*October 2021*

*Final*

*These evidence reviews were developed  
by NICE Guideline Updates Team*

## **Disclaimer**

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the [Welsh Government](#), [Scottish Government](#), and [Northern Ireland Executive](#). All NICE guidance is subject to regular review and may be updated or withdrawn.

# Barriers and facilitators for supporting care placement stability among looked-after children and young people

## Review question

What are the barriers to, and facilitators for, supporting care placement stability among looked-after children and young people?

## Introduction

This review will consider interventions to support placement stability in children and young people who are looked after. In March 2018, 75,420 children and young people in England were looked after. Care placements for looked after children and young people may include: foster placement (73%), residential accommodation (including secure units, children's homes, and semi-independent living arrangements) (11%), placement with birth parents (6%), placement for prospective adoption (3%), another placement in the community (4%), or placement in residential schools or other residential settings (3%). For looked after children and young people only 29% of placements are long term and 50% of long-term teenage placements have been found to break down. Placement break-down is associated with poor outcomes for looked-after children and young people including educational and relational outcomes, and physical, mental, and emotional health and wellbeing.

The broad system of care offered by local authorities in the UK aims to support placement stability. For example, regular review meetings are held with looked after children and young people during which problems with the placement can be raised and extra support can be requested. In addition, looked after children are assigned individual social workers to provide direct one-to-one care. Additional interventions may also be offered, for example, carer training courses or peer support. However, there is uncertainty about which aspects of statutory and non-statutory care are found to be helpful and accessible by looked after children and young people, their carers and support providers, for supporting placement stability.

The aim of this review is to explore the barriers to, and facilitators for placement stability in looked-after children and young people as perceived by looked after children themselves, their carers, and support providers and to synthesise overarching themes that can highlight ways that placement stability can be improved.

## SPIDER table

**Table 1: SPIDER table for barriers and facilitators for supporting care placement stability among looked-after children and young people**

Type of review	Qualitative evidence synthesis
----------------	--------------------------------

<b>Sample (S)</b>	Looked after children and young people, wherever they are looked after, from birth until age 18 and their families and carers (including birth parents, connected carers and prospective adoptive parents).  Also including: <ul style="list-style-type: none"> <li>• Children and young people living at home with birth parents but under a full or interim local authority care order and are subject to looked-after children and young people processes and statutory duties.</li> <li>• Children and young people in a prospective adoptive placement.</li> <li>• Looked-after children and young people on remand, detained in secure youth custody and those serving community orders.</li> </ul>
<b>Phenomenon of Interest (PI)</b>	Barriers and facilitators for supporting care placement stability, including the statutory support offered for looked after children and young people.
<b>Design (D)</b>	<ul style="list-style-type: none"> <li>• Systematic reviews of included study designs</li> <li>• Qualitative studies: including focus groups, unstructured, and semi-structured interview-based studies (mixed-methods studies will also be included provided they contain relevant qualitative data)</li> </ul>
<b>Evaluation (E)</b>	Evidence should relate to views concerning barriers and facilitators for placement stability in looked after children and young people, among: <ul style="list-style-type: none"> <li>• Looked after children and young people themselves</li> <li>• Carers of looked after children and young people</li> <li>• Other support workers providing and accessing support for placement stability</li> </ul> <p>With a focus on:</p> <ul style="list-style-type: none"> <li>• Experience of support for placement stability and accessing this support</li> <li>• Unintended consequences</li> </ul>
<b>Research type</b>	Qualitative or mixed methods where relevant qualitative data is presented
<b>Search date</b>	1990
<b>Exclusion criteria</b>	<ul style="list-style-type: none"> <li>• Countries outside of the UK (unless not enough evidence, then progress to OECD countries)</li> <li>• Studies older than the year 2010 (unless not enough evidence, then progress to include studies between 1990 to current)</li> <li>• Studies including mixed populations (i.e. looked after and non-looked after children) without reporting results separately for LACYP</li> <li>• Mixed-methods studies reporting qualitative data that cannot be distinguished from quantitative data.</li> </ul>

## Methods and process

This evidence review was developed using the methods and process described in [Developing NICE guidelines: the manual](#). For further details of the methods used see Appendix N. Methods specific to this review question are described in this section and in the review protocol in Appendix A.

The search strategies for this review (and across the entire guideline) are detailed in Appendix B.

Declarations of interest were recorded according to [NICE's 2018 conflicts of interest policy](#).

## Qualitative evidence

### Included studies

A single search was conducted to inform all of the review questions that formed part of this guideline. After removing duplicates, a total of 36,866 studies were identified from the search. After screening these references based on their titles and abstracts, 118 studies were obtained and reviewed against the inclusion criteria as described in the review protocol for barriers and facilitators for supporting care placement stability (Appendix A). Overall, 40 studies (39 original studies) were included (see Appendix D for full evidence tables).

### Excluded studies

In total, 78 references were excluded because they did not meet the eligibility criteria. See Appendix J for a list of references for excluded studies, with reasons for exclusion.

### Summary of studies included in the qualitative synthesis

Of the 40 included studies, there was an example of papers presenting the same population (Chase 2010, 2013). In this textual summary these two studies will be counted as one to prevent duplication of themes.

The number of participants ranged from four to 258 across all studies. A sufficient number of UK-based studies were identified, meaning that the review focussed on UK-based evidence alone. All studies were published after 2010.

The means of data collection in 21 studies used individual semi-structured interviews, in addition, 13 studies used focus group methodology. Five studies were less clear and simply referred to “in-depth interviews” with an additional study using an inductive “mosaic approach” with interview questions developed by participants.

Most studies were among children in care, broadly. However, four studies were among children in foster care and two among children in residential care, specifically. One study concerned children in care receiving drug and alcohol treatment, three studies considered sub-populations with mental health problems, three studies concerned unaccompanied asylum seekers, two studies considered trafficked children, two studies considered parents in care including one study considered black and ethnic minority mothers in care, one study considered those who are LGBTQ, and one study considered those with criminal involvement. A broad age range was included in most studies, however two studies considered looked after children (<11 years old) and 16 studies considered looked after young people (>11 years old), specifically. Twelve studies did not report the age of the looked after children considered, often where the perspectives of carers or support staff alone had been canvassed.

No studies focused on looked after children who were babies and young children, who were placed out of area, or with Special Educational Needs.

Further study characteristics are presented in [table 2](#).

**Table 2: characteristics of studies included in the qualitative synthesis for this review**

Study (country)	LACYP population (age)	Setting and context	Methods	Perspectives (n)
Alderson 2019 (UK)	Looked after children who have experienced receiving drug and alcohol treatment interventions and/or LAC accessing other services for support surrounding 'help seeking' behaviour. (age 12 to 20 years)	Taking part in an RCT of a behavioural change intervention to reduce risky substance use	Individual 1:1 semi-structured interviews with looked after children focus groups with professional participants. Thematic analysis was used.	Looked after children (19), carers (17), drug and alcohol workers (8), social workers (8)
Berridge 2017 (UK)	Children in care between the end of Key Stage 2 to end of Key Stage 4 (11–16 years of age).	Secondary school in England	Semi-structured interview data was analysed using a thematic approach.	Adolescents (26), social workers (17), Foster carers (17), residential worker (1), Teachers (20)
Brewin 2011 (UK)	Children who are looked after in one borough in Wales, on roll at a school within the local authority and about to make, or have recently made, transition into secondary school (age 9 – 12 years)	Looked after children in a semi-rural borough in Wales	Semi-structured interviews and thematic analysis using "framework analysis"	Child interviews (14), Foster carers (22), Teachers (19) Looked After Children Education Support Officers (3), and a social worker focus group
Brown 2019 (UK)	Looked after children (aged between 12 and 20 years)	Four local authorities in North-East England	Semi-structured interviews, dyad interviews, and focus group interviews. Thematic analysis was used.	Looked after children (19), Carers (17), Social workers (8)
Chase 2010/2013 (UK)	Unaccompanied asylum seekers (aged 9 – 17 years)	Local authorities in London.	In-depth interviews and thematic analysis	Unaccompanied asylum seekers (54)
Diaz 2019a (UK)	Looked after children (ages not reported)	One English local authority	Semi-structured interviews and thematic analysis	Independent Review Officers (8) and Social Workers (11)

<b>Study (country)</b>	<b>LACYP population (age)</b>	<b>Setting and context</b>	<b>Methods</b>	<b>Perspectives (n)</b>
Diaz 2019b (UK)	Looked after children (ages not reported)	One English local authority	Semi-structured interviews and thematic analysis	Social worker senior managers (7)
Dodsworth 2013 (UK)	Looked after children in foster care (age not reported)	Three authorities in England: a rural county that includes the county town, a city unitary authority and a London borough	Separate focus group discussions for foster carers and social workers, thematic analysis was used.	Foster carers (27 and social workers (18)
Evans 2016 (UK)	Looked after children and young people or those with prior experience of being in care and education (16 – 27 years old)	Wales. Participants were purposively sampled through The Fostering Network.	Focus groups with semi-structured interviewing and thematic analysis was conducted.	Looked after young people (26)
Fargas-Malet 2018 (UK)	Children and young people in care (age not reported)	Northern Ireland, foster, kinship, and residential care.	Focus group interviews, semi-structured interviews, and thematic analysis.	Carers (foster, kinship and residential) (233); interviews with young people (25); and multidisciplinary focus group interviews with professionals across the HSC Trusts.
Francis 2017 (UK)	Looked after children who would benefit from additional psychological support (5 to 11 years)	Looked after children referred from nine primary schools in an English local authority (Leicester)	Semi-structured interviews and thematic analysis.	Looked after children (20)
Franklin 2013 (UK)	Young people who were trafficked which children and became looked after (age 15 to 23 years)	Voluntary organisations supporting trafficked children	Semi-structured interviews with trafficked children and telephone interviews with stakeholders. Thematic analysis was used.	Looked after children (17), representatives from six local authorities (social care managers and front line social workers) (9), solicitors (welfare and immigration) (2) and voluntary sector staff (front-line

Study (country)	LACYP population (age)	Setting and context	Methods	Perspectives (n)
				workers with direct experience of supporting trafficked/suspected trafficked children) (7)
Gaskell 2010 (UK)	Looked after young people (age not reported)	Inner London Local Authority. All young people were also service users of a London-based children's charity.	Interviews and thematic analysis	Looked after young people (10)
Griffiths 2012 (UK)	Children in care (aged 7 to 11 years)	Three different UK local authorities. Participants took part in the Letterbox club intervention.	Semi-structured interviews. Unclear how data was analysed.	Children (4) and foster carers (4) for Letterbox Red and Blue in 2009, and with children (6) and their foster carers (6) for Letterbox Green in 2011
Groak 2011 (UK)	Unaccompanied asylum seekers (aged 16 to 18 years)	An inner-city borough in the UK	Semi-structured interviews and Interpretative Phenomenological Analysis (IPA) were used.	Unaccompanied asylum seekers (6)
Hiller 2020 (UK)	Looked after children in foster care (age not reported)	One local authority in England	Convenience sampling was used. Data from focus groups was analysed thematically.	Foster carers (21)
Hooley 2016 (UK)	Looked after children receiving life story interventions (age not reported)	Health and social care agencies with experience of life story work	Q-methodology for ranking qualitative statements and a focus group with thematic analysis.	Clinical psychologists (7), other therapists (2), social work professionals (6), foster carers (11), adoptive parents (5), care leavers (4)
Kirton 2011 (UK)	Looked after children involved with an evaluation of multidimensional treatment foster care (most were aged 13 or older)	Local evaluation of MTFC within one of the pilot local authorities.	Semi-structured interviews. Unclear how data was analysed).	Foster carers (8), children's social workers (6), supervising social workers (2), individual therapists, birth family

Study (country)	LACYP population (age)	Setting and context	Methods	Perspectives (n)
				therapists, skills workers (3), social work assistants, programme supervisor (1), programme manager (1), members of the management board (4)
Larkins 2021 (UK)*	Looked after children and care leavers (aged 6 to 17)	Three local authorities in the UK.	Creative methods and thematic interview schedules were developed in consultation with a steering group of young researchers who were LAC. All fieldwork activities were audio recorded and transcribed verbatim. A hybrid approach of inductive and deductive thematic analysis with a framework analysis approach was used. Data was listened to, read, looked at and reviewed by multiple researchers, young researchers and GUC members.	Perspectives of looked after children and care leavers (47)
Littlechild 2011 (UK)	Looked after children in residential care (13 to 17 years of age)	Four residential young people's units in a local authority involved with an evaluation of restorative justice methods	Semi-structured interviews with young people and focus groups with residential care staff	Residential care staff (33), young people in residential care (8)
Mantovani 2015 (UK)	Mothers in care or having left care with black minority ethnicity (aged 16 to 19 years old)	Three London Local Authorities (LAs) selected for their geographical diversity, reported rates of teenage pregnancy and their high concentration of black minority groups.	In-depth unstructured interviews and thematic analysis.	Looked after mothers in care (15)

Study (country)	LACYP population (age)	Setting and context	Methods	Perspectives (n)
Nixon 2019 (UK)	Looked after children (age not reported)	Social services, residential children's homes and foster care. All caregivers were recruited from a large urbanised local authority in Scotland.	Semi-structured interviews with thematic analysis.	Foster and residential care givers (22)
Ni 2015 (UK)	Unaccompanied asylum seekers (13 to 18 years old)	Four Local Authorities in England	Three focus groups with thematic analysis	Foster carers (23), Young people in their care (19), social workers (4) children's asylum team managers (4)
November 2020 (UK)	Parents in care (age not reported)	Parent-and-child foster placements across England	Semi structured interviews and focus groups. Snowball sampling was used. Thematic analysis was used with multiple analysts.	Parent and child carers (32) Mothers in care (8) Supervising social workers (9)
Oke 2013 (UK)	Adolescents in care stable in a placement despite previous expectations (aged 12 to 17 years old)	One local authority in the UK	Semi-structured interviews with thematic analysis	Foster carers (7)
Pert 2017 (UK)	Looked after children and young people in foster care (aged 8 to 17 years)	One local authority in England	In-depth interviews and thematic analysis	Looked after children and young people (25) foster carers (16)
Pearce 2011 (UK)	Trafficked children and young people (age not reported)	Three research sites in the UK selected to reflect geographical areas with different proximities to international airports	Focus groups and semi-structured interviews with thematic analysis and triangulation with case records.	Social workers (22); Specialist children's NGO's and separated children/asylum workers (12); Police, Crown Prosecution Service staff, Youth Offending Team workers and staff from the UK Borders Agency (11); residential childcare and statutory children's centre

Study (country)	LACYP population (age)	Setting and context	Methods	Perspectives (n)
				workers (10); health workers (10); and education workers (7).
Quarmby 2014 (UK)	Looked after children in residential care (aged 12 to 17 years)	One residential home in England	A "mosaic approach": a participatory, multi-method approach whereby young people's own research artefacts (photographs, maps, drawings, etc.) were joined to interview responses and observations. Interview questions were developed in collaboration with the participants.	Looked after children in residential care (4)
Roesch-Marsh 2017 (UK)	Looked after children attending reviews in the study period (aged 12 to 18 years old)	Scotland	Mixed methods. Survey questionnaires and "qualitative interviews". Individual interviews with young people and a focus group with the independent reviewing officers. Thematic analysis was used.	Looked after young people (10) Independent Review Officers (5)
Ridley 2016 (UK)	Looked after children and care leavers (aged 7 to 23 years)	Participants in the pilot evaluation of Independent Social Work Practices (SWPs), England.	Semi-structured interviews with thematic analysis.	Looked after children and care leavers (169)
Samrai 2011 (UK)	Looked after children in foster care (age not reported)	One English local authority (Midlands)	Semi-structured interviews and thematic analysis (using grounded theory)	Foster carers (8)
Sen 2011 (UK)	Looked after children (age not reported)	One large urban Scottish local authority	Semi-structured interviews and focus groups with thematic analysis	Social work professionals (19) reporters to the Children's Hearing system (3)
Schofield 2015 (UK)	Looked after children in contact with the youth justice system; and looked after children without involvement in	Four UK local authorities	Semi-structured interviews with thematic analysis	Looked after children offenders (33), looked after children non-offenders (35)

Study (country)	LACYP population (age)	Setting and context	Methods	Perspectives (n)
	the justice system (aged 15 to 17 years)			
Sidery 2019 (UK)	Unaccompanied asylum seekers (age not reported)	a semi-rural county in the South West of England with a considerably lower level of ethnic diversity than the national average	Semi-structured interviews with thematic analysis.	Foster carers (11)
Thomas 2012 (UK)	Looked after young people involved in Children in Care Councils (age not reported)	Boroughs around the city of London involved with the development of Children in Care Councils	Semi-structured interviews and focus groups. Unclear how data was analysed.	Looked after young people (10), participation workers (4), managers (4) and elected members (3)
Thompson 2016 (UK)	Looked after children and young people at homes with birth children (age not reported)	one UK foster agency only	Semi-structured interviews. Thematic analysis was undertaken using grounded theory.	Foster carers (9)
Valentine 2019 (UK)*	Looked after children in foster care (child's age at breakdown was 13 - 18)	foster carers from three fostering organisations where the placement had broken down	Semi-structured interviews. Interpretative Phenomenological Analysis (IPA) was used for thematic analysis.	Foster carers (7)
Wadman 2018 (UK)	Young people with experience of living in care who have self-harmed in the previous 6 months (age 11 to 21 years)	Foster homes or residential homes in the East Midlands	Semi-structured interviews. Interpretative Phenomenological Analysis (IPA) was used for thematic analysis.	Looked after young people (16), care leavers (8)

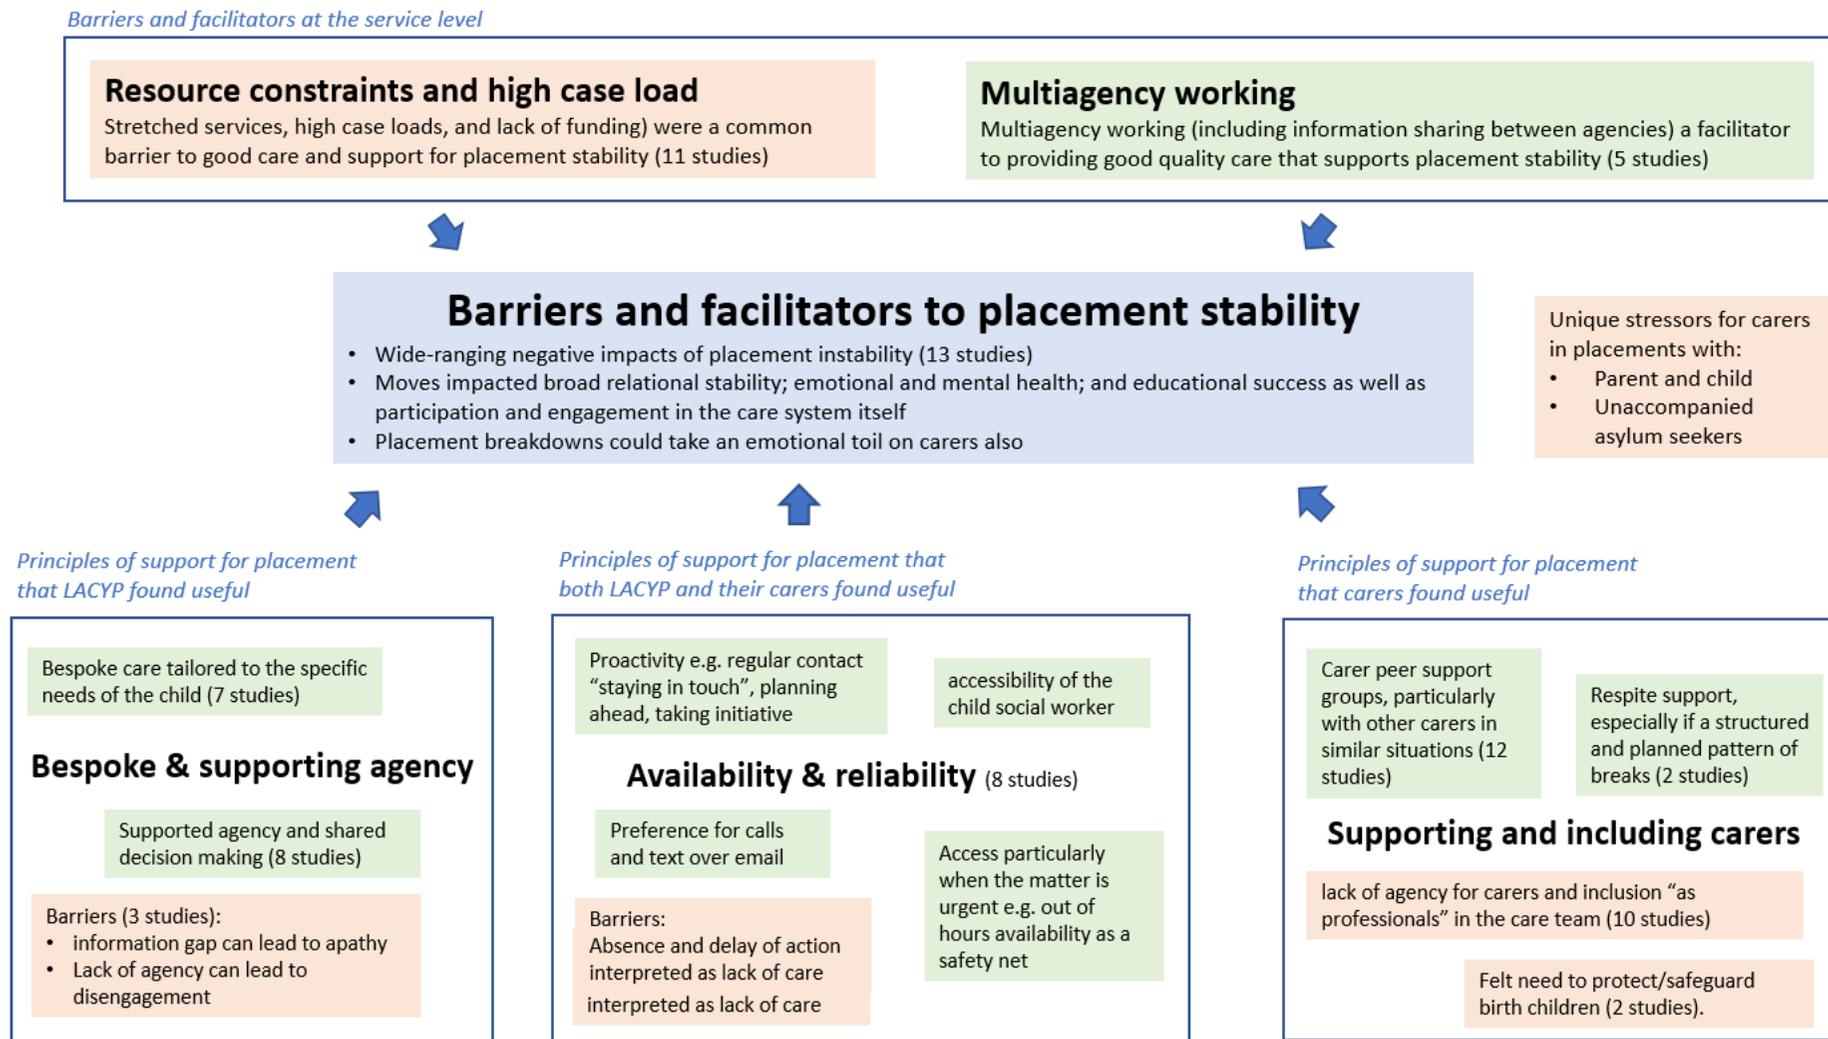

Study (country)	LACYP population (age)	Setting and context	Methods	Perspectives (n)
York 2017 (UK)	Looked after children in foster care with mental health difficulties (age not reported)	A single, inner city, local authority in England	Semi-structured interviews and thematic analysis using a grounded approach.	Foster carers (10)

See Appendix D for full evidence tables

### Summary of the qualitative findings included in the evidence review

Studies were critically appraised using the CASP qualitative study checklist. See appendix D for appraisal of individual studies.

**Figure 1: Summary of the qualitative themes observed in this review**

**Table 3: Summary of qualitative findings: barriers and facilitators for supporting care placement stability among looked-after children and young people**

Themes	illustrative quotes	Studies	CERQual concerns	CERQual explanation
<p><b>Detrimental and broad impact of placement moves</b></p> <p>Detrimental impact of placement moves and history of placement moves on educational, emotional, mental health, and relational stability. Stability may also improve participation in care processes. Placement breakdown can have an emotional toil on carers also.</p>	<p><i>“So they might, you know, have contact with their brothers or sisters, you know, it is just they get moved around, and when they are moved around they are vulnerable, they are desperate to have friends or they are desperate to have somebody to call their own..... people get attracted to them who are, I would say, not the type of kids I would want my kids to knock around with” FC</i></p> <p><i>“I’d say that the most important thing is to make sure that there is stability in the young person’s life because moving around a lot affects their education... I think there should be something in a young person’s life that stays the same so whether that be the social worker, or the school, or the placement. [Participant M04] Yeah I found obviously moving around schools a lot, because I moved from Wales to England and it was like during that transition of like for a year I was out of education so I was playing a catch-up game, always like right the way up through school until I left, I was always trying to catch up.” LACYP</i></p>	<p><b>13</b></p> <p>Alderson 2019 Berridge 2017 Brewin 2011 Evans 2016 Francis 2017 Franklin 2013 Gaskell 2010 Groak 2011 Kirton 2011 Quarmby 2014 Roesch-Marsh 2017 Wadman 2018 Valentine 2019</p>	<p>ML: No concerns C: No concerns A: No concerns R: No concerns</p> <p><b>Overall: High</b></p>	<p>Some studies were marked down for ML primarily for poor or limited reporting of their methods and indirectness. However, theme was reflected in low risk of bias and direct evidence also.</p>

	<p><i>"I was lucky, I didn't move that much. It's the moving that messes kids up. My brothers and sister have been in the same place the whole time. They were even luckier, they got a foster mum who really wanted them, and they've stayed." LACYP</i></p>			
<p><b>Peer support for carers</b></p> <p>Carers benefitted from mutual support and problem-solving among peer groups. And from engaging wider social networks e.g. family. Use of internet systems could help connect social workers and broader foster parent groups. Specialist peer support groups could be particularly useful for carers in specialist placements (e.g. unaccompanied asylum seekers and parent-and-child placements)</p>	<p><i>"We deal with it pretty well, but I think with this wee core group of carers that we've got there's always an opportunity for learning... 'I've tried to get this boy to do his bloody homework and he just will not do it' and somebody will say 'try this' and you find that it works. That's where our support is... from other carers in our group. We bounce off each other" FC</i></p> <p><i>"My support network is my friends who are foster carers, not necessarily in this borough (area). They can be a good source of help and more information like if you're in a crisis or not sure what to do. Your ordinary friends who don't do what you do have no idea, they wouldn't relate. (Anna) There is the group and some of us have already made friends any way so we can just call each other and that is very good. My cousin, she is also a foster carer and so we're also there for each other" FC</i></p>	<p><b>12</b></p> <p>Berridge 2017          Dodsworth 2013          Hiller 2020          Kirton 2011          Medforth 2019          Nixon 2019          November 2020          Oke 2013          Rogers 2017          Samrai 2011          York 2017          Siderly 2019</p>	<p>ML: No concerns          C: Minor          A: No concerns          R: No concerns</p> <p><b>Overall:          Moderate</b></p>	<p>Some studies were marked down for ML primarily for poor or limited reporting of their methods. However, theme was reflected in low risk of bias evidence also. There was minor cases of incoherence or contradiction across studies contributing to this theme.</p>

<p><b>Resource constraints, high case load, lack of funding led to stretched services, information gaps, and reactive not responsive care (“fire-fighting”).</b></p> <p>Resource constraints, high case load, lack of funding led to stretched services, information gaps, and reactive not responsive care (“fire-fighting”). Lower caseloads led to more direct care. Foster carers reported having to fight for resources e.g. an allocated social worker, respite care, or other placement support services. Carers felt that they were not informed of all services available upfront for support. Voluntary organisations were turned to too fill in the gaps left in statutory care.</p>	<p><i>“Young people are not properly protected because of social workers’ high case loads. Social workers don’t have time to do their job properly” SW</i></p> <p><i>“We no longer work as a social worker, we work as an admin officer” SW</i></p> <p><i>“But I think the difficulty, [is] we are “statutories” [statutory organisation employees], I think people and voluntary organisations who don’t have the same kind of “stat limits” can give that more consistent care and support to a teenager [which] is really important. Because as much as we want to, we can’t do it.” SW</i></p> <p><i>“. . . other agencies often use us as their extra resource . . . they will recognise the young people in care have gone missing and will let us know and we then spend all our time running around looking for things that we shouldn’t be doing really.” Voluntary sector worker with trafficked children</i></p>	<p><b>11</b></p> <p>Brown 2019 Diaz 2019b Fargas-Malet 2018 Franklin 2013 Gaskell 2010 Nixon 2019 Pearce 2011 Pert 2017 Ridley 2016 Samrai 2011 Diaz 2019</p>	<p>ML: No concerns C: Minor A: No concerns R: No concerns</p> <p><b>Overall: Moderate</b></p>	<p>Some studies were marked down for ML primarily for poor or limited reporting of their methods. However, theme was reflected in low risk of bias evidence also. There was some incoherence across studies contributing to this theme e.g. resource constraints were felt to be a problem across the board, however, this manifested in a variety of ways described by included studies. Also studies often did not link these problems directly to placement stability.</p>
<p><b>Foster carers treated as professionals</b></p> <p>Lack of agency/ input/ inclusion/ information sharing as professionals for foster carers. The opposite was valued. For example, the sharing of background</p>	<p><i>“As a foster carer you have this child 24 hours a day – you know the child – they [social worker] come and see them once every six weeks. [. . .] They don’t really know that child but they’re not prepared to listen to what the carers have to say. (Josie) We’re everything to</i></p>	<p><b>10</b></p> <p>Brown 2019 Dodsworth 2013 Hooley 2016 Hiller 2020 Kirton 2011 Nixon 2019</p>	<p>ML: No concerns C: Minor A: No concerns R: No concerns</p>	<p>Some studies were marked down for ML primarily for poor or limited reporting of their methods. However, theme was reflected in low risk of bias evidence also. There was</p>

<p>information and details about the child and their history.</p>	<p><i>that child: we're a mother, we're a father, you know, we could be a nurse when they're not well, you're there looking after them, you know, you can also be a therapist to them but you're also punch bag. . .and everything else, more than just a social worker, so you'd think they would listen. (Michelle)"</i></p> <p><i>"We spoke to the carer and found out a whole load of other details and said, 'No, we're not taking her,' but if I hadn't have spoken to the carer, we would have taken her and we would have had problems . . . there's just no point them coming to placements that just, it's just setting the child and you up to fail."</i></p> <p><i>"For me most foster-carers are hands on people. It's not (about) tweeting. I think the difficulty with the NVQ etc. is that a lot of people who come into fostering want to look after children, funnily enough. Sometimes they're not academic, they don't want to go down that route; they just want to look after these children. Standards are crucial, but we need more foster-carers. I think we're going to have an even smaller pot of people prepared to become foster-carers. There are people who the thought of doing any sort of paperwork at all is going to put them off."</i></p>	<p>Oke 2013 Samrai 2011 Sen 2011 York 2017</p>	<p><b>Overall: Low</b></p>	<p>some incoherence across studies contributing to this theme. Studies touched on different aspects e.g. social workers taking advice from carers, informing, and including them. Involvement in transition planning. Additionally, some contradictory views e.g. about losing more foster carers who simply want to “care for children” and don’t want more paperwork. And concerns about taking on roles such as sexual health education. Four studies (fewer than half) reported partially indirect evidence.</p>
---	--	--	--------------------------------	--

<p><b>Availability, accessibility, and reliability of support valued by carers.</b></p> <p>Availability and reliability of support. Foster carer's valued accessibility of their link workers, particularly where the matter is urgent. Out of hours availability (safety net) was appreciated and planned respite care (structured pattern of breaks). Calls and text were preferred to email for access. Proactive allocated social workers were appreciated (ones which planned ahead and took initiative with regular contact – "staying in touch"). Absence and delay of action interpreted as lack of care, e.g. delay waiting for mental health services/ interventions which may impact placement stability. Flexibility of work, reduced case load, and administrative support could help practitioners be available as and when needed.</p>	<p><i>"There's nothing more reassuring ... that you can ring someone up and actually hear that person on the end of the phone, it's not some call centre or someone you've never met before." FC</i></p> <p><i>"I felt they were pushing me back. If, I don't call, she doesn't know how I am, she doesn't know how I feel, she doesn't know how my son is. She doesn't seem to care about us. It's like she has completely forgotten us" LACYP</i></p> <p><i>"Like you say, 'Well, we could take this child but we'll need this help,' and you have the initial review meeting and things are promised, and then none of it happens, so the child's got expectations and you've got expectations and it doesn't happen." FC</i></p> <p><i>"He didn't sort of stay in touch as much as the other social workers that we've had, and I was sort of having to sort of phone him to chase him for things." FC</i></p> <p><i>"I tried to get help on several occasions, but at the time she didn't have a social worker, and the principal social worker kept saying, 'Oh it's no good, she hasn't got a social worker, we'll sort it out, and then you'll get some help,' and this went on for three</i></p>	<p><b>8</b></p> <p>Dodsworth 2013 Fargas-Malet 2018 Kirton 2011 Mantovani 2015 Pert 2017 Ridley 2016 Samrai 2011 York 2017</p>	<p>ML: No concerns C: Minor A: No concerns R: No concerns</p> <p><b>Overall: Low</b></p>	<p>Some studies were marked down for ML primarily for poor or limited reporting of their methods. However, theme was reflected in low risk of bias evidence also. There was some incoherence across studies contributing to this theme: While the direction of this theme was consistent between studies (accessible and proactive care, with few delays was good). The specifics of how this could be delivered varied between studies. Three studies (less than half) reported partially indirect evidence.</p>
---	---	--	--	---

	months." FC			
<p><b>LACYP wished to be included in, listened to, and supported in decision making processes (shared decision making).</b></p> <p>LACYP wished to be included in, listened to, and supported in decision making processes (shared decision making). Failing to do so had implications for placement stability. Unsuccessful attempts to influence events resulted in apathy and disengagement from care processes. For example, review meetings were aided by good preparation, direct questions, space in the meeting to check understanding and for the LACYP to be heard, and agency with decisions such as location and time of review meetings. At a higher level, children in care councils were used to influence policy, structural change, and recruitment. However, failure to recruit hard to reach groups and financial concerns were a barrier to these. Children with a lack of agency may try to control their environments by other means e.g. behavioural problems.</p>	<p><i>"[about review meetings] They are helpful in a way because you can put your point across about anything you might want to change. If you didn't have them then you wouldn't know who to see or what to do and nothing would be changed. (Young woman aged 16)"</i></p> <p><i>"What's the point? Nothing ever changes so there is no point. (Young woman aged 16)"</i></p> <p><i>"If participation, planning and listening to the child's views are integral to their experience of services, then the review is only one part of that, it's not going to shift all that, so it has got to fit into the culture" Review Officer</i></p> <p><i>"We secured funding from the mayor. Originally, he said no but we turned around and went to him and said we're your corporate kids, would you deprive your child from using your living room? So why are you depriving us? So we sort of put it to him like that and he couldn't say no after that'. (Young person)"</i></p>	<p><b>8</b></p> <p>Gaskell 2010 Pert 2017 Roesch-Marsh 2017 Thomas 2012 York 2017 Diaz 2019a Diaz 2019b Larkins 2021</p>	<p>ML: No concerns C: Minor A: No concerns R: No concerns</p> <p><b>Overall: Low</b></p>	<p>Some studies were marked down for ML primarily for poor or limited reporting of their methods. However, theme was reflected in low risk of bias evidence also. There was some incoherence across studies contributing to this theme: The variety of ways LACYP may be assisted in shared decision making made the theme less coherent. Agency was broadly seen as a good thing although with some push back that a looked after child may not always know what is in their own best interest. The relevance of this theme to placement stability is indirect.</p>

<p><b>Bespoke care tailored to the specific needs of the child.</b></p> <p>Bespoke care tailored to the specific needs of the child. For example, the usefulness of good placement matching with carers based on personality (“clicking”) or culture/language in the case of UAS (although this was not always necessary, particularly when carers made an effort to bridge the cultural gap). Meeting the carer before moving in was helpful. Participants felt the approach of one intervention or type of care for all was not appropriate – e.g. accessible options for those with learning disabilities. Inclusion in decision making was useful to support this.</p>	<p><i>"It is very difficult when they first come in because you don't know them and they don't know you / the whole house not just the child. It's the foster carer as well / it's a whole different routine because we don't know the person and they don't know us. But the click thing is a special liking for them I think, taking to them as soon as they come in [pause] like the one we're thinking about today. Umm I love Sim to bits and he drives me crackers." FC</i></p> <p><i>"I think it was all right because she [my foster carer], she's Nigerian and I'm Nigerian as well ... we kind of have the same values and norms so." LACYP</i></p> <p><i>". . . they don't take enough time and effort to actually see what's wrong, they don't get to know, they assume too much sometimes I think, maybe that's just personal experience but they assume like she or he is the same as him, so we'll keep them that way, nobody is the same . . . I think they need to try and meet the individual needs of the young people." LACYP</i></p>	<p><b>7</b></p> <p>Gaskell 2010 Griffiths 2012 Kirton 2011 Littlechild 2011 Ni 2015 November 2020 Oke 2013</p>	<p>ML: No concerns C: Minor A: No concerns R: Minor concerns</p> <p><b>Overall: Low</b></p>	<p>Some studies were marked down for ML primarily for poor or limited reporting of their methods. However, theme was reflected in low risk of bias evidence also. There was some incoherence across studies contributing to this theme: The principle of bespoke care was consistently stressed, however, the need to “match” carers by similar characteristics was not always considered necessary. Five studies (more than a half) reported partially indirect evidence (e.g. recruitment likely occurred prior to 2010)</p>
<p><b>Multiagency working and better information sharing</b></p> <p>Importance of better multiagency working and information sharing. For example: proper incorporation of advocacy</p>	<p><i>"We're all very clear about what we're working towards and it helps in not splitting that group around the child."</i></p> <p><i>". . . other agencies often use us as their extra resource . . . they will recognise the young people in care</i></p>	<p><b>5</b></p> <p>Pearce 2011 Pert 2017 Roesch-Marsh 2017 Samrai 2011 Sidery 2019</p>	<p>ML: No concerns C: Minor A: No concerns R: No concerns</p>	<p>Some studies were marked down for ML primarily for poor or limited reporting of their methods. However, theme was reflected in low risk of bias evidence also. There was</p>

