late.

12 **Proportion of women breastfeeding**

- 13 • Very low quality evidence from 2 RCTs (N=544 women and their babies) found  
14 no clinically significant difference in the proportion of women breastfeeding at one  
15 month between women discharged early ( $\leq 48$  hours plus home visits post  
16 discharge) and women discharged late (4 to 5 days plus home visits post  
17 discharge).  
18  
19 • Very low quality evidence from 1 RCT (n=435 women and their babies) found no  
20 clinically significant difference in breastfeeding at 6 months between women  
21 discharged early (24 to 48 hours following vaginal births and 72 to 84 hours after  
22 CS) and women discharged late (4 to 5 days following vaginal births and 6 to 7  
23 days after CS). Both groups received minimum 2 nurse home visits and 10 phone  
24 calls; number and timing were determined by the family.

25 **Proportion of women dissatisfied with their postnatal care**

- 26 • Very low quality evidence from 1 RCT (N=440 women and their babies) found no  
27 clinically significant difference in the proportion of women dissatisfied with  
28 postnatal care between women discharged early (24 to 48 hours following vaginal  
29 births and 72 to 84 hours after CS) and women discharged late (4 to 5 days  
30 following vaginal births and 6 to 7 days after CS). Both groups received minimum  
31 2 nurse home visits and 10 phone calls; number and timing were determined by  
32 the family.

33 **Proportion of infants' unplanned attendance for neonatal morbidity**

- 34 • Very low quality evidence from 1 RCT (N=131 women and their babies) found no  
35 clinically significant difference in the proportion of infants requiring physician  
36 referral in first 10 days between the group discharged early ( $\leq 48$  hours + 3 to 5  
37 home visits post discharge) and the group discharged late (4 days + 1 home visit  
38 post discharge). All women also received one home visit antenatally by a nurse.  
39  
40 • Very low quality evidence from 1 RCT (N=459 women and their babies) found no  
41 clinically significant difference in the proportion of infants readmitted within 8  
42 weeks between women discharged early (24 to 48 hours following vaginal births  
43 and 72 to 84 hours after CS) and women discharged late (4 to 5 days following  
44 vaginal births and 6 to 7 days after CS). Both groups received minimum 2 nurse  
45 home visits and 10 phone calls; number and timing were determined by the  
46 family.

1 **Comparison 8. Discharge at <72 hours versus >5 days**

2 **Critical outcomes**

3 **Maternal mortality**

4 No evidence was identified for this outcome.

5 **Neonatal mortality**

- 6 • Very low quality evidence from 1 RCT (N=2,077 women and their babies) found  
7 no clinically significant difference in infant mortality between the group discharged  
8 early (before 72 hours + 3 home visits post discharge) and women discharged  
9 late (after 5 days + 2 visits post discharge).

10 **Important outcomes**

11 **Proportion of women with unplanned attendance for complications related to**  
12 **childbirth or feeding**

- 13 • Very low quality evidence from 1 RCT (N=2,094 women and their babies) found  
14 no clinically significant difference between the group discharged early (before 72  
15 hours + 3 home visits post discharge) and the group discharged late (after 5 days  
16 + 2 visits post discharge).

17 **Proportion of women scoring above the cut-off score indicating probable**  
18 **depression or anxiety**

19 No evidence was identified for this outcome.

20 **Proportion of women breastfeeding**

- 21 • Low quality evidence from 1 RCT (N=2,077 women and their babies) found a  
22 clinically significant higher proportion of women breastfeeding at 3 weeks in the  
23 group discharged early (before 72 hours + 3 home visits post discharge)  
24 compared to women discharged late (after 5 days + 2 visits post discharge).

25 **Proportion of women satisfied with their postnatal care**

26 No evidence was identified for this outcome.

27 **Proportion of infants' unplanned attendance for neonatal morbidity**

- 28 • Very low quality evidence from 1 RCT (N=2,151 women and their babies) found  
29 no clinically significant difference in the proportion of infants readmitted within 8  
30 weeks between the group discharged early (before 72 hours + 3 home visits post  
31 discharge) and the group discharged late (after 5 days + 2 visits post discharge).

32 **Economic evidence statements**

33 Evidence from 1 Swiss study conducted alongside a pragmatic RCT (N=459)  
34 suggests that earlier postnatal discharge combined with home midwifery support has  
35 similar clinical and psychosocial effects and is significantly less costly than traditional  
36 postnatal discharge without subsequent home midwifery support for women  
37 delivering a single infant at term following an uncomplicated pregnancy in hospital.  
38 The study is partially applicable to the NICE decision-making context and is  
39 characterised by minor limitations.

## 1 The committee's discussion of the evidence

### 2 Interpreting the evidence

#### 3 *The outcomes that matter most*

4 Maternal and neonatal mortality were considered to be critical outcomes for decision  
5 making as mothers and babies are under observation during their stay in hospital and  
6 the length of hospital stay may be vital in identifying serious acute postnatal and  
7 neonatal adverse outcomes.

8 The proportion of women with unplanned attendance for complications related to  
9 childbirth or feeding and the proportion of infants with unplanned attendance for  
10 neonatal morbidity were rated as important outcomes because the committee wanted  
11 to see if early discharge would lead to more complications and to increased use of  
12 health services. The proportion of women scoring above the cut-off score indicating  
13 probable depression or anxiety was prioritised as an important outcome, because  
14 mental health problems are known to impact many women in the postnatal period  
15 and the committee wanted to see if early or late discharge could have an impact on  
16 this. The proportion of women breastfeeding was prioritised as an important outcome  
17 because it is possible that early or late discharge would lead to different kinds or  
18 levels of breastfeeding support and the committee was interested in whether this  
19 could impact on breastfeeding outcomes.

20 There was no evidence on maternal mortality (critical outcome) and on the proportion  
21 of women scoring above a cut-off score indicating probable anxiety (important  
22 outcome) for any of the comparisons. There was only evidence on neonatal mortality  
23 (critical outcome) for 2 comparisons ( $\leq 48$  hours versus  $> 48$  hours;  $< 72$  hours versus  
24 5 days) out of the 8 comparisons identified.

#### 25 *The quality of the evidence*

26 The quality of the evidence ranged from very low to moderate. All included studies  
27 had unclear risk of selection bias. There was insufficient information to assess  
28 whether random sequence generation was adequate in all included studies.  
29 Moreover, in 5 trials it was unclear whether there was allocation concealment. All  
30 trials had a high risk of performance bias as blinding of participants and personnel  
31 was not feasible. Whereas, the risk of detection bias was unclear or high as blinding  
32 of outcome assessment was not reported or was inadequate. Some studies reported  
33 substantial non-compliance and differential cross-over between intervention and  
34 control groups. Studies were downgraded for deviations from intended intervention  
35 where significant crossover occurred. The Cochrane review (Brown 2002) states that  
36 several studies had "very limited power to assess differences in relation to reported  
37 outcomes"; in the current review, some outcomes were downgraded due to  
38 imprecision, which in turn is related to small sample size.

39 Data in 2 studies (Boulvain 2004 and Winterburn 2000) were downgraded due to  
40 indirectness of the population because a minority with caesarean sections (11% and  
41 19%, respectively) were included.

42 Five trials did not clarify whether breastfeeding data referred to partial or exclusive  
43 breastfeeding (Boulvain 2004, Hellman 1962, Sainz Bueno 2005, Smith-Hanrahan  
44 1995, Waldenstrom 1987).

45 The committee noted that no study evaluated discharge before 12 hours postpartum.  
46 Moreover, only 1 study was conducted in the UK (Winterburn 2000), which reported  
47 on 1 relevant outcome (proportion of women breastfeeding). As per the protocol,

1 evidence from non UK high income countries was included and therefore was not  
2 downgraded for indirectness. However in discussing the results of the review the  
3 committee agreed that in fact care received in hospital and in the community in other  
4 high income countries could potentially differ from the UK and that this might affect  
5 health outcomes. The committee agreed that the kind of community care provided in  
6 the immediate postnatal period after discharge was likely to have an important impact  
7 on health outcomes.

## 8 **Benefits and harms**

9 Due to the fact that the majority of evidence was low quality and inconsistent, the  
10 recommendations were drafted by the committee through consensus using their  
11 experience and expertise rather than the clinical evidence. The committee raised  
12 particular concern that the evidence regarding breastfeeding rates was inconsistent.  
13 For some comparisons (6 to 36 hours versus 48 to 72 hours, <72 hours versus >5  
14 days), higher breastfeeding rates were observed with early discharge, but for other  
15 comparisons ( $\leq 48$  hours versus  $>48$  hours,  $<60$  hours versus  $>60$  hours,  $\leq 48$  hours  
16 versus 4 to 5 days), there was no significant difference in breastfeeding rates  
17 between early and late discharge. The only study from the UK (Winterburn 2000)  
18 showed no clinically significant difference between the proportion of women  
19 breastfeeding at 4 weeks between the early ( $\leq 48$  hours) and late discharge ( $>48$   
20 hours). For one comparison ( $<24$  hours versus  $>48$  hours), whether or not a  
21 significant difference in breastfeeding rates was observed depended on length of  
22 follow-up. The committee noted that in the included studies, women discharged early  
23 received extra support at home and speculated that this may have impacted  
24 positively on breastfeeding rather than the length of stay itself.

25 There was some evidence of lower dissatisfaction with early discharge for two  
26 comparisons ( $<24$  hours versus  $>48$  hours,  $\leq 48$  hours versus  $>48$  hours), but no  
27 significant difference in dissatisfaction was observed for the comparison  $\leq 48$  hours  
28 versus 4 to 5 days. The committee speculated that some women may prefer to be at  
29 home as opposed to the hospital and this may increase their satisfaction with  
30 postnatal care rather than the length of stay itself.

31 For all other outcomes; neonatal mortality; proportion of women with unplanned  
32 attendance for complications related to childbirth or feeding; proportion of women  
33 scoring above the cut off score indicating probable depression or anxiety; and  
34 proportion of infants unplanned attendance for neonatal morbidity, there was no  
35 clinically significant difference between early and late discharge.

36 The committee noted that in their experience transfer to home for low risk women  
37 usually occurred within 12 hours of birth in current practice, but they highlighted that  
38 there was no evidence to support this compared to for example 6 hours or 24 hours.  
39 In light of this, the committee agreed to draft recommendations on assessments to be  
40 conducted prior to discharge, as opposed to the exact time a woman and baby  
41 should be discharged.

42 The committee agreed that the wellbeing of the woman should be assessed prior to  
43 discharge, to reduce the risk of adverse outcomes for the woman. The committee  
44 agreed that the content of the assessment should be aligned with recommendations  
45 on the assessment and care of the women focusing on assessing the woman's  
46 psychological health, emotional wellbeing, and physical health from the content of  
47 postnatal care contacts in evidence review F.

48 The committee raised concerns that some women and babies may be discharged too  
49 early after birth. The committee agreed that in order to minimise harm for the woman  
50 and baby, that there should be prerequisites that are fulfilled prior to discharge.

1 Firstly, to assess urinary function the woman's first void after giving birth should be  
2 measured prior to discharge to rule out urinary retention.

3 The baby's general health should be assessed, through a physical check and  
4 observation of general behaviour. Not passing meconium within the first 24 hours  
5 could indicate bowel obstruction, therefore before discharge parents should be  
6 advised to seek advice from a healthcare professional if this is the case. This might  
7 be a midwife or a doctor, or in cases where the parents think the baby is in distress  
8 and might be seriously ill, it might be the emergency services. Some babies might pass  
9 meconium when still in the maternity unit in which case this would not be relevant.  
10 Furthermore, to ensure that there are no major complications with the baby's feeding,  
11 at least 1 effective feed (regardless of the method of feeding) should be observed by  
12 a healthcare professional.

13 The committee highlighted that the timing of discharge should be discussed with the  
14 woman to individualise care as much as possible based on the woman's and baby's  
15 needs and preferences. The committee agreed that this would be both beneficial and  
16 reduce harm by identifying any underlying issues.

17 The committee emphasised that discharge planning should identify factors that could  
18 delay a safe and timely transfer of care from the maternity unit, these concerns could  
19 include safeguarding issues, such as problems with unsafe housing or home  
20 environment, including domestic abuse. The committee acknowledged that the NICE  
21 guideline on [domestic violence and abuse](#) applied to the discharge planning of  
22 postnatal women, therefore the committee agreed to cross refer to this guideline  
23 when planning the woman's and baby's discharge home. The committee agreed that  
24 in order to reduce the risk of adverse outcomes for the woman and her baby, and to  
25 potentially reduce the need for reattendance or readmission, the timing of discharge  
26 should be based on the assessments of the health of the woman and the baby, and  
27 take into consideration any concerns, including safeguarding issues.

28 Given the low quality and conflicting evidence identified in this review, a  
29 recommendation for research on the length of postpartum stay was made. The  
30 committee agreed to combine a research recommendation on the timing of first  
31 postnatal contact by midwife in evidence review C to understand whether the timing  
32 of postpartum discharge and the first midwife visit are likely to cause unplanned  
33 health contacts.

#### 34 **Cost effectiveness and resource use**

35 Existing economic evidence suggested that early postnatal discharge (scheduled for  
36 24-48 hours after a vaginal delivery or 72-96 hours after a caesarean section)  
37 combined with home midwifery support has similar clinical and psychosocial effects  
38 and is significantly less costly than traditional postnatal discharge (scheduled for 4-5  
39 days after a vaginal delivery or 6-7 days after a caesarean section) without  
40 subsequent home midwifery support for women delivering a single infant at term  
41 following an uncomplicated pregnancy in hospital. The study is partially applicable to  
42 the NICE decision-making context and is characterised by minor limitations. The  
43 committee took this evidence into account but agreed that this is only partially  
44 applicable to the UK as it was conducted in Switzerland. Moreover, it was noted that  
45 'early discharge', as described in the study, in fact comprises routine 'late discharge'  
46 care in the UK and the 'traditional discharge' in the study reflects rather 'very late  
47 discharge' by UK practice standards. Another point that reduced the applicability of  
48 the study was that 11% of women in the study had a caesarean section, and  
49 therefore they were different from the population in the guideline review question.  
50 The committee also noted that the number of post-discharge midwifery contacts was

1 higher in the earlier discharge group compared with the traditional discharge group  
2 and concluded that the extra support at home is likely to have impacted positively on  
3 mothers' and babies' outcomes.

4 The committee noted that clinical evidence was limited, but available evidence  
5 suggested that there were no clinically significant differences in outcomes between  
6 earlier and later postpartum discharge, although they noted that shorter postpartum  
7 discharge was balanced with better support at home. In particular, there was no  
8 robust evidence to suggest differences in unplanned healthcare contacts, including  
9 admission, post-discharge (and, therefore cost differences further down the care  
10 pathway) between earlier and later postpartum discharge.

11 The committee discussed the immediate ward costs associated with early versus late  
12 postpartum discharge, and they agreed that, although the timing of discharge affects  
13 (and may be affected by) staff and bed capacity, reducing the time of discharge by a  
14 few hours has small impact on ward costs.

15 The committee also agreed that, in general, the timing of discharge (early versus  
16 late) does not affect the total number of community postnatal visits, unless there are  
17 clinical indications. Increasing the number of community postnatal contacts is not  
18 routine practice and occurs only when additional health needs are identified.

19 Overall, and after considering the limited available evidence and routine practice, the  
20 committee acknowledged that currently there is no evidence to suggest that offering  
21 early versus late postpartum discharge entails important resource implications either  
22 in the number of unplanned healthcare contacts post-discharge or in the community  
23 postnatal services.

24 Therefore, the committee made recommendations regarding the timing of postpartum  
25 discharge based on the assessment of the clinical and psychosocial needs of  
26 mothers and babies as well as mothers' preferences.

#### 27 **Other factors the committee took into account**

28 The committee noted during protocol development that certain subgroups of women  
29 may require special consideration due to their potential vulnerability:

- 30 • young women (19 years or under)
- 31 • women with physical or cognitive disabilities
- 32 • women with severe mental health illness
- 33 • women who have difficulty accessing postnatal care services.

34 A stratified analysis was therefore predefined in the protocol based on these  
35 subgroups. However, considering the lack of evidence for these sub-groups, the  
36 committee agreed not to make separate recommendations and that the  
37 recommendations they did make should apply universally.

38 The committee acknowledged that the included studies had different definitions and  
39 cut-offs for early and late discharge, this made it very difficult to meta-analyse the  
40 studies and the results were often presented as individual comparative timeframes.