<p>services into review meetings, sharing of information between social workers and IROs to aid preparation for review meetings, shared information between social workers and link workers. For groups where specialist knowledge was needed, the need for a worker or team with specialist knowledge to contact was suggested (e.g. unaccompanied asylum seekers). However, inappropriate use of voluntary services was a fear.</p>	<p><i>have gone missing and will let us know and we then spend all our time running around looking for things that we shouldn't be doing really" Voluntary sector worker</i></p> <p><i>"She [advocate] came, talked to the children and I thought great, that's done but then she didn't come to the review so I thought well where are the children's views? We've lost them. She [IRO] said nothing." FC</i></p>		<p><b>Overall: Moderate</b></p>	<p>some incoherence across studies contributing to this theme: Most studies reported the benefits of increased multiagency working and information sharing, however, an example of the inappropriate use of voluntary services to fill in the gaps left by deficient social services was raised.</p>
<p><b>The needs of asylum-seeking children were felt to be considerably different to those of other looked after children.</b></p> <p>Upon arrival UAS experienced a series of bewildering and destabilising systems of surveillance and control. For many, learning English was a starting point to order, routine and security which enabled more control e.g. solicitors, healthcare, education. For carers, bridging the communication barrier was important. Other areas of need included – cultural needs (religion and food); needs related to adjusting to life in England (e.g. learning to use a new currency and engaging in the English education system); advocacy needs often related to accessing services; needs pertaining to</p>	<p><i>"Well, I'll tell you the very first thing, when Adeel 1 came, we had no idea [what to expect]. This was our first asylum seeker. I looked up [online] about the unaccompanied children . . . it was a lot of research in a very short time. So, I don't think I really had any expectations. . . I had no idea. [After being given a few hours' notice that an unaccompanied young person was coming into placement with her]" FC</i></p> <p><i>"We don't know what they've been through, we don't know what their background is or their family or anything, do we. So we do take a big risk in taking them." FC</i></p> <p><i>"It was the unknown of having a refugee. Yeah. Definitely. And that is fear of the unknown, isn't it? Luckily, he was such a presentable young man,</i></p>	<p><b>3</b> Chase 2010 Chase 2013 Sidery 2019</p>	<p>ML: Minor C: Moderate A: Minor R: Minor</p> <p><b>Overall: Very Low</b></p>	<p>Studies were marked down for ML primarily for poor or limited reporting of their methods. Studies touched on many aspects of caring for unaccompanied asylum seekers. However, it was consistent that unaccompanied asylum seekers were found to be a very distinctive group for whom training and information was needed both for carers and support workers. Only three studies contributed to this theme. Two studies (over one half) reported partially indirect evidence (e.g. recruitment likely occurred prior to 2010)</p>

<p>the asylum seeking process, (including recovery from trauma, emotional support and practical assistance to attend appointment). The needs of asylum seeking children were felt to be considerably different to those of other looked after children so carers felt the need for training (which could be as little as one day). Information was also lacking, even from social workers who had little expertise themselves. There was a need for an information network for fostering UAS.</p>	<p><i>everyone who met him . . . Interviewer: Was won over? Cath: Completely! I mean he's extremely good looking, with a wonderful smile and very, very polite. So yeah, they were won over by him. Straight away."</i></p> <p><i>"Talk to other foster carers . . . That's easier said than done. You know we've only been in the area at that point just about a year. Fostering about six months at that point. We don't have a network."</i></p> <p><i>"Food, culture, language, you have no training whatsoever. These children are brought to you. The social worker comes back in a week, 'Are they OK?' or maybe phones, 'How are they?' Comes back in a week to see how they are, then they have a review within a couple of weeks. You have nothing. A lot of carers say we've just literally had the children placed here and we don't know what to do next."</i></p> <p><i>"I think we need training of what looking after an asylum seeker incurs, you know, the court process, the travelling, food, where they pray, Ramadan."</i></p>			
<p><b>Information gap is detrimental to care participation</b></p>	<p><i>Regarding review meetings: "They are to check up on me. (Young woman aged 14) I think it's to do with school. (Boy aged 8) They are to see how things are going. (Boy aged 10)"</i></p>	<p><b>3</b> Pert 2017 Roesch-Marsh 2017 Larkins 2021*</p>	<p>ML: No concerns C: No concerns A: Moderate</p>	<p>Only three studies contributed to this theme.</p>

<p>Information gap between LACYP and carers lead to apathy, e.g. with looked after children review meetings. Knowledge of the reason for reviews, decisions made, and the roles of the professionals involved was useful for participation.</p>	<p><i>"It's pretty like scary to obviously go [to a review for the first time] . . . like they are questioning you about your life and how it's going and all that stuff...I think I first went when I was about 5 and for a 5-year old to have to explain what's going on...you don't know how to...so it's kinda scary." LACYP</i></p> <p><i>"When there were big words then I switched off cos I don't like big words, it makes me feel like, like I don't understand so I just switch off until they ask me and then I just say yes... "</i></p>		<p>R: No concerns</p> <p><b>Overall: Low</b></p>	
<p><b>Preference for residential care in some cases.</b></p> <p>Preference for residential care in some cases. "Everyone has something in common." This was a concept which linked to looked after children's preferences being taken into account (shared decision making) when planning placements.</p>	<p><i>"I didn't like foster care. I just didn't like the feeling of being in someone else's family, in someone else's home, you get me? In a children's home everyone has something in common and it's like 'oh why are you here then, what's your story' you know."</i></p> <p><i>"At least in a foster family I felt loved man, in the children's home I felt hated by all the staff, it was just their job, they didn't care.... It was stupid though, he [pointing to a friend also taking part in the interview] just wanted to be in a children's home and they kept putting him in foster care. I wanted to be in foster care and they kept putting me in a children's home!"</i></p>	<p><b>2</b></p> <p>Gaskell 2010 Schofield 2015</p>	<p>ML: Serious C: Minor A: Moderate R: Minor concerns</p> <p><b>Overall: Very Low</b></p>	<p>Both studies were high risk for bias, this was largely because of poor description of methods, recruitment, and data analysis. One study merely touched on the positive outcomes occurring as a result of residential care. Only two studies contributed to this outcome.</p>

<p><b>Usefulness of respite support for carers.</b></p> <p>Support offered by the link worker, as well as financial and practical support from social services, was seen as essential. Although respite was also deemed important, not all participants had access to this.</p>	<p><i>"Support, the basic support is from the link worker – or supervising social worker they call them now – and we've been very fortunate over the years because our support workers have always been brilliant." FC</i></p>	<p><b>2</b> Kirton 2011 Samrai 2011</p>	<p>ML: Minor C: No concerns A: Moderate R: Minor</p> <p><b>Overall: Very Low</b></p>	<p>Both studies were either high or moderate risk of bias, this was largely because of poor description of methods, recruitment, and data analysis. Only two studies contributed to this theme. One of these studies (half) came from partially indirect evidence</p>
<p><b>The primacy of the natural family for carers, despite the desire to treat foster child “as one of own” – implications for placement matching</b></p> <p>The primacy of the natural family for carers, despite the desire to treat foster child “as one of own”. Benefit of careful matching of existing birth children to foster placement (e.g. older/younger child). Shared decision making that includes the birth child. Rivalry for attention between foster child and birth child, and need for different parenting techniques, deteriorating relationship between carer and birth children - a source of feeling overwhelmed. Implications for placement stability. Positive changes could also occur for existing family relationships as a result of fostering.</p>	<p><i>"I think if you go for the same age group and age range I think you could have a lot of problems as a foster carer . . . cos your children might be doing something with that foster child. So I think it's important that you keep that age gap. (Sharon, In. 491–495) Looking back that was difficult because they were the same age . . . they fought like cat and dog. (Katrina, In. 630–632)"</i></p> <p><i>"I think if you've got kids in the foster family you should try and keep the kids you're fostering . . . lower in age. (Stuart, has older birth children, In. 305–307)"</i></p> <p><i>"We didn't want to take another 'child' [referring to younger foster children] we didn't want to add to the stress because we've got all our three kids in the same school and we didn't want to have a child where . . . she's running around elsewhere going to another school."</i></p>	<p><b>2</b> Samrai 2011 Thompson 2016</p>	<p>ML: No concerns C: No concerns A: Moderate R: No concerns</p> <p><b>Overall: Low</b></p>	<p>Only two studies contributed to this theme.</p>

	<p><i>(Carl, In. 350–353)"</i></p> <p><i>"Your children, in your decision to become a foster carer, have to be involved in it. And if your child has any doubts don't do it. (Sharon, whose birth child was older, In. 461–463) Our way of dealing with it is basically explaining to the children rather than just sweeping it under the carpet and . . . not getting them involved in what's going on because of course they're young children. (Petula, In. 139–142)"</i></p> <p><i>"As soon as that young girl [foster child] sat and wanted to cuddle at night I instantly saw [birth child's] face and I knew, no we can't do this . . . Instantly I knew [birth child] didn't like it. . . . I knew he was fazed by how close that young girl wanted to be to his mum. (Sharon, In. 337–354)"</i></p> <p><i>"My kids aren't going to come second you know they have to come first and [foster child] has to come second it's as simple as that, because if they don't agree with that well then I'll end the placement. (Katrina, In. 367–369) I'm always asking [birth child] if she's okay . . . it's your family and you want to know that your children are okay. (Carl, In. 228–233)"</i></p>			
--	---	--	--	--

<p><b>Unique stresses for carers in parent-and-child placements</b></p> <p>Most of these stresses were associated with the tension inherent in the role, between nurturing a vulnerable mother and contributing to the assessment which decides whether she will leave with her child. Every carer and social worker cited times when, either implicitly or explicitly, the outcome of assessments had been decided by the LA before placing the mother-and-child, with the placement merely satisfying court proceedings. The desire to advocate for a mother whom the carer felt needed additional time and therapeutic input to develop “good enough parenting” skills was a huge source of stress, and the feelings of powerlessness that accompanied this were problematic. For other carers, very deep issues were raised by their involvement with such troubled families; one couple talked about their 18-year-old son having a breakdown a year after a baby left the family for adoption. Another older carer talked about the pain she experienced when a baby moved on to adoption at 4 months. Aspects of training for this role that carers would have welcomed included: How to manage endings—when a baby is removed;</p>	<p><i>"I had a very disturbed mum when she first arrived, and for the first three days couldn't go into the kitchen to make the bottles, cos she was just so overwhelmed ... there was a massive history of DV, so she didn't want to go into the kitchen if K (carer's husband) was in there. And that was really difficult to overcome. I had to work really hard with her initially, and all you've got is a social worker coming and saying "So, you're refusing to feed the baby." You just think "Back off!" And a few days later, this same social worker just said "Tell me when. Tell me when to pull the plug, and she's out!" And that was his exact words. And I said "No, no, give us some time, we're working on it." And do you know, she went on to do 7 months and went home with the baby. But they were prepared to write her off." (Foster Carer, Female, 60s).</i></p> <p><i>"Very very different, very specialist ... sometimes they will say "we don't want you doing this for the mum. They are to do it themselves and you are to record everything" ... I think that's quite off-putting for someone who's nurturing by nature." (Foster Carer, Female, 40s)</i></p> <p><i>"We've had times when our carers have been accused of "colluding with the mother!" Such negative language—</i></p>	<p><b>1</b> November 2020</p>	<p>ML: No concerns C: No concerns A: Serious R: No concerns</p> <p><b>Overall: Very Low</b></p>	<p>Only one study contributed to this theme.</p>

## **Economic evidence**

### **Included studies**

No existing economic studies were reviewed for this question given its focus on qualitative evidence.

### **Economic model**

No economic modelling was undertaken for this review question.

## **The committee's discussion of the evidence**

### **Interpreting the evidence**

#### ***The outcomes that matter most***

The committee heard qualitative evidence from an original piece of qualitative work commissioned for NICE (see Appendix O); and several UK-based qualitative studies. The committee noted that qualitative evidence could not provide strong evidence of the effectiveness of any particular approach or intervention but rather could highlight the priorities, values, and perspectives of those involved in the care system as well as the perceived barriers and facilitators to successful care outcomes experienced by their carers and workers. Qualitative evidence could also help to answer the question of “how” interventions and statutory systems of care could be delivered, rather than “what” interventions or systems work best. The committee valued certain themes more highly if they had been derived from many studies or studies at lower risk of bias, if the meaning of the theme was unambiguous, and where themes had been drawn directly from looked after children and young people themselves (see below).

#### ***The quality of the evidence***

The methodological quality of the studies included in this review were variable. Common reasons why qualitative evidence was marked down for quality included: unclear descriptions of the method of recruitment and selection of participants; unclear method of interview (for example, the topic guide used for semi-structured interview); unclear method of thematic analysis (for example, were multiple analysts used); and whether methods to validate findings were employed (for example, triangulation and respondent analysis). Some themes were marked down for quality where data had primarily come from studies with moderate or high risk of bias. In addition, certain themes were marked down for quality where few studies contributed to a theme, themes had become overly disparate (covering several subthemes), or there were contradictions in the direction of the theme.

The committee valued qualitative evidence that was direct from the population to which the recommendations would apply, that was recent, and particularly that was from the perspective of looked-after children and young people themselves. As such the qualitative evidence collected in this review was generally thought to be high quality since it was all UK-based, studies most commonly reported the perspective of looked after children and young people themselves, and all studies were published after 2010.

The qualitative work commissioned by NICE and performed by the University of Lancashire was considered the highest quality evidence since interview methods were tailored to address the review questions in this guideline, participants recruited into this study were also selected to provide a good cross-section across vulnerable

groups of interest, and data was gathered very recently. In addition, this piece of work was rated high quality when assessed using CASP criteria (see evidence table for Larkins 2021, Appendix D).

### **Benefits and harms**

#### *UCLan qualitative work*

Qualitative evidence was presented from the University of Lancashire with a particular focus on the barriers and facilitators to placement stability. The committee noted that there was significant overlap between the themes that arose in this review and the review question on positive relationships. The committee reflected that positive relationships were likely the best possible intervention to prevent placement instability. Themes that arose invoked the ideas of building trusting relationships, discussing and negotiating care plans, and consistent care which demonstrates an understanding of trauma. The committee considered an intervention that already exists in practice, that could help to address all of these issues: Life story work. Life story work had the potential to build relationships (one of the common qualitative themes was to do with sharing joint activities “doing things together”), was a trauma-focused technique, and could assist with discussing and negotiating care plans (by outlining felt priorities and experiences). However, life story work was considered neglected or poorly completed in practice. Therefore, the committee set out to establish a standard of life story work. This standard of life story work should be incorporated into a schedule of mandatory training for carers to equip carers for good quality work.

The committee initially discussed what life story work should consist of. The need for this work to take place in the context of a safe relationship was important. The committee recommended that life story work should consist of building a narrative that focuses first on the present (a young person’s identity, strengths, and any significant relationships); before moving onto the past (discussions of reasons for entering care in the first place); and finally turning thoughts to the future (discussions regarding building independence, hopes and dreams, and career plans). The committee then considered methods by which this may be achieved: techniques such as life mapping, use of pictures, art, written narratives, toys/play can be used to approach these discussions which should be compiled in one place (e.g. a ring binder) and built upon during regular life story sessions. As with other recommended interventions, the committee felt the approach should be flexible depending on the needs and response of the looked after person and should be a shared experience, in a setting preferred by the looked after person.

Considering those from subgroups of special interest also, the committee discussed the role that life story work could play in cultivating a positive self-image and identity, i.e. one that embraces the looked after child or young person’s ethnic, cultural or religious differences, as well as sexual identity and disabilities.

The committee also considered the occasions in which life story work may involve more persons present than the practitioner and the looked after person. The example of sibling relationships was raised, and about how at times it may be useful to perform life story work with siblings as a pair (for example, siblings may have had very different perspectives of previous shared life events that need to be reconciled). The committee recommended that shared life story work should be carefully considered and planned to ensure the sibling relationships were not destabilised in the process. Particularly for complex situations such as these, the committee recommended that life story work should always have social work

oversight, despite recognising that the work is not always performed by the social worker themselves.

In addition, the committee considered that the network around looked after children and young people comprised a community that needed to be primed to support ongoing life story work. As such, the idea of life story work and its importance needed to be expressed to the social work team, carers, educational staff, and birth family. This may be important so that broader social networks can be engaged in the work, for example, where sensitive or emotional information has been discussed with the child or young person during life story work, schools may need to be informed to be supportive. Likewise, involving birth families to encourage consistent narratives and reframing of previous events.

Finally, the committee made a recommendation regarding the prioritisation of life story work. As discussed previously, the committee felt that this intervention, despite being recommended, had been neglected in practice. Often only starting late into the care process and being poorly invested in. The reasons for this may be numerous - while there may be lack of professional time to devote to the work, it was possible for other significant adults with fewer time pressures to take on life story work. However, poor training and lack of understanding of the importance of life story work in others who may be expected to carry out the work (for example, foster carers) may obstruct good quality, impactful work. The committee discussed the importance of time for life story work being clearly set aside, with a named professional to ensure it happens, and for it to begin at the earliest opportunity following entry into care.

Qualitative findings from the University of Lancashire were clear about the importance of shared decision making. As part of this, a strong theme that emerged was that needs and priorities of carers are laid out transparently to the looked after person to help them make their own decisions. For example, the committee discussed occasions where an option for a new placement was being “dressed up” as great opportunity, when in reality the young person was being nudged into the placement due to financial pressures for the local authority, or because the foster carer had decided to terminate the placement. Rather, the committee recommended that reasons for placement breakdown should be discussed with emotional support and be built into ongoing life story work with accessible and age-appropriate communication.

#### Qualitative review work RQ1.2

The committee considered themes arising from the qualitative review of barriers and facilitators for placement stability. A moderate quality theme covered the desire for carers to be treated more like professionals. There was a perceived lack of agency/ and inclusion in input & information sharing as professionals for foster carers. The opposite was valued. As such the committee made a recommendation that carers should be valued as professionals and included as much as possible in multiagency working and decision making since they may have the most intimate knowledge of the looked after person.

Another moderate quality theme was the usefulness of peer support between carers, carers benefitted from the companionship, mutual support and problem-solving, that peer groups provided. Therefore, a recommendation was made that peer group support for carers should be facilitated by local authorities, and be regularly made available and accessible.

One moderate quality theme outlined the problem of resource constraints, stretched services, information gaps, and reactive care. Carers were often unaware of the different services available for support by the local authority, and therefore felt as

though certain services had been kept hidden in an attempt to save costs. The committee therefore recommended that carers should be informed and updated about the support services available e.g. given a “menu” of support upfront, and prior to the beginning of placement, as this would enable them to negotiate the support needed for their placement, as well as empower them to act on a more equal footing with professionals.

Lastly, another moderate qualitative theme described how carers and looked after children and young people particularly valued care that was available, accessible, and reliable. As such, carers felt the benefit of knowing that support was available even out of hours for urgent problems, as a kind of “safety net”. The committee therefore recommended that local authorities make available out of hours support in helping carers deal with urgent problems that arise. However, the committee recognised that there was a need for any help sought outside of usual hours to be fed back into the care records so that the whole team could be aware; therefore the committee recommended that carers log any help sought outside of usual operational hours as part of their routine and urgent reports.

### **Cost effectiveness and resource use**

No economic evidence was considered in relation to this review question given its focus on qualitative evidence. Overall, the committee felt that there was insufficient evidence of effectiveness from the quantitative evidence review (review question 1.1) in relation to costs to recommend any specific interventions for placement stability. However, the committee noted that in the short term, placement breakdown leads to increased social care case management work and the need for additional placement arrangements, some of which will be high-cost emergency placements. In addition, placement instability can contribute to further disruption of LACYP’s social and emotional relationships, sense of belonging and educational outcomes, with long-term consequences that were not captured in randomised controlled trials. Therefore, the committee made recommendations based on both the quantitative and qualitative evidence presented and discussed any expected cost impacts using their knowledge of the care system.

The committee discussed the importance of recognising carers as professionals and recommended that they be included in decision making and fully informed of all important information regarding the child they care for. Additionally, the committee recommended that carers be fully informed of any support services available to carers and LACYP within their local authority. It is unlikely that this recommendation will have a substantial resource impact, as its implementation would only require additional content to be communicated to carers.

The committee recommended that out of hours support should be available for carers and LACYP in the case of urgent issues. The committee discussed a range of possible ways in which out of hours support could be provided in order to allow local authorities to use a system that works best for them - both logistically and financially. One option was that out of hours support would consist of an “on-call” social worker. The committee noted that this would require a contract change for social workers, but agreed that it would be feasible to reallocate existing staff time from regular work hours to out-of-hours work. This contract change and reallocation would likely have cost implications but the committee felt that having social worker availability for these emergency situations would allow for serious issues to be addressed, and may avoid significant costs associated with those emergencies (e.g. self-harm, hospitalisation, placement breakdown, justice system costs).

The committee recommended that local authorities should facilitate accessible peer support for carers, for example hosting community groups or online forums. These community groups or forums would likely be peer-led and although there will be some costs to the local authority associated with setting up and monitoring these groups, the costs would be minimal and the benefits of this peer support are likely to outweigh the cost.

#### UCLan qualitative work

The committee heard qualitative evidence from the University of Lancashire with a focus on barriers and facilitators to placement stability, and made recommendations based on the findings presented. Since these recommendations were made without economic evidence, the committee used their knowledge and expertise to provide input on their expected resource impact.

The committee recommended that priorities and needs should be discussed transparently with the LACYP and that communication should be accessible and age-appropriate. This recommendation is not anticipated to have any resource impact as opportunities for this communication already exist in current practice.

The committee discussed multiple recommendations around life story work, which is mandated by statutory guidance for all LACYP with a plan for adoption and is already current practice, and these recommendations can be integrated into the process to improve how life story work is done. For example, the committee recommended that life story work should be prioritised and start at the earliest opportunity, which would simply require the professional/person conducting this work to initiate it soon after the LACYP enters care. The committee also recommended that life story work should support care placement and emotional stability, which are aspects of life story work that should be best practice and included in any training that the professional/person conducting this work would receive. Another recommendation made was that life story work should be considered when planning contact arrangements, which could easily be integrated into current practice by keeping the child's social worker informed of any important issues that may affect contact.

The committee recommended that training also be provided for the professionals/people conducting life story work (e.g. carers, social workers) where necessary to ensure a consistent approach. This training would not be associated with a resource impact as it could be incorporated into existing training frameworks and draw on materials that are freely available. The committee acknowledged that this may require another area of the existing training frameworks to be altered or removed, however given life story work is mandated by statutory guidance, the committee believed that training for appropriate delivery should be prioritised. Adjustments required to incorporate life story work considerations into existing training frameworks may also incur some administrative costs, but these were thought to be minimal and would be outweighed by the increased benefits achieved from the improved delivery of life story work to all LACYP. The committee also recommended that a social worker should oversee any life story work, even in cases where it is being conducted by another professional. Such an approach is anticipated to have minimal resource implications, as it is already current practice for life story work to be conducted by a social worker or in cases where another professional is leading the work, a social worker would simply need to be informed of the content of the life story work being conducted.

This evidence review supports recommendations 1.3.1 to 1.3.3, 1.3.12, 1.2.18, 1.5.15 to 1.5.25. Other evidence supporting these recommendations can be found
--

in the evidence reviews on the effectiveness of health and social care interventions and approaches to support care placement stability [evidence review A]

### **Recommendations 1.3.1 to 1.3.3, 1.3.12, 1.2.18, 1.5.15 to 1.5.25**

1.3.1 Involve and value the carer's input in decision-making in the broader care team, and keep the carers fully informed about a child or young person's care plan.

1.3.2 Provide out-of-hours support services for carers to help resolve urgent problems, for example through social workers working 'on call', voluntary or independent agency helplines, or carer peer support associations. Ensure that carers log any help sought outside of usual operational hours as part of their routine and urgent reports.

1.3.3 Facilitate peer support for carers at accessible times and places, including online if people may find it difficult to attend a physical meeting.

1.2.18 Discuss the priorities and needs, of caregivers sensitively and transparently with the looked-after person in a manner that takes into account the looked after child or young person's developmental age. For example, if placements are at risk of breakdown, social workers should facilitate communication between the carers and the looked-after person (and birth parents if relevant) to try to resolve problems.

1.5.15 Start life story work as soon as possible after the looked-after child or young person enters care to support care placement and emotional stability, rather than as an intervention to deliver once placements are stable.

1.5.16 Schedule regular, dedicated times for life story work to help the child or young person make sense of their journey through the care system and beyond, their significant relationships, and their identity.

1.5.17 Ensure that life story work is done in the setting preferred by the looked-after child or young person, and conducted by a named carer or practitioner with whom they have a continuous and close relationship. This named person may change over the period in care.

1.3.12 Provide a schedule of mandatory training for all carers. This should cover:

- Life story work to promote a positive self-identity, which has a consistent, child-focused, and planned approach (see recommendations 1.5.15 to 1.5.25).

1.5.21 Ensure that a social worker oversees the life story work if another carer or practitioner is carrying out the work. For example, the social worker may share background information to support the carer or practitioner performing life story work, with the looked-after child or young person's consent.

1.5.18 Include the following in life story work:

- the present – identity, strengths, and significant relationships
- the past – reasons for entering care and for any placement breakdowns, important memories and relationships
- the future – building independence, careers, hopes and dreams.

1.5.19 Take a flexible approach to life story work, and tailor it to the age and needs of the looked-after child or young person. The content could include life mapping,

pictures, art, narratives, and toys or play. Compile life story work in 1 place (such as a ring binder) and build on this in each session.

1.5.20 Ensure that life story work captures and embraces ethnicity, cultural and religious identity, as well as other personal aspects of identity, for example, sexual identity or disabilities.

1.5.22 Think about and plan how to carry out life story work with sibling groups in a manner appropriate to developmental age. This may include:

- preparing siblings for navigating conversations with older siblings or siblings not in care
- deciding whether it is appropriate to deliver life story work sessions in a sibling group or individually
- determining whether conversations will include sensitive information.

1.5.23 Ensure the experience and skillset of the practitioner or carer delivering life story work is sufficient to deliver good quality work, particularly in complex situations.

1.5.24 Explain to the looked-after child or young person's wider support network that life story work is ongoing, so that they can support it as needed. For example, if sensitive or emotional information has been discussed with the child or young person during life story work, schools may need to be informed.

1.5.25 Plan regular reviews of how life story work may affect contact arrangements and the person's relationship with their birth family. Use information from these reviews to adjust the support provided. This could include, for example, involving birth families in life story work to encourage consistencies in narratives explored, and helping the young person with reframing previous relationships.

# Appendices

## Appendix A – Review protocols

### Review protocol for RQ 1.2: Barriers to, and facilitators for, supporting care placement stability

ID	Field	Content
1.	Review title	Barriers and facilitators for supporting care placement stability among looked-after children and young people
2.	Review question	What are the barriers to, and facilitators for, supporting care placement stability among looked-after children and young people?
3.	Objective	To determine if there are certain points, events, or other triggers that impact care placement stability, and the success of efforts to support placement stability.
4.	Searches	<p><b>Sources to be searched</b></p> <ul style="list-style-type: none"> <li>• PsycINFO (Ovid)</li> <li>• Embase (Ovid)</li> <li>• MEDLINE (Ovid)</li> <li>• MEDLINE In-Process (Ovid)</li> <li>• MEDLINE Epubs Ahead of Print</li> <li>• PsycINFO (Ovid)</li> <li>• Social policy and practice (Ovid)</li> <li>• Cochrane Central Register of Controlled Trials (CENTRAL)</li> <li>• Cochrane Database of Systematic Reviews (CDSR)</li> <li>• Database of Abstracts of Reviews of Effect (DARE)</li> <li>• EconLit (Ovid) – economic searches only</li> <li>• NHSEED (CRD) - economic searches only</li> </ul>

		<p><b>Supplementary search techniques</b></p> <ul style="list-style-type: none"> <li>• Studies published from 1st January 1990 to present day.</li> </ul> <p><b>Limits</b></p> <ul style="list-style-type: none"> <li>• Studies reported in English</li> <li>• No study design filters will be applied</li> <li>• Animal studies will be excluded</li> <li>• Conference abstracts/proceedings will be excluded.</li> <li>• For economic searches, the Cost Utility, Economic Evaluations and Quality of Life filters will be applied.</li> </ul> <p>The full search strategies for MEDLINE database will be published in the final review.</p> <p>For each search the Information Services team at NICE will quality assure the principal database search strategy and peer review the strategies for the other databases using an adaptation of the PRESS 2015 Guideline Evidence-Based Checklist.</p>
5.	Condition or domain being studied	This review is for part of an updated NICE guideline for looked-after children and young people and concerns the support of placement stability in their current care placement.
6.	Population	<p>Looked after children and young people, wherever they are looked after, from birth until age 18 and their families and carers (including birth parents, connected carers and prospective adoptive parents).</p> <p>Also including:</p> <ul style="list-style-type: none"> <li>• Children and young people living at home with birth parents but under a full or interim local authority care order and are subject to looked-after children and young people processes and statutory duties.</li> <li>• Children and young people in a prospective adoptive placement.</li> </ul>

		<ul style="list-style-type: none"> <li>Looked-after children and young people on remand, detained in secure youth custody and those serving community orders.</li> </ul>
7.	Phenomena of interest	<p>Barriers and facilitators for supporting care placement stability, including the statutory support offered for looked after children and young people.</p> <p>Including support for: children and young people themselves; birth families (with children and young people under a full care order); foster carers; key workers in residential care units; connected carers; prospective adopters and special guardians; social care workers.</p>
8.	Comparator	Not applicable
9.	Types of study to be included	<ul style="list-style-type: none"> <li>Systematic reviews of included study designs</li> <li>Qualitative studies: including focus groups, unstructured, and semi-structured interview-based studies (mixed-methods studies will also be included provided they contain relevant qualitative data)</li> </ul>
10.	Other exclusion criteria	<p>Exclusion</p> <ul style="list-style-type: none"> <li>Countries outside of the UK (unless not enough evidence, then progress to OECD countries)</li> <li>Studies older than the year 2010 (unless not enough evidence, then progress to include studies between 1990 to current)</li> <li>Studies including mixed populations (i.e. looked after and non-looked after children) without reporting results separately for LACYP</li> <li>Mixed-methods studies reporting qualitative data that cannot be distinguished from quantitative data.</li> </ul> <p>Views and experiences relating to</p> <ul style="list-style-type: none"> <li>Support for transition from children to adult health or social care services</li> <li>Promoting positive relationships (covered in review questions 2.1 and 2.2)</li> <li>Improving health and wellbeing (covered in review questions 3.2 and 3.3)</li> </ul>

		<ul style="list-style-type: none"> <li>• Improving educational outcomes (covered in review question 4.1, 4.2, 4.3, and 4.4)</li> <li>• Improving permanency of placements out of care (covered in review questions 5.1 and 5.2)</li> <li>• Supporting and developing independence on leaving care (covered in review questions 6.1 and 6.2)</li> <li>• Specific interventions and programmes (covered in review question 2.1).</li> </ul>
11.	Context	<p>This review will consider barriers and facilitators to support placement stability in children and young people who are looked after. In March 2018, 75,420 children and young people in England were looked after. Care placements for looked after children and young people may include: foster placement (73%), residential accommodation (including secure units, children's homes, and semi-independent living arrangements) (11%), placement with birth parents (6%), placement for prospective adoption (3%), another placement in the community (4%), or placement in residential schools or other residential settings (3%). For looked after children and young people only 29% of placements are long term and 50% of long-term teenage placements have been found to break down. Placement break-down is associated with poor outcomes for looked-after children and young people.</p>
12.	Phenomena of interest - themes	<p>Evidence should relate to views concerning barriers and facilitators for placement stability in looked after children and young people, among:</p> <ul style="list-style-type: none"> <li>• Looked after children and young people themselves</li> <li>• Carers of looked after children and young people</li> <li>• Other support workers providing and accessing support for placement stability</li> </ul> <p>With a focus on:</p> <ul style="list-style-type: none"> <li>• Experience of support for placement stability and accessing this support</li> <li>• Unintended consequences</li> </ul>

13.	Secondary outcomes (important outcomes)	None
14.	Data extraction (selection and coding)	<p>All references identified by the searches and from other sources will be uploaded into EPPI reviewer and de-duplicated. 10% of the abstracts will be reviewed by two reviewers, with any disagreements resolved by discussion or, if necessary, a third independent reviewer.</p> <p>The full text of potentially eligible studies will be retrieved and will be assessed in line with the criteria outlined above. A standardised form will be used to extract data from studies (see Developing NICE guidelines: the manual section 6.4). Study investigators may be contacted for missing data where time and resources allow.</p>
15.	Risk of bias (quality) assessment	<p>Individual qualitative studies will be quality assessed using the CASP qualitative checklist and classified into one of the following three groups:</p> <ul style="list-style-type: none"> <li>• Low risk of bias – The findings and themes identified in the study are likely to accurately capture the true picture.</li> <li>• Moderate risk of bias – There is a possibility the findings and themes identified in the study are not a complete representation of the true picture.</li> <li>• High risk of bias – It is likely the findings and themes identified in the study are not a complete representation of the true picture</li> </ul>
16.	Strategy for data synthesis	<p>Information from qualitative studies will be combined using a thematic synthesis. By examining the findings of each included study, descriptive themes will be</p>

		<p>independently identified and coded in NVivo v.11. The qualitative synthesis will interrogate these 'descriptive themes' to develop 'analytical themes', using the theoretical framework derived from overarching qualitative review questions. Themes will also be organised at the level of recipients of care and providers of care.</p> <p>CERQual will be used to assess the confidence we have in the summary findings of each of the identified themes. Evidence from all qualitative study designs (interviews, focus groups etc.) is initially rated as high confidence and the confidence in the evidence for each theme will be downgraded from this initial point.</p>
17.	Analysis of sub-groups	<p>If different barriers or facilitators are observed between subgroups of interest, these will be drawn out under descriptive themes, which will then be used to develop analytical themes. The following constitute subgroups of interest:</p> <p>Age of LACYP:</p> <ul style="list-style-type: none"> <li>• LACYP in early years</li> <li>• LACYP in primary education</li> <li>• LACYP in secondary education and further education until age 18</li> </ul> <p>Other subgroups, of specific consideration:</p> <ul style="list-style-type: none"> <li>• Looked-after children looked after under a care order (section 20 (voluntary) or 31 (full care order))</li> <li>• Looked-after children on remand</li> <li>• Looked-after children in secure settings</li> </ul>

		<ul style="list-style-type: none"> <li>• Looked-after children and young people with mental health and emotional wellbeing needs</li> <li>• Looked-after children and young people who are babies and young children</li> <li>• Looked-after children and young people who are unaccompanied children seeking asylum, or refugees</li> <li>• Looked-after children and young people who are at risk or victims of exploitation (including female genital mutilation) and trafficking</li> <li>• Looked-after children and young people who are teenage and young parents in care</li> <li>• Looked-after children and young people with disabilities; speech, language and communication needs; special education needs or behaviour that challenges.</li> <li>• Looked-after children and young people who are placed out of area</li> <li>• Looked after children and young people who are LGBTQ</li> </ul>

26.	Funding sources/sponsor	This systematic review is being completed by the Guideline Updates Team, which is part of NICE.		
27.	Conflicts of interest	All guideline committee members and anyone who has direct input into NICE guidelines (including the evidence review team and expert witnesses) must declare any potential conflicts of interest in line with NICE's code of practice for declaring and dealing with conflicts of interest. Any relevant interests, or changes to interests, will also be declared publicly at the start of each guideline committee meeting. Before each meeting, any potential conflicts of interest will be considered by the guideline committee Chair and a		

		senior member of the development team. Any decisions to exclude a person from all or part of a meeting will be documented. Any changes to a member's declaration of interests will be recorded in the minutes of the meeting. Declarations of interests will be published with the final guideline.
28.	Collaborators	Development of this systematic review will be overseen by an advisory committee who will use the review to inform the development of evidence-based recommendations in line with section 3 of Developing NICE guidelines: the manual. Members of the guideline committee are available on the NICE website <a href="https://www.nice.org.uk/guidance/indevelopment/gid-ng10121">https://www.nice.org.uk/guidance/indevelopment/gid-ng10121</a>
29.	Other registration details	N/ A
30.	Reference/URL for published protocol	
31.	Dissemination plans	NICE may use a range of different methods to raise awareness of the guideline. These include standard approaches such as: <ul style="list-style-type: none"> <li>• notifying registered stakeholders of publication</li> <li>• publicising the guideline through NICE's newsletter and alerts</li> <li>• issuing a press release or briefing as appropriate, posting news articles on the NICE website, using social media channels, and publicising the guideline within NICE.</li> </ul>

## Appendix B – Literature search strategies

### Effectiveness searches

Bibliographic databases searched for the guideline:

- Cochrane Database of Systematic Reviews – CDSR (Wiley)
- Cochrane Central Register of Controlled Trials – CENTRAL (Wiley)
- Database of Abstracts of Reviews of Effects – DARE (CDSR)
- PsycINFO (Ovid)
- EMBASE (Ovid)
- MEDLINE (Ovid)
- MEDLINE Epub Ahead of Print (Ovid)
- MEDLINE In-Process (Ovid)
- Social policy and practice (Ovid)
- ERIC (ProQuest)

A NICE information specialist conducted the literature searches for the evidence review. The searches were originally run in June 2019 with an additional search of the ERIC database in October 2019.

Searches were run on population only and the results were sifted for each review question (RQ). The searches were rerun on all databases reported above in July 2020 and again in October 2020.

The principal search strategy was developed in MEDLINE (Ovid interface) and adapted, as appropriate, for use in the other sources listed in the protocol, taking into account their size, search functionality and subject coverage.

The MEDLINE strategy below was quality assured (QA) by trained NICE information specialist. All translated search strategies were peer reviewed to ensure their accuracy. Both procedures were adapted from the [2016 PRESS Checklist](#). The translated search strategies are available in the evidence reviews for the guideline.

The search results were managed in EPPI-Reviewer v5. Duplicates were removed in EPPI-R5 using a two-step process. First, automated deduplication is performed using a high-value algorithm. Second, manual deduplication is used to assess 'low-probability' matches. All decisions made for the review can be accessed via the deduplication history.

English language limits were applied in adherence to standard NICE practice and the review protocol.

A date limit of 1990 was applied to align with the approximate advent of the Children Act 1989.

The limit to remove animal studies in the searches was the standard NICE practice, which has been adapted from: Dickersin, K., Scherer, R., & Lefebvre, C. (1994). [Systematic Reviews: Identifying relevant studies for systematic reviews](#). *BMJ*, 309(6964), 1286.

No study design filters were applied, in adherence to the review protocol.

The effectiveness of interventions to support readiness for school in looked after children and young people

Sources to be searched:

- PsycINFO (Ovid)
- Embase (Ovid)
- MEDLINE (Ovid)
- MEDLINE In-Process (Ovid)
- MEDLINE Epubs Ahead of Print
- PsycINFO (Ovid)
- Social policy and practice (Ovid)
- Cochrane Central Register of Controlled Trials (CENTRAL)
- Cochrane Database of Systematic Reviews (CDSR)
- Database of Abstracts of Reviews of Effect (DARE)
- EconLit (Ovid) – economic searches only
- NHSEED (CRD) - economic searches only

Supplementary search techniques

- Studies published from 1st January 1990 to present day.
- A supplementary search of ERIC database was performed using terms relating to looked after children and education.

### Limits

- Studies reported in English
- No study design filters will be applied
- Animal studies will be excluded
- Conference abstracts/proceedings will be excluded.
- For economic searches, the Cost Utility, Economic Evaluations and Quality of Life filters will be applied.

## Appendix C – Qualitative evidence study selection

## Appendix D – Qualitative evidence

### Alderson 2019

<b>Study type</b>	Focus Groups Semi structured interviews
<b>Aim of study</b>	Authors aimed to establish whether the Motivational Enhancement Therapy (MET) and Social Behaviour and Network Therapy (SBNT) interventions were feasible and acceptable to adapt in relation to looked after children and other key stakeholders.
<b>Study location</b>	UK
<b>Study setting</b>	looked after children taking part in a randomised controlled trial of a behavioural change intervention to reduce risky substance use (drug and alcohol)
<b>Study methods</b>	Authors proposed to carry out individual 1:1 interviews with looked after children and carers and focus groups with professional participants. In reality, for pragmatic reasons we conducted a combination of individual interviews, dyad interviews and focus groups depending on participant's availability. Interviews were carried out by experienced qualitative researchers, they were audio recorded and transcribed verbatim. Transcripts were anonymised and identifiable participant details with a participant key were stored separately. Transcripts were thematically analysed, this entailed a line by line coding process and then analysis within a given transcripts and across the dataset as a whole. Analysis was an iterative process, using the constant comparative method [21], in order to identify key themes and concepts. Qualitative software (NVIVO 10) was used to organise thematic codes. The data were compared across the three participant groups (i.e. LAC, professionals and carers) with similarities and differences being highlighted.

<b>Population</b>	Looked-after children who have experienced receiving drug and alcohol treatment interventions and/or LAC accessing other services for support surrounding 'help seeking' behaviour.
<b>Study dates</b>	March 2016 to February 2018
<b>Sources of funding</b>	Newcastle University
<b>Inclusion Criteria</b>	Age 12 to 20 years  Health risks screened positive for being at risk of substance use
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size 19 looked after children, 17 carers, 8 drug and alcohol workers, 8 social workers  Reason for stopping recruitment not reported  Type of care 5 in foster care, 8 in residential care, 5 in independent or supported living, 1 living with biological parents  Other recruitment considerations The purposive sample aimed to ensure diversity with regards to age, exposure to drug and alcohol use and placement type.  Substance abuse 16 with current or previous substance, 3 never used substances
<b>Relevant themes</b>	Theme 1 Trust and genuine care: The qualities of trust and genuine care were the two main sub- themes that emerged regarding what underpinned a successful therapeutic relationship. Participants, inclusive of professionals and LAC themselves highlighted the importance of building a therapeutic relationship when working to reduce substance misuse.  Theme 2

Need to earn trust to gain confidence: The LAC's ability to confide in professionals and trust the substance misuse practitioner was a recurrent theme. Whilst trust is recognised as a necessary condition for any caring relationship, it was reported to be particularly important for LAC, whose experiences leading up to their placement in care may have impacted upon their ability to trust others. Professionals acknowledged that LAC often experience disorganised and difficult attachment. This included repeated experiences of their essential needs going unmet, relationship breakdown and abandonment, being let down and broken promises. Professionals displayed a clear understanding of these complex attachment issues and discussed the need to 'earn' trust when engaging with LAC: "You need to put in the groundwork initially. I think with teenagers you need to gain their trust, you need to work for it. Because if they have been hurt, which they will have been, they will try to push you away. They won't want to trust you." (Carly, Social worker, focus group)

### Theme 3

Availability: Practitioners were expected to act in particular ways in order to demonstrate their trustworthiness. Typically this involved the practitioner being reliable; a quality which practitioners reported could be communicated to the LAC in multiple ways within the interaction. One foster carer describes displaying their reliability in terms of being available 24/7, he is permanently 'on call' if a young person needs him, he states: "it is not a job because there is no job that makes you work 24 hours a day, 7 days a week and 365 days of the year, but this one does" (James, Foster carer, focus group).

### Theme 4

Reliability: Professional and LAC participants reported that the practitioner's reliability must be consistent as any inconsistency is likely to build mistrust. "Just by keeping to your word, even little things like keeping your appointments and attending on time, looking into things when you say you're going to..." (Susan, Social Worker, focus group).

### Theme 5

Time for building rapport: From the perspective of LAC, engaging with services depends fundamentally on the relationship between themselves and their allocated worker. To facilitate the sense of a reciprocal trustworthy relationship, young people explained the importance of 'working gradually', wherein at least the first couple of interactions should be dedicated to building a rapport and 'engaging' the young person prior to formal sessions commencing. Additionally, this could be shown by professionals not expecting young people to instantly make disclosures, but allowing a positive working relationship to develop first. Self-disclosures where practitioners 'trade' personal information were perceived to be beneficial to developing a trusting relationship, whereby the process of sharing information was not completely one sided. Some examples that young people provided for this were discussing a hobby that the practitioner enjoyed doing or talking about a pet they had. This level of disclosure enable a small 'trade' of personal information to be made without divulging any sensitive personal information. LAC reported that such disclosure enhanced their sense of connection to the practitioner as well as their own safety to disclose information. "When you work with someone you have to build a bond up first, before you can open up to them.....It's, well the way I've done is just ask questions about them, and then if they tell you, then you know well if they've told me this then I can tell them that" (Sophie, 17, YP interview).

### Theme 6

Genuine not contractual care: A further quality that LAC sought but did not always feel that they received was that of 'genuine care'. LAC described having multiple contacts with professionals, with much of the care a child usually receives from a loving family being provided by a professional who is employed to provide such care. The corporate parenting role dictates that safeguarding and risk management take precedent over the provision of emotional support. However, many social workers described going 'above and beyond' their role and being available outside of their contracted working hours in an attempt to show they care for the young people in their care. "Myself and his YOT worker had agreed between us that we would have our phones on 24/7. So that if he wanted to get in touch and check in we knew he was okay. So we did, we took turns and he did check in and he did arrange to meet up which was really good" (Steph, Social worker, focus group)

### Theme 7

Importance of genuine care (2): LAC were acutely aware of the corporate parenting role fulfilled by the professionals and highlighted the importance of practitioners (professionals and foster carers) whom made them feel like they 'genuinely' cared about their welfare. Despite being in a paid position to provide care for young people, foster carers reinforced their attempts to provide the same level of care and support to the children and young people they foster/care for in the same way they would treat their own biological children. "Any child that comes to live with me, I know they are not mine, however I will work with them, I will play with them, I will live with them and I will do everything to my best ability in every area, in every arena because I want what is best for them." (Liz, foster carer, interview).

### Theme 8

Genuine care and availability (3): For LAC, Genuine care involves professionals 'being available' when needed, showing empathy, perseverance and providing support (emotional and practical) which feels unconditional. For the young people, genuine care was described as stemming from personal investment rather than a professional obligation or remuneration. "Like Josie talks to me, not like I'm just someone she has to work with, she talks to me like she cares" (Carla, 17, YP interview)

### Theme 9

Sensitive and non-judgmental response: From the perspective of LAC, a further way of professionals showing that they cared for a young person was to take a non-judgmental approach and to show unconditional positive regard to the young people under their care regardless of the information they were disclosing. This was reinforced by professionals and foster carers, whom reported LAC disclosing information to them regarding historical experiences. Foster carers described having to respond in a sensitive and non-judgmental way. "We had a young man who had been abused by a family member. He was feeling guilty himself about it and thought that we would feel disgusted that things like that had been done. It is letting him see that we are not disgusted. Straight away, I have heard all of this before, you are not the only one. It is not your fault." (Carol, female, foster carer, focus group). "...my family is 'f.... up'...really 'f..... up'. And if I sat there and told someone they'd probably run a mile, they probably would. So that's why I've never really opened up to anyone, cause if I did they probably would run away, do you know what I mean?" (Ewan, 17, YP interview)

### Theme 10

Traditional one-to-one counselling style interactions are often unproductive for LACYP: Typically this was experienced as overly formal for LAC who might find this type of interaction difficult to engage with. Young people commented on how they found it harder to participate in 'traditional' formally structured sessions. "It was like in a room...and like there's a table there and it had like little seats round, and like, he was just on about things. Do you know, he didn't make it very good, like, he didn't make it very fun and enjoyable kind of thing. It was just like, boring. He was just writing things down that I was saying basically and it just upset me. He just kept on going over it and over it and over it, he was like "so how did that feel? Bla bla bla." I didn't really feel comfortable" (Isabelle, 13, YP interview)

### Theme 11

Need for therapeutic practitioners to work creatively and use visual strategies. The ability for practitioners to work creatively and use visual strategies such as the 'node-link mapping' used in the International Treatment Effectiveness Project (ITEP) and mood cards whilst staying true to the intervention delivery was deemed a successful strategy to engage LAC. "That are not many young people who you'll get to the point where you're doing that one to one counselling really. It is few and far between. You're being creative..." (Adam, drug and alcohol worker, focus group). Many LAC wanted other strategies and approaches to be used to help them connect with professionals, maintain concentration and become more involved in sessions. "Writing it down or doing it like arts and crafts way because I don't like just talking and having conversations cause I just get a bit bored and lose track, then I'll start fiddling about." (Abbie, 18, YP interview)

### Theme 12

Explicit upfront acknowledgement of the complexities of life in the care system when addressing drug and alcohol addiction: A further approach deemed necessary when working with LAC was to explicitly acknowledge the complexities of their life due to them being in the care system. This enables a holistic approach to be taken within sessions. LAC identified it was important that goals did not focus solely around substance use. They valued discussions that recognised the difficulties occurring within their lives and facilitated a personalised approach to be taken to meet their needs. Professionals also clearly identified that a bespoke approach has to be taken; "I think what's coming out here is that with the kids we work with, the drug and alcohol issue is over there, if you like, and a whole raft of other issues are here. As workers we're dealing with all of these here and that tends to sort the drug and alcohol issues out quite naturally" (Laura, Drug and alcohol worker, focus group)

### Theme 13

Frequent placement changes resulting in inconsistent and fragmented support networks: Frequent placement changes resulted in inconsistent and fragmented support networks for LAC. The transient nature of the LAC population can result in young people being eager to find friends even if that results in becoming involved in unhealthy friendships. "So they might, you know, have contact with their brothers or sisters, you know, it is just they get moved around, and when they are moved around they are vulnerable, they are desperate to have friends or they are desperate to have somebody to call their own..... people get attracted to them who are, I would say, not the type of kids I would want my kids to knock around with" (Liz, foster carer, Interview).

### Theme 14

Gaps in the social network: the central part that social interaction and support for change plays in any resolution of substance misuse problems. "It is quite sad sometimes when they haven't got anybody in the family, not even an uncle or a cousin or somebody who they can put down as a support really" (Steph, social worker, focus group). The challenges of finding appropriate network members was explored, in many interviews LAC struggled to identify someone they felt they could turn to, feelings of not having support or the need to be self-sufficient was verbalised; "My boyfriend and his friends, and there's a few of my friends. Actually they've got their own lives as well, they've got their own houses and their partners and they're all settling down as well, so... there's not really many people there. When you think about it though, how many of them can you turn to if you've got a problem? Cause there's not a lot" (Abbie, 18, YP interview).

**Theme 15**

Unconventional social support networks: When young people did identify positive support, it was often people outside of the traditional family support network as would be expected within the LAC population. This in itself could be challenging due to the identified sources of support often being professionals whose ability to provide ongoing or out of hours support is not always practical as would be possible from a more traditional family member. "There's two main people I've got in my life which provides me with support. One's my boss, he's a farm manager, I work with him most days. Another person is the manager of [name of school], he owns the company and he helps quite a lot by, when I moved out of here the first time, he's the one that made me come back, and let me get my head back" (Philip, 17, YP interview).

**Theme 16**

Looked after children's inability, at times, to recognize support

**Theme 17**

In interventions the need to include criteria for a 'network member' was made more flexible to enable less traditional members to engage with sessions and act as a support

**Theme 18**

That in interventions for substance abuse there is a need for treatment goals to be wider than substance use alone

	<b>Section</b>	<b>Question</b>	<b>Answer</b>
<b>Risk of bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes <i>("The purposive sample aimed to ensure diversity with regards to age, exposure to drug and alcohol use and placement type. The final sample was representative of the LAC population so far as there was an equal mix of male and female participants and a</i>

		<i>range of placement types across the different local authority areas" However, there was no discussion regarding why/if some people chose not to take part. )</i>
Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(However, researchers did not justify the setting for data collection. data saturation was considered.)</i>
Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(Can't tell if the researchers critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
Ethical Issues	Have ethical issues been taken into consideration?	Yes <i>(ethical approval obtained)</i>
Data analysis	Was the data analysis sufficiently rigorous?	Yes <i>(However, unclear if researcher critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
Findings	Is there a clear statement of findings?	Yes
Research value	How valuable is the research?	The research is valuable
Overall risk of bias and directness	Overall risk of bias	Low
	Directness	Directly applicable

**Berridge 2017**

<b>Study type</b>	Semi structured interviews RQ4
<b>Aim of study</b>	to identify care and educational factors associated with the progress and attainment of children in care between the end of Key Stage 2 to end of Key Stage 4 (11–16 years of age). to hold semi-structured interviews with young people, carers, social workers and (designated) teachers in order to explore and contrast factors associated with high- and lower-progress.
<b>Study location</b>	UK
<b>Study setting</b>	Secondary schooling in England
<b>Study methods</b>	Semi-structured interview data was analysed sequentially by two researchers using a thematic approach. This incorporated elements of both an inductive and deductive approach, taking into account pre-formulated theory and ideas as well as concepts formed from the data. Following an initial reading of all interviews, NVivo software was then used to organise and code the data.
<b>Population</b>	Children in care between the end of Key Stage 2 to end of Key Stage 4 (11–16 years of age). In addition, social workers, foster carers, residential worker, teachers
<b>Study dates</b>	2013
<b>Sources of funding</b>	the Nuffield Foundation
<b>Inclusion Criteria</b>	None reported

<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> 26 adolescents, 17 social workers, 17 foster carers, 1 residential worker, 20 teachers</p> <p><b>Time in care</b> Entry to care varied between 3 and 16 years of age with most separations occurring during secondary schooling</p> <p><b>Mental health problems</b> "Children's mental health problems were reported with at least one, possibly two, attempting suicide."</p> <p><b>non-white ethnicity</b> About a quarter were from minority ethnic groups and one young man had been an asylum seeker.</p> <p><b>Unaccompanied asylum seekers</b> one participant</p> <p><b>Gender</b> 15 females and 11 males</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> Trouble at home spilled over into schooling: Young people reported an inability to concentrate in class and problems spilling over into conflict and aggression with teachers or peers. Many lacked confidence.</p> <p><b>Theme 2</b> Entry into care was felt to lead to educational improvement: there was an overwhelming view from young people that entry to care had led to an improvement in their lives: one young woman put it starkly when she said the biggest difference was that she was no longer being shouted at. Another explained: 'When I got into care, that's what basically saved me'. Entry to care was also generally felt to have benefited schooling. Half had made good educational progress, which was how they were sampled, and most overall had become regular attenders</p> <p><b>Theme 3</b> Expressions of individual agency were used to help authors understand variability in attitude to schooling and engagement with learning, which is linked with children's resilience. Four broad groups can be identified from our interviews. These are termed: 1. 'stressed/unresolved'; 2. 'committed/ trusted support'; 3. 'private/self-reliant'; and 4. 'disengaged'. Not all young people fit neatly under these headings and there is some overlap between groups. Furthermore, high- and lower-progress young people were included in each of the first three categories.</p> <p><b>Theme 4</b> (stressed/unresolved group) Influence of birth family on education: for most of the sample, birth family continued to influence their lives and education. Children do not cease to belong to a family simply because they no longer live with one. Social media brings a further dimension to this, permitting children to keep in contact with birth parents and others in different ways. Birth family could have positive benefits but was often a source of conflict. At the time of her GCSEs a young woman had been experiencing a complex and very stressful court case in which her loyalties were torn. Another young woman was troubled by the continuing violence in her birth family home, especially as 'My poor old</p>

brother still lives there'. She explained how she could become aggressive in class as a consequence but teachers were unsympathetic: 'And they didn't understand if you told them, look I just [need] space, and they didn't understand, they didn't really care...They hadn't got a clue, they probably just didn't know'.

#### Theme 5

(stressed/unresolved group) importance of close relationships with carers for turning point in education: She also stated that she would have done better at school if her foster carers and social worker had shown more interest in her education and given her more encouragement. She took an overdose before her examinations but subsequently formed a close bond with her foster carers who did not reject her. She described this as something of a turning point in her life: a key stage in her resilience.

#### Theme 6

(stressed/unresolved group) Impact of shocking events on ability to concentrate: a young woman had entered care early in her secondary schooling. As she explained it, her mother had a new 'boyfriend', who said that she had to choose either him or the children. Shortly after, the girl was hit with a succession of shocks: two bereavements of close foster relatives and her foster mother was diagnosed with cancer. She stated that she had too many social workers and not all teachers were as supportive as they could have been. 'Obviously, when you're going through things, you can't really ignore it completely...And although I tried my best to get on with what I could do, and do the best I could, it wasn't always that easy, and it wasn't easy just to block everything out, but I did the best I could when it came to school'.

#### Theme 7

(stressed/unresolved group) No body to talk to/to listen: One young woman had entered care at 15. She stated that she had no stability in her life and felt that she had no one whom she could talk to. If there had been someone who understood her, she felt that she could have done better.

#### Theme 8

(stressed/unresolved group) supports of varying quality: the 'Stressed/unresolved' group had accessed different forms of support, including school mentors, counselling, CAMHS (Child and Adolescent Mental Health Services) and a maths tutor. However, supports were of a varying quality and had not (yet) managed to help young people to contain their problems and engage fully at school. In terms of resilience, the negative influences from the past had not yet been successfully managed. Reliable social relationships, particularly with carers, still needed to be established to help provide a secure base for the future.

#### Theme 9

(Committed/trusted support group): Most were planning university careers and at least three are at leading UK universities pursuing careers in medicine, engineering and English Literature. There were several distinguishing features of this group. They had strong support, which young people engaged with. They lived with highly caring, sometimes quite remarkable foster families. Young people felt genuinely cared for, that their lives mattered and that it was, therefore, worth making an effort. They said that they needed to feel that their lives matter to someone else before it could matter to them.

#### Theme 10

(Committed/trusted support group) Wider support beyond family: Grandparents also emerged as important in two cases. There were accounts of good teachers, who were also supportive. These positive social relationships facilitated young people's resilience.

#### Theme 11

(Committed/trusted support group) foster carers believed strongly in the benefits of a good education and pushed young people to do well.

#### Theme 12

(Committed/trusted support group) genuine care, one of the family: There were six other birth and foster children in total and he had never felt treated differently to any of the others. He commented that he always had good social workers; he meets his birth mother every weekend; and teachers have respected his wish to keep his family background confidential in the school. If he needs anything for his education or more generally, the foster carers buy it first then claim it back later if they can. He comments: 'I was treated like one of their own children, so you become part of the family and when that happens it's easier for you to excel'. 'I think that everyone has the ability actually to do well in education. It's just the support mechanism that you give to them...For me, I just needed someone to give me a kick up the backside and say to me "[name], you can do it"

...Because when someone does something for you, you don't want to let them down...It made me feel touched and it made me feel like, you know, maybe this is not just a placement...And it made me feel more warm'.

### Theme 13

(Committed/trusted support group) the importance of support needing to be tailored to the individual and that social workers and teachers need to ask carers and young people about what is required.

### Theme 14

(Private/ self-reliant group) autonomy/independence/no preferential treatment: These young people explained that they preferred to remain independent and autonomous. Some were very clear that they did not like to be treated differently to others and they could be very stubborn. Some were very determined to succeed educationally and were doing well. It could entail a high level of support but this 'Private/self-reliant' group did not like to feel dependent on others. As a group, they tended to enter care slightly older than other interviewees. They were divided between the high- and lower achieving groups, so independence and self-reliance are not necessarily linked with educational failure. 'I don't think anyone can help you get on in school, it's just yourself, it's if you want to get on yourself...Wasn't focused on the future. I didn't think it was going to end, to be honest...I was living in the moment if you know what I mean'. Some individuals (young women) in the 'Private/self-reliant' group described undertaking caring roles for their mothers with substance misuse and mental health problems, which may be linked to their autonomy and exercise of control.

### Theme 15

(Private/ self-reliant group) importance of privacy/not being labelled: She did not feel that her placement moves affected her achievements ('...I was used to changing. It was a normal thing'). She received support from others '...but I didn't want them knowing my business'. 'I wasn't that type of person to be branded needing help'.

### Theme 16

(Private/ self-reliant group) impact of home context on education: One said that at every Personal Education Plan (PEP) meeting she attended, she reiterated that the best way that professionals could help her do well at school was to make sure that her mother was taking her medication. The young woman felt that, in effect, she was having to undertake the social worker's role, who was unhelpful: 'Oh, I'm very outspoken. It's just been part of my character...And I was quite articulate in what I wanted. So I was just like, "This is what I want, and this is what I'm asking". And you can see I was a bit of a gutsy person, so I wasn't going to take no for an answer. And plus, my IRO [Independent Reviewing Officer] was quite nice... if my social worker wasn't going to do anything, I'd just literally go to my IRO and say, "Look, my social worker and her manager are not helping me out here. So can you help me out, please? Like, I don't know, nag them or do something to them, but just get them to do something". I wanted to ask my social worker about helping my mum, because she's not been taking medication for a year now, and they've been like...they literally will say, "Oh, we'll look into it, we'll look into it, we'll look into it." But they never look into it. So in the end, I'm just like... and I literally, review after review after review, I'm telling them I need someone to look at that'.

### Theme 17

(Private/ self-reliant group) criticism of services. One theme of this 'Private/self-reliant' group was the criticism of services, particularly foster carers but also some teachers. Services were not sufficiently reliable to genuinely support young people. Their high level of independence could be seen as a demonstration of 'hidden resilience': an attempted protective mechanism against further harm. One described her first carers as 'nasty'. Two others described their carers as uninterested in their education; one of whom never attended any parents' evenings or school functions. Another said her foster carers were too strict, laid down too many rules and so she felt very soon she should leave, which she did.

### Theme 18

(Private/ self-reliant group) impact of independence/agency on health: One young person, struggling to deal with depression and anxiety, explained how '...I keep it to myself rather than discuss problems with others. He felt that none of his schools had helped him, spending most of his time in the library having been excluded from classes ('No...I don't think any school did').

### Theme 19

(Disengaged group) These young men felt that they could have done better in their exams and that the reason for this was down to them. Their explanations were that they disregarded advice and that they did not pay attention. They were often offered support at school, such as counselling for example, but chose not to take advantage. In their own words: (Interviewer - 'Is there anyone that's stopped you from doing well?') 'Yeah my mates really...and mainly myself.' 'I think it was mainly down to me...if I'd focused more than I did on my coursework, I probably would have done a lot better.'

#### Theme 20

(Disengaged group). Disengagement from school associated with school discipline problems: There was more evidence of school discipline problems for this group than others, including disobedience of teachers and rule-breaking. There were accounts of fighting at school, smoking and setting-off fire alarms. One young man was selling drugs at school.

#### Theme 21

(disengaged group) impact of home situation: One young man was said not to cope well with exam pressure and missed a GCSE exam: he said that 'Things were going on at home'. The mother of one young man had died and another had never met his father, nor had a reliable male adult in his life. The father of one was in prison for drug convictions.

#### Theme 22

(disengaged group) Importance of being in care in benefiting education: Despite feeling that they had under-achieved, nevertheless, all of this group felt that entry to care had helped them and benefited their education. When interviewed, three were still living in the same, stable placements. Two were at college and one on an apprenticeship. They had become regular school attenders, unlike previously.

#### Theme 23

Importance of relationships as preconditions of engaging with education: Stable, fulfilling relationships provided the foundation for children's resilience. The second precondition for many was that birth family issues need to be managed. Birth parents required support and boundaries need to be placed around contact. As far as possible, young people need to be protected from family stress, or helped to deal with it, in order to get on with their own lives and create new opportunities.

#### Theme 24

Importance of tailored support in school once stable and secure: once these structures were in place, young people said that they could then engage with schooling and it was individual teachers who could make the difference. They did this by understanding pupils' social and emotional problems; exercising confidentiality and sensitivity in the classroom; and taking into account individual learning styles with flexibility. Additional tuition was often welcomed. There is no guarantee that this would work: some young people had these supports in place but did not make good progress (yet). A few others did very well despite their difficulties remaining unresolved.

	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes ( <i>This study was looking to explore factors associated with high- and lower-progress, which, it could be argued, is better answered using quantitative methods. However, the study was mixed methods.</i> )

Research Design	Was the research design appropriate to address the aims of the research?	Can't tell <i>(It is not clear that the researchers justified the research design and discussed how they decided which method to use)</i>
Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Can't tell <i>(It was not clear how participants were selected; it was not clear why the participants they selected were the most appropriate to provide access to the type of knowledge sought by the study; it was not clear why some people chose not to take part)</i>
Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(no justification of setting for data collection; no discussion of data saturation)</i>
Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(unclear that researcher critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
Ethical Issues	Have ethical issues been taken into consideration?	Yes
Data analysis	Was the data analysis sufficiently rigorous?	Yes <i>(However, unclear if researchers ritically examine their own role, potential bias and influence during analysis and selection of data for presentation )</i>
Findings	Is there a clear statement of findings?	Can't tell <i>(More than one researcher performed thematic analysis, however, no other discussion of triangulation, or respondent validation. Credibility of findings were not discussed at length )</i>

	Research value	How valuable is the research?	The research has some value ( <i>Authors considered models of agency in secondary school aged children, which did not always have clear applications for policy or practice.</i> )
	Overall risk of bias and directness	Overall risk of bias	Moderate
		Directness	Directly applicable

**Brewin 2011**

<b>Study type</b>	Focus Groups social work managers  Semi structured interviews Looked after children
<b>Aim of study</b>	to elicit factors that stakeholders perceive as supporting or hindering the transition from primary to secondary school for Looked After children
<b>Study location</b>	UK
<b>Study setting</b>	a semi-rural borough in Wales
<b>Study methods</b>	Semi-structured interviews. Different types of questions were included in the interview. These included questions to elicit factual information; “descriptive” questions that prompt participants to provide accounts of what happened; “evaluative” questions to explore the participants’ feelings towards someone or something; and questions designed to encourage participants to think hypothetically about the future and possible alternative events. Data from the interviews were analysed using themes and principles derived from “framework

	analysis”: familiarisation, identifying initial themes and concepts, indexing, charting and finally synthesising. These stages were applied to the data collected from the present study.
<b>Population</b>	Children who are looked after in one borough in Wales, on roll at a school within the local authority and about to make, or have recently made, transition into secondary school  Child interviews, foster carer interviews, teacher interviews, interviews with Looked After Children Education Support Officers, and a social worker focus group took place
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported
<b>Inclusion Criteria</b>	Care Situation “Looked After” by one borough in Wales  Education On roll at a school within the local authority; in Year 6 and about to make a transition to secondary school from primary school, or they were in Year 7 and had recently moved from primary to secondary school
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size 14 child interviews took place, 22 foster carer interviews, 19 teacher interviews, three interviews with Looked After Children Education Support Officers, and a social worker focus group  Mean age (SD) Six Year 6 children (age 9-10) and 13 Year 7 children (age 11-12) were identified
<b>Relevant themes</b>	Theme 1 Need for holistic/individualised care - complexity of factors that impact transition from primary to secondary care: no single factor, or single set of factors, was perceived as supporting Looked After children when moving from primary to secondary school. Instead, interacting factors, at many levels, appeared to play an important role when supporting children through transition.

**Theme 2**

difficulties in transition due to social skills and behaviour: Around half of teachers and carers indicated that the “Looked After” child in question had difficulties making and maintaining friendships, with most attributing these difficulties to the child’s inadequate social skills. Many adult respondents indicated that the children presented behaviours which caused, or would cause, difficulties around the time of transition. While adults often attributed difficult-to-manage behaviours to within-child factors, children tended to attribute such behaviour to external factors, such as being triggered by other children or school staff.

**Theme 3**

Fears and anxiety before transition: Many children indicated that they felt fearful or anxious before transition. Some of this fear related to the work being hard, getting lost or having strict teachers, although the most commonly cited fear was that of bullying.

**Theme 4**

Minimising differences: All participants made reference to the immediate systems children interacted with as having an influence on their transition. Within these systems it was considered important to minimise children’s differences so as to not make the child feel different or stand out.

**Theme 5**

Importance of maintaining peer relationships during transition: The influence of peer relationships was mentioned in some form by almost all participants and across all groups, making this a very strong theme to emerge. Carers, teachers, and children in particular, indicated that friendships were an important factor in choosing a secondary school. Participants reflecting on transition considered that making the move with friends had helped, and conversely an absence of friends was sometimes associated with difficulties following transition. As well as being accompanied by existing friends, making new friends was considered to be a positive aspect of moving to a new school for most children.

**Theme 6**

Importance of maintaining wider local social networks of support: This theme appeared to be very pertinent to carers, who indicated that extended networks of people, relating to their locality and forged over time, were important for the child they fostered. Most carers emphasised this, other than the small minority who fostered children attending school outside their immediate locality.

**Theme 7**

Importance of children building up positive relationships with individual members of staff: Teachers and Looked After Children Education Support Officers talked about the importance of children building up positive relationships with individual adults at school. Most school staff indicated that they, or another member of staff, had built up a positive relationship with the young person, or were in the process of doing so.

**Theme 8**

Usefulness of transition “activities”: A range of general transition activities for all of Year 6 was cited as supporting children’s transitions. Primary school staff, children and carers were more likely to identify transition in terms of specific activities that children were involved with. Secondary school staff were more likely to describe transition in terms of processes. This may reflect their experiences: information from participants indicated that secondary schools organised transition activities, so subsequently those on the receiving end of these may have perceived them as separate activities, while the organisers perceived activities as fitting into an overall process. Most participants indicated that Looked After children as a group did not experience different transition activities to other children. It was felt unnecessary, and important that children were not singled out.

**Theme 9**

Usefulness of sport as a transition activity: Sport emerged as a factor that was perceived to engage and support children. In particular it was mentioned by carers, with over half indicating that sport was enjoyed by their child. Some participants indicated that sport enabled success to be experienced in a way that was not easy in other areas of the curriculum, others indicated that sport supported children more generally.

**Theme 10**

Difficulties adapting to the environment: All groups of participants mentioned difficulties triggered by the new secondary school setting. Getting lost was most commonly cited by carers and children; many indicated that children had got lost or felt overwhelmed following arrival at the school. However, in all cases it was indicated that these difficulties were soon resolved.

#### Theme 11

Information sharing and relationships between stakeholders: The importance of sharing information about the child and planning for the transition was a particularly strong theme, with nearly all adults making some reference to this. It was thought important that information was shared between primary and secondary schools, and also between different agencies, and that this went on over time. Many adult participants also talked about the value of building and maintaining relationships between themselves and other adult stakeholders, to facilitate information sharing and support children.

#### Theme 12

Allocation of secondary school places: The children in the study transferred to either their local school in their home placement catchment area, or transferred to the secondary school of which their primary school was a feeder school. Social workers and Looked After Children Education Support Officers in particular talked about the different systems and circumstances that impacted on a child's transfer. Respondents talked about how catchment areas could be restrictive, and one suggested that the rules should perhaps be more flexible for Looked After children.

#### Theme 13

Turnover of social workers and lack of involvement: Adult participants indicated that frequent changes of social worker impeded information sharing, which subsequently had a negative effect on children. School staff also expressed the view that social workers were not as involved or pro-active as they should be. Some teachers felt that they were forced to perform duties that they considered should be the role of a social worker, such as preparing paperwork for review meetings, and ensuring contact between Social Services and the school.

#### Theme 14

Importance of minimising differences between LACYP and peers: All adult participants made explicit reference to the importance of not singling out children and making them appear or feel different due to their Looked After status, particularly in front of their peer group. Some teachers indicated that it was unlikely that any pupils other than the child's close friends knew they were Looked After, indicating that children did not want to single themselves out amongst their peers. No child made reference to feeling different or the same as other children, or wanting to be treated differently.

#### Theme 15

Change as a way of life for children: As well as the transition itself, many participants talked of additional change in the child's life. Children tended to mention change far less than adults, perhaps because change was so much part of their lives anyway, or it was too difficult or confusing a topic. Some children were unclear about their own personal history, indicating difficulties remembering previous changes

#### Theme 16

Impact of placement stability on school attendance and ability to cope at school: Many children were reported to have experienced numerous changes of care placements, which were in turn associated with having attended many different schools. Some adult participants indicated that lack of stability had a negative impact on children's ability to cope with changing school. Adults talked of the value of providing stability and routine for children who had experienced change.

#### Theme 17

Missing relationships that were left behind: When children talked about change, it tended to be about people they had "left behind". Many children indicated that they missed the relationships they had with their families or friends from previous schools or neighbourhoods.