# 1 Appendices

## 2 Appendix A – Review protocols

### 3 Review protocol for review questions:

4 **How does the length of postpartum stay affect women and their babies (single births)?**

5 **How does the length of postpartum stay affect women and their babies (twins or triplets)?**

### 6 Table 3: Review protocol

Field (based on PRISMA-P)	Content
Review question	How does the length of postpartum stay affect women and their babies (single births)? How does the length of postpartum stay affect women and their babies (twins or triplets)?
Type of review question	Intervention
Objective of the review	The aim of this review is to determine how length of postpartum stay impacts on the outcomes of women and babies.
Eligibility criteria – population	Pregnant women and women who have given birth vaginally to a healthy baby at term (or to healthy twins or triplets) in a hospital or standalone birth centre. All types of vaginal deliveries, including instrumental deliveries, will be considered. Women receiving specialist care due to a high-risk pregnancy (for example, due to diabetes or pre-eclampsia) and women who become high risk due to intrapartum complications will be excluded.
Eligibility criteria – intervention	Early discharge defined as a shorter length of hospital stay than the comparator. The committee highlighted that this is an area where decisions about length of stay have been made on the basis of operational or resources factors (rather than on evidence). For this reason, they decided not to define a threshold for early discharge. Although early discharge is defined purely in terms of time, data on additional interventions (for example, number and frequency of home visits, telephone calls by a healthcare professional) will be captured and presented with the evidence, as this could influence morbidity and mortality outcomes.

Field (based on PRISMA-P)	Content
Eligibility criteria – comparator	<p>Late discharge, defined as a length of hospital stay that is longer than the intervention.</p> <p>The committee highlighted that this is an area where decisions about length of stay have been made on the basis of operational or resources factors (rather than on evidence). For this reason, they decided not to define a threshold for late discharge.</p> <p>Although late discharge is defined purely in terms of time, data on additional interventions (for example, number and frequency of home visits, telephone calls by a healthcare professional) will be captured and presented with the evidence, as this could influence morbidity and mortality outcomes.</p>
Outcomes and prioritisation	<p><b>Critical outcomes</b></p> <ul style="list-style-type: none"> <li>• Maternal mortality (MID: any statistically significant change)</li> <li>• Neonatal mortality (MID: any statistically significant change)</li> </ul> <p><b>Important outcomes</b></p> <ul style="list-style-type: none"> <li>• Proportion of women with unplanned attendance for complications related to childbirth or feeding (for example postpartum haemorrhage, retained products of conception, infection, postpartum psychosis) in the first six weeks after the birth (default MIDs).</li> <li>• Proportion of women scoring above the cut-off score indicating probable depression or anxiety on a well-validated standardised instrument at six to eight weeks, three months and six months after the birth (default MIDs). If data at 6 to 8 weeks is not available, use follow-ups between 3 and 5 weeks</li> <li>• Proportion of women breastfeeding (exclusively or partially) at six weeks, 12 weeks and six months after the birth (any statistically significant change). If data at 6 weeks is not available, use follow-ups between 3 and 8 weeks</li> <li>• Proportion of women satisfied with their postnatal care (default MIDs).</li> <li>• Proportion of infants' unplanned attendance for neonatal morbidity (including jaundice, dehydration, infections or for feeding problems) within 28 days (default MIDs).</li> </ul>
Eligibility criteria – study design	<p>Published full text papers only:</p> <ul style="list-style-type: none"> <li>• Systematic reviews of RCTs</li> <li>• RCTs</li> </ul> <p>Conference abstracts will not be considered.</p>
Other inclusion exclusion criteria	<p>Studies from low- and middle-income countries will be excluded, as the configuration of antenatal and postnatal services in these countries might not be representative of that in the UK.</p>
Proposed sensitivity/sub-group	<p>Groups that will be reviewed and analysed separately:</p>

Field (based on PRISMA-P)	Content
analysis, or meta-regression	<ul style="list-style-type: none"> <li>• young women (19 years or under)</li> <li>• women with physical or cognitive disabilities</li> <li>• women with severe mental health illness</li> <li>• women who have difficulty accessing postnatal care services</li> <li>• mode of birth (non-instrumental vaginal birth/instrumental vaginal birth)</li> <li>• different lengths of stay (for example, early discharge &lt;24 hours will be presented separately from early discharge &lt;5 days)</li> </ul> <p>In the presence of heterogeneity, the following subgroups will be considered for sensitivity analysis:</p> <ul style="list-style-type: none"> <li>• singletons, twins and triplets</li> <li>• women who chose to not breastfeed versus women who chose to breastfeed</li> <li>• primiparous versus multiparous women</li> <li>• 'early discharge' accompanied by co-interventions (antenatal preparation or not, policy on enhanced recovery or not, home visits or not)</li> <li>• women who had epidural versus those who did not.</li> </ul> <p>Statistical heterogeneity will be assessed by visually examining the forest plots and by calculating the <math>I^2</math> inconsistency statistic (with an <math>I^2</math> value of more than 50% indicating considerable heterogeneity)</p>
Selection process – duplicate screening/selection/analysis	<p>Review questions selected as high priorities for health economic analysis (and those selected as medium priorities and where health economic analysis could influence recommendations) will be subject to dual weeding and study selection; any discrepancies above 10% of the dual weeded resources will be resolved through discussion between the first and second reviewers or by reference to a third person. This review question was prioritised for health economic analysis however no formal dual weeding, study selection (inclusion/exclusion) or data extraction into evidence tables will be undertaken because the technical team was aware of an existing Cochrane review on the subject and agreed to use this to check the weeding and study selection steps. (Moreover, internal (NGA) quality assurance processes will include consideration of the outcomes of weeding, study selection and data extraction and the committee will review the results of study selection and data extraction).</p>
Data management (software)	<p>Pairwise meta-analyses will be performed using Cochrane Review Manager (RevMan5). 'GRADEpro' will be used to assess the quality of evidence for each outcome. Where default MIDAs are used to assess the clinical significance of outcomes they will also be used to rate imprecision. For those outcomes for which any statistically significant difference is clinically significant, imprecision will be assessed as follows:</p> <ul style="list-style-type: none"> <li>• Downgrade once if the confidence interval crosses the line of no effect</li> </ul>

Field (based on PRISMA-P)	Content
	<ul style="list-style-type: none"> <li>Downgrade once if the sample size is below 400 for continuous outcomes and if the total events is below 300 events for dichotomous outcomes.</li> </ul>
Information sources – databases and dates	<p>The following databases will be searched:</p> <ul style="list-style-type: none"> <li>CCRCT</li> <li>CDSR</li> <li>DARE</li> <li>Embase</li> <li>EMCare</li> <li>HTA Database</li> <li>MEDLINE and MEDLINE IN-PROCESS</li> <li>PsycINFO</li> </ul> <p>Searches will be restricted by:</p> <ul style="list-style-type: none"> <li>Date limitations: database inception to 4th December 2019</li> <li>English language</li> <li>Human studies</li> <li>RCTs</li> <li>Systematic reviews</li> </ul> <p>Other searches:</p> <ul style="list-style-type: none"> <li>Inclusion lists of systematic reviews</li> </ul>
Identify if an update	This guideline will update the <a href="#">NICE guideline on postnatal care up to 8 weeks after birth</a> (CG37). All reviews are being conducted afresh. The CG37 (2006) did not include recommendations on this topic.
Author contacts	National Guideline Alliance <a href="https://www.nice.org.uk/guidance/indevelopment/gid-ng10070">https://www.nice.org.uk/guidance/indevelopment/gid-ng10070</a>
Highlight if amendment to previous protocol	For details please see section 4.5 of <a href="https://www.nice.org.uk/article/pmg20/chapter/4-Developing-review-questions-and-planning-the-evidence-review-planning-the-evidence-review">Developing NICE guidelines: the manual 2014</a> <a href="https://www.nice.org.uk/article/pmg20/chapter/4-Developing-review-questions-and-planning-the-evidence-review-planning-the-evidence-review">https://www.nice.org.uk/article/pmg20/chapter/4-Developing-review-questions-and-planning-the-evidence-review - planning-the-evidence-review</a>

Field (based on PRISMA-P)	Content
Search strategy – for one database	For details please see appendix B.
Data collection process – forms/duplicate	A standardised evidence table format will be used, and published as appendix D (clinical evidence tables) or H (economic evidence tables) of the full guideline.
Data items – define all variables to be collected	For details please see evidence tables in appendix D (clinical evidence tables) or H (economic evidence tables) of the full guideline.
Methods for assessing bias at outcome/study level	Standard study checklists were used to critically appraise individual studies. For details please see section 6.2 of <a href="#">Developing NICE guidelines: the manual</a> The risk of bias across all available evidence was evaluated for each outcome using an adaptation of the ‘Grading of Recommendations Assessment, Development and Evaluation (GRADE) toolbox’ developed by the international GRADE working group <a href="http://www.gradeworkinggroup.org/">http://www.gradeworkinggroup.org/</a>
Criteria for quantitative synthesis (where suitable)	For details please see section 6.4 of <a href="#">Developing NICE guidelines: the manual</a>
Methods for analysis – combining studies and exploring (in)consistency	For a full description of methods see Supplement 1.
Meta-bias assessment – publication bias, selective reporting bias	For details please see section 6.2 of <a href="#">Developing NICE guidelines: the manual</a>
Assessment of confidence in cumulative evidence	For details please see sections 6.4 and 9.1 of <a href="#">Developing NICE guidelines: the manual</a>