#### Theme 18

	<p>New peers bringing back issues from the past: Some participants talked about transition creating difficulties by bringing the child back into contact with people or memories from their past, especially when moving to a secondary school that had a large number of feeder primary schools. This could bring children back into contact with peers who knew them in a previous context and their association with being bullied, coming to school in a dirty state or behaving differently. Some participants reported that this resulted in children reverting to the kind of negative behaviours displayed in a previous setting.</p> <p><b>Theme 19</b> New school as a fresh start for looked after children: For some participants the move was an opportunity to get away from associations with the past. Many participants talked about the child having “a fresh start” and having an opportunity to create a new image for themselves.</p> <p><b>Theme 20</b> Biological change as well as other transitions: In addition to all the changes related directly to school, some adult participants recognised that primary-to-secondary transition comes at the same time as children are having to manage other changes such as the biological and hormonal changes of puberty, and changes in cognitive capacity, emotional development and personal identity</p> <p><b>Theme 21</b> Pre-care experiences impacting on current ability to form relationships: Some adults made reference to children’s pre-care experiences, or their experiences in care, as affecting their current emotional well-being, behaviour and ability to form and maintain relationships.</p>		
<b>Risk of Bias</b>	<b>Section</b>	<b>Question</b>	<b>Answer</b>
	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes <i>(no discussion about why certain participants chose not to take part. Sample was well defined to answer the research question otherwise)</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Can't tell <i>(No discussion of setting for interview or saturation of data. Unclear the form of the data analysed (e.g. tape recordings, video material, notes))</i>

	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(Unclear if researcher critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Yes <i>(However, unclear that researchers critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	Can't tell <i>(Unclear that the researcher has considered the credibility of their findings (e.g. triangulation, respondent validation, more than one analyst). In addition, it is often unclear which source (population) the themes have been drawn from most strongly)</i>
	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	Moderate
		Directness	Directly applicable

**Brown 2019**

<b>Study type</b>	Focus Groups Semi structured interviews
-------------------	--

<b>Aim of study</b>	to explore how care is perceived and practiced among LACCL and those with a duty of care for them
<b>Study location</b>	UK
<b>Study setting</b>	four local authorities in North-East England
<b>Study methods</b>	Twenty-eight semi-structured 1:1 interviews, four dyad interviews and three focus group interviews. Interview questions differed according to the group i.e. there were separate semi-structured topic guides; one each for LACCL, carers and professionals. Audio recordings were transcribed verbatim and subject to iterative, in-depth, thematic analysis. Qualitative software (NVIVO 10) assisted in the organization of thematic codes and categories. To ensure trustworthiness of findings, data was critically discussed in project management meetings and among the qualitative team to agree a consensus on the interpretations.
<b>Population</b>	Looked after children (aged between 12 and 20 years), carers, and social workers.
<b>Study dates</b>	between May and July 2016.
<b>Sources of funding</b>	National Institute of Health Research (NIHR)
<b>Inclusion Criteria</b>	Age between 12 and 20 years old
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size 19 looked after children 17 carers, 8 social workers  Reason for stopping recruitment not reported  Mean age (SD)

	<p>six participants were under 16 years old</p> <p><b>Type of care</b> Six were care leavers and the remainder was deemed 'looked after'. Eight of the young people lived in residential care homes, five lived with foster carers, three lived independently, two lived in supported accommodation, and one lived with a biological parent after recently leaving residential accommodation, but was still subject to social services supervision and was deemed to be 'in care'.</p> <p><b>non-white ethnicity</b> All were white british apart from one young woman who was black African</p> <p><b>Other recruitment considerations</b> Purposive sampling techniques ensured diversity with regard to age, placement type and experience of service.</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> Genuine care - going above and beyond (not just contractual): Above all, the young participants evaluated their relationships with practitioners and carers according to the extent they felt 'cared for' and they categorized individuals as either 'caring' or 'uncaring'. They also contrasted those who 'genuinely' and/or 'actually' cared with those who were 'just doing their job' and/or 'in it for the money'. This reflects the non-contractual aspect to genuine care. Relatedly, one of the main themes in relation to such care was the importance of going 'above and beyond' i.e. going further than the remit of one's paid role and contractual obligations. Examples of going 'above and beyond' included foster carers staying in touch after a placement ended and residential keyworkers making contact when they were off work. Going above and beyond formal duties was key to building a relationship with the LACCL participants and also engendering feelings of being cared for: "I have been very lucky to find a lovely, lovely [foster] carer, who actually cares.....there are carers, and there are carers who actually care" (Natalia, 20) "The old social worker who I used to have, she cares and this (new) one's just about the job. ....you know yourself when someone cares or when someone just looks at you and thinks 'You're just a piece of paperwork'"</p> <p><b>Theme 2</b> Limits of the care that social workers are able to provide: Most of the social workers talked about 'going the extra mile' for the children and young people on their caseload. However, this did not necessarily involve spending more time with a young person or doing 'fun' activities. Rather, it involved doing overtime, working outside of scheduled hours, and leaving one's phone on 24/7. However, their care was not unconditional and limitless in every respect. One of the main themes among the social workers was rationing the distribution of care. All of the social workers spoke of the limits to the kind of care they could provide to LACCL. This related to time, workload and the nature of statutory care rather than how much they personally cared about the young people. They stressed the need for realism because their care needed to be distributed among others on their caseloads. This is acknowledged in the following quote from a dyad interview with two social workers: Carly: But I think the difficulty, [is] we are "statutories" [statutory organisation employees], I think people and voluntary organisations who don't have the same kind of "stat limits" can give that more consistent care and support to a teenager [which] is really important. Because as much as we want to, we can't do it."</p> <p><b>Theme 3</b> Clash between expectations of looked after children and their social workers: Whilst the young participants conceptualized care in terms of altruism (limitless, selfless and spontaneous), the social workers understood care in terms of equal rationing and distribution between different young people. Social workers therefore had to manage and negotiate this discrepancy in their relationships with LACCL such as by stressing the need to be available 'when it matters', such as during an out of hours crisis or an emergency. many of the workers recognized that some colleagues were unavailable outside of office hours and the 'service' was therefore inconsistent which affected LACCL's expectations. Some also felt that constantly that going 'above and beyond' could lead to LACCL becoming overly dependent upon their social worker: "...because you're not on 24-hour call. You're not. You don't get paid for that. Me personally, I would have my work's mobile on and I would say to my young people, "If it's an absolute emergency text me" ....but I think you do have to realise you've got some social workers that are very much the opposite. That literally the phone goes off. You know, at 5 o'clock"Despite these potential problems, all the social workers nevertheless felt that sometimes going 'above and beyond' was necessary in caring for LACCL and essential to building a relationship with them. Some stressed the need to do 'whatever it takes' to help the individual at particular times.</p>

#### Theme 4

Carers going beyond contractual relationship in caring: One of the main themes among the carers was the regular need to go beyond their prescribed/statutory role. In contrast to the social workers, most of the carers highlighted the potentially boundless nature of their role, in the sense that it was more than simply a 'job': "...it is not a job because there is no job that makes you work 24 hours a day, 7 days a week and 365 days of the year, but this one does" (James, foster carer).

#### Theme 5

Carers struggling with limitations of social care support: They felt the role was boundless due to the needs of LACCL, but particularly in terms of gaps in social workers' abilities to provide a certain level of care. Most of the carers stressed the difficulty of working within the care system due to a lack of resources and the increasing pressures placed on social workers and their subsequent limited ability to provide consistent high-quality care to LACCL. Foster carers in particular saw themselves as the young person's main advocate and as in a constant 'battle' with the system over resources and access to services for the LACCL: "If you have got 30-odd cases and only 35 h a week to do it you can only spend about an hour on each kid. How on earth do you care for somebody an hour a week? It is just pants. We will just battle away" (Carol, foster carer). "I had to fight to get him into college and then I had to fight to get a taxi to take them. I then had to fight with both the IRO [Independent Reviewing Officer] and the social worker because they weren't sure whether they wanted to fund another year of education for him.....[over] the last few years we have become more fighters and pests than foster carers" (James, foster carer).

#### Theme 6

The desire for carers to "treat as their own": Most of the young people had low expectations about being cared for and described needing constant reassertions that 'someone cares'. Isabelle's quote below highlights the importance of her residential care home workers demonstrating care via tangible, practical acts such as doing activities, buying things and showing concern for welfare. "We go out every weekend, we get bought things, they treat you like you're one of their own, care for you, and if I'm gone for just half an hour they're always ringing me wondering where I am, and that shows to me that someone cares about me" (Isabelle, 13). "It is when you think, "What if that was my kid? Would I be relaxed? Would I want to be there and help them?" Forget about being a foster child and forget about you being a social worker, put yourself in their shoes and think, "What if that was my kid?" (Natalia, 20).

#### Theme 7

Day to day tangible acts of care: carers also conceptualized care in terms of day-to-day, tangible acts of care. But in contrast to the practitioners, this was more explicitly in terms of treating the child 'as one of their own' and they stressed the parental nature of their role. For example, care involved basic familial acts such as ironing clothes, playing football, and 'nagging' young people to eat vegetables: "...what they [care leavers] would tell you is [that] they want someone who doesn't nag them about having a shower, eating vegetables, washing up, washing their laundry or getting to college on time. They would tell you that is what I spend my life doing and they wish I'd shut up. But I do...realistically they really need that and they do appreciate it" (Jackie, Supported Accommodation worker).

#### Theme 8

Importance of discipline and boundaries: discipline was the main way the foster carers in particular treated LACCL 'as their own'. They felt that care resided in teaching LACCL boundaries and consequences for their behavior as it demonstrated care to them. All the foster carers stressed that their methods of discipline were the same as they used with their biological children: "The telling off he'd get would be exactly the same as our four children [got], ...We treat him just the same as we did our own. If you go out and come back later than what you should do, you'll get told off" (Charlie, foster carer). "We say to [our foster son], 'If we didn't care, we'd just say, right then, go on, do what you want to do'. That makes him think, 'they do care'" (Elaine, foster carer).

#### Theme 9

Lack of legal authority undermined ability to provide appropriate discipline: discipline was a source of tension for many foster carers. They often felt undermined in their ability to discipline LACCL as the local authority were the legal corporate parent. Carers felt unable to carry out simple 'parental' tasks such as booking a GP appointment which had to be arranged by the social worker. The corporate parent also set boundaries for discipline, which the foster carers were obliged to adhere to. For example, carers were unable to withhold LACCL's pocket money as they would do for their biological children and they could only 'ground them' for a very short amount of time. Although the carers sympathized with some of the logic behind this, they felt it hindered the young person from learning from the consequences of their behavior and restricted carers' attempts to 'treat the child

as their own': "If my kids were naughty or misbehaving when they were younger they wouldn't get pocket money. Now looked after children have to get pocket money, you can't not give them pocket money. You just do as you're told, we all do as we are told. I don't think it is the right thing to do, but we have to do it" (Carol, foster carer).

**Theme 10**

Care should be unconditional "no matter what": key component of care is that it felt unconditional and endured 'no matter what'. This related to empathy and compassion, which most of the LACCL participants talked about in terms of 'understanding'. For some of the young people, this particularly referred to understanding certain risky behaviors as a consequence of being in care (behaviors require safeguarding procedures such as drug use or going missing). For some this extended to a desire for some leeway or leniency. Many LACCL participants felt that adults who did not demonstrate such understanding did not care and were unsupportive, even if in reality they were following safeguarding protocols. Feeling unfairly disciplined was often interpreted as a lack of care. This is clear in the quote below from a young woman who claimed she would not turn to her teachers for support as she did not trust them. Here Louise seeks empathy and compassion rather than judgment and discipline: "Who's gonna trust a teacher?...Sometimes if I haven't attended for school, they ring the police. Like they don't give you time it's just like, do it now, do it now. That's what they're like. They used to always ring the police on me cause I was like, never on time. But it's because I didn't wanna go into school cause I was upset, I was hurting, from going into care and not being able to see my brother and sister and things like....but the teachers I had they weren't bothered" (Louise, 16).

**Theme 11**

The need for persistence in care: majority of social workers and carers also articulated the need for care to be unconditional, particularly in relation to problematic behavior and they stressed the need for persistence. For example, most social workers expected LACCL to reject them in order to test if their care was unconditional. As such, they demonstrated care by perseverance and an acceptance of certain behaviors. "I think with teenagers you need to gain their trust, you need to work for it. Because if they have been hurt, which they will have been. They will try to push you away. They won't be used to having that consistent relationship maybe so actually when I try to push you away and you keep on going back no matter how many times they swear at you or slam the door in your face. The fact that they start realising, she is still coming – do you know what I mean?" (Carly, Social Worker). "...and we've had young people in here who've had 10 previous placements. Depending how they view that, that could be 10 rejections.... [Isabelle] spent the first few months of being here trying to break the placement down. She still does to a degree but she's starting now to realise that it isn't going to happen" (Frank, Residential Keyworker).

**Theme 12**

Persistence of care when children have additional needs: Most of the carers described how many of the children and young people in their care had additional needs due to emotional and behavioral issues. Many carers had experience of dealing with issues such as mental health problems, drug and alcohol misuse, and having their property damaged. However, these carers stated that, when facing such problems, care must be unconditional. They stressed the need to try and understand the young person's behavior and support them in the same way they would with their biological children, rather than reject them because of their complex issues. This is illustrated in the following quote: "I just think foster carers need to be trained to a really high standard. Lots of foster carers when issues like this arise just give up, [and say] "Right, I am getting rid of him." Would you get rid of your own kid if they were involved with drugs and alcohol? You wouldn't just say, "I am getting rid of him." We have to keep them, be resilient with them and support them" (Elsie, foster carer).

	<b>Section</b>	<b>Question</b>	<b>Answer</b>
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes

	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes <i>("Purposive sampling techniques ensured diversity with regard to age, placement type and experience of service." However no discussion as to why some participants chose not to take part)</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Yes
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Yes <i>("We re-iterated the participant's views back to them during interviews to ensure interpretation and understanding was correct.")</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Yes <i>(Thematic analysis with triangulation of views. "To ensure trustworthiness of findings, data was critically discussed in project management meetings and among the qualitative team to agree a consensus on the interpretations.")</i>
	Findings	Is there a clear statement of findings?	Yes
	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	Low

		Directness	Directly applicable

## Chase 2010

<b>Study type</b>	<p>Subgroup of interest UAS</p> <p>See also Chase 2013</p>
<b>Aim of study</b>	<p>To explore factors affecting the emotional well-being of young people seeking asylum on their own in England.</p> <p>The main research questions examined in the course of the study were:</p> <ul style="list-style-type: none"> <li>• what factors are perceived to positively and/or negatively impact on the emotional well-being of unaccompanied children and young people seeking asylum in England?</li> <li>• what types of health and social care provision and services may be useful in promoting the emotional well-being and mental health of unaccompanied children and young people?</li> </ul>
<b>Study location</b>	UK
<b>Study setting</b>	London local authorities in which there were a high number of young people seeking asylum and where there was a degree of specialist knowledge and expertise among professionals of working with this group.
<b>Study methods</b>	<p>"in-depth" interviews. Young people were asked to talk about their experiences since coming to the UK and to focus on the things that had made them feel well and happy since arriving here and the things that had made them feel sad or had created difficulties for them. Discussions with young people lasted between forty-five minutes and three hours. Members of the research team frequently met a young person on more than one occasion, for example an initial conversation in a neutral venue</p>

	such as a cafe' followed by a more in-depth interview at a later date, sometimes supplemented by an additional telephone discussion. The main interviews with young people were recorded, using a digital or tape recorder and then transcribed. A thematic analysis was conducted of all interview transcripts using the constant comparative method (Glaser and Strauss, 1967) to identify recurrent themes. Emerging themes were then checked for 'negative instances', or examples that contradicted these themes.
<b>Population</b>	young people seeking asylum on their own in England
<b>Study dates</b>	Between January and July 2007
<b>Sources of funding</b>	UK Department of Health
<b>Inclusion Criteria</b>	Care Situation unaccompanied children and young people seeking asylum accommodated (or previously accommodated) by local authorities in London.
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> 54 unaccompanied children and young people seeking asylum and accommodated (or previously accommodated) by local authorities in London.</p> <p><b>non-white ethnicity</b> Research participants originally came from a total of eighteen different countries (boys and young men originating most commonly from Afghanistan and girls and young women from Eritrea).</p> <p><b>Other recruitment considerations</b> Young people were recruited to the study through three different specialist social work teams working with unaccompanied young people—reflecting different age groups of young people (under sixteen years; sixteen to seventeen years; and eighteen years and older). This provided a balance of young people supported under different care arrangements, including foster-care, residential care, semi-independent housing and independent living arrangements.</p> <p><b>Age</b> The age of young people on arrival ranged from nine to seventeen years for boys and young men and twelve to seventeen years for girls and young women. At the time at which they were interviewed, the age range was eleven to twenty-three years and thirteen to twenty-one years, respectively.</p>
<b>Relevant themes</b>	Theme 1

Initial feelings of bewilderment and confusion upon contact with immigration systems: usually upon arrival at a major airport. From here onwards, young people frequently described finding themselves catapulted into a series of interlocking systems of surveillance and control that were completely alien to them but that had been set up to identify, label, oversee and monitor.

### Theme 2

The branding/labelling as an asylum seeker: the categorisation of young people as 'asylum-seekers' (or otherwise)—labels that many soon recognised, and fundamentally defined other people's perceptions and treatment of them. Examples of surveillance, judgement and 'othering' abounded in young people's descriptions and analysis of their subsequent experiences: "They took me inside, they took picture . . . something like that and they ask me if I come to claim asylum . . . I say, 'What is asylum?'. I had no idea what is asylum . . . so I just stay like that (remain silent). They just took picture, finger prints and X-ray to see if I've got chest infection . . . But it's hard when you claim asylum here because you don't know what to say. 'Cos for me, I told you, I didn't get interpreter. I didn't know what is asylum— those kinds of things." "I just still remember those eyes. I was so scared, yeh?, but I didn't want them to see that I was scared. 'Cos I see worse things yeh? But it was a totally different environment. I didn't even want to tell them my name or where I came from like . . . But they treat me like an animal—that is the worst thing."

### Theme 3

Resisting the stigma of the asylum seeker: many young people talked of developing strategies to distance themselves from the 'asylum-seeker' label or avoid situations in which they would have to answer to it. William, aged nineteen, had arrived in England from the Democratic Republic of Congo when he was seventeen. When asked about how open he was able to be about his asylum-seeking status, his reply was indicative of the normalising judgements he feared from his peers: "No, the British I don't tell them, I don't tell them . . . all of my friends they don't know, they don't know I am an asylum seeker. I just feel, you know . . . I never tell no one. 'Cos they never ask as well. Most of the people think I am French and I never tell no-one I'm French. I just feel embarrassed to tell them . . . 'I have been here for this, blah, blah' . . . it's not quite good." Malashu, aged seventeen years and from Eritrea, commented on how when she first arrived at the age of fifteen, she had observed other young people being teased and called names because they were asylum-seekers. Not wanting to be treated in the same way, she said she told no one about her situation, not even her friends.

### Theme 4

Resisting the stigma of asylum seeker: "I have to lie in some situations . . . I lie because I don't want to have fuss on my ear. I don't want to have to explain to anyone. How can I explain to say a British born 19 year-old man what indefinite leave to remain is, what exceptional leave to remain is, what discretionary leave to remain is, what the appeals process is? That's the sort of questions they would ask you, and they can't get their heads around it." "What really gets me down is the term 'asylum-seeker'. When I tell people, I feel really uncomfortable. I have to fill in a form at college and I have to say I am an asylum-seeker. I see their faces change."

### Theme 5

Selective disclosure of the past and current struggles: Many young people described either not telling friends or carers about details of their past and their asylum-seeking status, or carefully selecting one or two people whom they confided in, usually other young people who had endured similar experiences. Their reasons for this selective disclosure were varied. "There is (sic.) only like two people who know my situation, so they can always understand if I am a certain way. But not everybody, I would never tell everybody . . . because some people, you know, they don't like asylum seekers so they are bound not to understand the way I am feeling." "I cry sometimes but I keep it to myself. I never talk to no one about my mum and my family. My friends at school don't know about me living with a foster carer. They just think I live with my mum. But my friends at church know." "With my friends from college, I never feel comfortable about talking to them about what I've been through with my family. My boyfriend and my social worker and the people at the children's home are the only people I've told."

### Theme 6

selective disclosure, and university as a fresh start: Maryam, age twenty-one from Iran, told how she had, in the past, tried being open about her asylum status with friends at college but felt rejected because of it. When she subsequently started university, she decided not to talk about her status or situation with others. Aware of the negative consequences on herself of not being open with her peers, she commented: "It's strange because I feel they (friends at university) are my closest friends but they they're not because they don't know about me. It's good to be able to be who you are, without hiding bits and pieces of your life."

### Theme 7

Valuing carers who "give them space" and are "not intrusive": Thierry, aged sixteen years from Burundi, indicated that the difficulties with his first foster-care placement at the age of thirteen largely emanated from the carers attempts to overly examine and scrutinise his past: "The people wanted to know too much, asking me a lot of questions so I didn't like feel comfortable. I didn't feel part of the family, I used to feel like a stranger every day."; And Asif, aged fifteen, having arrived when he was ten years old from Afghanistan, commented on how difficult it was to communicate his experiences to foster-carers who had no knowledge of his life previous to arriving in the UK: "Sometimes you can't communicate. You try but it doesn't always work out. It's not your own family, it's not your real mother. If I had my family, I wouldn't be having this meeting right now (with the researcher). I'd just get on with my life. But living here is much different so that's why I can't always communicate things with the foster family."

### Theme 8

"bracketing" the past to focus on the future: For many, it was only through 'bracketing' the past that they could focus on the future without being distracted by the upset and trauma of what had gone before. Peter, aged eighteen from Uganda, had arrived in the UK five years earlier. Like many other young people who spoke with us, he explained that not openly talking about what had happened enabled him to look to the future and move forward with his life: "I don't keep secrets but I keep to myself. I keep quiet about some issues. I tend to hold in some issues . . . I feel that if I hold in those issues, they won't feel bad on me . . . sometimes they go away but at some point they always catch up . . . I've just come . . . Its come to be where I just keep quiet about the whole thing. I don't really talk about it, or think about it. I just tend to move on and carry on with my life. I'd rather carry on with my life than address some issues."

### Theme 9

Resisting intrusive elements of the system: Young people often described complex relationships with social workers and other social care professionals. While some such relationships were depicted as being open, offering young people extensive practical and emotional support, others were less positively portrayed. positive feelings were often juxtaposed with a sense that they were to a large extent controlled by social care and immigration systems, that the privileges they enjoyed were limited and that their futures were highly uncertain. These concerns were more evident among (though not exclusive to) those young people in the study who were nearing the end of their discretionary leave to remain in the UK, and who had been exposed more directly to the confusion and uncertainties surrounding the immigration system. These young people were also more mistrustful of the interplay between social care and immigration services. Several young people who spoke with us disliked what they felt to be a degree of constant scrutiny and intrusion on the part of others. "It's hard to tell . . . even now it's hard for me to tell you about my family because I don't want to talk about it. I just want to keep it for myself. They (social services) don't know anything about it. Like, if I want to talk about it I just talk to X (her closest friend). I don't like my social worker 'cos she keep asking me the same question and I tell her just leave me alone, don't ask any question. She keep saying, 'do you want to find your family?' I just say I don't want to . . . (and) I don't want the counsellor to hear my story again."

### Theme 10

Stress through being constantly questioned and reminded about the past/sense of surveillance: "It's just a waste of time . . . I don't know. I've got my friend downstairs and she says, 'don't ask me about my family, I don't want to talk about it'. 'Cos she got migraine every day . . . every day and she is sick. Her social worker left and now she has to see duty social worker. And when she see that duty social worker—when she needs something—they just say, 'who are you, where are you from, what happened in your life . . .'" "Sometimes they don't understand you when you are sad. They keep asking you questions. It makes me angry, it makes me want to shout. It makes me remember all the bad things and they don't understand that. If they ask me (questions) I will suffer for months."

### Theme 11

constant sense of surveillance: the sense of surveillance that young people experienced in other ways was a recurrent theme. Nanu (aged twenty, having arrived from Eritrea when she was sixteen) captured the way that many aspects of young people's lives were perceived to be controlled by 'the system': "Everything, they (social services) know what we are doing, everything . . . it is all on the computer. And every six months with social worker we have interview (i.e. review). And one month, my friend, when her social worker was doing a review for her she said, 'what are you going to do for your future?'. And she said, 'I don't know because all my future is in your hands (laughs), because when I say something to do you say "NO"—I always do what you want not what I want. Don't ask me about my future'. I said to her why did you said this (still laughing) and she said, 'all the time when I say I want to do this, she say don't do this you have to do this. She told me that when I am 21 they are going to take the house, they are going to stop supporting me, why she ask me about my future?'. "When they (social services) visit, it's really . . ., they have to 'cos they have to check the house etc. I didn't understand when he came to my house. I am very sensitive and I see that he is checking things but he is not saying it out . . . and I say, 'When you come to my house, you are checking on me and I don't like it!'"

### Theme 12

Contractual, not genuine, relationship: "[about social worker] They visit every six weeks but they just write whatever they want to write. At the end of the day, they seem to just do their work and they go. They are not there for you."

### Theme 13

The impact of forced moves and overt control of social services: Miguel, from Angola, talked of how he resented the fact that social services had forced him, at the age of eighteen, to move from living with his older sister into independent living arrangements, far from all his friends and social networks. Mireille, aged eighteen from Cameroon and mother of a young baby, found the repeated accommodation moves she was subjected to extremely difficult to cope with, but felt she had no control over them: "I had to make a complaint about social services. They keep moving me; I have no security; I can't do anything. Next week they can call me and say 'you have to move'. They don't take care of you." Similarly, Daisy, aged twenty-one from China, spoke of how she had been dispersed with her seven-month-old baby son at a day's notice to a city far from her partner (the baby's father) and friends.

### Theme 14

Immigration and uncertainty about the future as the overriding concern: When young people were asked about the factors that made them sad or created difficulties for them, almost all identified their immigration status and uncertainty about the future as their overriding concern. The immigration system therefore was perceived to exercise the greatest degree of control over young people and impacted on their daily lives. Ultimately, the decision made by the Home Office determined whether or not young people could remain in the UK, and ultimately decide every aspect of their futures.

### Theme 15

Being categorised as "undeserving" by social services (and age disputes): A number of young people in the current study felt that they had been categorised as 'undeserving'. In fact, about one-quarter of the young people who participated in the current study had their age disputed by the local authority within which they were resident. Although Kiki from Eritrea, for example, had been accepted by the Home Office as being aged fifteen when she entered the UK, the local authority in which she resided had assessed her as being eighteen years old. This meant that she was placed in independent accommodation, had no allocated social worker and very limited support from social services. At the time of the study, she was being transferred to the benefits system and was struggling to complete a complex housing benefit application." Some were not able to defend themselves due to the lack of English speaking skills.

Risk of Bias	Section	Question	Answer
	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes (However, no discussion regarding why some participants chose not to take part )

	Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(However, unclear that study setting was justified and unclear that researcher considered saturation of data )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(unclear that researcher examined heir own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Yes <i>(However, unclear that researcher critically examined their own role, potential bias and influence during analysis and selection of data for presentation )</i>
	Findings	Is there a clear statement of findings?	Can't tell <i>(no adequate discussion of evidence both for and against the researcher's arguments; unclear that esearcher discuss the credibility of their findings (e.g. triangulation, respondent validation, more than one analyst))</i>
	Research value	How valuable is the research?	The research has some value <i>(Not clear that researcher has considered whether or how the findings can be transferred to other populations or consider other ways the research may be used)</i>
	Overall risk of bias and directness	Overall risk of bias	Moderate
		Directness	Partially applicable <i>(study data collected prior to 2010)</i>

**Chase 2013**

<b>Study type</b>	Subgroup of interest UAS  Interviews (unclear) "in-depth interviews"
<b>Aim of study</b>	to consider how young people seeking asylum alone in the UK conceptualised wellbeing.
<b>Study location</b>	UK
<b>Study setting</b>	Unaccompanied children and young people seeking asylum and accommodated (or previously accommodated) by local authorities in London.
<b>Study methods</b>	In-depth "qualitative" interviews were carried out. An inductive methodology based on the grounded theory approach (Corbin and Strauss 2008, Glaser and Strauss 1967) was adopted. Young people were encouraged to talk openly about their lives and wellbeing in an integrated way, focusing on the life events and circumstances they considered most relevant. They were asked to think about two broad questions: (i) the things that had made them feel happy since arriving in the UK and (ii) the things that had made them feel sad or created difficulties for them. A topic guide was used to draw out key aspects of young people's lives and experiences. Once all interviews had been transcribed, an inductive thematic analysis was conducted. Emerging themes were then tested for negative instances, or examples that contradicted the themes, prior to their inclusion in the findings.
<b>Population</b>	Children and young people seeking asylum on their own in the UK
<b>Study dates</b>	Between January and July 2007

<b>Sources of funding</b>	UK Department of Health
<b>Inclusion Criteria</b>	Care Situation unaccompanied children and young people seeking asylum accommodated (or previously accommodated) by local authorities in London.
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> 54 unaccompanied children and young people seeking asylum and accommodated (or previously accommodated) by local authorities in London.</p> <p><b>Mean age (SD)</b> The age range at the time of interview was 11–23 years</p> <p><b>non-white ethnicity</b> seeking asylum from 18 different countries</p> <p><b>Gender</b> 9 girls and young women and 25 boys and young men.</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> The destabilising impact of previous trauma on self: Each story was different; in total 54 girls and boys, young men and women from 18 different countries each having experienced a unique trail of events that had irreversibly transformed their worlds, shaken their identities and launched them into the unknown. At global, national, local and family levels, events conspired to set them on trajectories over which they had no control. Others made decisions for them; others took control over what happened to them; others treated them with kindness or not, in what they believed was in their best interests, or as cargo for which they received a price. This lack of control combined with varying degrees of loss, trauma and upheaval all worked to fundamentally undermine these young people's sense of self and evoke fear about what become of them: "And what happened one day...I was taking a shower outside. Some gun machines [sic] just start...'cos where I was living gun machine you can hear it everywhere, every time. And I didn't know it was happening in my house and I just hide. When it finished, it cool down and everything quiet. I could hear people running up and down. I came inside the room and I find my sister dead, my mum dead and my younger brother was crying there ...and I bite my tongue and I thought I was dreaming. And I catch him [brother] and shake him and say, 'what happened...what happened?'...he couldn't talk." These events turned William's life upside down and things, as he indicated later, would never be the same again. He described being constantly haunted by what happened, chose a vocational training course rather than a more academic one which, he said, would stop him from 'thinking too much'; experienced a chronic sense of detachment from family or community and feared the prospects of being returned to the DRC, having been threatened by his mother's assailants.</p> <p><b>Theme 2</b> Importance of immigration status: Irrespective of the degree of trauma they had experienced, when they were asked about the factors that had made them sad or created difficulties for them, most young people in their late teens identified their immigration status and the consequent uncertainty about the future as their overriding concern. They spoke of being restricted by their lack of status, not receiving any response to their asylum applications for extensive periods of time and having to communicate with the Home Office through their own, third-party, legal representatives. Many had been told that they might have to wait up to five years for a decision from the UK Border Agency with respect to their applications for further leave to remain in the UK. The temporary immigration status of most of these respondents placed them in limbo. Many said they had a persistent sense of uncertainty about what lay ahead, an inability to envisage a future and feelings of having fundamentally no importance in the world. Mesaret aged 18 from</p>

Ethiopia, commented: "Last August I had to apply for exceptional leave as I got two years when I first came. I met my solicitor but the Home Office has still not given me an answer. To be honest, I don't see a future. If I had to go home it'd be horrible. To be here – I can't hope for too much... I am like a beginner in this country. I need to know if they accept me in this country. I have been here for three years but I'm down here [gesturing to the floor]."

### Theme 3

Impact of language and unfamiliarity causing disorientation: they felt frightened, they had no idea what might happen to them, they were unable to read signals in an alien language or express themselves independently without the intervention of an interpreter.

### Theme 4

The impact of asylum seeker label: They recognised early on how being branded 'asylum seekers' fundamentally determined how they were treated. Within the system this label subjected them to continued surveillance and control. Outside of the system it served to differentiate them from citizens and meant that they suffered the pervasive stigma directed at the asylum seeker. Many young people described how this generalised stigma meant they could not be open about who they were, or mention the fact that they were seeking asylum or their past experiences. His inability to sustain a biographical narrative was inextricably linked to the perceptions that others had of them. Hence, their own identities were subsumed by the institutional labels given to them and society's responses to them as the categorised 'other'.

### Theme 5

A range of mental health problems experienced by asylum seekers linked to both previous trauma and immigration status: Young people talked of experiencing a wide spectrum of emotional health difficulties ranging from problems with sleeping and generalised anxiety to acute and chronic depression, attempted suicide and, in some cases, periodic mental illness requiring them to spend time in hospital psychiatric units. While the roots of such difficulties lay in earlier trauma and upheaval, there was little doubt from the analysis of young people's accounts that other uncertainties, most crucially with respect to their immigration status, exacerbated these mental health problems.

### Theme 6

Impact of change in immigration status on deterioration in mental health: Innocent, aged 20 had arrived from Nigeria at the age of 16 and, at the time of interview, reported having persistent mental health difficulties. He had, he said, made several attempts at suicide, had repeated nightmares and managed to sleep barely four hours a night even though he had doubled the recommended dose of his prescription sleeping tablets. He was under the care of a psychiatric team and saw a counsellor on a weekly basis. Innocent drew an unquestionable link between changes in his immigration status and the deterioration in his mental health. On arrival in the UK he was awarded discretionary leave for two years. During that time he described himself doing really well, working under an apprenticeship scheme with a large supermarket chain which taught him new skills, kept him busy and helped him maintain his mental health. At the end of his discretionary leave, however, Innocent entered a period of extended limbo as he waited for the Home Office to consider his application for further leave to remain. He spoke of how, during this time, his mental health took a turn for the worse and reached a crisis point when he was asked to appear in court to defend his application. He was subsequently sectioned under the Mental Health Act (Department of Health 1983) and taken into hospital: "But last year January, it was too much for me, with the Home Office as well. I was doing well, but when the papers ran out and I started going to the Home Office, I didn't know what to do...my plans collapsed. I don't have the heart to carry lots of things more. You don't know when you're going to have your freedom [status]. I don't believe in anything now, 'cos tomorrow they can say you go back."

### Theme 7

Ability to cope with what happened in the past depending largely on how they feel about the future (contingent on immigration status), however their ability to grasp onto opportunities impeded as they moved into the adult immigration and asylum system: young people were highly sceptical of clinical and therapeutic interventions to address past trauma, feeling instead that a sense of coping and wellbeing was better derived from bracketing the past and looking towards the future. Yet while they sought to grasp onto the things that gave them hope and helped them consider prospects and opportunities, they found themselves subjected to tighter restrictions on what they could and could not do. This was particularly the case as they made the transition from child to adult within the immigration and asylum system.

### Theme 8

Learning English as a starting point to order, routine and security: the young people typically described a process through which they began to re-establish order and comprehension in their lives. For many, the starting point was learning English which, they recognised, not only facilitated communication with others but also gave them access to other important social spheres. They described making enormous efforts to learn English, often with no or limited support. "Nasir (from Somalia) had arrived only one year

prior to participating in the research. Unable at first to communicate with others around him, he talked of how he set himself a target of learning five new English words every day, diligently attended all his English for Speakers of Other Language classes and practised his new language skills whenever he could with friends. He commented, 'I don't want to waste my time, so I try to improve my English and try to study hard'. Within a year Nasir's English was good enough to enable him to begin a course in business studies at a local further education college."

### Theme 9

Other benefits of knowing English: On a practical level, a command of English afforded young people more control over issues such as selecting solicitors who they knew would provide a good service, accessing services such as doctors and pharmacists and expanding social networks and developing a social identity. English also provided an entry point to other educational opportunities.

### Theme 10

The importance of college, school, and learning for order routine and security: Importantly, in response to the wider question over what helped them feel well and happy, 'college', 'school', 'learning' were repeatedly named as being among the most positive dimensions of their current lives. Juxtaposed against earlier sporadic and inconsistent educational experiences (see also Hek 2005, Rutter 2006, Sporton et al. 2006), the regularity and predictability of school were fundamental to re-establishing order and routine.

### Theme 11

Importance of college, school, and learning for overcoming past difficulties (as well as other structured activities): when asked how they managed to cope with past difficulties as well as the ongoing stresses in their lives, the respondents frequently cited the importance of education alongside other routines such as attending church, the mosque or the temple or attending weekly youth groups, choirs or volunteer programmes. Over and above providing them with new opportunities, therefore, education and other regular activities provided structure, security and solace. The day to day routinisation (Giddens 1984) of going to school or college, building trust in the professionals and others that they came into contact with and the sense of predictability it afforded helped strengthen the feeling of basic trust that was essential to their ontological security. "College was like a haven for me, you know? A safe haven where I could go and hide. I'd be in the college morning to evening every day. Education provided a smokescreen in a way – that's how I sort of coped with it...until I stood on my feet. That's my way of looking at it...that's my analysis." "For me, the better things that helped me is that I go to college...that help me a lot. I used to concentrate on my study and forget everything. I just want to be someone for me and my son...I don't want to live this life every year. I want to change something in my life. ...When I stay at home, all the thing I think about is family, myself and what I have been through with these problems. But now I have college I think, 'what am I going to do next year? What is my progress now?'"

### Theme 12

Importance of college, school, and learning, for being able to picture a future for themselves, for aspirations, and hope: Education and learning and the multiple pathways they generated also became central to how the young people described their futures. Once engaged in education, they were able to structure the possible trajectory of their prospects. Ali was 13 when he first arrived from Afghanistan. At the age of 15 he was about to complete his GCSEs and go on to a Sixth Form College to study science and maths. From there, he said, he planned to go on to university to study medicine. He was very clear about the meaning that education afforded to his life: "You want to become something in your life. You don't want your life to be like meaningless. That's why you have to get your education...to become something."

### Theme 13

Re-emergence of insecurity as a result of aging in the immigration system (education): On reaching the age of majority in the immigration system, young people's rights to education become less clear and they face difficulties on a number of levels with respect to accessing and sustaining educational opportunities. Maryam, despite doing well in her university studies, described her constant anxiety about whether she would be able to complete her course and the destabilising impact of her uncertain immigration status: "It's really, really stressful. I ask, 'what I am doing this for?' Two months before I graduate, they might ask me to leave the country. You just don't know. It's really horrible. You don't know if you'll be able to live here the day after tomorrow. I don't enjoy thinking about the future at the moment. I just want to take it step by step. Not knowing doesn't make me feel more motivated – it actually puts me off. You think, 'they don't even have to kick me out of the country: it's enough to get an interview just before my finals'."

### Theme 14

Re-emergence of insecurity as a result of aging in the immigration system (mental health): the prospect of deportation to their countries of origin, a real threat for many young people, provoked extreme anxiety. Ibrahim had been obliged to report every month to the Home Office for over three years. Each time he went he faced the possibility of

immediate removal. He commented: "They don't know if they're going to deport me or what. I don't know. I don't understand and I have been here for three years. Every month I am going there and the last time I asked, 'please help me about this, can you please give me information about how long I have to come more? I am coming three years every month'. And they said they don't know."

#### Theme 15

Lack of social ties and connections a prominent concern about returning to country of origin: For those forced to contemplate being returned to their countries of origin, anxieties about not belonging and no longer having social and family ties and connections in their country of origin emerged as a prominent concern. Nadine, aged 18, had left Rwanda at the age of six, having spent many years in refugee camps outside her country of birth before finally arriving in the UK. She recounted a discussion with her solicitor of how she would respond if she were told to return to Rwanda: "I said to him [solicitor], 'if they tell that to me, I will just tell them, I will just hold a gun and I will say, "you know what, you can either shoot me right now or, I don't know, go and put me somewhere in a hole rather than take me to Rwanda. OK?"' Because I have got nothing to go there for'. If they tell me, 'we have found your parents living safely there, they have gone back to their normal way'...oh my God, I will say, 'please take me tomorrow morning'. But telling me they are going to give me money to start a new life...I don't know...'do anything you want but taking me there, no chance'."

#### Theme 16

Improvement in wellbeing after secure immigration status: "For those few young people granted asylum in the UK, the end of the wait had come. They could make plans, had security and could carve out a future for themselves. Azyeb was 12 when she arrived from Eritrea. At the time of the research, six years later, she was applying for permanent citizenship, having passed the citizenship exam. Similarly Asif, 15 and having arrived aged 10 from Afghanistan, had just been granted indefinite leave to remain status and contemplated the fact that within a year 'I can be British basically'. These young people had lost the label and the associated stigma of 'asylum seeker'; they no longer experienced the persistent intrusion of the asylum and immigration system into every aspect of their lives and they were able, with some confidence, to carve out a future for themselves, knowing that they had every chance of accessing the necessary resources to devise and execute a life plan."

	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	No ( <i>Researchers did not state a clear aim of the study</i> )
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Can't tell ( <i>There is no clear discussion about why researchers chose to use the research design outlined in the methods</i> )
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Can't tell ( <i>unclear how participants were selected and no discussion about why the selected participants were the most appropriate to provide access to the type of knowledge sought by the study, no discussion about why some participants chose not to take part.</i> )

Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(Data were collected by what looks like a semi-structured interview; however methods are not justified. No discussion of saturation of data.)</i>
Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(No indication that researchers considered their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
Ethical Issues	Have ethical issues been taken into consideration?	Yes
Data analysis	Was the data analysis sufficiently rigorous?	Yes <i>(thematic analysis was used however, the researcher did not appear to critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
Findings	Is there a clear statement of findings?	Can't tell <i>(No discussion of credibility of findings e.g. triangulation, respondent validation, more than one analyst. Evidence both for and against the researchers arguments were considered )</i>
Research value	How valuable is the research?	The research has some value <i>(Lack of consideration regarding the contribution the study makes to existing knowledge or understanding (e.g. do they consider the findings in relation to current practice or policy, or relevant research-based literature. )</i>
Overall risk of bias and directness	Overall risk of bias	High
	Directness	Partially applicable <i>(data collection occurred prior to 2010)</i>

**Diaz 2019a**

## Study Characteristics

<b>Study type</b>	Semi structured interviews
<b>Aim of study</b>	Explores the perceptions social workers and Independent Review Officers regarding children’s participation in reviews. The paper considers the barriers to young people participating meaningfully in decision making and how practice could be improved in this vital area so that children’s voices are more clearly heard and when possible acted upon by professionals.
<b>Study location</b>	UK
<b>Study setting</b>	One English local authority. This was a large, rural authority characterised by a broad spectrum of deprivation and wealth.
<b>Study methods</b>	Through a purposive sampling method, professionals were recruited who currently worked with children in care, either as social workers or IROs, and who had attended at least one Children in Care review. Data were collected through audio-recorded semi-structured interviews. Specifically, authors were interested in gaining insight into their views about the following research questions: RQ1. To what degree do children and young people meaningfully participate in reviews? RQ2. What are the barriers to participation? RQ3. What can be done to improve children’s and young people’s participation in reviews?
<b>Population</b>	Social Workers and Independent Review Officers
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported

<b>Inclusion Criteria</b>	Time in care worked for at least a year with children in care, currently worked with children in care, either as social workers or IROs, and who had attended at least one CiC review
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size IROs and 11 social workers
<b>Relevant themes</b>	<p><b>Theme 1</b> Barrier - minimal available planning time due to high caseloads and management deadline pressures. A common theme that emerged during the interviews with the IROs and social workers concerned the fact that they were under a great deal of pressure and were struggling to carry out their role as outlined in statutory guidance such as the IRO Handbook (Department for Education and Skills, 2010). Barriers to IROs enabling effective participation of children covered a range of different aspects of the working life and practices of IROs and social workers. Minimal available planning time due to high caseloads and management deadline pressures. High caseloads were an especial challenge highlighted by all IROs and social workers: IRO 3: We've got so many kids coming into care [...] for me, any Child in Care Review, you wing it and if you don't wing it – I know that's awful to say. That's what social work is about. You know, you deal with crises don't you [...]. This notion of "winging it" described above was consistent with how other IROs and social workers described review meetings. A plethora of research has demonstrated that frontline childcare social work can be extremely challenging, not to mention that it is difficult to plan for every single eventuality. However, the above quote also suggests that meetings are responded to in the context of crisis focussed working as opposed to a planned feature of the overall review process. It is reasonable to extrapolate from this that reviews held in an unplanned and ad hoc fashion are likely to present a significant challenge for how far children and young people can actively engage in the review process. All the social workers and IROs expressed that high caseloads had a detrimental impact on their ability to ensure that the child or young person was able to participate in their review in a meaningful manner. This routinely accepted reality of having too much work relates closely to the culture of the profession as often being in a state of crisis. Researcher: Do you think social workers have the time and resources to prepare people for the meetings? IRO 3: No. But I think they could make time and find time to some degree. They're so busy [...] they're so, so, busy, and I don't mean just on the ground but in their heads. They've got so many things they're carrying, so many pressures [...] they're not able to think ahead or plan ahead because everything is on the ground. The IROs interviewed for this study also reported feeling subjected to this bureaucracy. A significant majority acknowledged that some reviews took place without young people even being present so as to meet agency timescales. This meant that the young people would not always attend their review simply because it did not fit with the IRO's or social worker's diary: IRO 3: If there were more time to prepare then IROs would insist on children being present, because you'd have the time to help prepare for that and to meet those around, and social workers would have the time to prepare [...] and plan for it. Researcher: Do reviews ever take place where children just wouldn't be able to attend because of your diary and the social worker's diary? IRO 3: Yeah. Sadly, yes [...]. Within this particular local authority, some review meetings took place without children and young people even being aware that they were happening, because professionals were under such pressure to ensure that they occurred within a set timeframe. One IRO cited an example of a review meeting (to which the young person was invited) taking place on the child's birthday to meet the statutory timescale. As a time-saving measure, several social workers reported that they would combine CiC reviews with Personal Educational Plan meetings at the school: Researcher: Did that seem to work well? SW 1: [...] they can end up being quite long meetings and a child might be more comfortable if it is in their home instead of being dragged out of class, sitting around with however many professionals looking at them and then leaving again [...] I have one boy that very much just thought it was a process and he'd sit there like "great, I've just got to do this".</p> <p><b>Theme 2</b></p>

Barrier - high turnover of social workers and inexperienced staff. Almost all professionals interviewed raised the issue of high turnover of social workers serving as a potential barrier to children's participation in reviews. The interview extract below from IRO 3 illustrates the impact of the inexperience of many of the social workers in this local authority upon how children and young people were prepared for reviews. This was presented as being due, in part, to the social workers themselves not understanding the purpose of the review: IRO 3: I think the challenge is though, a lot of social workers don't really know what to expect from a Child inCare Review [...] So, often the social worker comes to a review and they might not know what to expect so aren't really able to prepare the child, which makes it very difficult then [...] and also we all practice slightly differently, so I think there's an issue about IROs being consistent because we're independent. This quote raises two issues: first, inconsistencies within the IRO team pertaining to the way different IROs manage the process; and, second, less experienced social workers do not always understand the purpose of reviews themselves. This was also noted in the interview with IRO 7: IRO 7: they [social workers] should be talking with them and asking questions [...] that, in my experience, often doesn't happen and so I've been at reviews, sadly, where young people don't know what the plan's going to be, let alone think about things that we need to talk about, so that can make it really, really difficult to have an honest and open discussion. The implication is that if the social worker has not explained to the young person the plan, and in some cases may not even be clear what the care plan is themselves, then there is automatically a significant barrier to fulfilling one of the core purposes of the CiC review, namely, reviewing the care plan, as well as to ensuring that the young person can participate.

### Theme 3

Barrier - lack of understanding and training of professionals in participation - Lack of social workers understanding of children's participation rights and limited training of professionals in enabling children's participation in decision making. One interesting finding from this research was that although IROs, like social workers, recognised how important participation is, IROs had greater awareness of the barriers within current practice. This could be because the IROs were more experienced social care professionals. It may also be because a central tenet of the IRO role is to ensure that all views are heard and considered. A key finding was that despite the recognition of the importance of children's participation in decision making, only one professional interviewed (an IRO) had received any training on participation: IRO 5: I went on some IRO training (name of externally commissioned provider) a few years ago in Manchester, which covered stuff like that [participation][...] the training for IROs is atrocious, I have to say. We used to look as a team for training and find bits and pieces from BAAF or whoever and we'd go on it and we'd think, actually – not being arrogant – but we knew that! This extract reflects the IRO interviewees' experiences of the inadequacy of current provision for IRO training, and in particular the dearth of training on children's participation. All the social workers interviewed agreed that it was very important that children participate meaningfully in their review meetings. However, there was confusion about what this actually meant in practice. Social Worker 8 put forward a definition of participation, which was fairly typical of those provided by other social workers in the study: SW 8: Participation to me just means a group of people all working together for the same goal or achievement. Arguably, this definition of participation more adequately describes inter-agency working, and bears little resemblance to the legal or theoretical definitions of children's participation outlined in the introduction. In terms of Hart's (1992) ladder of participation, children's participation in reviews was most frequently described by social workers implicitly as "tokenistic" or "manipulative." One potential reason for social workers' limited understanding of participation in practice is that none of our respondents had attended any training on participation. In addition to this, there appeared to be a disconnection between the importance social workers attributed to children's participation and how far they actively sought to ensure that children participated in reviews and decision making. Although all 11 social workers interviewed asserted that children's participation in review meetings was extremely important, they also reported that either they or the IRO would make all key decisions regarding the arrangements for the meeting. This may be seen as an example of what Argyris and Schön (1974) identify as a disjunction between "espoused theory" (what professionals say they do) and "theory in use" (what they actually do). Whilst these social workers appeared to view children's participation as important, there was little evidence that their practice ensured that this happened. The reasons for this may be outside social workers' control, in the shape of structural barriers such as heavy workloads and bureaucracy, but there remains a pronounced dissonance between what is espoused and what actually takes place in practice: one social worker acknowledged that in practice children's participation in reviews was often tokenistic: Social worker 6: I think [...] that a lot of what we do can be quite tokenistic. You know, it's one thing going and getting the child's view before the review which is what I've done, but on reflection that's still quite tokenistic. That's a visit to a child with a pre-set of questions for a meeting that isn't going to change it in structure, and the actual issues can be pretty abstract and complex and they are very, very difficult to explain to a child. The social worker here is articulating a view that many of the participants had in this study, namely, they had a paternalistic approach which means that they think that the concepts are too complex for children to understand, and that even if they see the child ahead of the review it will not impact on the agenda, structure or focus of the review. This ties in with a notion that all professionals had which was that "keeping children safe" was more important than upholding their rights to participate meaningfully in decisions made about their lives.

### Theme 4

Barrier - children and young people's negative experiences of reviews and consequent reticence in taking part - children and young people's negative experiences in reviews and ensuing reticence about attending. The IRO Handbook states that the review meeting should be child-centred, i.e. it is the child's meeting and they should be given the opportunity to give their opinions and whenever possible for those opinions to be acted upon. Notably, all the IROs interviewed for this study reported instances of professionals, in particular school

staff and foster carers, using review meetings to chastise, rebuke or shame the young person. The research by Pert et al. (2014) and Dickens et al. (2015) did not highlight this as an issue, although it is mentioned briefly in Thomas' (2002)[2] research. The following interview extracts testify to this problematic practice: IRO 1: Foster carers and teachers will use the review as an opportunity to shame the child by bringing up their bad behaviour. I did a review at a secondary school the other day. The boy is in Year 7[3] with quite a few additional needs and his care plan is complex, but he was on that day facing permanent exclusion and the head had made a decision that he couldn't enter the school that day for his review. That got turned around but then there were about four education representatives and [...] the big male teacher, head of year, he wanted to take us through the whatever, 28 incidents, and he was a tiny little boy, very small for his age with some physical disability, and I could just see him shrivelling up. So, how on earth can that child have a voice in that meeting? And foster carers sometimes will talk about behaviour incidents, I think sometimes to justify or to defend their own position. Overall, the IROs in this study reported that such practices of blaming, shaming or being placed under the spotlight served as a significant barrier to children and young people attending, engaging and participating in reviews: Researcher: What do you think the main things are that lead to good participation from young people in children's care reviews? IRO2: Well, I suppose they've got to feel safe [...] [They] feel like they're under the spotlight. They're being kind of criticised, everyone's talking about them, everyone's looking at them, they're worried about bad things that will be said and so that's the kind of thing which deters young people. Both of these extracts from IROs 1 and 2 outline how these meetings can lead to young people feeling blamed. The organisation VCC (2005) has outlined how stressful, difficult and oppressive a review meeting can be for young people, whilst more recent research found that some teachers had prejudicial views about children in care and that this was borne out in CiC reviews.

### Theme 5

Barrier - structure and process of the review not being child-centred -

### Theme 6

Facilitator - quality of the relationship between the child and professionals - Quality of the relationship between the child and professionals. All the social workers and IROs interviewed agreed that participation in the review process was very important for young people and that a trusting relationship with the social worker and IRO was integral to this: SW 1: It's that child and it's that child's life, so they need to know what's going on and have a say, because it's them that's got to live with it every day. It shouldn't just be a tick-box exercise [...] it's normally done with an IRO, isn't it? So, in the hope that they have the same IRO every year that they can build a relationship with and speak honestly with, because they may have had several changes of social workers. But it's [...] whether that relationship is built with them or it's just another meeting that the child's got to sit in and whether they feel they can speak honestly about it [...] it can only be meaningful if that relationship [with the IRO] is actually there. All participants concurred that the concept of a positive relationship (between the IRO, social worker and child/young person) should be at the heart of meaningful participation but for the reasons explained below it was very difficult for them to build this relationship in practice. As a result of having high caseloads none of the IROs in this study visited children either prior to or between reviews as suggested by the IRO Handbook (Department for Education and Skills, 2010) unless they were in formal dispute with the local authority which was extremely rare. Moreover, they all acknowledged that this had a detrimental impact upon their ability to build and maintain meaningful relationships with young people. Studies of children's participation in decision making suggest that "developing an effective procedure for eliciting children's perspectives and establishing a trusting relationship takes time". Each IRO reported a caseload in the region of 85 children, which is considerably higher than the IRO Handbook recommends (50–70 cases). Six of the eight IROs reported that they did not need long to build rapport with a young person and, in fact, that they were able to do so in just a few minutes prior to a meeting. This appears contrary to research which suggests that it takes a considerable amount of time to build up a trusting relationship with a young person. With respect to this issue, and the fact that they only meet young people twice a year, social workers raised concerns about the ability of IROs to build relationships with young people: SW 1: I wonder whether he would have actually spoken truthfully to his IRO about this, because he took a long time to build a relationship with (me) and a lot of intense direct work.

### Theme 7

Facilitator - the child or young person chairing their own review meeting - The child or young person chairing their own review meeting. Most IROs and social workers spoke positively about their experiences of young people chairing their own reviews, although they also raised some reservations: SW 5: It can go either way, can't it. It can become extremely productive with a really engaged young person. I can think of one or two over the years that would, I think, be really switched on and really actually would have made a lot of professionals maybe buck their ideas up and maybe become a bit more child-focused. I can obviously think of one or two where they might feel it is an opportunity to rub a few people's noses in it and maybe have a bit of fun at everyone else's expense. This view was shared by other social workers and IROs, who also voiced concerns around how far the procedural functions of the review could be carried out in such circumstances. Most social workers spoke positively about young people chairing their own reviews and, indeed, saw it as an effective way through which to increase meaningful participation by young people in the review process: SW 4: I did a Child in Care review about six-months ago where it was

chaired by the young person [...] and he decided how he wanted to do it, and we started off by playing “hangman” to work out what his favourite things were [...] so it was completely different to how a normal Child in Care review would be. My experience would be that when things are calm and settled and straightforward then participation is thought of more. When things are falling apart or in crisis, or we feel like adults need to step in and make those decisions. Although here the social worker acknowledges the importance of participation, it is still deemed to only be realistic if the placement is settled and things are going well. The implication, then, is that participation is a choice ( for professionals), rather than being essential to the functioning and ethos of the process.

## Diaz 2019b

### Study Characteristics

<b>Study type</b>	Semi structured interviews
<b>Aim of study</b>	To consider the extent to which young people in care were encouraged to participate in decision making, particularly in their review meetings
<b>Study location</b>	UK
<b>Study setting</b>	One local authority in England
<b>Study methods</b>	A qualitative research design using semi-structured interviews. Thematic analysis was performed. Unclear if multiple analysts or respondent validation used.
<b>Population</b>	This paper considers the views of seven SMs who were interviewed in relation to their views on children's participation in CiC reviews. The data collected formed part of a wider study into children's participation in reviews whereby ten young people, eleven SWs and eight IROs were also interviewed.
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported
<b>Inclusion Criteria</b>	None reported
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size  Seven senior managers all working within Children's Services at a single agency were interviewed. Their position within the authority ranged from Service Manager up to Director.

<p><b>Relevant themes</b></p>	<p><b>Theme 1</b></p> <p>Relationships between SWs, IROs and children and young people - As part of the broader research, the young participants all highlighted the difficulty of building trusting relationships with their SWs, primarily because of the high turnover of staff. It was noted by many of the young participants that this had impacted on their ability to participate in reviews and they complained about being asked the same questions repeatedly. It is surprising, therefore, that SMs in this study rarely touched on the importance of the SWs' and IROs' relationships with children and young people, the impact of a transient workforce and the challenges SWs faced in having the time to get to know children and young people. Indeed,</p> <p>SM 1 commented:</p> <p>"SM 1: I don't think that's a social work role [engaging the child]. I think that social workers just wouldn't have time to do that, and I think you need a different skill set to do it. I'm not saying all social workers couldn't do it, I'm sure they could if they had time, but I don't really think that's the best use."</p> <p>This quote raises wider questions about what the role of a SW is, if not to engage a child or young person and put them at the heart of their practice.</p> <p>"SM 2: If money wasn't an issue, I would have someone in every team who wouldn't necessarily be a social worker, probably would come from a more youth worker type of background but a person whose role it really is to engage and also to get messages out to young people and to be the owner of that team, someone who is not burdened down with a caseload."</p> <p>This point contradicts the responses from the young participants, who felt that a consistent relationship with the same SW and IRO was helpful and played a key role in assisting them to participate meaningfully in their reviews. Furthermore, it also runs counter to the wider message from research that children and young people would prefer one stable adult professional in their lives rather than a plethora of professionals (Selwyn and Riley 2015).</p>
	<p><b>Theme 2</b></p> <p>High Caseloads - All social workers interviewed raised high caseloads and excessive paperwork has a barrier to effective participation with children and young people. On this subject, there appeared to be a disconnect between social work views and those of senior managers on this issue. An example of this was SM 2's response:</p> <p>"SM 2: Some of our social workers spend an awful lot of time sat in the office doing paperwork, and we hear a lot about that, but we see other social workers who manage to balance that and do a lot more face-to-face work. We have done our own exercises to try and capture how much face-to-face work some of our social workers are doing and we understand there can be a quite significant difference and that doesn't necessarily correlate to having things like up-to-date plans and other bits of paperwork in place...sometimes you will see a lot of recordings. Texts and phone calls are all very important, but they are not an entire substitute for being sat in front of someone."</p> <p>The suggestion is that some SWs would prefer to be in front of the computer rather than spending time with young people. This comment demonstrates a common theme amongst those SM's interviewed. SM's typically placed responsibility for social workers spending so much time in front of a computer upon SW's. None considered that it would be SMs driving front-line staff to keep their paperwork up to date (Munro 2012). In the broader research, one SW stated in her interview that when a child came into care she wanted to spend time with him ensuring that he had settled into placement, but instead her managers put her under pressure to fill out the 21 forms that needed to be completed when a</p>

child comes into care. In this study SMs appeared to be naïve about the realities of SWs having the time to do all of the tasks required. Many of the SWs in this LA had a caseload of over 30 children and those interviewed for this study clearly stated that this impacted on their ability to carry out effective work with children and their families.

When SWs and IROs were asked what they would do if they were “king of the world” and could change one thing to improve children’s participation in reviews they all highlighted more time and lower caseloads. The young participants, too, highlighted the impact of high caseloads on the service that they received and were aware that this meant they could rarely see their SW. By contrast, during the SM interviews this was barely touched upon; more focus was placed on processes and paperwork being completed properly and on time. This evidenced a clear disconnect between the perceptions of SMs and the views of frontline staff and children on the challenges that SWs face in relation to carrying out effective direct practice with children, young people and families. The majority of the SMs suggested that since some SWs managed, in their views, to carry out high quality direct work with families and complete the paperwork in a timely manner, all SWs should be capable of doing this. However, this fails to consider the complexity of the current challenges faced by SWs and the notion that, while some SWs may be able to carry out high quality direct work as well as fulfill the bureaucratic purposes of the role, they are the exception as opposed to the rule (Author’s own and Drewery 2016). It also pays limited attention to the challenges retaining SWs in frontline practice, which has led to the average childcare SW leaving frontline practice within two years of qualifying (Bowyer and Roe 2015). By way of context, the same figure for teachers is 15 years; for nurses it is 16 years, and for doctors it is 25 years (Bowyer and Roe 2015). Indeed, some SWs may be able to maintain their direct work with families alongside their paperwork to an excellent standard over a period of time but given the high turnover of SWs in frontline practice and the profession in general, this points to an inability to sustain this quality practice over longer periods, let alone over an entire career. Frequent changes of SW or infrequent visits are noted to ‘reduce opportunities to hear children’s views and understand their experience’, and in their review of the IRO role in 2013 Ofsted concluded that high caseloads were a significant barrier to IROs carrying out their roles effectively (Ofsted 2013). SM 3 was a notable exception in her recognition of the time pressures on SWs and IROs and the impact on children and young people’s participation:

"Researcher: Do you think social workers have the time and resources to prepare young people properly for Children in Care Reviews?"

SM 3: No, I don't.

Researcher: Any reason why that is?"

SM 3: I think it's because they've just got too much work to do. I'm sure most social workers would want to give more time but I think there's lots of competing demands...I think for real participation it is a very labour intensive, time intensive exercise and you really have to give it space...I don't think caseload ties, workload management really allows and builds in enough time for that to take place properly."

While it is positive that this SM identified the issue, it was notable that, despite their position of authority and responsibility, there was no discussion as to how it was being addressed. As a part of the wider research SWs and IROs also outlined how frequent changes of SWs impacted on the ability of young people to have a meaningful relationship with them.

### Theme 3

A potential culture of blame - Some of the SMs appeared to deflect the responsibility for meaningful participation and child-centred practice on to service users themselves or individual professionals:

"SM 1: I think a lot of the barriers will be young people's perceptions of the system already and what their experiences have been, and some of that may just be anger because they haven't come to terms with it. It may not be that the system has treated them badly but, actually, the system has still interfered in their life and they may have parents in the background that are very angry at the system. Unfortunately the system sometimes doesn't keep its word, it says things and then it doesn't follow through. You know we keep saying to social workers how important it is when they are going to be late, that they do something about that and they make efforts to let people know, just like they would expect

to be told. But I think there is a whole combination of things like that which could so easily undermine the work of saying that we care and we want to listen and all of those messages."

In a similar vein SM 7 commented:

"SM 7: If everybody was great and good at what they do then things tend to function but the barriers will often be around incompetence. Communication – social workers who don't respond to you – it boils down to social work competence practice."

These comments tied in with a general theme from six of the seven SMs that the faults lie with individual SWs and their poor practice, and would appear to suggest that a blame culture potentially exists in this particular LA. The SMs did not reflect on their own role in 'the system' or, indeed, if there was poor practice from an individual, how they were challenging this. Arguably, the blame culture which appeared to potentially exist in the LA research site is likely to impact on practitioners' well-being and their ability to carry out their work effectively with children, young people and their families. This is an issue as child protection practice 'is so highly charged and emotional it is essential that middle and senior managers create a safe context for talking about doubts, uncertainty and the emotional impact of the work. The data suggests that in this LA, SMs were not able or willing to ask themselves this question. The effects of a blame culture being cultivated by SMs cannot be minimised. It has a severely negative impact on practice; indeed, 'the fear of being criticised or blamed for problems encourages practitioners to adopt coping mechanisms such as denial, blame and projection.

#### Theme 4

Senior managers' knowledge and oversight of the review process - One striking finding of this research was that of the seven SMs who were interviewed, only one had been to a CiC review in the last year, five had not been to one in over twenty years, and one SM had never been to a review. Given this lack of attendance at review meetings it is reasonable to assume that this would contribute to the limited understanding and oversight of the review process by the majority of SMs. The response given by SM 3 was typical when they were asked who they think decides who attends the review:

"SM 3: I think that would be in discussion between the social worker and the IRO. I would like to think it also included the views of the young person but I don't know how often that happens.

Researcher: And what about where the review takes place? Who do you think decides that?

SM 3: Probably IRO and social worker but also maybe carer as well. I'd like to think it was the views of the young person but I don't know how often that happens."

When considering whether children and young people are always present at the review, SM 4 commented:

SM 4: I don't know how many young people have to finish school early to have their reviews, I haven't got an answer to that, or whether they're always outside of school. That must be a big challenge to make sure that that is managed."

This comment is noteworthy given the strong emphasis nationally on educational opportunities for CiC. The issue of reviews being in school time – with young people complaining about being called out of class and the lack of privacy – has also been documented in numerous studies. This lack of curiosity is problematic and is suggestive of a lack of understanding by some SMs in relation to children's attendance and participation in essential review meetings. This raises questions about whether and how this issue will be

addressed. In a similar vein, one SM outlined the lack understanding some SMs appeared to have in relation to the fundamental purpose of the review. The point was raised by SM 5 when asked about the agenda for the review:

"SM 5: Well I think the agenda is set by the IROs and there's a fairly standard agenda here which I now understand doesn't include reviewing the care plan. The reason given for that is that we, within the children's services bit aren't following the process of ensuring that the care plan is bang up to date at the point at which the review meeting is held. But I am slightly bemused by this. It's news. I only had this conversation this morning. Because I'd understood - from an off the- cuff comment that one of the service leaders made which was something along the lines of, "We've got all the emphasis on having a good care plan but the review doesn't actually review the care plan." I thought that was the purpose of the review, is the plan the right one? Are we on the right track? And apparently that's not how the agenda's set here. I had a meeting with the IRO Senior Manager this morning and I asked him that. He said, "No we don't. We haven't for years." So I said, "Why is that?" and he said, "Because of all the issues that we've got about the care plan being up to date and the right care plan. So we can't spend the meeting reviewing something that's either out of date or not relevant." When I would have thought that that's exactly what the meeting should do so that if the care plan's not right at the beginning of the review it certainly should be right at the end. But I don't want to take any more battles on really with the IROs at the moment, I'm trying to build bridges."

According to the IRO Handbook (DfES 2010), a central aim of the CiC review is to review the care plan; this SM – who was at a very senior level – is outlining that this is not happening in this LA, and they appear to have no plans to resolve this issue despite holding ultimate responsibility for it. Despite their lack of knowledge about reviews, all seven SMs were aware that children and young people sometimes chaired their own reviews and all were positive about this happening. SM 2's response was typical:

"SM 2: We could help them understand that the reviews are a really great place for their voice to be heard as well, around their progression, around their plan and their opportunity to take control and chair their own reviews at times, which we have seen happen in some of the older ones... We obviously need to try and support that as a service area to make sure we are helping young people to feel confident enough to chair their own reviews and see what we can do to support that side of it. It was interesting that for some of the SMs, who had lengthy careers in the sector, this was not a new idea. Indeed, it was quite concerning that for many of these SMs it appeared that not much had changed or improved; and that that children and young people's views and negative feeling for reviews has not changed much since Thomas and O'Kane's research carried out in 1999.

"Researcher: How effectively do you think we engage young people in their reviews?"

SM 5: Most of my career it was terribly variable. I'd say I went through periods when kids hardly ever went to their reviews 'cos again I think the culture of the organisation was if they don't wanna sit in there they don't have to. So I think it's still very variable and I think our understanding is probably still quite variable about the extent to which children are at the heart and young people are at the heart of their meeting."

This comment again shows a lack of oversight and suggests that there is an acceptance that things are just the way that they are and there are no plans to address these issues. This fatigue towards reform in many respects is unsurprising, as Forrester comments in relation to the countless structure and procedure changes that have been implemented in children's social care: 'Yet, by and large, most of these initiatives seem to have achieved little. Many have actually been counter-productive'.

Similarly, SM 5 relating when they worked in a residential children's home and the young people had decided to chair their own review meetings. They went on to comment:

"SM5: Well, that example that I gave you, that will have been about 28 years ago. Now I don't think we've made progress since then really. That was practice 28 years ago and we're still in a situation where we've got a handful of kids chairing their own meetings."

Theme 5

Senior managers' understanding of participation - The data from this study suggested that the seven SMs in this LA held only a superficial understanding of the term participation and that tokenistic participation was deemed 'good enough'. Given their leadership roles, this is a problematic finding. The following comment from SM 3 illustrates the manner in which participation was considered:

"SM 3: So I suppose the overarching thing is that we want to know and understand what the views of children are and that can be on a personal basis, on a day-to-day social work basis. But it can also be on a service development basis. So there's also an effort to try and get the views of young people when we're making decisions about how we deliver services. And participation for me means that we ask children what their views are, whatever the level, that we ensure that those views are included in the consultation process or whatever it is and then we tell the children what the outcome of that was after. That would be my view of what is participation."

Another example came from SM 5, who showed limited insight into the contradictory nature of their overall response when they were asked what participation meant to them:

"SM 5: It means that children and young people are fully engaged with - if we're talking about participation - with us. Fully engaged in our system. That they've been properly involved in understanding why we're involved, what we're doing, that they've been empowered to express a view about what they want and what their important things are, that they're empowered to express that in different forms."

One SM seemed to have a particularly poor understanding of the meaning of participation and wider concept when they were asked if they had a magic wand and they could do anything to improve children in care reviews their response was as follows:

"SM 4: I'd like to be certain that every professional going to a review understands exactly what they're there for and what their role is. Because if everyone does that then it should be a good experience."

Role clarity, though important, does not in itself does impact necessarily on children's participation in review meetings or wider practice. This answer also highlights that this SM had potentially low expectations of social work practice. It is noteworthy that the SM made no reference to children in their response. The over-focus on the professional and their role is noted by research to be one of the barriers to children engaging with services (Munro 2012). This SM was also asked what was the main message they gave to staff about children's participation and they stated the following:

"SM 4: Erm ... I think, the conversations we've had, or I've had have been this kind of thinking about participation and thinking about direct work of children and the potential difference. So understanding a child's experience, understanding their lived experience - what's it like being them is kind of direct work and listening. Now some teams say that's child participation but I think that's slightly different. At a team day recently young ambassadors were there talking about their experience. That's participation, isn't it? ... So I think it's complex; I don't think it's, and I think in our, in social care maybe that gets mixed up a bit."

This SM describes her experiences coming from a group session at a team day – not something that is embedded into the everyday practice of working with individual children and young people. This appears to be the only direct experience related to participation that SM 4 is involved with. This SM's insight is only facilitated because they attended this team day and saw this presentation. There does not seem to be a clear message coming from SM 4 or their leadership team in relation to children's participation, and they generally demonstrated a lack of understanding about what participation means and what SMs were doing in relation to it – a theme which came through in all of the SM interviews. This said the SM's reference to the young ambassadors giving a talk could be viewed as laying a foundation and developing a culture for future participation.

## Risk of Bias

Section	Question	Answer
Aims of the research	Was there a clear statement of the aims of the research?	Yes
Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
Research Design	Was the research design appropriate to address the aims of the research?	Yes
Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Can't tell <i>(unclear why the participants they selected were the most appropriate to provide access to the type of knowledge sought by the study)</i>
Data collection	Was the data collected in a way that addressed the research issue?	Yes
Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Yes
Ethical Issues	Have ethical issues been taken into consideration?	Yes
Data analysis	Was the data analysis sufficiently rigorous?	Yes
Findings	Is there a clear statement of findings?	Can't tell <i>(Unclear that findings were validated e.g. with use of multiple researchers for analysis or respondent validation)</i>
Research value	How valuable is the research?	The research is valuable
Overall risk of bias and directness	Overall risk of bias	High
	Directness	Directly applicable

### Dodsworth 2013

Study type	Focus Groups
------------	--------------

	<p>Semi structured interviews</p> <p>Evaluation of an intervention Digital Inclusion Team: fostering internet service</p>
<b>Aim of study</b>	<p>To ascertain how far the implementation of the service had:</p> <p>(1) altered, and potentially improved, the way in which social workers and foster-carers communicate with each other and work together;</p> <p>(2) facilitated access by foster-carers to training resources and enabled them to efficiently book training courses online;</p> <p>(3) provided secure file transfer between foster-carers and social workers;</p> <p>(4) given carers greater access to support materials and an extensive online knowledge base that could be expected to improve child outcomes and placement stability;</p> <p>(5) created an ‘online community’ of carers who use the social networking aspects of the site to message each other, share ideas and provide mutual support.</p>
<b>Study location</b>	UK
<b>Study setting</b>	Three authorities in England: a rural county that includes the county town, a city unitary authority and a London borough.
<b>Study methods</b>	Focus group discussions for foster-carers took place after the questionnaire phase of this mixed methods study. A semi-structured interview schedule was used, with participants encouraged to engage in a wide-ranging discussion of the issues raised. Separate focus groups were held with social workers. Focus group discussions were, with the participants’ permission, recorded, transcribed and analysed using Nvivo. No information about the method of thematic analysis was reported.
<b>Population</b>	foster carers and social workers

<b>Study dates</b>	2009
<b>Sources of funding</b>	The funding for the original project came from the Digital Inclusion Team (a delivery body funded by the Department for Communities and Local Government/City of London).
<b>Inclusion Criteria</b>	None reported
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size 27 foster carers and eighteen social workers
<b>Relevant themes</b>	<p><b>Theme 1</b> Computer technology intimidating: While it would appear that the technology is not, in itself, a barrier to the use of the specialist fostering internet service, individual foster-carers did admit in the focus group to finding computer technology intimidating: "To me this computer I've got is like a monster in the corner. I'm afraid of it and I won't go on it, because just the thought of switching it on is quite scary."</p> <p><b>Theme 2</b> Impersnal nature of computer communication: "I'm not a computer person, and I don't think that's what fostering is about."</p> <p><b>Theme 3</b> for many, the provision of an adapted specialised and accessible resource made good use of existing skills, habits and interests. For the fostering internet site to be of benefit, that enthusiasm needs to be harnessed and skills improved by the provision of sufficient training and additional support in using computer technology for a wide range of professional tasks.</p> <p><b>Theme 4</b> Usefulness of initial training: The subject of initial training and the adequacy of ongoing support to use the system generated much discussion in the foster-carers' focus groups. In one authority, the perception of some carers was that they 'never got any training'. In the second authority, there had been personal home visits to install computers and give start-up advice. However helpful this had been, and there were many complimentary comments, the view was that the brief one-off introductory session was insufficient, at times inconvenient, and that further formal training was needed. In the third authority, training took place primarily in group settings in libraries, with a back-up mentoring system of training coaches. Given the number of carers in that authority, attendance at the sessions was not comprehensive and views were mixed on how effective these sessions had been.</p> <p><b>Theme 5</b> Internet service to facilitate communication between carer and social worker: In all three authorities, focus group discussion centred mainly on how foster-carers and social workers communicate with each other. Fostercarers were aware that social workers 'check e-mails first thing', whilst text messages were perceived to yield a response, as</p>

'people can't ignore a text'. Carers felt that social workers were too busy, that the new internet service had not yet become a normal part of social workers' working practice and that too few staff used the service to make it an accepted, and thereby viable, method of communication: "It's a positive thing, but if the supervising social worker and social teams aren't using it that's the big stumbling block we've got to overcome."

#### Theme 6

Preference for telephone or email contact particularly if the matter was urgent: Fostering social workers and managers also preferred telephone or e-mail contact with the carers they supervised, particularly if the matter was urgent and it was vital to know the message had been received: "It's replaced the telephone to an extent. If it's urgent it's still the telephone or (they) ring your mobile and get you, but if it isn't . . . then I've got one or two who would just put it on (the website)."

#### Theme 7

Importance of face to face contact: "There's something about working with people; there's a lot to be gained by doing so face to face with them. We're going to gain a lot more from our foster-carers in return. If we got into too much of an electronic exchange it's too alienating. It can support what we do but it can't replace it."

#### Theme 8

Web service as a method of facilitating communication between foster carers: Focus group discussions with social workers indicated that their initial perceptions were that the online service had been developed primarily for foster-carers. It was expected to enable an exchange of experiences, views and questions between foster-carers who were facing similar situations and challenges, and provide links between individuals, of particular value to those who did not know any or many other foster-carers, or who lived in isolated areas: "If foster-carers are contacting each other for support on it then that's brilliant, it is, to coin a phrase, 'the point of it'. It was networking foster-carers together so they could actually talk to each other, such as Facebook but a more secure site, a more professional site." Those foster-carers who had contacted other carers did so to arrange car shares, suggest excursions, discuss paperwork, fostering standards and training courses, share their experiences of their child's behaviour and problems, 'off load' after a bad day, exchange ideas, seek or offer support and chat. "I'd love to develop contacts; swap stories, share advice, meet (support, grumble, laugh, cry) . . . Internet's so convenient; you can send a message late at night, while you snatch lunch etc. and the recipient can reply when it's convenient to them."

#### Theme 9

dedicated site useful for confidentiality: While the use of the website for communicating with other carers was fairly limited, this aspect was used and liked by a small number of individuals. Some reported that they appreciated the confidential nature of the dedicated site, comparing it favourably to Facebook, whose public nature could pose problems: "It's safer than a Facebook system I'd say. Parents track down foster-carers (through Facebook), where they live, and that's worrying."

#### Theme 10

Lack of immediate response or knowledge that message had been received: Reported drawbacks included not knowing whether messages had been looked at, particularly problematic if a quick response were needed. In general, carers said that they preferred more personal contact, and mentioned mobile phones, meeting outside school, meals out and meeting at fostering support groups: "To come in and see face to face, I prefer that. To me that's more a way of socialising. Younger people socialise a lot and seem to believe a lot in the virtual world, but I prefer to see people."

#### Theme 11

Use of internet service for booking foster carer training sessions: Foster-carers need to communicate with their local authority fostering service in order to book foster-carer training courses. The ability to book training courses via the purpose-designed pages within this website had been a key selling point for this service and the first facility within it to become widely used in all three authorities. Moreover, there was an intention that, in the future, training courses would only be bookable online: "I've really loved being able to book the training, it's a lot of time saved. Gives an instant picture of training courses available and whether there are any places left."

#### Theme 12

Use of internet service for transferring daily log records: A further dimension of foster-carer/social worker communication concerned the transfer of documentation, particularly the daily record of the child. It had been envisaged that the website would allow for the electronic keeping and transmission of the daily records, or log, which the foster-carer writes. This had begun to occur in one of the three authorities: "I've started using it recently; I've had the paperwork on line. Often in the evening I check my e-mails, so it's easy just to

log on and do your diary as well. It's quite useful for that because it gave me access to my supervising social worker. It should be accessed by the child's social worker, but she can't work out how to do it." "I'm getting so much paper, so to do it electronically, yes definitely . . . . If encrypted and secure it will be fine; a plus point if it speeds up communication." But perceived concerns around confidentiality were often the bar to wider use of the electronic log transfer facility. One foster-carer admitted that, while she kept her log on the computer, she submitted it by post: "I'm a bit worried about the security of it. I do type it in, and print it out at the end of the month and then delete that file. That way nobody can access it."