Field (based on PRISMA-P)	Content
Rationale/context – Current management	For details please see the introduction to the evidence review.
Describe contributions of authors and guarantor	A multidisciplinary committee developed the guideline. The committee was convened by the National Guideline Alliance and chaired by Dr David Jewell in line with section 3 of <a href="#">Developing NICE guidelines: the manual</a> Staff from the National Guideline Alliance undertook systematic literature searches, appraised the evidence, conducted meta-analysis and cost-effectiveness analysis where appropriate, and drafted the guideline in collaboration with the committee. For a full description of methods see Supplement 1.
Sources of funding/support	The National Guideline Alliance is funded by NICE and hosted by the Royal College of Obstetricians and Gynaecologists
Name of sponsor	The National Guideline Alliance is funded by NICE and hosted by the Royal College of Obstetricians and Gynaecologists
Roles of sponsor	NICE funds the National Guideline Alliance to develop guidelines for those working in the NHS, public health, and social care in England
PROSPERO registration number	This protocol has not been registered in PROSPERO

## 1 Appendix E – Forest plots

### 2 Forest plots for review questions:

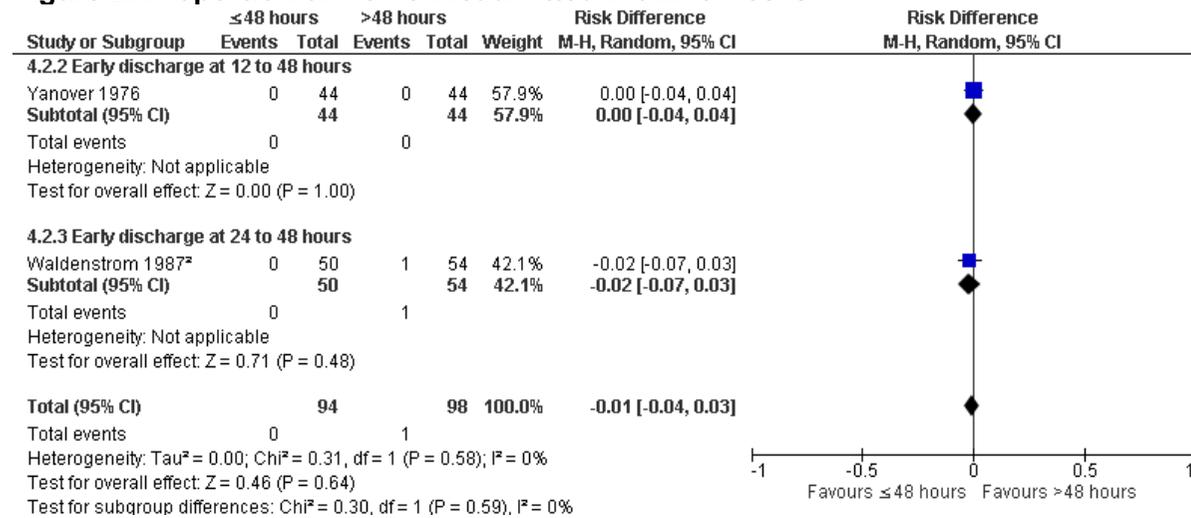

3 **How does the length of postpartum stay affect women and their babies (single births)?**

4 **How does the length of postpartum stay affect women and their babies (twins or triplets)?**

5

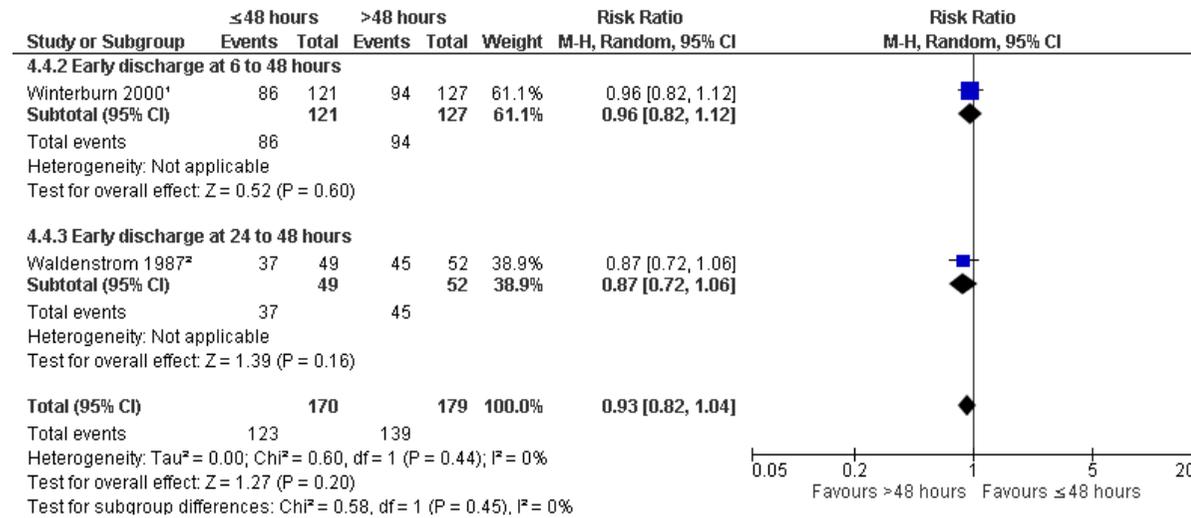

6 This section includes forest plots only for outcomes that are meta-analysed. Outcomes from single studies are not presented here; the quality  
7 assessment for such outcomes is provided in the GRADE profiles in appendix F.

**Figure 2: Proportion of women readmitted within 6 weeks**

8 *CI: confidence interval; M-H: Mantel-Haenszel*

**Figure 3: Proportion of women breastfeeding in first 8 weeks**

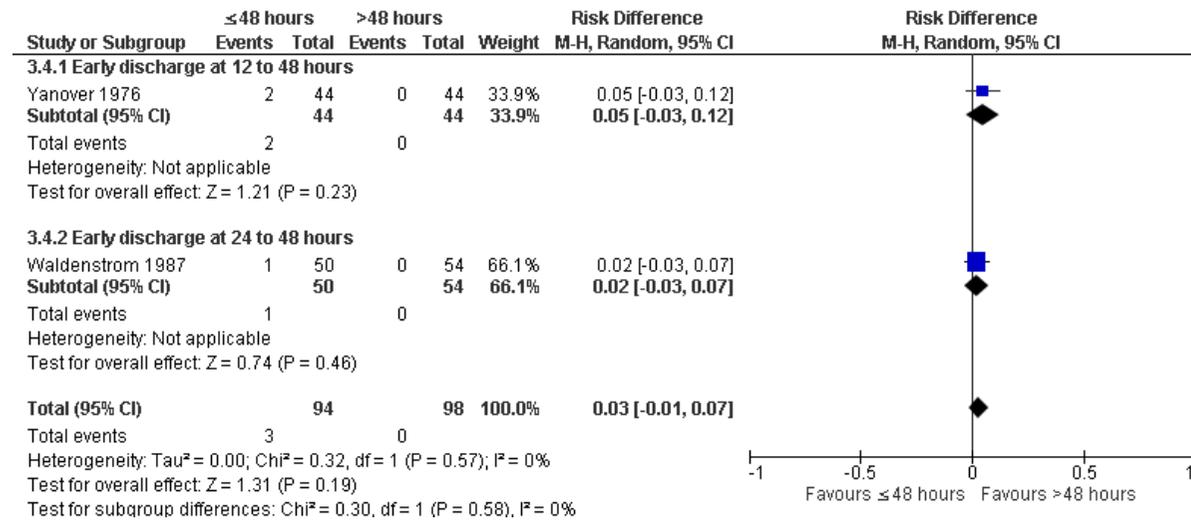

CI: confidence interval; M-H: Mantel-Haenszel

<sup>1</sup> Exclusively and partially breastfeeding women were grouped together. Breastfeeding rates reported at 4 weeks.