### Theme 13

Accessibility of the internet service: The internet could be expected to provide a significant resource to fostercarers, with the specialist online service acting as a portal, providing assurance as to the quality or veracity of the information it linked to. Additionally, the internet is accessible twenty-four hours per day, when other sources of information or support, such as help lines, might be unavailable.

### Theme 14

Use of discussion boards on the internet service: Discussions had rarely been generated and sustained. One example in which it had been was mentioned by a manager in a social worker focus group: "Last summer when we were consulting on the new proposals, (the site) really came into its own just for a few days, and to my detriment unfortunately! . . . because one carer started a debate on it about something they disagreed with, and another foster-carer contributed and I responded in some depth. I was hoping that it would spark it off as a medium for debate on other specific issues; unfortunately it hasn't happened since. I think we have to encourage foster-carers to have more general discussion. It might be quite heated and sometimes it will be critical but we have to give them the message that if you are going to say something you are going to have to justify it, and it has got to be appropriately said." These quotations indicate emerging threads of awareness and discourse on the potential for the technology to change aspects of the power balance between social workers and foster-carers and an awareness of the need to embrace the changes, but some trepidation about doing so. Equally, however, as some of the quotations below indicate, there was also some resistance to changes in what fostering was perceived to be about.

### Theme 15

"professionalisation of foster caring": The professional identity and status of foster-carers were discussed by both foster-carers and fostering staff. Some carers stated that they had been attracted to the job because they liked children and that an overemphasis on standards and qualifications, or a requirement to become IT proficient in order to foster well, could act as impediments: "For me most foster-carers are hands on people. It's not (about) tweeting. I think the difficulty with the NVQ etc. is that a lot of people who come into fostering want to look after children, funnily enough. Sometimes they're not academic, they don't want to go down that route; they just want to look after these children. Standards are crucial, but we need more foster-carers. I think we're going to have an even smaller pot of people prepared to become foster-carers. There are people who the thought of doing any sort of paperwork at all is going to put them off." Other foster-carers, however, were willing to use all the resources, including IT resources, available to them to foster as effectively as possible: "Using computers should be part of the training, part of the induction as a foster-carer, so that it becomes obvious it is part of the role. I think it (fostering) should be seen as a more professional standing. Some managers will view us as professionals, but some won't."

### Theme 16

Social worker perceived need for the internet service: "One social worker questioned the need for carers to become proficient on the new internet service, commenting that: "Carers that have got the little ones are just exhausted and they should just be left, because what we want them to do primarily is provide good care for children, not going on to (the website). Would that improve outcomes for children? I'm not really sure." In general, however, fostering practitioners thought it important that carers became more adept at using computer systems and the internet: " They (foster-carers) have to take some responsibility on being able to receive information, because gone are the days where we can tie up the whole admin team sending out a mail shot to 260 households every time. Carers who are very reluctant to use any form of IT are disadvantaging children's placements, so we need to find a legitimate way of challenging that and continue to challenge it. We have carers who still find it very difficult to record in this day and age."

### Theme 17

Fears of encouraging "horizontal" exchange of information and views: the 'horizontal' exchange of information and views between those engaged in fostering, which computer-assisted technology encourages, and the potential for increased foster-carer knowledge and participation may, on occasions, appear threatening to social workers, some of whom might feel less competent technologically than some foster-carers. This potential change of dynamics between carers and social workers was alluded to by two social workers, in the focus group discussions: "We'll be in a funny situation of carers knowing more about what they're supposed to be doing in terms of (the website) than their

supervisors. We could get to the point where foster-carers would have a sense of ownership, and be pushing to develop it, and could be telling us how to be using it. That's a scenario that's a little scary. We are really holding back from empowering carers because we don't want them to really take over this communication."

**Theme 18**

Inclusion of foster parents as professionals through technology: a fostering manager expressed the view that: "This (online) community gives carers a chance to communicate . . . feel they belong to a professional community who understand what they are doing. From there hopefully there will be better corporate parenting and better experiences for children, because they are being cared for by a more professional group."

**Theme 19**

Internet services as the "way of the future": Some practitioners suggested that the next generation of foster-carers would be more receptive to new ways of working and that: "The new people that are coming through are foster-carers who are prepared to use the internet and want to record things regularly and are happy to be engaged in conversations and will even send you a text. All contemporary ways of living and that's what you want from your foster-carers."

	<b>Section</b>	<b>Question</b>	<b>Answer</b>
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Can't tell <i>(researchers do not appear to have justified their research design or how they decided which method to use. )</i>
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Can't tell <i>(no in-depth discussion about how participants were selected for the focus groups, or why some people chose not to take part. )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Can't tell <i>(researchers have not justified the setting for data collection; have not justified the method used for interviews; researcher has not discussed saturation of data)</i>

	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(not clear that researcher examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Can't tell <i>(unclear how analysis was performed or if there was sufficient data to support the findings; unclear if researchers critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	Can't tell <i>(no discussion of credibility of findings: e.g. triangulation, respondent validation, more than one analyst)</i>
	Research value	How valuable is the research?	The research has some value <i>(no discussion of generalisability )</i>
	Overall risk of bias and directness	Overall risk of bias	High
		Directness	Partially applicable <i>(data collection occurred prior to 2010)</i>

**Evans 2016**

<b>Study type</b>	Focus Groups
-------------------	--------------

	<p>Semi structured interviews</p> <p>Evaluation of an intervention a range of interventions highlighted in the Evans review</p>
<b>Aim of study</b>	to explore the acceptability of the theory of change and delivery mechanisms associated with educational interventions already subjected to evaluation and potentially in routine practice
<b>Study location</b>	UK
<b>Study setting</b>	Wales. Participants were purposively sampled through The Fostering Network, a non-governmental organization that aims to promote and support the participation of care-experienced children and young people in social care policy and practice.
<b>Study methods</b>	The sample size allowed for theoretical saturation to be reached. Focus groups were used with semi-structured interviewing. Focus group centered on brief vignettes depicting the hypothetical participation of a care-experienced child or young person in one of the interventions. Each vignette outlined: participant demographics; the context of the participant's recruitment; delivery mechanisms, including delivery agent, setting and point of intervention; postulated outcomes. Creative methods were integrated into the groups in order to facilitate discussion by making interventions less abstract for participants by providing some concrete visual stimuli. These included examples of intervention activities (e.g. behaviour charts and book parcels) and a range of drawing and writing materials. Focus groups were recorded with use of a digital audio recording device and transcribed verbatim. Thematic analysis was conducted. A subset of the data was indexed and coded by two members of the research team. Discrepancies in coding were resolved through discussion. Themes were developed through the process of constant comparison. Two researchers independently constructed themes. The research team read the data, agreed on the interpretation and refined the themes.
<b>Population</b>	Looked after children and young people or those with prior experience of being in care and education
<b>Study dates</b>	June and July 2015

<b>Sources of funding</b>	Welsh Government
<b>Inclusion Criteria</b>	<p><b>Care Situation</b> urrently living in local authority care or prior experience of being in care</p> <p><b>Education</b> involvement in mainstream or nonmainstream, alternative educational placements (e.g. Pupil Referral Units);</p>
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> Twenty-six young people</p> <p><b>Type of care</b> Participants had resided in foster care (n = 25), kinship care (n = 4), and residential care (n = 13).</p> <p><b>Gender</b> Fifteen participants were male and 11 were female.</p> <p><b>Number of previous placements</b> Twenty- five of the participants had experienced multiple placement moves across the range of care types, with the number of placements ranging from four to 24.</p> <p><b>Age</b> Participants were aged 16– 27 years old. The median age was 18, and 22 of the participants were aged 21 or younger.</p> <p><b>Education</b> All participants had lived in local authority care and attended mainstream school.</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> Attachment problems and dearth of meaningful relationships at the root of educational disadvantage for children and young people in care: They spoke of the importance of relationships with primary care givers in supporting educational development, with some individuals noting how the absence of such relationships had inhibited their social, emotional and educational progress: "...because of my learning difficulties and I always used to have books andWhere'sWally? Andmy carers used to read them, letme read them, and then I had to summarize the whole book, and then that helped me with English...We had. A drama piece, like a drama book and we did... act it. [Participant M01] ...at 16 I am, Iwas, and probablymy emotional and behavioural level or social, the social side of it was below, was below that level anyway. [Participant M02]"</p> <p><b>Theme 2</b> Relational learning could be aided through a "properly applied" letterbox-type intervention: From such discussions arose a notable preference for the Letterbox Club,with the reported aspects of acceptability reiterating the reasons offered by Mooney et al. (2016) for the intervention's lack of effect. Evaluation concluded that for book-gifting programs to have impact they need to focus on encouraging direct involvement by foster carers in shared literacy activities with children and young people. Participants in the present study</p>

felt the key underpinning mechanism of change for the Letterbox Club was the facilitation of better relationships between foster carers and children, which would provide support for learning: "Its bonding, you knows, it shows the foster carer what you weaknesses are so maybe they can give you a bit more help. [Participant F01]"

### Theme 3

Inclusion of games and interactive activities to consolidate relationships in younger children: Inclusion of games and other interactive activities were considered to be particularly important in consolidating relationships with younger children, as 'a child is going to want to sit there and play and color with his [foster] mum and stuff' (Participant F02)

### Theme 4

Letterbox - receipt of parcels would make them feel special or worthy within a system where they often felt to be a burden. This led to suggestion of inclusion of other significant items, such as memory boxes or teddy bears, which would serve to develop additional positive attachments.

### Theme 5

Ongoing intervention to support development of social and emotional competencies to remove a key barrier to educational engagement and achievement: Ongoing intervention to support development of social and emotional competencies were considered to be vital to participants, with the home-based counselling offered by Fostering Individualized Assistance Program (FIAP) being cited as an exemplar (Clark et al., 1998). Possession of these competencies were seen to remove a vital barrier to educational engagement and achievement: "...they're encouraging educational, social and emotional development of the children, that's what it says that they're doing. I mean if the kid is struggling socially in school their schoolwork is suffering, that's pretty much a fact isn't it? [Participant M03]" HOWEVER Despite preference for interventions focusing on social and emotional competencies and relationship development, a number of participants did warn against approaches privileging these outcomes at the expense of educational attainment, thus suggesting academic measures should serve as the primary outcome: "People tend to focus on behaviour instead of education, it's like we will fix their behaviour and then we'll give them an education. It doesn't work, it's got to go at the same time. Because what happens is youngsters lose chunks of their education because people are trying to fix their behaviour and then they know that type of thing, that doesn't really you don't get anywhere for the kid. [Participant M02]"

### Theme 6

Concerns about being overly focused on behaviour change: participants rejected approaches that constructed them as a problem in need of solving, indicating a desire to move beyond medicalized models that utilized clinical sounding vernacular, such as Fostering Individualized Assistance Program (Clark et al., 1998) and Multi-dimensional Treatment Foster Care (Leve & Chamberlain, 2007; Green et al., 2014). One young person maintained that the names of these interventions made them feel as though they were 'suffering from a disability' (Participant F03). With particular regard to the latter program, which employed a points system to monitor good and bad behaviours, one participant claimed 'I'm not a dog, it sounds like they are training a dog' (Participant F04).

### Theme 7

Inadequate focus in many of the interventions on the major issue of care and school placement instability: Beyond discussion of the strengths and weaknesses associated with interventions' underpinning theory of change, participants' explored elements that the interventions had largely failed to address. They felt that the interventions considered did not sufficiently address the structural determinants of educational disadvantage. Firstly, was an inadequate focus on instability in care and school placements: "I'd say that the most important thing is to make sure that there is stability in the young person's life because moving around a lot affects their education... I think there should be something in a young person's life that stays the same so whether that be the social worker, or the school, or the placement. [Participant M04] Yeah I found obviously moving around schools a lot, because I moved from Wales to England and it was like during that transition of like for a year I was out of education so I was playing a catch-up game, always like right the way up through school until I left, I was always trying to catch up. [Participant F05] The dream would be that you only ever have two schools, like everybody else. [Participant F06]" Therefore, whilst interventions to enhance the relationships between carers or care system professionals and children and young people were deemed necessary, there also needs to be a focus on improving the stability of these relationships.

### Theme 8

Interventions had too low aspirations for looked after children: participants noted the failure of interventions to address entrenched discourses around the educational capacities and aspirations of children and young people in care, namely a dominant expectation that care-experienced individuals had lower academic ability: "They had expectations that basically I was going to become a thick shit. [Participant F07] Some teachers were like openly against us. You know they were like 'oh there's no point like trying with them sort of thing'.... I think sometimes young people in care do get a bad rep. You know the teachers are told this young person is in foster care or residential, 'ooh care kid, trouble maker'.

[Participant F05] I think if you're not challenged enough as a person just because of you being in care... you go to school and you know and everyone will pull you to the side and say are you ok and blah blah blah. [Participant F08]"

#### Theme 9

High degree of acceptability for educational specialists to act as advocates for educational rights of individuals in care: was a notably high degree of acceptability for education specialists, who advocate for the educational rights of individuals in care when social workers are unable to resolve difficulties (Zetlin et al., 2004). Participants felt that an independent authority figure would be extremely beneficial in ensuring that a young person was enrolled in school, received the necessary resources to complete their education, and that the educational environment was conducive to their learning needs. As one participant commented, 'sometimes it takes, literally sometimes it takes someone threatening legal action for people to pull their fingers out' (Participant M03).

#### Theme 10

A lack of resources, particularly in the care placement: participants acknowledged the lack of financial resources afforded to children and young people in care, which may not only restrict the funding of interventions but would prevent sufficient investment in their education, thus ensuring their continued disadvantage. Although not a universal statement, a number of young people commented on their inability to achieve in line with peers due to their limited access to computers, lap-tops, and internet facilities within their care placement: "I wasn't able to use my own [lap top] in the care home because obviously there was no Wi-Fi or anything like that. [Participant M05]"

#### Theme 11

Lack of resources more broadly: Others noted an awareness of the cost implications of resources in times of austerity 'when we're supposed to be spending less' (Participant F09). Participants shared anecdotes of witnessing arguments over the funding of educational resources, particularly when they had moved across local educational boundaries: "If you are removed out of county then one county will argue with another county about who pays for transport, who pays for schooling, who pays for food, who pays for everything. That has something to do with your education. And they do, they can be, councils are just like no that's your problem, no that's your problem, palming young people off sort of thing and it's just really unpleasant. [Participant M06]"

#### Theme 12

Importance of intervention delivery agent (not adding more!): Participants reported the delivery agent as being the most important criteria against which intervention acceptability was assessed. In general young people were disinclined to partake in interventions involving the introduction of additional care system professionals. Indeed, professionals were already thought to be omnipresent, and as a result, programs such as the Fostering Individual Assistance Program, which provided clinical program specialists in the development of tailored wraparound services (Clark et al., 1998), were seen as excessively increasing the number of professionals in young people's lives: "There is enough meetings and stuff that go on with kids... Don't want another person coming and telling you to say 'look you've got to do this, you've got to do that... [It is] what's wrong with him but it's just here we go again, another person in a suit, another bureaucrat. [Participant, M02]"

#### Theme 13

The problem with introducing yet another transient relationship: "Participants further expressed caution about external intervention potentially contributing to the problem of transient relationships experienced by young people in care, especially where they are delivered for a fixed duration: "Nine months is a long time for a child to have someone in their life and spending that much amount hours with them. And then just suddenly be like right that's it now, good bye. It's going to be really hard for a child to accept after everything they've been through obviously. So it's going to be really hard that is... Because I still struggle with that now. My [social worker] has just left me and I broke my heart because she was with me 18 months I think it was and I actually broke my heart, knowing that I will never see her again. [Participant F10]" In response to these concerns, participants highlighted the necessity of stipulating the duration of an intervention in advance and ensuring young people know the relationship is time limited, whilst ensuring that this does not compromise its authenticity or meaningfulness.

#### Theme 14

Need for educational advocates: There was nuance within young people's perceptions of professionals however, with delineation of those whose practices were informed by principles of transparency and co-production and those whose were not. In particular, participants indicated support for the intervention that provided educational specialists charged with advocating for children's rights within the educational system (Zetlin et al., 2004). These individuals were considered to prioritize the views and perspectives of those in care, rather than making decisions on their behalf. Thus the intervention was valued for respecting children's rights and privileging their voice.

**Theme 15**

Preference for carer-delivered interventions: Participants preferred interventions delivered by their carer. The reasons for this were threefold. Firstly, intervention could serve to improve the relationship between the carer and the young person, thus facilitating the 'normal' parent-child relationship that those not in care may enjoy. This was considered to increase parity between care-experienced and non-care-experienced individuals: "It's being a normal parent really isn't it? It's what they basically are. If you had children you would sit down with them and help them with their homework so why can't foster carers?"

**Theme 16**

Preference for carer delivered interventions: Secondly, intervention delivery by carers was thought to provide an opportunity to form positive attachments. In particular, engagement in informal activities within these healthy relationships could offer a supportive and safe environment where more formalized educational learning can then be effectively delivered: "...it's challenging them [individuals in foster care] because they're learning how to bake, but they're also learning how to do numbers, and they're also learning like with the colouring stuff. It's like number games and counting games and stuff so you can help them with their maths and whatever else. [Participant F10]"

**Theme 17**

Preference for carer delivered interventions: Thirdly, the provision of specialist training to foster carers, as in Teach Your Children Well (Flynn et al., 2011; Flynn et al., 2012; Marquis, 2013), was considered to address instances where carers were too busy or unwilling to support education within the home, or lacked the necessary skills to do so: "Yeah they did sit there and they did like give me time and they did like try and help me but they, I knew that they couldn't. RE [religious education] they had even less clue about. [Participant F09]"

**Theme 18**

Preference for care rather than school setting for interventions: Intersecting with discussions pertaining to delivery agents were concerns regarding the delivery setting. Interventions were predominantly provided within the school or care setting, with discussion indicating preference for the latter. A number of participants expressed their reticence to receive interventions within the school context. Their status as being in care had already served to demarcate them as different, and enrolment in educational interventions or engagement with professionals only served to further exacerbate this sense of difference: "...you've got people making fun of you and stuff because you know they're giving you extra support for no need. [Participant F08] ...it's singling me out and its making me seem special when I'm not, I'm a normal person. [Participant M07]"

**Theme 19**

Don't like being singled out: As an extension of these concerns about being constructed as different, many participants indicated a preference for universal rather than indicated intervention approaches: "We don't like being singled out as individuals, as care leavers, we always make that big point that we want to be treated the same as others, so this is where we need to be treated the same as others, do you get that? ... It should be for like all kids, not just looked after children. [Participant F03] This education liaison officer and the rules should be apply to any young person, or any child rather than just looked after kids. [Participant F03]"

**Theme 20**

Fears that transition in to school programs such as Kids in Transition to School would be stigmatizing, wraparound services better: in resonance with the broader literature on the unintended harms of targeted interventions (Evans et al., 2014), participants felt that programs such as in Kids in Transition to School, which delivers skills training to children in care as they enter into kindergarten (Pears et al., 2013), would be stigmatizing. There was concern that conferral of the label of 'at risk' of educational failure at commencement of a child's educational journey could lead to a self-fulfilling prophecy whereby it diminished children's expectations for their future educational attainment. In contrast to interventions exclusively targeted at those in care, many participants found the Head Start program, which is a wraparound set of services intended to support disadvantaged pre-school aged children (Lipscomb et al., 2013), to be highly acceptable: "This program is for everybody, which I think is good because it's not just focused around young people in care. [Participant F11]"

**Theme 21**

Appreciation of interventions which afforded the opportunity to spend time with peers: Yet despite wanting to avoid overt targeting of individuals in care, participants appreciated interventions that afforded the opportunity to spend time with other young people who were care-experienced as these peers could offer support in ways that professionals or

individuals not in care could not. Indeed, one participant cited the study's focus group as potentially being a beneficial intervention composition due to the opportunities to discuss the structural factors associated with the educational disadvantage they experience, which allowed them to avoid any deficit-modelling and understand their position as being someone in care: "I'd say it's more the idea that you get to see other people in the same position. Because that's what's valuable, this is the reason why I came here because I thought you know it would be nice to see other people that are in the same position. [Participant M08]"

**Theme 22**

Preference for group level interventions which allow for relationship building: Regardless of the composition of interventions, and whether they comprised peers who are or are not in care, participants were keen to emphasize the importance of group-level rather than individual-level interventions. This was primarily due to opportunities for relational development, which they saw as being important due to citing the enhancement of social and emotional competencies as a key theory of change for interventions. Foster Healthy Futures, which a group-based approach informed by the evidence-based PATHS curriculum and Second Step approach (Taussig & Culhane, 2010; Taussig, Culhane, & Hettleman, 2007; Taussig, Culhane, Garrido, Knudtson, & Petrenko, 2012), was particularly popular due the opportunities to forge new healthy relationships: "...it helps to learn how to interact with people because that helps your emotions a lot because it teaches you to talk to people and stuff. [Participant F10] ...it creates bonds like you'd be surprised how not many young people sit down and have a meal together you know...I didn't do that when I was in a children's home, never ate together. [Participant M09]"

<b>Risk of Bias</b>	<b>Section</b>	<b>Question</b>	<b>Answer</b>
	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes <i>(However, no discussion about why some chose not to take part)</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Yes
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Yes
	Ethical Issues	Have ethical issues been taken into consideration?	Yes

	Data analysis	Was the data analysis sufficiently rigorous?	Yes
	Findings	Is there a clear statement of findings?	Yes
	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	Low
		Directness	Directly applicable

### Fargas-Malet 2018

<b>Study type</b>	Focus Groups Semi structured interviews
<b>Aim of study</b>	To outline the health problems of children and young people in care in Northern Ireland, and to explore how their health needs were being addressed.
<b>Study location</b>	UK
<b>Study setting</b>	Northern Ireland
<b>Study methods</b>	Authors asked the HSC Trusts to identify social work managers, senior practitioners and senior social workers for looked after children, fostering and residential services who would have particular experience in relation to meeting the health needs of looked after children. The focus group interview was designed to ascertain participants' views on how

	<p>the HSC Trusts were meeting the health needs of children and young people in care, what facilitated or obstructed implementation, gaps in service provision and suggestions on how to make things better. Carers of 10 per cent of all 2,500 children and young people in care in Northern Ireland were also interviewed over the phone. This interview involved the collection of quantitative and qualitative data. It lasted approximately forty-five minutes and included questions regarding: (i) the medical information they received when the child/young person was placed with them (including historical health information); (ii) their perception of the child/young person's health needs; (iii) the impact of past and current assessments to attend these needs; and (iv) any other health services they were given. Authors interviewed twenty-five young people, who agreed to be interviewed. Two researchers went to their homes to carry out the face-to-face interview. They asked the young people about their understanding of their health and their experience of help-seeking and supports. All interviews (with practitioners, carers and young people) were digitally recorded, transcribed and analysed using content analysis. Authors scrutinised the transcriptions for recurring themes, and identified and developed detailed codes, which were input in Excel sheets.</p>
<b>Population</b>	social work managers, senior practitioners and senior social workers for looked after children, foster carers, and looked after children
<b>Study dates</b>	August 2013
<b>Sources of funding</b>	Office of the First Minister and Deputy First Minister in Northern Ireland
<b>Inclusion Criteria</b>	Care Situation children and young people in care
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size 233 telephone interviews with carers (foster, kinship and residential); twenty-five semistructured interviews with young people; and multidisciplinary focus group interviews with professionals across the HSC Trusts.

<b>Relevant themes</b>	<p><b>Theme 1</b> prevalence of mental health problems: Participants highlighted the prevalence of mental health difficulties, in addition to alcohol and drug abuse, for children and young people in care, especially for those in residential care, but also for those in the older age groups, who were about to leave care.</p>
	<p><b>Theme 2</b> Attribution of improved mental health to relationships: Half of the young people recalled a time when they were feeling not as well as in the present, some of whom had experienced serious mental health problems (e.g. suicidal feelings, depression, selfharming, etc.). Young people attributed these positive changes in their mental health to their new situations and their supportive relationships, having grown up or the support offered by particular formal services. Four young people were still struggling with their mental health. For instance, Nina had taken two overdoes recently and described her mental health as 'not good'; and Anna was deeply affected by guilt because of the way she entered care, and had a difficult relationship with her mother and grandmother. She had also overdosed and had been self-harming, but felt she was working through her issues and was on the path to recovery.</p>
	<p><b>Theme 3</b> Difficulty engaging young people in addiction and mental health services: Professionals, carers and the young people themselves highlighted the difficulties in engaging young people in mental health and addiction services. Social work practitioners emphasised young people's lack of engagement with services as one of the factors or challenges hindering their capacity to meet the health needs of children and young people in care: "I think there are services out there but it's just the young people are not engaging because of the culture that they're in, but once they do start engaging you know it's working for them, so . . . there are a lot of good services . . . a lot of it is down to their involvement and engagement (Focus Group—FG1)."</p>
	<p><b>Theme 4</b> Lack of willingness or ability to "open up": Some carers drew attention to young people finding it difficult to talk to somebody about their mental health. Sometimes, they stated that children and young people found it hard to talk about their feelings and their past, and they believed in the need for these young people to 'open up' to somebody they felt comfortable with. Some carers were also concerned that the young people, whom they cared for and had been 'emotionally damaged', refused professional help. They also felt there was a lack of effort made to encourage young people to engage with these services.</p>
	<p><b>Theme 5</b> Opening up about mental health problems (young people perspective): the majority were able to seek help and talk to significant others (especially their families and carers) when they were not feeling mentally well, one-third did not feel capable of talking about mental health difficulties with others, largely due to the stigma associated with that. These young people spoke of feelings of embarrassment, insecurity or guilt. Some understated the importance of feeling mentally unwell, arguing that it was something that eventually goes away. Two believed they never felt mentally unwell: "I usually wouldn't tell anyone about mental health issues because it's triggered by a lot of guilt, . . . if I knew something was up and something was bad then yeah I would definitely tell them, but usually I just kind of deal with it myself because it passes, so usually I just keep on top of it (Anna). You don't feel mentally unwell for that long, well I haven't. I just get over it. Bottle it up for a couple of days and it will go away . . . . What stops me telling people? It's just not knowing what other people would think (Connor)."</p>
	<p><b>Theme 6</b> Barriers to help seeking, embarrassment, and stigma: Young people's feelings of embarrassment, stigma, guilt and fear of opening up were identified by the young people themselves and their carers as obstacles for seeking help. In addition, Bridget also talked about her fear of the process of seeking help and the service itself, and the unknown ('What are they going to try and get out of me?').</p>
	<p><b>Theme 7</b> Barriers to help seeking - effort of services: some carers claimed that services were not making sufficient effort to engage the young people. Carers in children's homes stressed the fact that involving CAMHS was not always the appropriate response. They stressed the mental health difficulties that young people living in residential care faced and that not enough was being done to help them: "It seems to be that young people who don't readily engage with CAMHS or find it difficult to engage with CAMHS</p>

can be quite quickly discharged, whereas these are the young people with the most complex difficulties, most in need of the service and there should be greater effort maybe in trying to engage them, if you miss three appointments, forget about it (Residential Carer 1)."

### Theme 8

Barriers to help seeking - professionals do not spend enough time to build positive relationships: Young people and carers also talked about professionals, in particular social workers, not spending enough time with them in order to build positive strong relationships. Although some had good experiences with professionals, others recalled damaging ones that they had with practitioners that did not take the time to know them or put pressure on them: ". . . they don't take enough time and effort to actually see what's wrong, they don't get to know, they assume too much sometimes I think, maybe that's just personal experience but they assume like she or he is the same as him, so we'll keep them that way, nobody is the same . . . I think they need to try and meet the individual needs of the young people (Bridget)."

### Theme 9

Barriers to help seeking - timeliness of help: research participants talked about a range of difficulties in accessing the services needed at the right time. These difficulties related to timing issues (e.g. long waiting lists, difficulties in getting a referral, etc.), geographical/locality issues (no local services available in rural areas, having to travel, etc.), appropriateness of services, and a lack of information provided in relation to the services that are available and where to ask for help. Long waiting lists for mental health services was a regular issue, reported by practitioners, carers and young people. Professionals explained that young people could be waiting fourteen to fifteen weeks to have an appointment with CAMHS and carers revealed how sometimes they never received the service at all. That could be a deterrent to seeking help in the first instance. The importance of receiving the right service at the right time was highlighted by social work and health professionals, carers and young people. If the service is not provided when needed, it may be too late for it to work when it is finally provided (as the level of need may have multiplied), the young person might have had to look for immediate short-term help elsewhere and/or the young person might not be ready to avail of the service (at the time it is finally offered): "Takes a long time to wait for referrals. In my experience of this one time, there was too long a gap from knowing [child] was ready to talk about it, to getting an appointment. The notion would nearly leave [child] . . . If I had to say that these services are fabulous, yes, they might well be, but I do think they have to have a quicker turnaround to be of benefit. Waiting list is too long (Foster Carer 1)."

### Theme 10

Barriers to help seeking, slow referral to mental health teams in the first place: For some, it was also difficult to get a referral in the first place. Sometimes, this could be due to staff turnover (which slowed down the time to put actions in place to meet young person's needs), the lack of efficiency of the young person's social worker or social work team or the young people not fitting the restricted criteria needed to be referred.

### Theme 11

Geographical barriers to help-seeking: professionals identified difficulties regarding the shortage of local provision and the consequent travelling times needed to avail of specific services. This was a specific problem for LACYP that were not living in the Belfast HSC Trust, and especially those in rural areas, as well as for those that had moved jurisdictions. These young people were forced to travel long distances to access a service. This has implications for the effectiveness and responsiveness of the service, as well as for the young person's engagement: "On occasions, when a child is placed outside of the Trust area, it can be difficult accessing available resources for the young person, travelling can also take up a lot of time and impact on the amount of times you get to review the young person (FG2)."

### Theme 12

Lack of training, clear indicators, and information leading to inappropriate referrals: Regarding the appropriateness of services, professionals talked about difficulties in providing the young people with the appropriate service. They believed this was because of the challenges in assessing the youth's mental and emotional well-being (e.g. lack of appropriate indicators and training for social workers in doing so), as well as gaps in service provision (e.g. lack of therapeutic services for children under the age of eleven, lack of services for young people with autism spectrum disorder (ASD), lack of a regional secure mental health facility and assessment centre for children with high risk-taking behaviour and severe mental health issues, etc.). Finally, carers, especially kinship carers new to fostering, and some young people described a lack of information provided on the services available to them.

### Theme 13

Need to make services more engaging: Carers talked about services needing to be more 'proactive in how they seek to support young people'. A suggestion from one young person was to create more outreach mental health support: "I would like to find a way that they could come into the house or do something that they can analyse maybe more and see exactly what you can do maybe without necessarily going to a place like that [i.e. CAMHS], because I think sometimes you don't need it, you just need somebody to talk to. . . ., and you don't really want to tell people that's where you're going, whereas you can say 'I have a friend coming over', that's a lot easier to say than 'oh, I have to go to an appointment', because I didn't tell anybody in school (Bridget)."

**Theme 14**

Need for services to be more locally accessible: Carers also argued about services being more locally accessible, while young people highlighted the need for more local drop-in centres: "I think if we could bring those services in an informal way into the local area, I mean where [child] has to go to access some of them services is 15 miles away, which means [child] has to commit to being here for us to take them over and commit to being away from friends for three hours, which [child] doesn't want to do, so access, if they were local in your GP surgery, [child] might go (Residential Carer 1)."

**Theme 15**

Greater multiagency working (communication): Another key recommendation by young people and carers was more communication between health professionals. Young people commented on the frustration they felt having to retell their stories and problems over and over, which in itself discouraged them from seeking help: ". . . the social worker ended up sending me to three different counsellors and I keep explaining things, I couldn't keep doing that and it upset me more, . . . I would be panicking, not trusting people like that. I ended up in a worse state crying and stuff, because they made me change, and I just ended up refusing to go anywhere (Nicole). . . . really the lack of communication is dreadful between each department . . . it's the main problem and children have a tendency to get lost in the system . . . there's not a consistent member in this child's life, one member or even two members of a staff team that would be there to see a child through and support them through it, it's not there (Foster Carer 2)."

"It has to be a multi-agency response, it can't be in isolation, can it? . . . there are other things impacting and sometimes you have to stop the other things to do the mental health issues or the emotional support, and then you have to swap to something else, so it needs timing and agreement and a proper plan, these ad hoc services coming in, it doesn't really work, does it? (FG2)"

**Theme 16**

Possibility of a one stop shop for all children in care: Another suggestion was to set up a multidisciplinary mental health team (occupational therapy (OT) specialist, clinical psychologists, specialist nurse and educational psychologists) working in a 'one-stop shop' for all children in care.

**Theme 17**

Information needed on the services available and knowing where to find them: Having been provided with information on the services available and knowing where to seek help was also considered crucial by young people and carers. Some highlighted the need to give the appropriate information to young people and parents/carers, so they could seek and obtain the support they required: "There's help available but a lot of us don't know that it is there . . . because nobody tells us, I mean if social services can get away with not doing something for us, they'll not do it, . . . you really have to push the Trust for something that you want, instead of them actually telling you what's available (Anna)."