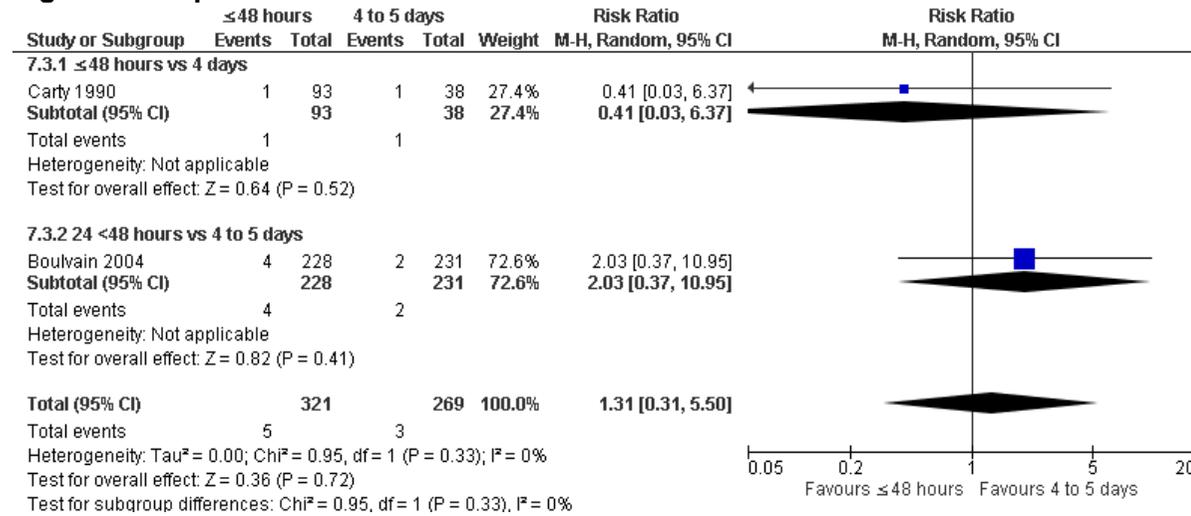

<sup>2</sup> Unclear whether women were breastfeeding exclusively or partially. Breastfeeding rates reported at 8 weeks.

**Figure 4: Proportion of infants readmitted within 8 weeks**

CI: confidence interval; M-H: Mantel-Haenszel

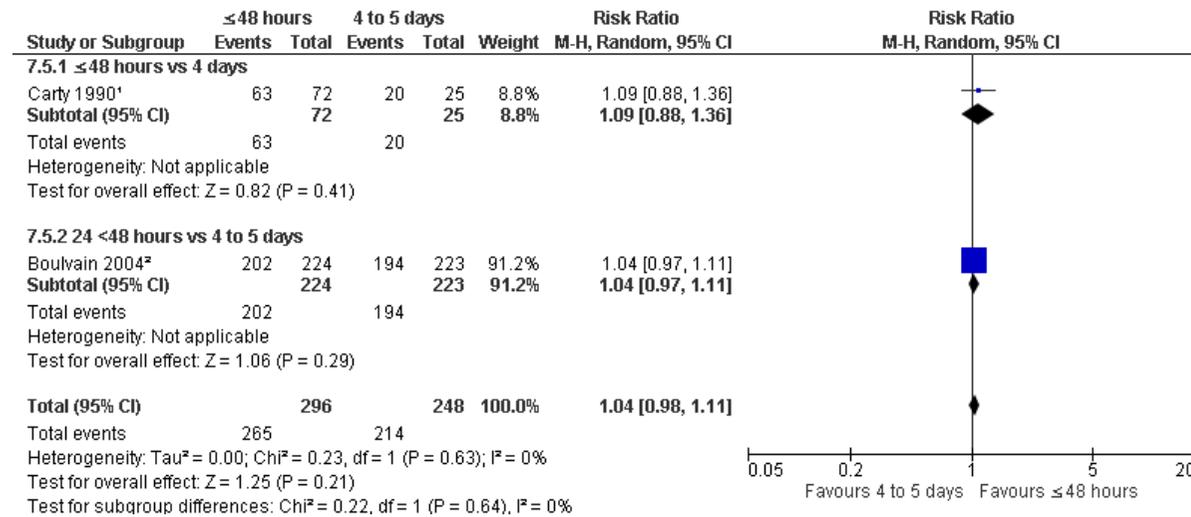

**Figure 5: Proportion of women readmitted within 6 weeks**

CI: confidence interval; M-H: Mantel-Haenszel

1

**Figure 6: Proportion of women breastfeeding at one month**

CI: confidence interval; M-H: Mantel-Haenszel

<sup>1</sup> Breastfeeding defined as “exclusive”

<sup>2</sup> Unclear whether women were breastfeeding exclusively or partially

## 1 Appendix F – GRADE tables

### 2 GRADE tables for review questions:

3 **How does the length of postpartum stay affect women and their babies (single births)?**

4 **How does the length of postpartum stay affect women and their babies (twins or triplets)?**

### 5 **Table 5: Clinical evidence profile for comparison discharge at 12 to 24 hours versus 25 to 48 hours**

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	12 to 24 hours	25 to 48 hours	Relative (95% CI)	Absolute		
<b>Proportion of women requiring physician referral within 10 days</b>												
1 (Carty 1990)	randomised trials	serious <sup>1</sup>	no serious inconsistency	no serious indirectness	very serious <sup>2</sup>	None	2/44 (4.5%)	3/49 (6.1%)	RR 0.74 (0.13 to 4.24)	16 fewer per 1000 (from 53 fewer to 198 more)	VERY LOW	IMPORTANT

6 *CI: confidence interval; RR: risk ratio*

7 <sup>1</sup>*The quality of the evidence was downgraded by 1 due to unclear risk of selection bias (insufficient information in the report to assess whether sequence generation was adequate) and high risk of performance and detection bias (non-blinded for participants, personnel, and outcome assessors).*

9 <sup>2</sup>*The quality the evidence was downgraded by 2 due to very serious imprecision as 95% CI crosses both default MIDs*

### 10 **Table 6: Clinical evidence profile for comparison discharge at <24 hours versus >48 hours**

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other consideration	<24 hours	≥48 hours	Relative (95% CI)	Absolute		
<b>Proportion of women readmitted within 6 weeks</b>												

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other consideration	<24 hours	≥48 hours	Relative (95% CI)	Absolute		
1 (Sainz Bueno 2005)	randomised trials	serious <sup>1</sup>	no serious inconsistency	no serious indirectness	very serious <sup>2</sup>	None	4/213 (1.9%)	5/217 (2.3%)	RR 0.82 (0.22 to 2.99)	4 fewer per 1000 (from 18 fewer to 46 more)	VERY LOW	IMPORTANT
<b>Proportion of women probably depressed at 1 month</b>												
1 (Sainz Bueno 2005)	randomised trials	serious <sup>1</sup>	no serious inconsistency	no serious indirectness	serious <sup>3</sup>	None	2/213 (0.94%)	8/217 (3.7%)	RR 0.25 (0.05 to 1.19)	28 fewer per 1000 (from 35 fewer to 7 more)	LOW	IMPORTANT
<b>Proportion of women breastfeeding at 1 month</b>												
1 (Sainz Bueno 2005)	randomised trials	serious <sup>1</sup>	no serious inconsistency	no serious indirectness	serious <sup>4</sup>	None	190/213 (89.2%)	182/217 (83.9%)	RR 1.06 (0.99 to 1.15)	50 more per 1000 (from 8 fewer to 126 more)	LOW	IMPORTANT
<b>Proportion of women breastfeeding at 12 weeks</b>												
1 (Sainz Bueno 2005)	randomised trials	serious <sup>1</sup>	no serious inconsistency	no serious indirectness	serious <sup>5</sup>	None	141/213 (66.2%)	119/217 (54.8%)	RR 1.21 (1.03 to 1.41)	115 more per 1000 (from 16 more to 225 more)	LOW	IMPORTANT
<b>Proportion of women breastfeeding at 6 months</b>												
1 (Sainz Bueno 2005)	randomised trials	serious <sup>1</sup>	no serious inconsistency	no serious indirectness	very serious <sup>6</sup>	None	94/213 (44.1%)	76/217 (35%)	RR 1.26 (1 to 1.6)	91 more per 1000 (from 0 more to 210 more)	VERY LOW	IMPORTANT
<b>Proportion of women dissatisfied with postnatal care</b>												
1 (Sainz Bueno 2005)	randomised trials	very serious <sup>7</sup>	no serious inconsistency	no serious indirectness	no serious imprecision	None	99/172 (57.6%)	111/125 (88.8%)	RR 0.65 (0.56 to 0.75)	311 fewer per 1000 (from 222 fewer to 391 fewer)	LOW	IMPORTANT
<b>Health service consultations for neonate pathology in the first 28 days</b>												

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other consideration	<24 hours	≥48 hours	Relative (95% CI)	Absolute		
1 (Sainz Bueno 2005)	randomised trials	serious <sup>1</sup>	no serious inconsistency	no serious indirectness	very serious <sup>2</sup>	None	18/213 (8.5%)	13/217 (6%)	RR 1.41 (0.71 to 2.81)	25 more per 1000 (from 17 fewer to 108 more)	VERY LOW	IMPORTANT
<b>Proportion of infants readmitted within 8 weeks</b>												
1 (Sainz Bueno 2005)	randomised trials	serious <sup>1</sup>	no serious inconsistency	no serious indirectness	very serious <sup>2</sup>	None	3/213 (1.4%)	5/217 (2.3%)	RR 0.61 (0.15 to 2.53)	9 fewer per 1000 (from 20 fewer to 35 more)	VERY LOW	IMPORTANT

CI: confidence interval; RR: risk ratio

<sup>1</sup> The quality of the evidence was downgraded by 1 due to unclear risk of selection bias (insufficient information to assess whether sequence generation was adequate) and high risk of performance and detection bias (non-blinded for participants, personnel, and unclear for outcome assessors).

<sup>2</sup> The quality of the evidence was downgraded by 2 due to very serious imprecision as 95% CI crosses both default MIDs

<sup>3</sup> The quality of the evidence was downgraded by 1 due to serious imprecision as 95% CI crosses 1 default MID

<sup>4</sup> The quality of the evidence was downgraded by 1 due to serious imprecision as the 95% CI crosses the line of no effect.

<sup>5</sup> The quality of the evidence was downgraded by 1 due to serious imprecision as there are fewer than 300 events.

<sup>6</sup> The quality of the evidence was downgraded by 2 due to very serious imprecision as the 95% CI crosses the line of no effect and there are fewer than 300 events.

<sup>7</sup> The quality of the evidence was downgraded by 2 due to unclear risk of selection bias (insufficient information in the report to assess whether sequence generation was adequate), high risk of performance and detection bias (non-blinded for participants, personnel, and outcome assessors), and high risk of attrition bias (differential missing data for maternal satisfaction with care, 17.8% for early discharge, and 42% for late discharge, which introduces risk of bias potentially favouring late discharge).

12 **Table 7: Clinical evidence profile for comparison discharge at 6 to 36 hours versus 48 to 72 hours**

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	6 to 36 hours	48 to 72 hours	Relative (95% CI)	Absolute		
<b>Proportion of women breastfeeding at one month</b>												

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	6 to 36 hours	48 to 72 hours	Relative (95% CI)	Absolute		
1 (Gagno n 1997)	randomised trials	very serious <sup>1</sup>	no serious inconsistency	no serious indirectness	serious <sup>2</sup>	none	43/78 (55.1%)	38/97 (39.2%)	RR 1.41 (1.02 to 1.94)	161 more per 1000 (from 8 more to 368 more)	VERY LOW	IMPORTANT
<b>Infant health service contacts at one month</b>												
1 (Gagno n 1997)	randomised trials	very serious <sup>1</sup>	no serious inconsistency	no serious indirectness	very serious <sup>3</sup>	none	12/78 (15.4%)	17/97 (17.5%)	RR 0.88 (0.45 to 1.73)	21 fewer per 1000 (from 96 fewer to 128 more)	VERY LOW	IMPORTANT

1 CI: confidence interval; RR: risk ratio

2 <sup>1</sup> The quality of the evidence was downgraded by 2 due to unclear risk of selection bias (insufficient information in the report to assess whether sequence generation was adequate), high risk of performance and detection bias (non-blinded for participants, personnel, and outcome assessors), high risk of attrition bias (loss to follow-up was 51.4%, and it was higher in the early discharge group), and high risk of deviations from intended intervention (33% non-compliance with allocation to early discharge)

3 <sup>2</sup> The quality of the evidence was downgraded by 1 due to serious imprecision as there are less than 300 events

4 <sup>3</sup> The quality of the evidence was downgraded by 2 due to very serious imprecision as 95% CI crosses both default MIDs

5

8 **Table 8: Clinical evidence profile for comparison discharge at ≤48 hours versus >48 hours**

Quality assessment							No of patients		Effect		Quality	Importance

## 1 Appendix G – Economic evidence study selection

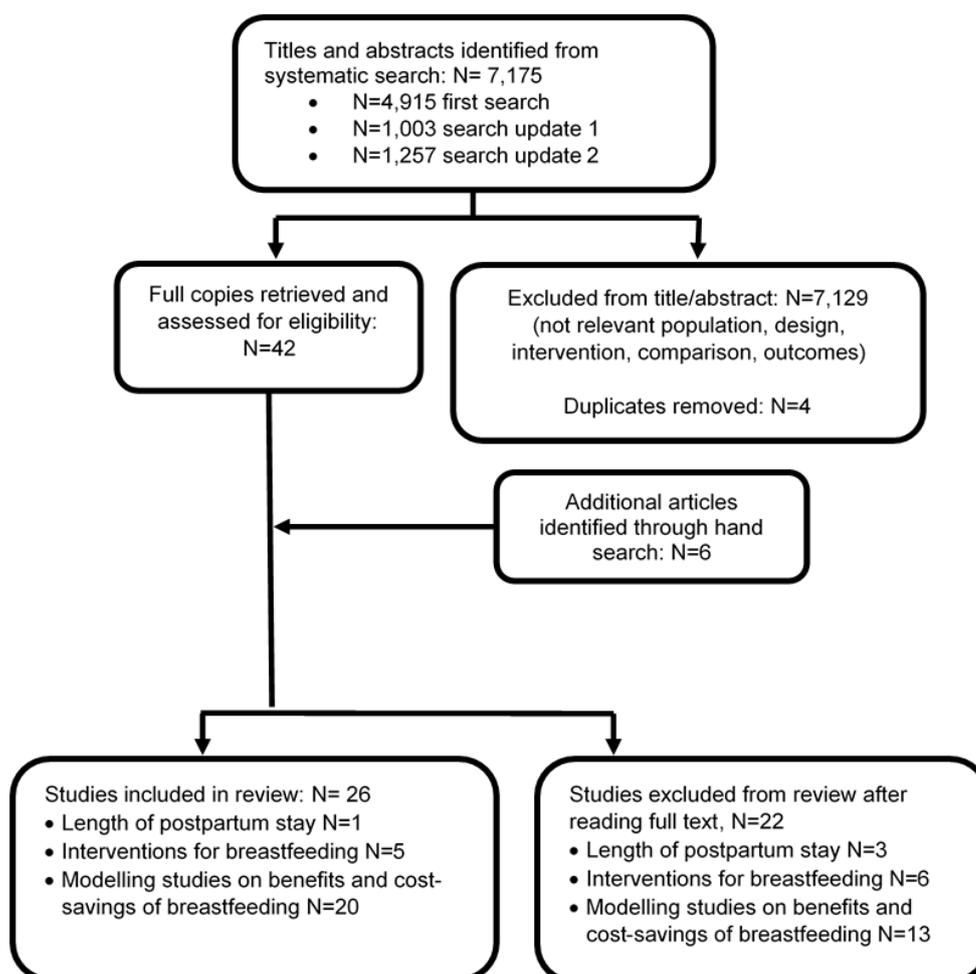

### 2 Economic evidence study selection for review questions:

3 **How does the length of postpartum stay affect women and their babies**  
4 **(single births)?**

5 **How does the length of postpartum stay affect women and their babies**  
6 **(twins or triplets)?**

7 A global health economics search was undertaken for all areas covered in the  
8 guideline. Figure 2 shows the flow diagram of the selection process for economic  
9 evaluations of postnatal care interventions, including modelling studies on the  
10 benefits and cost-savings of breastfeeding.