	Section	Question	Answer
Risk of Bias	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes

	Research Design	Was the research design appropriate to address the aims of the research?	Can't tell <i>(researchers did not justify their methods in great detail )</i>
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes <i>(however no discussions about why some participants chose not to take part )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(Researchers broadly covered the topics that were covered, although a range of different techniques were used. Researcher did not discuss saturation of data. )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(Unclear that researcher critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Can't tell <i>(No in-depth discussion of analysis process. Unclear how themes were derived from the data. Unclear if sufficient data was presented to support the findings (e.g. saturation). Unclear if researchers critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	Can't tell <i>(Unclear that researchers have discussed the credibility of their findings (e.g. triangulation, respondent validation, more than one analyst))</i>
	Research value	How valuable is the research?	The research is valuable

	Overall risk of bias and directness	Overall risk of bias	Moderate
		Directness	Directly applicable

### Francis 2017

<b>Intervention</b>	<p>Theraplay (N = 20)</p> <p>Each child received weekly Theraplay sessions lasting for 30 minutes. The number and content of sessions varied depending on the needs of the child, determined at initial assessment. Some individual sessions took place at home. Group and individual sessions with the children were based on the Theraplay framework suggested by Booth and Jernberg (2010). A typical session would have the following core elements: welcome song, check-ups; Theraplay activities based on the dimensions of structure, nurture, challenge and engagement; snack and goodbye song. Consultation sessions with the significant adult were offered throughout the intervention.</p>
<b>Study type</b>	<p>Evaluation of an intervention</p> <p>Theraplay</p>
<b>Aim of study</b>	<p>This study aims to:</p> <ul style="list-style-type: none"> <li>• Explore the impact of Theraplay® group or individual interventions on the child's relationship with a key adult in school;</li> <li>• Explore whether there are changes in the child's engagement with education, such as their self- confidence, attention and concentration skills.</li> </ul>
<b>Study location</b>	UK
<b>Study setting</b>	Looked after children referred from nine primary schools in an English local authority (Leicester)

<b>Study methods</b>	Post-intervention qualitative data were collected from the child's significant adult in school, using semi-structured interviews involving open and closed questions. A small number of semi-structured interviews with carers and a social worker were completed. The data were transcribed and analysed using thematic analysis (Braun & Clarke, 2006). Data extracts were colour coded and categorised into themes. The themes were then analysed using a Realist Evaluation approach (Pawson & Tilley, 1997, 2004).
<b>Population</b>	Looked after children who would benefit from additional psychology service support
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	supported by the Leicester City Virtual School Team.
<b>Inclusion Criteria</b>	Age Primary school  Mental health Looked after children were identified in consultation with the Virtual School Team as children who would benefit from additional psychology service support
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size 20 looked after children  Special educational needs or learning disability Four children had a Statement of Special Educational Needs or an Education and Health and Care plan and a further nine children had identified SEN and received SEN support in school.  Mental health problems Looked after children were identified in consultation with the Virtual School Team as children who would benefit from additional psychology service support  non-white ethnicity 60% White, 20% Asian and 20% Black/African/Caribbean/Black British  Gender

	<p>girls 55% and boys 45%.</p> <p><b>Number of previous placements</b> The number of care placement changes the children had experienced ranged from one to six.</p> <p><b>Age</b> The age of the LAC ranged from five to 11 years</p> <p><b>Education</b> 70% of the children were in Key Stage One and 30% in Key Stage Two; 0% of the children had had two or more school moves. Three children had had one or more fixed term exclusions from school. Two children attended a pupil referral unit.</p>
<p><b>Relevant themes</b></p>	<p><b>Theme 1</b> Context: Care setting – carers and school staff felt that the child’s early life experiences and placement instabilities impacted on the child’s learning.</p> <p><b>Theme 2</b> Context: School systems – staff felt the work was constrained by limited time for sessions, support for teachers and the intervention not being embedded in the school.</p> <p><b>Theme 3</b> Mechanisms of intervention: Relationship with significant adult – staff appreciated opportunities to build relationships with the child/children.</p> <p><b>Theme 4</b> Mechanisms of intervention: Theraplay® activities – staff felt the individualised nature of Theraplay® activities matched the child/children’s needs.</p> <p><b>Theme 5</b> Mechanisms of intervention: Consultation with staff – staff valued the additional sessions and having protected time for their own well-being and learning.</p> <p><b>Theme 6</b> Outcomes: Increase in positive relationships with peers and key adults.</p> <p><b>Theme 7</b> Outcomes: Increase in engagement with education – school staff noticed improvements in attendance, the children following adults’ requests, and their attention and concentration.</p> <p><b>Theme 8</b> Outcomes: Increase in confidence and self-esteem.</p> <p><b>Theme 9</b> Outcomes: Increase in positive behaviours.</p> <p><b>Theme 10</b></p>

Outcomes: Increase in enjoyment and engagement – children reported enjoying the group, making friends and feeling happy; some children shared the activities with their carers at home.			
	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Can't tell <i>(The main focus of this mixed methods study seemed to be the effectiveness of the intervention, which is best answered using a quantitative approach. )</i>
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes <i>(However, unclear if/why some participants chose not to take part )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Can't tell <i>(Setting not justified; unclear in what form the data took; unclear if data saturation was considered. )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(Unclear that researchers examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes

	Data analysis	Was the data analysis sufficiently rigorous?	Can't tell <i>(No in-depth description of thematic analysis. Unclear if sufficient data presented to support the findings; unclear if contradictory data was taken into account; unclear if researchers critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	No <i>(There was no adequate discussion of the evidence both for and against the researchers arguments, or the credibility of the qualitative findings e.g. triangulation, respondent validation, more than one analyst)</i>
	Research value	How valuable is the research?	The research has some value <i>(Findings were very much related to the intervention only, generalisability not discussed. )</i>
	Overall risk of bias and directness	Overall risk of bias	High
		Directness	Directly applicable

### Franklin 2013

<b>Study type</b>	Semi structured interviews Subgroup of interest Human trafficking
<b>Aim of study</b>	<ul style="list-style-type: none"> <li>Assess the experiences of children identified as trafficked or suspected trafficked and accommodated in local authority care.</li> <li>Assess mechanisms in place to support trafficked or suspected trafficked children and the role of social workers, Independent Reviewing Officers (IROs) and other professionals mapped as having had contact with the child in providing and accessing care appropriate for them</li> </ul>

	<ul style="list-style-type: none"> <li>• Assess the multi-agency response in the context of best practice in child protection and safeguarding as set out in the Home Office/Department for Education – Safeguarding Children who may have been Trafficked Guidance (2007)</li> <li>• Identify good practice and areas for improvements.</li> </ul>
<b>Study location</b>	UK
<b>Study setting</b>	Voluntary organisations supporting trafficked children
<b>Study methods</b>	Face-to-face interviews were undertaken with 17 young people who were trafficked when they were children. The interviews explored the practical care and safeguarding arrangements for trafficked, or suspected trafficked children, from their perspective. Interviews gathered information about the types of services they had received and how professionals supported them, their understanding of care processes, and transition at 18. Interviews were conducted using a themed template to guide the interviewer through exploring the experiences of the child. Interviews lasted a maximum of an hour and were digitally recorded and transcribed. In order to gather more in depth information, 18 telephone interviews were undertaken with a sample of key stakeholders. These were professionals who had direct (or indirect) experience of working with trafficked children, either in local authority, voluntary sector, or legal roles. Data collected from the telephone interviews and face-to-face qualitative interviews with children were fully transcribed and then thematically coded and analysed.
<b>Population</b>	17 young people who were trafficked when they were children, nine representatives from six local authorities (social care managers and front line social workers), two solicitors (welfare and immigration) and seven voluntary sector staff (six of these were front-line workers with direct experience of supporting trafficked/suspected trafficked children)
<b>Study dates</b>	between January and May 2013.
<b>Sources of funding</b>	UK Home Office
<b>Inclusion Criteria</b>	None reported

<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> 17 young people who were trafficked when they were children, nine representatives from six local authorities (social care managers and front line social workers), two solicitors (welfare and immigration) and seven voluntary sector staff (six of these were front-line workers with direct experience of supporting trafficked/suspected trafficked children)</p> <p><b>Type of care</b> the young people lived in at least eight different local authority areas in London, the South East and West Midlands</p> <p><b>non-white ethnicity</b> The children in the sample were from nine different countries of origin: Burundi, Democratic Republic of Congo, Ethiopia, Ghana, Guinea, Ivory Coast, Nigeria and Vietnam and a South American country</p> <p><b>History of trafficking</b> The reasons they had been trafficked included for domestic servitude (seven people), forced labour and criminal activity including cannabis cultivation and selling drugs (three people) and sexual exploitation (nine people).</p> <p><b>Gender</b> 15 girls and two boys</p> <p><b>Age</b> At the time of the interviews, they were aged between 15 and 23 years</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> Key findings regarding discovery and identification of trafficked children: Following discovery or escape, the period immediately after is an extremely confusing and frightening time for children; Being kept locked up or threatened or controlled prevented children from escaping, as did threats made against their family; Children may disclose unintentionally, or may wait until they feel safe, or until they have a trusting relationship, or they may reach a point of desperation; Children may not know that they have been trafficked or see their situation in these terms; Trafficked children will often not have any understanding of where they are, will not know their rights and will not know how they can be protected. Not speaking English and possibly not even knowing which country they are in is also a major barrier; A lack of awareness, understanding and training can lead to some practitioners and the police not identifying trafficked children even in situations where children have sought help;</p> <p><b>Theme 2</b> Criminalisation of trafficked children: Some trafficked children were criminalised for activities such as documentation offences and criminal acts which they were forced to engage in while being exploited; Some trafficked children were treated as adults when discovered and were subsequently wrongly placed within the adult criminal justice system or immigration detention facilities;</p> <p><b>Theme 3</b> Concerns were raised about private fostering arrangements and potentially trafficked children remaining hidden from view in these situations.</p> <p><b>Theme 4</b></p>

Trafficked children going missing: Trafficked children going missing are a major concern for practitioners; Interviewees reported that a lack of awareness of trafficking meant some children were not properly protected, supervised, accommodated and supported, and went missing; A lack of safe accommodation or specialist trained foster carers was reported to be leading to children being placed in inappropriate placements;

#### Theme 5

Reducing the risk of missingness: There was agreement about what can help to minimise the risk. This included quick action based on suspicion, a multi-agency safety plan, safe accommodation, trained and supported foster carers and one-to-one intensive support for the child and the forming of a trusting relationship with an independent adult; Some respondents felt that tackling this issue was beyond the scope of local level provision and there needed to be a regional/national response such as reciprocal arrangements, new funding models or a national specialist foster care programme; Respondents saw the value in the training of specialist foster carers funded by the Department for Education and wanted this to be rolled out nationally; Respondents reported that a higher priority needed to be given to trafficked children who go missing;

#### Theme 6

Recommendations for missing and trafficked children: Recommendations included the need for: Improved multi-agency responses to trafficked children going missing; Trafficked children who go missing to be treated as cases of abduction; The introduction of a national database to record missing trafficked children; Trafficked children are known to have used written information given to them by professionals before they went missing. They have subsequently used this information to facilitate a return to the local authority.

#### Theme 7

Current guidance and multiagency working: Child trafficking toolkits and NRM guidance containing indicators of trafficking were considered helpful; Some respondents, however highlighted that there was little understanding of how the indicators should be incorporated into the assessment process, used to predict risk or to determine the most appropriate services; It was reported that good social care for trafficked children should be about a duty to protect these children, rather than focusing on them as being trafficked; Multi-agency working was identified to be highly dependent on the importance placed on the issue by local authorities; Few local authorities had developed multi-agency strategic or operational groups focusing on trafficking. Even fewer had developed local joint strategies on trafficking or undertaken local needs assessments. Thus very few local authorities were implementing current guidance; Multi-agency joint training was seen as helpful. However, multi-agency working depended on a shared understanding and proper training across agencies, otherwise it could fail; Some respondents expressed frustration with the National Referral Mechanism process and did not see it providing support to trafficked children; Respondents recommended that gathering information from children should be compliant with Achieving Best Evidence guidance;

#### Theme 8

Repetition of story causing distress: Trafficked children had to repeat their story multiple times to multiple agencies, often causing them distress.

#### Theme 9

Only a minority of the sample of trafficked children were happy with the care and support provided by their social workers. Although some individual social workers were seen as supportive, practice varied widely

#### Theme 10

Trafficked children often had multiple social workers or key workers and so lacked continuity of care, and had to frequently repeat their story

#### Theme 11

Trafficked children's criticism of social care support centred around a lack of contact and support, not being listened to and social workers not doing things that they should do. This was reported to lead to a lack of trust.

#### Theme 12

Trafficked children reported turning to welfare solicitors and/or support workers from voluntary organisations to get the services and support they needed

#### Theme 13

Stakeholder respondents repeatedly highlighted the need to see what has happened to the child as a child protection issue and respond accordingly

#### Theme 14

Concerns were raised that social work teams specialising in one area (e.g. asylum or looked after children) might not have the full range of knowledge or skills required to manage the often complex situations

#### Theme 15

Concerns were raised that child protection support could be compromised by some trafficked children's uncertain immigration status especially during transition from children's services to adult services/independence

#### Theme 16

Many trafficked children undergo (multiple) age assessments, which some practitioners thought were highly problematic for this group of children; Age assessments were often taking place in police stations and in some cases it was reported that they were being undertaken by social workers who were making pre-judgements; Children reported that following age assessments and the questioning of them (and often disbelief about their age) they found it difficult to have good relationships with their social worker; Some children within the sample interviewed had their age wrongly identified and had been sent to adult prisons, detention centres or been placed in adult accommodation, placing them in a very vulnerable position;

#### Theme 17

Access to good quality immigration advice was highlighted by stakeholders to be a concern

#### Theme 18

Local authorities reported barriers to supporting trafficked children including insufficient accommodation, a lack of understanding amongst social workers of the immigration system and pressures relating to the immigration process

#### Theme 19

Continuity: There were reported barriers to providing an allocated permanent social worker to trafficked children

#### Theme 20

Local authorities reported that they had faced some difficulties in accessing appropriate education, mental health services and leisure opportunities for trafficked children

#### Theme 21

Education for trafficked children was seen as vitally important, although provision was varied. Some trafficked children received incorrect advice about their education, and/or did not receive their right to an education

#### Theme 22

A lack of appropriate accommodation was highlighted as posing potential risks to trafficked children as well as having detrimental effect on children's access to leisure, education and/or cultural opportunities

#### Theme 23

Trafficked children reported multiple accommodation moves and sometimes living in inappropriate placements where they reported living in fear.

#### Theme 24

	<p>Transition to adulthood was identified by all participants in this review to be problematic; Transition for trafficked children is especially problematic as it is often linked to the immigration decision making process; Many stakeholders raised concerns about the increased vulnerability of these young people, and the severe drop in support and services following transition; Although most local authorities reported undertaking Pathway Planning with trafficked children, the quality of this was questioned and in some cases reported to be very poor; Trafficked young people reported not understanding the Pathway Planning process, being left unsupported and without the life skills to cope with their situation; Trafficked children may require particular additional support around skills for independent living; Some respondents felt that the Home Office should prioritise the immigration decision making process for this group of young people.</p> <p><b>Theme 25</b> Across all respondents it was identified that trafficked children find the care process confusing; Stakeholders reported that if a child did not understand what was happening to them and did not have trust in an adult then there was a risk that they may return to their traffickers; Although most local authorities provided interpreters there were concerns about the quality of the service provided; Although all local authorities stated that trafficked children were invited to their LAC reviews, there were repeated concerns from stakeholders that the children did not understand what was going on. Trafficked children confirmed this; A consistent theme throughout the research was a need for trafficked children to have a trusted adult, independent from statutory service delivery to support young people to navigate the care process (and legal processes) and to challenge possible care arrangements which were not meeting their entitlements. A guardianship model was identified as a way to address this challenge.</p> <p><b>Theme 26</b> Across the research respondents identified a gap in training and awareness of trafficking issues: More public awareness and information specifically for young people was considered necessary so that people could identify trafficking; Across all agencies working with children and young people it was felt that they needed to be more aware of trafficking and know what to do if they had suspicion; Specifically the police, immigration, youth offending, criminal justice system, health and education were identified as needing specific training; Social workers and social work managers across all teams were seen as needing a better understanding of child trafficking.</p>		
<b>Risk of Bias</b>	<b>Section</b>	<b>Question</b>	<b>Answer</b>
	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Can't tell <i>(Researchers did not explain why the participants they selected were the most appropriate to provide access to the type of knowledge sought by the study, or why some participants chose not to take part)</i>

	Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(However no discussion of data saturation )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(Can't tell if researchers critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Can't tell <i>(No in-depth description of the analysis process. Unclear that researcher critically examine their own role, potential bias and influence during analysis and selection of data for presentation )</i>
	Findings	Is there a clear statement of findings?	Yes
	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	Moderate
		Directness	Directly applicable

**Gaskell 2010**

<b>Study type</b>	Interviews (unclear) RQ2 RQ4
<b>Aim of study</b>	to explore young care leavers' experiences of care.
<b>Study location</b>	UK
<b>Study setting</b>	inner London area
<b>Study methods</b>	All interviews took place in cafe's. No interviews were recorded, notes were written up instead. Young people fed back into the write up and final analysis. Interviews were written up in full and coded thematically.
<b>Population</b>	Young people each with experiences of the care system within the inner London area. All young people were also service users of a London-based children's charity
<b>Study dates</b>	not reported
<b>Sources of funding</b>	not reported
<b>Inclusion Criteria</b>	None reported
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size 10 young people Time in care

	<p>all participants had entered the care system for the first time before the age of 11 years.</p> <p><b>Type of care</b> Eight of the group had experienced both residential and foster care placements</p> <p><b>non-white ethnicity</b> Five of the group were from Black British backgrounds, three were from mixed Black British and White British backgrounds and two young people described their ethnicity as White British.</p> <p><b>Gender</b> seven young women and three young men</p> <p><b>Number of previous placements</b> All of the young people interviewed had multiple experiences of care placements.</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> (inclusion in decision making) Some may have preference for residential care: Entering the care system after a breakdown of care within their own familial system, some young people felt strongly that foster family care was not the most suitable option for them. Many expressed the desire that their own, dysfunctional family, should not be replaced by a foster family. Ruby2, a 19-year-old young woman explained that she favoured a children's home environment, rather than the increased stigma and further alienation of living as what felt like an 'add on' to another family: "I didn't like foster care. I just didn't like the feeling of being in someone else's family, in someone else's home, you get me? In a children's home everyone has something in common and it's like 'oh why are you here then, what's your story' you know."</p> <p><b>Theme 2</b> Need to listen and include in decision making: When young people hold these strong views of their own care needs and of how they might be met, the failure to listen can be interpreted as a failure to 'care'. All of the young people interviewed described being confused by decisions made on their behalf. Twenty-one-yearold Crystal explained how she had attempted to include herself in the decision making process. After requests to be placed in a children's home could not be met, she took influencing her care into her own hands: "You know, I told social services 'I don't like God people' and they sent me to live with a pastor and his wife! I mean what were they thinking?! So I just ended up running away again." A common theme emerged amongst the young participants in this research, that after unsuccessful attempts to influence the nature of the care they received, many young people became disillusioned. A common conclusion was that the type of care they needed and wanted was simply unavailable.</p> <p><b>Theme 3</b> (inclusion in decision making) preference for foster families: Unlike the above examples and reflecting the individual needs, children within the care system, nineteen-year-old Jodie found the children's home environment unpleasant, preferring instead to be cared for through foster families: "At least in a foster family I felt loved man, in the children's home I felt hated by all the staff, it was just their job, they didn't care.... It was stupid though, he [pointing to a friend also taking part in the interview] just wanted to be in a children's home and they kept putting him in foster care. I wanted to be in foster care and they kept putting me in a children's home!"</p> <p><b>Theme 4</b> The need to explain decision making: Clearly, there are many considerations to be taken into account when placing a vulnerable young person in appropriate care. However, when the constraints on services were rarely explained in an accessible form, the actions of the local authority can be internalised by looked after children as a failing in their role as carer. Young people entering local authority care have already experienced failures in their care needs during their childhood. This rejection and the failure to have their care needs met is a dominant attachment pattern and framework of understanding for many looked after children. For this reason, the young people who took part in this research commonly internalised and interpreted a whole range of actions played out within the care system through their previous experiences of a lack of care.</p>

### Theme 5

Shared decision making: regardless of government moves towards 'choice' in service provision, these young research participants did not say they wanted a greater choice of services. Rather than a choice of services, the young people simply wanted the services that were being delivered to be good enough services that took into account some aspects of their background, context and need. The hierarchical nature of service delivery often does not allow for the background, context and need of the service user being acknowledged or incorporated into the services provided. As Jodie explained of an experience of violence within a children's home: "If they'd [the children's home staff] sat down and talked to me, asked me how I wanted to deal with it, it would have shown.... I don't know, it would have shown caring, I suppose." This experience fuelled feelings of a lack of care, but it also reconfirmed a hierarchical framework of adult knowledge in the context of child welfare. This young woman increasingly felt that her input into her own welfare was neither valued nor requested.

### Theme 6

Support through disclosure of information process (being listened to): Disclosing family and personal difficulties is a challenging and often traumatic process. It has personal and emotional implications for the individual and can have significant ramifications within the family. If young people are not supported through their complex disclosures (for example of sexual abuse, physical abuse, neglect and so on) young people can withdraw from further disclosures and thus the support services they require. A number of the young people said that they had struggled to express their personal difficulties to service providers throughout the care system. Their main concern was that they were being ignored, or worse, disbelieved: "I was being abused by my mum's boyfriend, but everyone thought I was making it up (nineteen-year-old Derek)"

### Theme 7

impact of resource constraints on listening: This feeling of not being believed also tied into the concern that service providers, stretched and under resourced, often failed to understand the complexity and severity of young people's problems. Nineteen-year-old Natasha explained her feelings when she was accessing local authority care: "They don't listen yeah, but even when they do, they have these little tricks. They twist what you're saying. They turn it all round. They make out you're lying, that you're making things up. They do it so well it even makes you think you're making it up! You get me?" "Social Services didn't try to understand where you were coming from. They just didn't listen to what you wanted. (twenty-one-year-old Crystal)"

### Theme 8

continuity of care: In order for social care provision to have successful outcomes, trust in both institutions and individuals is necessary. Some young people made these links between the perceived lack of care and young people's difficulties in building trusting relationships: "As soon as you were beginning to trust them [social workers] they moved on. Just as you were putting trust in them, if you did put trust in them, they were gone. (twenty-one-year-old Crystal)" Because this young woman came to expect the sequence of being let down, by her own admission, she blocked the access of care from her social workers and from other care providers. Through time, she stopped placing any trust in her social workers, thus building what she considered to be a reciprocal relationship of mistrust.

### Theme 9

Lack of a trusted adult figure impacting on educational results: "People need to have higher expectations for kids in care. If I'd had a really strong person behind me pushing, pushing, I wouldn't be where I am now."

### Theme 10

Lack of aspirations for looked after children within the educational system: the lack of aspirations for looked after children was felt by many of the young people to be endemic within both the education system and the care system itself: "The head teacher didn't exclude me in the end, he just kept saying, 'do you want to go home'? And I'd go home. (twenty-year-old Tyrone)" "I was in a children's home, there were ten of us, and only two actually went to school. Kids in care just don't go to school. They [the staff in the children's home] woke you up, but that was it. They woke you up if you had a school to go to. If you didn't you were just left to wake up when you wanted."

### Theme 11

	<p>Impact of placement moves on educational performance: For looked after children, frequent moves between care placements can be very destabilising both practically and emotionally. As twenty-year-old Tyrone explained of the practical implications of unstable care placements: "One week you'd be in one place, come Monday you'd be trying to get to school from a different place."</p> <p><b>Theme 12</b> Constant moves impacting a child's ability to form attachments and enter crucial relationships with carers, social workers and peers alike. Stability of placement is a crucial aspect of the emotional repairing necessary after early childhood trauma. "I was lucky, I didn't move that much. It's the moving that messes kids up. My brothers and sister have been in the same place the whole time. They were even luckier, they got a foster mum who really wanted them, and they've stayed. (nineteen-year-old Jodie)"</p> <p><b>Theme 13</b> lack of continuity in care workers: Many of the young participants expressed their concern that the turnover of social workers was very high and that this impacted upon the effectiveness of the care they received. These feelings were mostly based upon the difficulties they faced in contacting and accessing their social worker when they needed help. This was expressed through their feelings that they required more time in direct contact with their social workers, if care was to be effective. As sixteen-year-old Lucy explained, her attempts to contact her social worker in times of need were restricted: "I kept phoning, writing, leaving my number asking her to call, but she still hasn't. Social workers should call every child one–two times a week. It shouldn't be down to the child to contact the social worker." "I had about six or seven [social workers]. I can't remember all their names, some I only had for a few weeks." "It was no fault of mine that they changed so much. You don't get an explanation. Sometimes you don't even see them and you get a letter saying 'I'm sorry I'm not going to be your social worker anymore', and you think hang on, I've never even seen you!"</p> <p><b>Theme 14</b> Positive care by social workers (above and beyond): nearly all the young people who contributed to this research were able to describe at least one social worker or care provider with whom they developed a positive and trusting relationship. These care providers were talked about very positively and were clearly central to young people's experiences of support and personal development. Nineteenyear- old Jodie explained the importance of her positive experiences with service providers: "One of my social workers was great. She took me shopping, she did things she didn't really have to. She looked at me like a daughter. She cried at me, pleading with me to stop with the crack ... so they're not all bad!"</p>		
<b>Risk of Bias</b>	<b>Section</b>	<b>Question</b>	<b>Answer</b>
	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	No <i>(no in-depth discussion about methodology )</i>

	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	No <i>(unclear why the participants selected were most appropriate, or why/if some participants chose not to take part)</i>
	Data collection	Was the data collected in a way that addressed the research issue?	No <i>(Setting is justified however it is not clear how data were collected (e.g. focus group, semi-structured interview etc.). Methods are not explicit for interview technique, in addition the researcher did not discuss saturation of data. )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(unclear that the researchers critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location? How did the researcher respond to events during the study)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	No <i>(no in-depth description of the thematic analysis used. Sufficient data was not always presented to support the findings. Unclear that contradictory data was taken into account. Unclear that researchers critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	No <i>(Researcher did not critically examine the credibility of their findings: .g. triangulation, respondent validation, more than one analyst)</i>
	Research value	How valuable is the research?	The research is valuable <i>(however, generalisability not discussed)</i>

	Overall risk of bias and directness	Overall risk of bias	High
		Directness	Partially applicable <i>(Very likely that data were collected prior to 2010)</i>

### Groak 2011

<b>Study type</b>	Semi structured interviews Subgroup of interest UAS
<b>Aim of study</b>	To gain an in-depth understanding of the experience of being a young person who is unaccompanied and seeking asylum in the UK. To gain an understanding of how past and present life experiences impact on these young people's psychological well-being. To explore the psychological processes these young people use to manage or cope with the difficulties they experience.
<b>Study location</b>	UK
<b>Study setting</b>	an inner city borough

<b>Study methods</b>	Semi-structured interviews. Open-ended questions were used in the interview to elicit a wide range of experiences. Interpretative Phenomenological Analysis (IPA) (Smith, Flowers, & Osborn, 1997), a qualitative methodology that aims to capture the quality of an individual's experience and gain some understanding of the meanings held by the participant, was used. The Spence's Children's Anxiety Scale (SCAS), the Child Impact of Events Scale (IES) and the Birlson Depression Scale were completed by each participant in order to evaluate mental health and to triangulate the data. Taped interviews were transcribed verbatim. One transcript was transcribed and translated by an interpreting agency. The transcripts were then analysed individually and then across participants using the IPA coding framework. The emergent themes were examined and arranged into meaningful clusters and a list of main themes and the corresponding sub-themes was developed that aimed to reflect the experience of all the participants. Emerging themes that were not well supported across the participants were either re-conceptualized under other existing themes or excluded in the process of determining the final sub-themes. Respondent validation was carried out with one participant and incorporated into the process of developing the analysis.
<b>Population</b>	Unaccompanied asylum-seeking adolescents aged 16–18 years
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported
<b>Inclusion Criteria</b>	Care Situation cared for under sections 17 or 20 of the Children Act and had resided in the UK for at least six months  Mental health not currently involved with CAMHS
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size 6 unaccompanied asylum seekers  Time in care

	<p>Participants had been in the UK between six months and one year (mean length of stay 9 months).</p> <p><b>Type of care</b> Four lived in shared accommodation; three sharing a room with another person. Two participants lived in their own flats. Five participants were single and one had a partner and a young child. Four participants had been granted leave to remain for a set time period. One participant was waiting to hear about a Home Office asylum appeal. One participant's asylum status was unknown.</p> <p><b>non-white ethnicity</b> Five participants came from countries in Africa and one came from Asia.</p> <p><b>Gender</b> four male and two female participants</p> <p><b>Age</b> aged 16–18 years old</p> <p><b>Education</b> All participants reported having attended school prior to coming to the UK although this had been disrupted. Five of the six participants attended college at the time of the interview.</p> <p><b>Language</b> Two participants used an interpreter.</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> Loss of family and friends: All participants talked about multiple losses they had experienced. This loss was both tangible and emotional. They spoke about loss in relation to their time prior to and following arrival in the UK. These losses were painful and often sudden losses of family and friends: "I lost my mum again in that kind of confusion, everyone was just running in all directions, people running all over the place. Either you stay down or you try to run out, so I stayed down, and didn't go with my dad. That was the last time I saw them. P5 8 17–20"</p> <p><b>Theme 2</b> Loss of identity: the sense of loss also extended to loss of community, homes, way of life, freedom, trust, security, wealth, cultural identity and even feeling as though they had lost "themselves": "I really don't know, I've lost myself. I know I have. P1 15 1"</p> <p><b>Theme 3</b> Loneliness and isolation: Losses left participants feeling a sense of loneliness and isolation. One participant reflected on the loss of help and support that was provided by his friends and family: "You are all alone, you have to go through it and come out of it by yourself. P1 16 12–14"</p> <p><b>Theme 4</b> Loss of control, certainty, and safety (home country): "So they [rebel fighters] are unpredictable and that was the way of life. Sometimes it would be safe sometimes it would not. P5 2 14–15" "First I do not know where my parents are and how they are doing. P3 7 22 It was difficult because they [parents] disappeared mysteriously. P5 6 22" "They would come and threaten us and like say if you don't give us food we will take you or kill you. P5 2 10–12"</p>

**Theme 5**

Loss of control, certainty, and safety (UK): The fear of being returned to their home country dominated all the participants' worries. Four participants expressed a sense of vulnerability and a need for protection. All six participants spoke about living under the threat of being returned: "My biggest worry is that if I return to my country, you understand, then I will be fighting for my life. P4 14 13–14" "The Home Office hasn't answered yet if I could stay in the country or not. I'm still waiting for them. I went for an appeal, but they haven't written to me. P6 22 332"

**Theme 6**

Loss of control and powerlessness: All the participants spoke about the loss of control that they had over their lives. Again this spanned the two aspects, prior to and since arriving in the UK. There was a sense of having no personal agency in the past or for their future. All participants talked about feeling helpless at times when their circumstances became really difficult. They described feeling powerless to stop or change what was happening: "When something like this [rape] happens, there's nothing you can do about it you know. P6 27 378". The sense of a loss of control continued once living in the UK. All six participants identified striking experiences of being under the control of and to some extent "at the mercy of" the asylum system. "You become the lassie [dog] of the system. P1 18 16–17 There it [the asylum system] is knocking at your door coming to get you, I'm the system, I'm coming to get you. P1 11 4–5"

**Theme 7**

High value of education: Participants placed a high value on education and trying to "better themselves". This seemed to stem from familial beliefs and expectations. However it also seemed to be about education as a "way out", and a way to better their life. This might be more important given they had experienced powerlessness or loss. "I remember that when I study I will get a good job and do something for myself. P5 18"

**Theme 8**

Impact of evaluation by others: All participants talked about their experiences of interacting with other people in the UK and how they felt they were evaluated by others. The group expressed mixed experiences of this evaluation: "Well some will look at you in a negative way. Some will look at you in a positive way. P4 11 13–14" "Oh they just, no, they just see me normal. P6 18 273" "Now when you are out there and you are known as an asylum seeker the first thought that comes into mind is oh he's bumming. All he came here to do was sit down and take benefits and do absolutely nothing. P1 13 15–18"

**Theme 9**

Labelled as an asylum seeker: Three participants spoke about the identity they acquired as an asylum seeker. For one this seemed to be a positive experience as it had made them feel helped and acknowledged. However for the two other participants being "labelled" an asylum seeker had had a powerful impact on their identities: "Because you know you are an asylum seeker, you've gone inside [your head], you've branded yourself. P1 12 13–14" "Like me I can't go to a pub and say who are you, what you are, to make friends. I know who am I, and the conditions, I'm just a refugee. P2 11 28–32"

**Theme 10**

Asylum seeker label impacts ability to make trusting relationships: :Negative experiences of how people in the UK perceived the participants were likely to have impacted on self-esteem and on transitional processes involved in living in a new country and culture. For this group in particular it may have impacted on the extent to which they made new trusting relationships and asked for help. This meant that the world remained an uncertain and threatening place.

**Theme 11**

Experience of distress: All six participants identified difficult life experiences having impacted on them. This consisted of descriptions of feelings, perceived changes in ability to do things and "becoming sick". Two participants talked about "becoming sick" as a result of worries and stresses related to loss of family or being returned. The researcher took this either to be a way to describe physical sensations that were closely linked to mental distress, or to describe distress in terms of a complete bodily experience: "Sometimes like last time when I, when you call me when I said I am sick, the previous day I was just thinking about it [being returned to country of origin], till it make my mind become so I was sick. P4 14 23–25" "I just think I just feel negative of my entire being. P4 15 24" "It is so like your mind is being paralysed. P5 21 1–3"

**Theme 12**

Sleeping and eating problems: All six mentioned worries and anxiety linked to the uncertainties they were experiencing and three talked about feelings of anger and frustration. Three participants said their thoughts and feelings were impacting on their sleep and eating patterns: "Once I start thinking about people back there they don't have anything to eat, I just can't eat. P3 8 6–7"

**Theme 13**

Trouble with concentration impacting education: This sense of the mind being frozen prevented participants from completing tasks and interrupted their lives. This disconnection with the world could be interpreted as a type of dissociation, a way of distancing themselves from painful memories or thoughts. Interestingly the same three participants also spoke about their experiences of intrusive thoughts or memories of past life experiences "popping" into their head without their control. These findings also linked to elevated scores on the Impact of Events Scale for these participants. Their descriptions gave these thoughts an intrusive nature that interrupted their daily activities at times. "Because sometimes if I am getting study or even if I am in class and I just think, it just come in my mind about something that may come to me. PS 13 17–18"

**Theme 14**

Trying to gain control through education: Trying to gain control was a strong theme for five of the participants. It seemed to be a direct reaction to the experience of lacking control in their lives as discussed previously. Three participants in particular acknowledged the need to change their "status", in terms of being allowed to stay in the UK and in terms of being successful and respected by others: "For me I want to be a success, respected, a success. P2 4 43–47" Education and gaining knowledge was seen as the primary way of gaining control in their lives for the five participants. There was a sense of intense determination to succeed in education. It was seen as a "way out" of their current lives and "disempowered" position: "Because if you know something then you can do something for yourself. P5 18 22" Fear of failure was expressed by two of the participants and highlighted the importance of education for this group and ultimately their success and survival in the UK. "And college, college work stresses me everyday, you know. Because my work is hard, it's really hard, if you want to make it to the top it's not easy you know. P6 23 332"

**Theme 15**

The wish to help others in a similar situation: The wish to have control and power to bring about change was extended to others' lives as well for three of the participants. There was a need in them to help others in a similar situation, to make changes in their home country or to help young people in the UK: "would like to go back when I am someone who can speak and you know when I am someone who they can listen to. I will then try to bring about change. P5 25 21–22" Participants were passionate when they spoke about being able to bring about change in their lives and the lives of others. This looking to the future and working towards a position of being in control seemed to be their way of coping with experiences over which they were lacking control. This helped them maintain a belief in themselves.

**Theme 16**

Coping by avoiding distressing thoughts and feelings: Avoidance of distressing thoughts and feelings was a striking theme throughout all the interviews. All participants explained how this was the best way for them to cope. They outlined a number of different ways they avoided bad feelings: seeing friends, reading, music, walking and schoolwork. This ability to block out thoughts and feelings was discussed at length by them in the interviews: "Well there's not really a best medicine for it, so I just avoid it, you know? P6 30 401"

**Theme 17**

Acceptance as a coping strategy: Acceptance seemed to be an important way of managing difficulties for four participants. They talked about how they were unable to make changes so they had to accept what was happening and let it just become "part of their lives": "I've embraced it. It has become part of me. P1 19 8"

**Theme 18**

Utilizing support networks (lack of trust - secretive): The role of friends in managing difficulties and the capacity to trust was a dominant theme for all six participants. The group described the importance as well as the uncertainty they felt about having friends. Two participants avoided having friends completely due to fears of being found out or deceived by others and as a result remained isolated in order to protect themselves. Trust was an issue even for those who did report having friends: "I mean, I do have friends, but that don't mean I have to trust them 100%. P6 12 200"

	<p><b>Theme 19</b>                  living in limbo affecting ability to make close friends: Although four participants described having friends, only one described them as close. A number of factors may have impacted on the participants' ability to make friends such as "living in limbo", the threat of being returned, being secretive about being an asylum seeker or the inability to mourn and process previous losses. Not having safe, secure and trusting relationships was likely to impact negatively on the participants' ability to manage distress about the past and future and in terms of initial transitions in the UK: "Because if you don't have someone to talk to you keep on thinking about your problems here and back home. P3 9 21–22"</p> <p><b>Theme 20</b>                  Benefits on having friends for distress and assimilation: Being with friends was a way of avoiding difficult thoughts and feelings. Friends helped distract participants and helped engage them in the "here and now" and to forget about their experiences of loss and uncertainty about the future: "Sometimes when something and some difficulties come into my mind, I just went to my friend, yeah, spend time talking a lot and do things in common. I just like to get myself to forget about what I am thinking. P4 17 16–18" For two participants, friends were a source of advice and acted as a guide to how to "fit in". Participants spoke about this in terms of what clothes to wear to fit in and what courses were good to take. Friends were likely to play an important role in helping participants learn about life in the UK and begin to adjust to differences that they came across.</p> <p><b>Theme 21</b>                  Utilizing support networks: professionals - Four participants experienced receiving help from their social worker, with two participants experiencing their relationship with their social worker as that of a "father" figure, who in some respects was "trusted" and who they felt was meeting their needs in terms of advice, reassurance and financial support: "I must point it out that [the social worker] has done so much for me, he is like a father here. P5 24 11–12". Two participants experienced help from school tutors in terms of their learning about UK culture. Three experienced help from church in terms of the relationships they made and in terms of church as a safe place where he could be near others. "Two participants experienced help from school tutors in terms of their learning about UK culture.</p> <p><b>Theme 22</b>                  Other support networks: Three experienced help from church in terms of the relationships they made and in terms of church as a safe place where he could be near others. "I just feel lonely and alone so go into a church which is better as there are many people there. P2 16 35–36"</p> <p><b>Theme 23</b>                  The need for a guidance figure: Three participants highlighted their need for more guidance and reassurance in their lives. There was a sense that they felt lost without guidance and suggestions from "someone who knows". The need for a close and trusting relationship was also important to three of the participants and having someone you could rely on and trust to tell things to. There seemed to be a mixed response to the need for emotional or mental health help. Three participants spoke about the importance of having some form of "counselling". By "counselling" they seemed to mean someone they could go to for advice and who would help them problem-solve rather than share deeper emotional distress: "Help is maybe give me information to deal with and to cope with the difficulties P2 17 10–11"</p>		
<p><b>Risk of bias</b></p>	<p><b>Section</b></p>	<p><b>Question</b></p>	<p><b>Answer</b></p>
	<p>Aims of the research</p>	<p>Was there a clear statement of the aims of the research?</p>	<p>Yes</p>
	<p>Appropriateness of methodology</p>	<p>Is a qualitative methodology appropriate?</p>	<p>Yes</p>

	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Can't tell <i>(No discussion RE why participants were the most appropriate to access knowledge sought by the study, no discussion about why/if some participants chose not to take part. )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(No justification of setting for data collection or data saturation )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(unclear that researchers critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Yes <i>(unclear that researchers critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	Yes <i>(respondent validation and triangulation was used )</i>
	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	Moderate

		Directness	Partially applicable (Data was likely collected prior to 2010)

### Griffiths 2012

<b>Intervention</b>	<p><b>Letterbox (N = 14)</b></p> <p>The “Letterbox Club” is an intervention that provides reading, writing and mathematics materials to children in public care with the aim of improving their educational attainment. Materials are sent addressed to the child at their place of residence, for children to use on their own or to share with other family members. In response to concerns expressed by carers that materials addressed to them implied an expectation of them offering educational support, the decision was made to send materials directly to the child. The child would be told they were a member of a club, the “Letterbox Club”, to reduce any feeling that they were being given compulsory homework; The materials would be provided in installments, to avoid the child feeling overwhelmed, and to provide an element of novelty and excitement each time the child received a parcel; The parcels would be sent through the post, making distribution relatively simple, including for children whose placements were outside each local authority area.</p>
<b>Study type</b>	<p>Semi structured interviews</p> <p>RQ2</p> <p>RQ4</p> <p>Evaluation of an intervention Letterbox</p>
<b>Aim of study</b>	<p>To explore participants’ views about each aspect of the Letterbox Club in greater detail, including whether the children continued to use any of the items they had received.</p>
<b>Study location</b>	<p>UK</p>

<b>Study setting</b>	Three different UK local authorities
<b>Study methods</b>	Semi-structured interviews six months after the children had received their last parcel. parcel, with a sample of four children and four foster carers for Letterbox Red and Blue in 2009, and with six children and their foster carers for Letterbox Green in 2011, selected from three different local authorities. These explored participants' views about each aspect of the Letterbox Club in greater detail, including whether the children continued to use any of the items they had received. Unclear how thematic analysis was performed.
<b>Population</b>	Children in care aged 7 to 11
<b>Study dates</b>	2009-2011
<b>Sources of funding</b>	not reported
<b>Inclusion Criteria</b>	Age aged 7 to 13  Care Situation in foster care
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size four children and four foster carers for Letterbox Red and Blue in 2009, and with six children and their foster carers for Letterbox Green in 2011
<b>Relevant themes</b>	Theme 1 Encouragement to learn: "many carers and children did feel that receiving the materials had provided important additional support and encouragement to learn. For example, the carer of a boy aged 8 wrote, "The parcels have played a big part in Hamza becoming more enthusiastic about reading. Even made him keen to bring home school books". "Mr Quinn [my teacher] done a test on us today and I got twenty out of twenty on it. Because I answered all twenty of them right, because I've been playing the maths games and it's helped me with my adding up".  Theme 2

Receiving personalised packages created the sense of being important and that someone was interested in them: "It may not seem a lot, but when you've not had much attention in your life, it is." Children clearly felt they could make decisions themselves about what to do with the materials, and were usually keen to share them: "Jake felt rather special as he loved the postman delivering the parcel for himself each month. He enjoyed getting everyone together and playing with his games and reading his books". The bright envelope was important to many: "Brandon watches the post and can immediately identify 'his' package." Many children told us they kept each envelope, "because it has my name on".