11 **Figure 2. Flow diagram of selection process for economic evaluations of**

 6 **(twins or triplets)?**

### 7 Clinical studies

#### 8 Table 15: Excluded studies and reasons for their exclusion

Study	Reason for exclusion
Benahmed, N., San Miguel, L., Devos, C., Fairon, N., Christiaens, W., Vaginal delivery: How does early hospital discharge affect mother and child outcomes? A systematic literature review, <i>BMC Pregnancy and Childbirth</i> , 17 (1) (no pagination), 2017	Relevant included studies were also included in the Cochrane review on early postpartum discharge. The authors mention that they used the Cochrane review to extract data. The current review also used the Cochrane review and the primary studies to extract data.
Braveman, P., Egerter, S., Pearl, M., Marchi, K., Miller, C., Problems associated with early discharge of newborn infants. Early discharge of newborns and mothers: a critical review of the literature, <i>Pediatrics</i> , 96, 716-726, 1995	Relevant included studies were also included in the Cochrane review (Brown 2002), from which data were extracted.
Bravo, P., Uribe, C., Contreras, A., Early postnatal hospital discharge: The consequences of reducing length of stay for women and newborns, <i>Revista da Escola de Enfermagem</i> , 45, 758-763, 2011	Literature review. Relevant included studies were also included in Cochrane review on early postpartum discharge.
Burnell, I, McCarthy, M, Chamberlain, Gvp, Hawkins, Df, Elbourne, Dr, Patient preference and postnatal hospital stay, <i>Journal of Obstetrics and Gynaecology</i> , 3, 43-47, 1982	Data are provided by actual length of stay, not by randomised trial allocation.
Calhoun, Bc, Gries, D, Barfield, W, Kovac, C, Hume, R, Cost consequences of implementation of an early obstetrical discharge programme in a military teaching hospital, <i>Australian &amp; New Zealand Journal of Obstetrics &amp; Gynaecology</i> , 39, 35-40, 1999	Observational study.
Escobar, Gj, Braveman, Pa, Ackerson, L, Odouli, R, Coleman-Phox, K, Capra, Am, Wong, C, Lieu, Ta, A randomized comparison of home visits and hospital-based group follow-up visits after early postpartum discharge, <i>Pediatrics</i> , 108, 719-727, 2001	No relevant comparison. Post-discharge home health visits versus post-discharge hospital-based follow-up. "To minimize any potential effects of study participation on the mother's LOS [length of stay], the research nurses attempted to enroll mothers after the decision to discharge them had been made".
Farhat, R., Rajab, M., Length of postnatal hospital stay in healthy newborns and re-hospitalization following early discharge, <i>North American Journal of Medical Sciences</i> , 3, 146-151, 2011	Observational study.

Study	Reason for exclusion
Forster, D. A., Savage, T. L., McLachlan, H. L., Gold, L., Farrell, T., Rayner, J., Yelland, J., Rankin, B., Lovell, B., Individualised, flexible postnatal care: a feasibility study for a randomised controlled trial, <i>BMC Health Services Research</i> , 14, 569, 2014	Feasibility study to inform a future RCT. No control group was included, as the aim was to determine the feasibility of the intervention.
Gagnon, Aj, Dougherty, G, Jimenez, V, Leduc, N, Randomized trial of postpartum care after hospital discharge, <i>Pediatrics</i> , 109, 1074-1080, 2002	No relevant comparison. Post-discharge community follow-up versus post-discharge hospital follow-up. All study subjects participated in the hospital's short stay programme, which involved discharge within 36 hours of birth.
Grullon, K. E., Grimes, D. A., The safety of early postpartum discharge: a review and critique, <i>Obstetrics &amp; Gynecology</i> , 90, 860-5, 1997	Relevant included studies were also included in the Cochrane review (Brown 2002), from which data was extracted.
James, L., Sweet, L., Donnellan-Fernandez, R., Breastfeeding initiation and support: A literature review of what women value and the impact of early discharge, <i>Women &amp; Birth: Journal of the Australian College of Midwives</i> Women Birth, 30, 87-99, 2017	This review includes only one RCT. This RCT has been included in the current review and data has been extracted from the Cochrane review on early postpartum discharge.
Laliberte, C, Dunn, S, Pound, C, Sourial, N, Yasseen, As, Millar, D, White, Rr, Walker, M, Lacaze-Masmonteil, T, A randomized controlled trial of innovative postpartum care model for mother-baby dyads, <i>PLoS ONE</i> , 11, 2016	No relevant comparison. Post-discharge follow-up by newly established postpartum community-based clinic versus standard post-discharge follow-up. Both groups were discharged based on current hospital standards.
Lassi, Z. S., Das, J. K., Salam, R. A., Bhutta, Z. A., Evidence from community level inputs to improve quality of care for maternal and newborn health: interventions and findings, <i>Reproductive Health</i> , 11, 2014	This review reports findings from 43 systematic reviews relating to community level interventions. It does not mention a systematic review focused on early postpartum discharge.
Levitt, C., Shaw, E., Wong, S., Kaczorowski, J., Springate, R., Sellors, J., Enkin, M., Systematic review of the literature on postpartum care: Methodology and literature search results, <i>Birth</i> , 31, 196-202, 2004	Relevant included studies were assessed for inclusion in the current review. No relevant outcome data.
Lieu, Ta, Braveman, Pa, Escobar, Gj, Fischer, Af, Jensvold, Ng, Capra, Am, A randomized comparison of home and clinic follow-up visits after early postpartum hospital discharge, <i>Pediatrics</i> , 105, 1058-1065, 2000	No relevant comparison. Post-discharge home visits versus post-discharge paediatric clinic visits. Nurses attempted to enrol mothers in the study after a decision to discharge them had been made.
McKeever, P, Stevens, B, Miller, Kl, MacDonell, Jw, Gibbins, S, Guerriere, D, Dunn, Ms, Coyte, Pc, Home versus hospital breastfeeding support for newborns: a randomized controlled trial, <i>Birth (Berkeley, Calif.)</i> , 29, 258-265, 2002	Breastfeeding rates were assessed from 5 to 12 days postpartum (time of outcome assessment different from review protocol). Data on satisfaction of mothers of term newborns is provided for the early discharge group but not for the late discharge group.
O'Connor, K. S., Mowat, D., Scott, H., Larson, M., Horton, N., Galbraith, A., Routine home visits may not be needed for postpartum care in low-risk cases, <i>Evidence-Based Healthcare</i> , 7, 182-184, 2003	Abstract and commentary of a paper that has been separately assessed for inclusion in the current review.

Study	Reason for exclusion
Paul, Im, Beiler, Js, Schaefer, Ew, Hollenbeak, Cs, Alleman, N, Sturgis, Sa, Yu, Sm, Camacho, Ft, Weisman, Cs, A randomized trial of single home nursing visits vs office-based care after nursery/maternity discharge: the Nurses for Infants Through Teaching and Assessment After the Nursery (NITTANY) Study, Archives of Pediatrics & Adolescent MedicineArch Pediatr Adolesc Med, 166, 263-70, 2012	No relevant comparison. Post-discharge home nursing visits versus standard post-discharge office-based care.
Paul, Im, Downs, Ds, Schaefer, Ew, Beiler, Js, Weisman, Cs, Postpartum anxiety and maternal-infant health outcomes, Pediatrics, 131, e1218-24, 2013	Secondary analysis of RCT data. The RCT has been separately assessed for inclusion and excluded from the current review. This secondary analysis focuses on the prevalence of anxiety and its association with maternal and child health outcomes.
Petrou, S., Boulvain, M., Simon, J., Maricot, P., Borst, F., Perneger, T., Irion, O., Home-based care after a shortened hospital stay versus hospital-based care postpartum: an economic evaluation, BJOG: An International Journal of Obstetrics & Gynaecology, 111, 800-6, 2004	No relevant outcomes.
Steel, O'Connor Ko, Mowat, DI, Scott, Hm, Carr, Pa, Dorland, JI, Young, Tai Kf, A randomized trial of two public health nurse follow-up programs after early obstetrical discharge: an examination of breastfeeding rates, maternal confidence and utilization and costs of health services, Canadian journal of public health = revue canadienne de sante publique, 94, 98-103, 2003	No relevant comparison. Post-discharge home visits versus post-discharge screening telephone call. All women were discharged within 2 days of the birth of their infants.
Stevens, B, Guerriere, D, McKeever, P, Croxford, R, Miller, KI, Watson-MacDonell, J, Gibbins, S, Dunn, M, Ohlsson, A, Ray, K, Coyte, P, Economics of home vs. hospital breastfeeding support for newborns, Journal of Advanced Nursing, 53, 233-243, 2006	No relevant outcomes.
Thompson, Jf, Roberts, CI, Ellwood, Da, Early discharge after childbirth: too late for a randomized trial?, Birth (Berkeley, Calif.), 26, 192-195, 1999	Pilot study to assess the feasibility of an RCT. No relevant outcomes.
Waldenström, U, Early and late discharge after hospital birth: father's involvement in infant care, Early Human Development, 17, 19-28, 1988	No relevant outcomes.
Waldenström, U, Lindmark, G, Sundelin, C, Methodological problems of clinical trials in nursing illustrated by a study of post-partum care, Scandinavian journal of caring sciences, 1, 15-22, 1987	No relevant outcomes.
Waldenström, U, Nilsson, Ca, No effect of birth centre care on either duration or experience of breast feeding, but more complications: findings from a randomised controlled trial, Midwifery, 10, 8-17, 1994	No relevant comparison. Birth centre care versus standard obstetric care. Birth centre care involved early discharge within 24 hours, and standard obstetric care involved discharge at 3 to 4 days, however there were other differences

Study	Reason for exclusion
	between the two models of care. For example, at the birth centre, parents were cared for by the same team of midwives from the outset of pregnancy, during birth, and postnatally. This did not occur with obstetric standard care. Therefore, it would be difficult to relate outcomes to early or late discharge.
Waldenström, U, Nilsson, Ca, Experience of childbirth in birth center care. A randomized controlled study, <i>Acta Obstetrica et Gynecologica Scandinavica</i> , 73, 547-554, 1994	No relevant outcomes.
Waldenström, U, Nilsson, Ca, Winbladh, B, The Stockholm birth centre trial: maternal and infant outcome, <i>British Journal of Obstetrics and Gynaecology</i> , 104, 410-418, 1997	No relevant comparison. Birth centre care versus standard maternity care. Birth centre care involved early discharge within 24 hours, and standard maternity care involved discharge at 3.5 days on average, however there were other differences between the two models of care. For example, at the birth centre, parents were cared for by the same team of midwives from the outset of pregnancy, during birth, and postnatally. This did not occur with maternity standard care. Therefore, it would be difficult to relate outcomes to early or late discharge.
Zadoroznyj, M., Postnatal care in the community: Report of an evaluation of birthing women's assessments of a postnatal home-care programme, <i>Health and Social Care in the Community</i> , 15, 35-44, 2007	Not an RCT. No relevant comparison. This study uses both qualitative and quantitative methods to evaluate a new postnatal home-care support worker.

1 *RCT: randomised controlled trial*

## 2 Economic studies

### 3 Table 16: Excluded studies and reasons for their exclusion

Study	Reason for exclusion
Bostanci Ergen E, Ozkaya E, Eser A, Abide Yayla C, Kilicci C, Yenidede I, Eser SK, Karateke A. Comparison of readmission rates between groups with early versus late discharge after vaginal or cesarean delivery: a retrospective analyzes of 14,460 cases. <i>J Matern Fetal Neonatal Med</i> 2018; 31(10):1318-1322.	No details of the economic analysis reported; only related figure is the difference in costs between early and late discharge without any cost analysis / cost data reported.
Bowers J, Cheyne H. Reducing the length of postnatal hospital stay: implications for cost and quality of care. <i>BMC Health Serv Res</i> 2016; 16:16.	No economic evaluation; financial model developed to explore the quantitative and organisational consequences of reducing the length of postpartum stay, taking into account excess demand, work intensity and bed occupancy.
Ellberg L, Högberg U, Lundman B, Lindholm L. Satisfying parents' preferences with regard to various models of postnatal care is cost-minimizing. <i>Acta Obstet Gynecol Scand</i> 2006; 85(2): 175-81.	The study compared 5 models of postnatal care, all of which comprised a mixture of 3 different options post-delivery:

Study	Reason for exclusion
	<ul style="list-style-type: none"><li>• admission to the maternity ward, when the mother or baby needed special medical or nursing care</li><li>• transfer to family suite for healthy mothers and babies, where all families had their own room and family members could stay all hours if desired; midwives offered support and assistance during the day, and at night, a nurse was available at the reception desk</li><li>• early discharge for healthy mothers and babies, at no less than 6 hours and no later than 72 hours</li></ul>

1

## 1 Appendix L – Research recommendations

### 2 Research recommendations for review questions:

3 **How does the length of postpartum stay affect women and their babies**  
4 **(single births)?**

5 **How does the length of postpartum stay affect women and their babies**  
6 **(twins or triplets)?**

### 7 Research question

8 How does the length of postpartum stay and the timing of the first midwife visit after  
9 discharge affect unplanned or emergency health contacts for women and babies?

### 10 Why this is important

11 The review on the length of postpartum stay found no overall identifiable  
12 disadvantages for mothers or babies from early postnatal discharge and some  
13 advantages in terms of maternal satisfaction with care. However, no data were  
14 located about the impact of earlier discharge on unplanned, out-of-hours or  
15 emergency health contacts by women or babies. There was also a lack of data from  
16 another review about the impact of the timing of first postnatal contact by midwives  
17 on these unplanned admissions or attendances. The committee were in agreement  
18 about the relatively high financial and personal impact to families and healthcare  
19 providers of such unplanned contacts so they recommended that future research  
20 should take account of the association between early discharge and the impact on  
21 health services and the extent to which the first midwife visit interacts with this.

### 22 Table 13: Research recommendation rationale

Research question	How does the length of postpartum stay and the timing of the first midwife visit after discharge affect unplanned or emergency health contacts for women and babies?
<b>Why is this needed</b>	
<b>Importance to ‘patients’ or the population</b>	Whilst some women will have a personal preference for the length of their postnatal hospital stay, and obstetric or neonatal problems will be important determinants for some women and babies, the advantages and disadvantages of early discharge are unclear. The review found some evidence in favour of early postpartum discharge based on breastfeeding and dissatisfaction outcomes. However, there are no data about the impact of early discharge on health service outcomes, such as unplanned attendance or emergency admissions for either women or babies. It is possible that these negative outcomes outweigh the potential benefits. Furthermore, the timing of the first midwife visit following discharge may mitigate these negative outcomes but supporting evidence is lacking. It is therefore important to understand the impact of both early hospital discharge and early midwife visits on outcomes for the women, their babies and families.
<b>Relevance to NICE guidance</b>	There is currently insufficient evidence about the timing of postpartum discharge so the committee recommended that

<b>Research question</b>	<b>How does the length of postpartum stay and the timing of the first midwife visit after discharge affect unplanned or emergency health contacts for women and babies?</b>
	discharge timing is based on the clinical and psychological needs of women and babies and the woman's preferences. Due to the low quality and indirectness of the evidence the committee drafted recommendations about the timing of the first midwife visit on the basis of informal consensus. Understanding whether the timing of postpartum discharge and the first midwife visit are likely to cause unplanned health contacts will support the development of stronger, more specific future recommendations and enable clinicians to plan appropriately timed discharge and reduce adverse outcomes.
<b>Relevance to the NHS</b>	The timing of postpartum discharge and the timing of the first midwife visit may affect health service outcomes but this is currently unclear from the evidence. If the associations could be established through a prospective, observational study, this could lead to a change in practice and significant cost-savings for the NHS as well as an improvement in women's satisfaction with their care in the postnatal period.
<b>National priorities</b>	Making the best use of NHS resources and improving outcomes for women and babies is a national priority.
<b>Current evidence base</b>	There is currently some evidence in favour of early discharge, based on breastfeeding and dissatisfaction outcomes, however, evidence is lacking on how this impacts unplanned attendance and readmission rates. The evidence base for the timing of the first midwife contact is lacking.
<b>Equality</b>	It is important that the duration of postnatal hospital stay takes account of the needs and wishes of the woman and baby – those living in disadvantaged conditions may benefit from a longer hospital stay, whilst women with other caring responsibilities (e.g. older children or other dependents) may benefit from earlier discharge if adequately supported.
<b>Feasibility</b>	Since the proposed study design is observational the research would not require significant infrastructure.
<b>Other comments</b>	-

1 **Table 18: Research recommendation modified PICO table**

<b>Criterion</b>	<b>Explanation</b>
<b>Population</b>	Women and their babies during the first 2 months after birth
<b>Intervention (exposure)</b>	Primary: Timing of discharge Secondary: Timing of first midwife visit
<b>Comparator</b>	Different timing of discharge Different timing of first midwife visit
<b>Co-variables</b>	<ul style="list-style-type: none"> <li>• Timing of first midwife visit (for primary exposure)</li> <li>• Timing of discharge (for secondary exposure)</li> <li>• Obstetric complications</li> <li>• Mode of birth</li> <li>• Maternal characteristics</li> <li>• Gestational age of the baby</li> <li>• Birth weight of the baby</li> </ul>

<b>Criterion</b>	<b>Explanation</b>
<b>Outcomes</b>	<ul style="list-style-type: none"><li>• Unplanned attendance in primary care for woman and/ or baby</li><li>• Unplanned attendance in secondary care</li><li>• Hospital readmissions for woman and/or baby</li><li>• Costs and cost-effectiveness</li><li>• Morbidity (in woman, in baby)</li><li>• Mortality (in woman, in baby)</li></ul>
<b>Context</b>	Postnatal period
<b>Study design</b>	Prospective cohort study
<b>Additional information</b>	In the absence of robust data, the committee drew on their own expert knowledge to recommend that the first midwife visit should occur 12-36 hours after birth. Therefore, the 12-36 hour timing for the first midwife visit should be incorporated in the design of the research, namely in the secondary exposure and comparator.

1