### Theme 3

Enthusiasm maintained for the parcels: Children who had been in Letterbox Club before were still very enthusiastic when they were members again. One carer said that her foster daughter had had the Red parcels eighteen months before, and when her first Green parcel came she "just ripped it straight open. Excited and straight into it!" Her foster daughter said, "It's a great thing and it makes you feel a bit happier ... To get the parcels, it'll take a lot of money to put together for people, but it makes people happy".

### Theme 4

Source of continuity: The fact that the parcels followed placements was important: The fact that the parcel is delivered to the child's home address was particularly important to children who had moved recently or frequently. One boy (aged 9) in the earlier pilot had expressed this very poignantly: "So somebody knows where I live?" The foster mother of a girl aged 10 who had moved three times in a year, said, "The Letterbox Club was the continuity, something that stayed the same when she moved from A to B. She'd had so many ups and downs and I think something like that, that stays the same, is quite important to children and it was very important to Kelly." A carer with two foster daughters aged 11 confirmed this: "They love just getting the parcels and that was important to them, especially when they hadn't been here very long, it was like 'somebody from the outside knows I'm here'."

### Theme 5

Useful for under resourced foster homes: Some foster homes had comparatively few books suitable for the children they cared for, so the Letterbox Club parcels were a valuable resource.

### Theme 6

Something to call their own: Even where foster families were already well-provided, many carers commented that a critical element in gaining children's interest was that the Letterbox books were their own. For example, the carer of a boy aged 9 said, "We've got a cupboard absolutely full of books, but he never paid them any attention at all, so it was nice that these came just for him." Similarly, Katie's foster mother wrote: "The books she has received we've often got already, being a 'bookish' house, but none the less she enjoys the parcels and it gets her to read old favourites again".

### Theme 7

Being part of a club: Lewis, aged 8, told us: "It was good fun because I've never been in a club before". The aspect of being a member of a club seemed to have encouraged many children to tell their teacher at school about the books and games they had received. Perhaps "I'm a member of a club" provides a simpler, less problematic explanation than the more emotional "I'm getting books and games because I'm in care". Elements in the parcels that emphasised 'being in a club' (all marked with a Letterbox Club logo) were consistently popular, including personalised sticky labels with "This book belongs to..." and the child's name printed on them.

### Theme 8

Children liked the element of surprise, not knowing what books they might get, and carers, too, commented that this broadened the range of books their children used. Many foster carers said that they looked forward to the parcels arriving as much as the children. For example, the foster mother of Janie, aged 8, wrote, "Everything in the parcels was excellent, but the Diary of a Killer Cat was superb and the CD is used in the car all the time – I love it, too!! Hope we can have more parcels one day."

### Theme 9

Relationship building aspect of Letterbox: Children enjoyed Where's Wally? (published as Where's Waldo? in North America) for its social qualities – one carer of a girl aged 8 wrote, "We all had a go at Where's Wally? – even the teenagers wanted to have a go." There were many reports of children reading to each other, and asking others (both adults and children) to read to them. For example, Kyle, aged 12, told us he read excerpts from the Guinness Book of World Records to his younger brother: "I'd show him stuff that was

a bit weird and stuff. Like the dog with the longest tongue". The majority of carers (over 80%) indicated that the parcels had helped them do more with the child. Many foster carers commented on the value of the materials in helping them make better attachments with their children. The carer of Marley, aged 10, wrote, "Found it a great way to bond with my daughter", and the carer of Danny, aged 9, said, "He has had fun, and we have spent a lot of time together because of Letterbox Club." Cadey was 11, and his foster carer wrote, "He is still a reluctant reader, but the books give us an opportunity to spend time together". The carer of another 11 year old said, "It's nice to have something to do with Jamie, where he doesn't feel I'm forcing my attentions on him. He finds it very hard to be close to anyone, but he's been keen to be read to and to play the games he's made. It's made me feel more comfortable with him".

#### Theme 10

New ways of reading (audio): At least one parcel in each age range included a story on CD with its accompanying book. Many carers commented that they had not previously thought of using audio stories with their foster child, but said they were often used at bedtime or on car journeys. The carer of Damon (aged 11) said, "He's of an age where he wouldn't appreciate a bedtime story from me, but he listened to the CD at bedtime" and another, with a foster son aged 8, wrote, "Best gift ever... He never seems to get enough of it".

#### Theme 11

Variety in the packages was helpful: Foster carers commented favourably on every genre of books in the parcels – one foster father said, "Poetry, I'd never have thought of that, but it's great!" Non-fiction was similarly praised by foster carers: "I've learnt such a lot". Classic books, where many foster carers would already know the story, were welcomed: for example, when Danny, aged 10, received The Silver Sword, he said, "my [foster] dad knows this story, he read it when he was at school".

#### Theme 12

Encouraging education in a non-threatening way: providing educational support in a nonthreatening and enjoyable way could contribute to improving the stability of foster care placements. Certainly, the parcels raised the profile of educational activity amongst children and adults in many of the participating families, and for some children it seemed to have begun a 'virtuous circle' of improved engagement at school and improved feelings of well-being in the child, with consequent feelings of relief and positive engagement for the foster carer. As Kezia (aged 12) said, "When you come home [from school], you're not expected to read or write, are you! Cause it's sort of your spare time. But because I got the Letterbox Club, I did sometimes read or write at home, and it helped me at school because I was prepared to do it at school." Her foster mother's pleasure at the improvement in Kezia's attitude to school was evident when she was interviewed.

	Section	Question	Answer
<b>Risk of bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	No ( <i>Authors do not clearly justify the qualitative research design</i> )

	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	No <i>(Unclear how participants were selected for the qualitative aspect of this mixed methods study, or why these were the most appropriate. Unclear why some participants chose not to take part. )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	No <i>(Semi-structured interviews were conducted, however it is not explicit what the methods were. Form of data is not clear and the researchers did not discuss saturation of data. )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(unclear that researchers ritically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Can't tell
	Data analysis	Was the data analysis sufficiently rigorous?	No <i>(there was no description of how/if thematic analysis was performed. Unclear that researchers critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	Can't tell <i>(Often unclear what portions of the data were retrieved from the qualitative interviews and which from comments on the questionnaires. No discussion of credibility of their findings (e.g. triangulation, respondent validation, more than one analyst))</i>
	Research value	How valuable is the research?	The research has some value <i>(The research focuses on an intervention of interest. No discussion of generalisability of findings. )</i>

	Overall risk of bias and directness	Overall risk of bias	High
		Directness	Partially applicable <i>(It is likely that some of the data was collected prior to 2010)</i>

## Hiller 2020

### Study Characteristics

<b>Study type</b>	Focus Groups
<b>Aim of study</b>	The aim of this study was to understand how carers support the emotional needs of the young people in their care and their views on barriers and opportunities for support.
<b>Study location</b>	UK
<b>Study setting</b>	Foster care in one local authority in England
<b>Study methods</b>	Authors used an opportunity sampling method. Flyers and information sheets advertising three focus groups were circulated via the local authority, foster carer newsletters and social media. Recruitment involved two key methods. First, authors accessed established support groups within the local authority, and second passive recruitment was used whereby interested carers contacted the researcher for more information on the study. Authors ran three qualitative focus groups to gather in-depth information about their views on supporting their foster children's emotional well-being. Participants also completed short questionnaires about their training experiences and sense of competence. The three focus groups consisted of nine, seven and five participants. All took place in a local community hall. Focus groups were run using a semi-structured topic guide that was intended to capture information on (1) the types of challenging behaviours and

	emotional difficulties that carers have managed, (2) how they cope with, or manage, the emotional and behavioural needs of the children and teens they care for, (3) the positives and negatives of being a carer, and (4) barriers to providing effect support to their foster child. All focus groups were audio recorded and transcribed verbatim. Transcripts were quality checked by another researcher who had not attended the focus groups. Using NVivo software, the transcripts were then coded using a reflexive thematic analysis approach to identify themes and patterns in the data.
<b>Population</b>	Foster Carers
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	ESRC Future Leader Grant
<b>Inclusion Criteria</b>	Carer situation foster carers, who cared for young people within a moderate-sized urban local authority in England.
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p>Sample size: 21 foster carers</p> <p>Type of care: Type of care - Long term: 71%; Short Term: 62%; Respite: 43%</p> <p>Gender: 86% female</p> <p>Age: mean 51.94 ± 5.85</p> <p>Caring for: Babies: 19%; Preschool: 10%; School-aged: 76%; Adolescent: 52%</p> <p>Ethnicity: 81% White British. 19% Black British</p> <p>Carer characteristics: Years as a foster carer: 10.39 ± 8.42; Biological children at home: 57%; Partner at home: 43%; Additional employment: 38%; Number of foster children: 2.00 ± 1.14</p>

<b>Relevant themes</b>	<p><b>Theme 1</b> Theme 1: carer strategies for managing challenging behaviour Participants discussed the types of behaviour exhibited by the young people they cared for, and how they responded to these issues. Responses across all three groups broadly fell into three subthemes.</p>
	<p><b>Theme 2</b> Subtheme 1: foster carers often manage extreme and challenging behaviours - For most participants, the most salient examples of their challenges supporting young people were in cases of extremely challenging behaviours that were very difficult to manage. While it was acknowledged that this was certainly not the case for all young people for whom they cared, all focus groups largely focused their discussions on their particularly challenging examples. Participants discussed, at length, the difficult behaviours displayed by some of the young people they currently or previously cared for. Commonly discussed behaviours included aggression, behaviours that were perceived to be manipulative (eg, chronically lying), violent conduct and poor emotion regulation. Managing these behaviours day to day in the home was reportedly extremely challenging. "Very, very violent to everybody, violent to things, smashing up cars and that sort of thing. She did not sleep, she stripped herself naked, she weed all over the place, she was banging herself on the wall."</p>
	<p><b>Theme 3</b> Subtheme 2: reliance on training and general parenting techniques - to manage challenging behaviours. Participants discussed their application of general parenting techniques and content from training courses in response to challenging behaviours. Responses commonly included practical responses to keeping the young person and broader family physically safe. "I literally slept on the landing [hallway]. [to keep family safe]" In addition, foster carers described trying to make the child feel psychologically safe, including feeling loved, having the opportunity to share their worries and having stability. In terms of how they learnt these responses, there was little consensus, although many carers suggested they were drawing on their parenting instincts, rather than formal training. "You can make them your own kids and I think sometimes that is all they want, they just want the normality." There was also much discussion about 'trying to manage their exposure triggers', which meant trying to predict situations or factors that might remind a young person of their early experiences and work out how to respond. "We are all psychologists whether we've had the training or not. You've literally just got to stop for a minute and look at what they're doing and look at what the triggers are and think 'Well what sort of lifestyle did they have? Why is that a trigger?'" This was often challenging as carers were not always aware of the extent of early experiences, particularly when the child was new to them. Views on how to respond to triggers for challenging behaviours varied. When a trigger had been identified, some carers talked about using techniques to support children to face their fears in a controlled and safe way. This was particularly used as a method if they understood where the child's behaviour was stemming from. "I turned my vacuum cleaner on, s/he'd be hysterical... I said to the [biological] grandma one day about her having [this reaction] and she said 'that would've have been because [grandma explained maltreatment experience related to this reaction]'." So then we worked with the vacuum cleaner, with his/her own vacuum... and I dropped things on the floor ALL the time... Not to traumatise him/her but to say 'it's ok'. In other cases, identifying the triggers and avoiding them in the future was seen as the best approach, to avoid the child experiencing further distress, as well as outbursts of anger that often accompanied exposure to triggers. For example, in the case of a young person who had particularly difficult memories around kitchens. And you can be sitting there and 'oh I'm just cooking come and sit...' [and then you think] 'Oh shit I shouldn't have done that' because all of a sudden pots and pans are flying because it took [the child] into a dark place. So if we're recognising those things and trying to avoid them, really. Carers also made specific reference to their formal training, with the most commonly discussed training based on the principles of playfulness, acceptance, curiosity and empathy (PACE). Positive and negative aspects of this technique were discussed by participants. All agreed with the principles of this training (eg, the importance of empathy), although participants described difficulties in successfully employing playfulness and humour with their young people who had particularly complex psychological needs. "Playfulness was very, very difficult."</p>
	<p><b>Theme 4</b> Subtheme 3: it was considered particularly important that the young person had someone to talk to about their experiences, which was usually the carer - All carers agreed that to support the child's emotional well-being it was important that they had the opportunity to talk about their precare experiences. All reported that they were often the first person to whom the young person begins to disclose their maltreatment, but some felt ill equipped to manage this or questioned whether it was appropriate for the carer to take on such a therapeutic role without support from services (discussed further later). "Until the kids start talking, they're not healing." Of course, young people varied in how open they were when talking about the past, often only disclosing in situations in which they felt safe or more willing to talk, such as when watching TV or in the car. Often carers reported that this might happen in quite unexpected places (eg, while out shopping) so carers needed to be prepared to respond whatever the environment. Participants frequently responded to disclosures by maintaining a safe environment to encourage continued disclosure, such as by putting something benign on TV or extending car journeys. "One child who used to always talk while the foster carer was driving. And s/he said one day s/he'd just go round and round this roundabout 'cause s/he wanted this kid to carry on talking." While carers thought these</p>

discussions were important for supporting the young person and also for developing trust and security, they also reported that the training they were provided with in relation to such conversations could be constraining. Caregivers described training as being focused on important concerns with respect to legal aspects of disclosure, such as being careful not to ask leading questions. Many also reported that training suggested that the carer should conceal any emotional response during these conversations. Participants discussed how much of this guidance is difficult to follow in practice and questioned its benefits in terms of the child's emotional well-being. In particular, displaying no emotion was criticised as being an 'impossible' and potentially damaging response to disclosure. "[It's] not really giving them [the child] permission to show feeling." This was especially relevant to the discussion of young people who had demonstrated a limited understanding of their experiences, often expressing confusion, guilt or a lack of emotion and awareness that what happened to them was wrong. Therefore, in what they perceived as a contrast to what they learnt in training, some carers discussed the importance of naming emotions for the young person, so that they can begin to comprehend what happened to them. "He's got no emotions with it, he's got no feelings, he's got no understanding of it. [If they cannot label their emotions] So you're saying 'oh if that was me, I reckon I'd be feeling...'"

### Theme 5

Theme 2: perceived lack of support and adequate training from services - Almost all participants reported seeking additional support from services, particularly social care, regarding the mental health of a young person who was, or had been, in their care. However, there was a strong perception that support from services was extremely limited. Most, but certainly not all, carers discussed this as a major barrier in supporting the needs of their young person. Across all three focus groups there were two consistent subthemes.

### Theme 6

Subtheme 1: perceived support from social care and mental health services was often seen as poor and inconsistent - A few participants reported positive relationships with their social workers, and discussed how they were central to supporting the carer and the child, and most recognised that social care systems were under significant resource pressures. Nevertheless, in many cases communication between carers and social workers was described as poor and particularly problematic in terms of being able to effectively support the child. Perceived long delays in the time social workers took to respond to carers played a significant role in this, as they meant that participants frequently were left to manage extremely difficult behaviour unsupported. That's what's really hard, it's the waiting time. You're struggling to hold these together, you've got nowhere to turn, or you feel you've got nowhere to turn, you're really managing really traumatised children and you have to wait and wait ... and wait. Participants were also concerned that responses were often inconsistent across social workers. This lack of a clear, universal protocol was perceived as leading to inconsistencies in practice, meaning that the quality of support provided depended on the social worker, rather than the individual needs of the young person. Participants discussed how this inconsistent and often broad-brush approach created challenges for carers in navigating and communicating effectively with social workers. If you lined them up and asked them the same question, you'd end up with 40 different answers, and that is scary. Many participants discussed the negative impact of this poor support as a potential barrier to the relationship between the carer and the child. For example, there was a perception that social services did not always pass along information to carers, or in some cases actively withheld information, particularly in relation to previous behaviour or emotional difficulties. Most participants described how significant information about the young person was often discovered a considerable amount of time into the placement through sources outside of social services, such as previous foster carers or the young person's biological family. Many participants felt that, had this information been passed on earlier, particularly around their maltreatment histories or behaviour difficulties, they would have acted differently to manage behaviour and facilitate their relationship. Some thought this information was withheld as the social worker was worried that the carer would not take the placement if they knew the details of behavioural difficulties. Sometimes you find out things six months down the line and you think I wish I had known that at the beginning because you would have done things different. And it, you know, it is very hard. Once that six months have lapsed it's very hard to backtrack. Overall, communication within and between services (eg, between social care and mental health services), and then with the carers themselves, was seen by most participants as highly problematic and a key hindrance to their ability to advocate for their young people and support their needs. None of the systems talk to each other. I feel complicit in a system that is not really helping these children it's just housing them, and that feels tragic.

### Theme 7

Subtheme 2: perceived professional support limitations have a negative impact on the young person and carer well-being - The perceived lack of support from outside services was described as affecting both foster carers and the young people in their care. Many foster carers reported feeling exhausted as a result of managing challenging behaviours unsupported. This, in turn, compromised their ability to support the young person with techniques which often require a great deal of energy and consistency. "We are working 24/7 on very little sleep at times and we are expected to continue, and be playful, and empathetic, and curious and accepting!" Participants also described experiencing 'secondary trauma', relating to the emotional distress experienced in response to young person's disclosures. Participants explained that their training in relation responding to disclosures did not adequately prepare them for how they might feel when hearing the young person describe precare experiences. "You feel absolutely everything that [the child experienced], and that is horrible." In light

of the limitations to perceived support from services and negative consequences for foster carers' well-being, foster carers perceived the support of their own community to be particularly important. Friendships and online groups within the foster carer community were generally identified as being valuable in providing foster carers a safe space to express their frustrations and support each other emotionally. It also allowed foster carers the opportunity to acquire more practical support, where outside services were lacking, through sharing parenting techniques and advice. "That's where we get most of our ideas and training."

### Theme 8

Theme 3: lack of access to mental health services and mixed views on helpfulness - Formal mental health services, particularly child and adolescent mental health services (CAMHS; part of the UK National Health Service), were discussed by almost all participants across the three focus groups, who had all had a young person whom they believed required professional support.

### Theme 9

Subtheme 1: many young people whom foster carers perceived to need mental health support were not able to access it - In many cases carers had examples of young people with significant needs who they perceived as being failed by the system because they were not referred for mental health support or they were referred but could not get access. S/he could see this black hole... s/he'd hit her head on the wall. I was still left to deal with it all and in the end they sectioned him/her [at 16 years old]. I think from the age of 6 [years old] I was telling them there was something wrong. But you know what we get a lot of is... there's nothing wrong with them, it's attachment. They love to throw attachment absolutely everywhere." In many cases where referrals were made, carers discussed extremely long waiting times and increased criteria/thresholds to access treatment. The discrepancy between mental health support accessibility for biological children and for young people in care was also criticised by some participants. "Now he's in line for CAMHS and by the time he's 21 he'll be there!" "My own daughter suffers from anxiety, I can go and say 'she needs to see somebody', she's seen, she went to CAMHS within 3 months. Yet we've got children that are in the system that have got to wait years."

### Theme 10

Subtheme 2: where professional services were accessed views on usefulness were mixed - Only a minority of cases had successfully accessed mental health support, either via CAMHS, the charity sector or a school counsellor. From those that did, mixed opinions were expressed surrounding the quality of support received. The primary positive of getting a child into professional support was that they were provided with an opportunity to talk about their experiences with a trained professional. It's giving him a space, where he can go and um be... to talk really I suppose. He's learning to talk ... about things. If you get to a place where they'll [child] engage they [mental health professional] will do brilliant stuff. Key barriers to successful treatment outcomes included the perceived message from CAMHS that the child could not be seen unless they were in a stable placement: "They can't go to CAMHS until they're in a stable placement. But you can't say that they're going to be in a long term stable placement because you don't know whether or not you're going to be able to look after that child." Attachment models were often viewed as the blanket response for children in care, without proper assessment of the child's needs. Relatedly, some carers felt their views were not appropriately considered in relation to the psychological support needs of their foster children or teens. There was particularly frustration around the response to requests for support to be the offer of further carer training, without any direct work with the young person: "... [CAMHS says] it's attachment, it's attachment. I said 'It's not attachment, he is saying some weird things, it's not attachment. I don't need for you to tell me how to manage his behaviour, I'm fine, I don't need counselling, I'm alright, it's him that needs the counselling but they can't do him [see child] until they've done you [further carer training]. [CAMHS says] oh no no, everything's fine...' and we're like 'No no no, I'm with this child 24/7, you have no idea, you have no idea of what that is then...' And that the young person may not engage with the therapist, meaning sessions were ceased. The thing with CAMHS they're only any good if the child is willing to engage. Overall, where young people had accessed support, carers were also keen to be as involved as possible in the therapeutic process. Some reported that they felt left out of the therapeutic process. While they understood considerations around confidentiality, they believed that being more involved, even by just knowing what they should expect from the process in terms of the young person's reaction, would have been helpful in enabling them to appropriately support the young person at home. I know what they sometimes tell you they don't want us to know and I know it's supposed to be confidential and contained, but sometimes it would be nice for them to give you a little bit of feedback and say 'well in thi- in today's session, they talked about this, this' or 'look out for this, this and this' because sometimes you can have little kids that can come out, I mean I used to get tied to a chair, I used to get things thrown at me, and I used to think 'where's that come from?'

## Risk of bias

Section	Question	Answer
Aims of the research	Was there a clear statement of the aims of the research?	Yes
Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
Research Design	Was the research design appropriate to address the aims of the research?	Yes
Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes
Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(no discussion of saturation of data)</i>
Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell
Ethical Issues	Have ethical issues been taken into consideration?	Yes
Data analysis	Was the data analysis sufficiently rigorous?	Yes
Findings	Is there a clear statement of findings?	Yes <i>(more than one researcher used for analysis)</i>
Research value	How valuable is the research?	The research is valuable
Overall risk of bias and directness	Overall risk of bias	Low
	Directness	Directly applicable

**Hooley 2016**

<b>Study type</b>	Focus Groups
<b>Aim of study</b>	to capture a wide range of views from individuals with different experiences of the work, from implementing to receiving life story work, and to see if they shared an opinion regarding how to do it effectively.
<b>Study location</b>	UK
<b>Study setting</b>	Health and social care agencies with experience of life story work
<b>Study methods</b>	The study used Q-methodology. The participant was asked to rank statements about the topic along a continuum, in this case from least important to most important, using a Q-sort. This is a grid that forces the participant to rank statements against each other. It only allows a few statements to be placed in the most and least important ranks in order to identify those that participants feel most strongly about. Participants are then clustered into groups based on the way they rank the statements. Those who rank them in a similar way are clustered into the same group and are said to hold similar views. Participants in this study were asked to rank 57 statements (Appendix 1), derived from a wide range of views on the topic of LSW and developed via a thematic analysis of available literature. A focus group of professionals who carry out LSW was also conducted to check the validity and completeness of the statements.
<b>Population</b>	Cinical psychologists, other therapists, social work professionals, foster carers, adoptive parents, care leavers
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported

<b>Inclusion Criteria</b>	None reported
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> Clinical psychologists (7), other therapists (2), social work professionals (6), foster carers (11), adoptive parents (5), care leavers (4)</p> <p><b>non-white ethnicity</b> one participant was a traveller, one was arabic</p> <p><b>Gender</b> 7 male, 22 female</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> Group A: 'Successful life story work involves the safe and supportive exploration of a coherent life narrative'</p> <p><b>Theme 2</b> Group B: 'Successful life story work involves a child-led, ongoing approach based on here-and-now relationships'</p> <p><b>Theme 3</b> Group C: 'Successful life story work involves a comprehensive and adaptable record'</p> <p><b>Theme 4</b> All groups - Life story work should not be stopped if difficult feelings come up: The analysis of the views of the three groups revealed one common perception. The statements relating to this all emphasised 'feelings to be shown, managed and normalised'. Participants in all groups agreed with the suggestion that work should not be stopped if difficult feelings came up and that upsetting or traumatic experiences should be explored. They indicated that a balance needed to be achieved that included happy as well as difficult memories. One participant described how: "... if the worker prevented the child from expressing and discussing their feelings ... they are in danger of replicating unhelpful parenting patterns which might perpetuate any existing emotional difficulties." "Everyone has a history we can't control and we need to learn how to handle the feelings and emotions that come to the fore when we try to learn about it and understand it. That's all we can control about it."</p> <p><b>Theme 5</b> Group A - A safe and secure relationship is key: Participants in Group A ranked statements about the child needing to feel safe and secure with an adult before starting LSW as particularly important. Among them, there was an emphasis on getting the aspects of the support 'right' in terms of establishing the 'right time' to start the work rather than relying on the cognitive ability or age of the child. Participants highlighted an 'attuned' and 'safe' relationship with a worker as an essential pre-requisite of LSW and linked this to needing to go at the child's pace as opposed to being driven by other agendas: "Life story work can sometimes be a tick box exercise to appease the system rather than for the benefit of the child." "Children can make meaning from their story at any stage in their life, with the right support and carers around them."</p> <p><b>Theme 6</b> Group A - Questions need to be answered during life story work while exploring meaning: Four of the most important statements ranked by this group related to the information that needs to be shared with the child, answering questions about his or her birth family, why they came into care and details of their background and culture. A thorough history</p>

needs to be obtained before starting LSW with the child in order to provide a coherent and accurate narrative. "I have worked with children where a placement turned out to be abusive yet the life story book suggested it was a happy placement. A thorough history needs to be understood before making assumptions about a child's life." "We cannot assume meaning for the child. The child may have a very different experience of an event than the professional who put the story together." "Facts are often hard to establish . . . and it depends on a person's viewpoint – a social worker's view of the 'facts' will be different from a birth parent's."

### Theme 7

Group A - training and support: Training and support for workers and carers were more important for this group than for the others, with one participant commenting that 'workers are under great pressure to do work in less time with less support'. One-to-one sessions with a worker were ranked as especially important and it was indicated that specific skills and expertise were needed when carrying out the work. Participants in this group also thought that LSW could not take the place of therapy. One described the specific skills required as: ". . . [an] ability to take the child's perspective, attunement to the child's needs during the session, e.g. recognising signs of distress and helping to co-regulate these in situ, basic knowledge of attachment theory in relation to the need to provide a secure base."

### Theme 8

Group B - Child taking the lead: Participants in Group B placed more importance on the child's contribution to the process of LSW, in particular on the pacing and direction taken by the work and on the need for it to be interesting and fun. Comments included: 'the child always needs to have input into their life stories' and 'the child should decide how it is done – time–speed–understanding'. A 'here-and-now' approach was advocated by this group, with the child determining when she or he is ready to look back. One participant emphasised the value of the carer and child finding information out together: "[LSW] could be more effective if it is discovered when appropriate by the child and the worker/ foster carers together."

### Theme 9

Group B - need for a secure base and attunement: There was importance placed on the child feeling safe and settled before starting the work, with the relationship between the child and carer or worker needing to be strong. Time, predictability, structure and empathy were seen as the key components for achieving this. Qualitative information suggested that showing empathy and understanding would help children engage and feel able to express themselves: "This helps the child to engage in conversation about their past, problems . . . the adults cannot easily help the child if they have no understanding of them."

### Theme 10

Group B - Carers can do life story work: This group placed less importance on formal one-to-one work with a trained professional and gave high rankings to statements relating to carer involvement. These emphasised the need for carers to be included in the work, interested and supported. Qualitative information suggested that more attention needs to be given to the carers and adopters who provide the main support to the child: "There are no skills needed, only a bond between the child and the adult that ensures the child is comfortable to share with this person important events in their life. . . . children should see everyone working together."

### Theme 11

Group B - Collecting an ongoing story. This group again identified items that should be included within the LSW, such as important events and milestones, photos and memorabilia. Participants also highlighted the importance of the ongoing nature of LSW. Qualitative reports suggested that Hooley et al. 225 ' . . . adding memories is important and allows the child to understand they can have good memories as well as bad ones'. They disagreed strongly with the use of fantasy when information was not available and the need for the story to reflect what the child wanted to find out rather than seeking to provide a full chronology that might be inaccurate.

### Theme 12

Group C - Building a comprehensive record. The most important statements for those in this group related to providing the child with information, answering questions and recording important details. Links to the birth family such as names, looks and cultural background were highlighted. The value of collecting items and photos was especially emphasised by this group. Facts and detailed information were also seen as more important, particularly as they might be useful in the future: ". . . book that tells the baby/child of his/her life with me. It . . . will hopefully answer the questions of what did I do, when did I do it, how did I do it, who did I do it with? . . . the child, a future adult, may not have contact with birth family members who can tell them anecdotal stories or anything about their past."

	<p><b>Theme 13</b> Group C - a full and complete life story work: Value was also given to achieving full and complete LSW. Statements relating to missing information, leaving out details and providing a variety of views were ranked lowly. Qualitative accounts referred to the importance of including both good and bad memories: '... all memories are important – both happy and difficult – as they have helped shape the child's life</p> <p><b>Theme 14</b> Group C - A changing record started as soon as possible (when young): Group C also placed more importance on the ongoing nature of LSW, but with an emphasis on the usefulness of giving information to a child when they are young and adding more detail as the child gets older. The life story book was seen as a method of providing this and, therefore, should contain information about the whole of a child's life and not be compiled by a single worker. Qualitative information suggested that any work and information should also be age appropriate: "You can't bring children up with lies, but decide which age throughout the life is appropriate. The child will get different things at different age/times from the book. It is important that it is looked at as and when the child wants to. It also suggested that information collection should start from the day the child enters care: The memory box and book starts from the day the child came into foster care not at the end of that part of their life."</p>		
<b>Risk of Bias</b>	<b>Section</b>	<b>Question</b>	<b>Answer</b>
	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Can't tell <i>(Researchers did not explain how the participants were selected or why the participants they selected were the most appropriate to provide access to the type of knowledge sought by the study. No discussion regarding why some participants chose not to take part)</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(However setting was not justified or form of data.)</i>

	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Yes
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Yes
	Findings	Is there a clear statement of findings?	Yes
	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	Low

### Kirton 2011

<b>Intervention</b>	<p><b>Multidimensional treatment foster care (N = 31)</b></p> <p>Multidimensional treatment foster care, in its UK incarnation, reflected New Labour's concerns for joined up working between social care, education, and health agencies. There were important differences between the context and operation of MTFC in the UK compared to the USA. These included the location of MTFC within the care system rather than in a criminal justice setting. Another difference was that planned returns to birth families were relatively rare. Instead, the focus was on improved contact and relationships rather than training birth parents to pick up the model of care taught by Oregon Social Learning Centre. Government guidance suggested initially concentrating on those who were likely to progress in the programme, to build confidence, before</p>
---------------------	---

	moving on to harder cases. In evaluating the workings of the OSLC model it is useful to highlight two distinct but related challenges. The first is the different profile of UK participants compared with the US counterparts, and the greater emphasis on voluntary participation. Second, the highly prescriptive nature of the model can be seen as giving rise to tensions between the need for creative adaptation to the UK welfare system and the benefits of strict adherence to the programme.
<b>Study type</b>	Semi structured interviews Evaluation of an intervention Multidimensional Treatment Foster Care
<b>Aim of study</b>	to explore the experiences of multidimensional treatment foster care
<b>Study location</b>	UK
<b>Study setting</b>	local evaluation of MTFC within one of the pilot local authorities.
<b>Study methods</b>	Semi-structured interviews were conducted to explore respondents experiences of working within and perceptions of the MTFC model. No further information was provided about thematic analysis.
<b>Population</b>	Foster carers (8), children's social workers (6), supervising social workers (2), individual therapists, birth family therapists, skills workers (3), social work assistants, programme supervisor (1), programme manager (1), members of the management board (4)
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported
<b>Inclusion Criteria</b>	None reported
<b>Exclusion criteria</b>	None reported

<b>Sample characteristics</b>	<p><b>Sample size</b> 31 interviews were conducted: Foster carers (8), children's social workers (6), supervising social workers (2), individual therapists, birth family therapists, skills workers (3), social work assistants, programme supervisor (1), programme manager (1), members of the management board (4)</p> <p><b>Number of previous placements</b> half of the children had had ten or more placements</p> <p><b>Age</b> roughly three quarters of the children were aged 13 or over.</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> A common language and focus: One of the main strengths offered by the OSLC model was a degree of focus or 'common language' (seen as crucial in a multi-disciplinary team) and clarity of expectations for young people: "We're all very clear about what we're working towards and it helps in not splitting that group around the child. (Team member)"</p> <p><b>Theme 2</b> The emphasis on rewards and punishments was generally regarded as crucial, both for its transparency and potential for setting and maintaining boundaries: "If they don't earn it, they can see it, there's something there that they can see, you can hold up in front of them and show them. (Foster carer)"</p> <p><b>Theme 3</b> Taking the emotion out of the situation: Another strength was the perceived capacity for the model, with its relatively neutral and technical language, to 'take the emotion out of the situation' and to avoid escalation in the face of anger and outbursts: "In a way it stops people really feeling too criticised because it's like ... if someone says to you 'off model' that's like, 'Oh well, I can get back on the model.' (Team member)" "You need to be quite calm and not easily fired up, to be able to just walk away when they're ranting and raving and they're in your face and they're shouting at you, and just walk away and let them calm down. (Foster carer)"</p> <p><b>Theme 4</b> Limitation 1: certain aspects of it needed to be 'Anglicised': Where they occurred, flexibilities tended to reflect either cultural differences or acquired practice wisdom. Within its UK context, some team members saw the programme being more holistic and less focused on 'breaking the cycle of offending', an emphasis sometimes couched in the language of 'leniency': "Helping that child develop ... in whatever way they need and meeting their needs to enable them to move to independence or whatever goes next to it. (Team member)"</p> <p><b>Theme 5</b> Limitation 2: , it would work for some young people but not others;</p> <p><b>Theme 6</b> Limitation 3: the longer-term benefits of the programme were uncertain</p> <p><b>Theme 7</b> Sticking to the model as a team: A clear majority of interviewees saw themselves and the programme sticking closely to what they understood as 'the model', while often disclaiming any detailed knowledge of it. This partly reflected the routinisation of practice and perhaps the strength of team ethos: I know ... as a team we work towards the model and it's the Oregon model that we follow but it feels much more like we're working to our team model. (Team member) Broad adherence reflected a number of factors. First, the model appeared to 'make sense' to most of those involved, with several foster carers claiming (though with perhaps some oversimplification) that this had been the basis of their own childrearing: It's basically the way I brought my own children up, which is good children get lots of nice things and naughty children get nothing, but I do it with</p>

points. Second, the consensus was that, albeit with some flexibility (see below), the model 'worked' but that this required fairly strict adherence: We're very close to the model on most things and whenever we stray I have to say that it kicks us in the teeth. (Team member) A third factor was that of external monitoring and reporting mechanisms, whether from the NIT or OSLC itself. While this sometimes involved elements of 'presentation' to outside audiences that differed from day-to-day realities, it also served to reinforce the programme's logic and philosophy.

### Theme 8

Followed in spirit rather than to the letter: Much of course, depended on how far the model and its weighty manuals were to be followed 'in spirit' or 'to the letter'. For example, one team member argued that expectations of young people in terms of healthy eating and eschewing of hip hop or rap music were unnecessarily restrictive and perhaps 'unrealistic'. While most foster carers came to find the award and deduction of points reasonably straightforward, the challenges, such as balancing consistency and individualisation and handling value judgements, should not be underestimated: "My lifestyle to somebody else's might be totally different and what I accept in my house is different to what somebody else accepts in theirs. (Foster carer)"

### Theme 9

What constitutes normal teenage behaviour? - Additional challenges included what constituted 'normal teenage behaviour' and how far the focus for change should rest with 'large' and 'small' behavioural problems respectively. These issues were, however, usually resolved fairly easily, with foster carers happy with their degree of discretion. Parental Daily Reports were sometimes seen as 'a chore' (Westermarck et al, 2007), but almost universally valued for their capacity to concentrate minds on behaviours, to ensure daily contact between foster carers and the programme and help 'nip problems in the bud'. "It makes me think about if things have happened, how I can do them better or how we can both do it better. So it's reflection for me. (Foster carer)"

### Theme 10

parental daily report - The data yielded were seen as useful for identifying trends and one-off or recurrent 'spikes' that might reveal behavioural triggers, such as contact visits or school events and as having a potential 'predictive' value for disruptions and optimal transition timing (Chamberlain et al, 2006). There were concerns that the prescribed list of behaviours was in places too 'Americanised' (eg 'mean talk') and that selfharm (not infrequent within the programme) was not listed separately but under destructiveness, requiring annotation to distinguish it from instances of 'kicking the door in'. Similarly, there was no reference to eating disorders other than 'skipping meals'. The question of whether behaviours were 'stressful' was clearly dependent to a degree on foster carers' tolerance and time of completion: "The next morning or the night time everything's died down and it probably isn't such a big deal ... [do] you give yourself that time just to calm down before you put it in the behaviour or should you do it when it happens? (Foster carer)" Concern was also expressed that the Parental Daily Report's focus on negative behaviours was not entirely congruent with the programme's aims of accentuating the positives (see below), a situation that was seen as having a cultural dimension, with one team member commenting, albeit as a generalisation, on how US counterparts in MTFC tended to be 'more upbeat about things' and hence less likely to dwell on negative behaviours.

### Theme 11

Engagement was crucial to outcomes but highly variable and prone to change over time: "She couldn't give a monkey's. It didn't matter what I'd say she was not gonna . . . And she stayed with me for three months and then she decided she'd had enough and went. (Foster carer)" More generally, however, engagement levels were thought to be high, with some respondents indicating surprise at the apparent willingness to accept a restrictive regime with its initial 'boot camp' withdrawal of privileges: "I find it bizarre that they engage with it really quite well ... I kind of think if I was a 13-year-old lad ... would I really want to be negotiating buying my free time, my time out with points? But they do ... and they stick to it. (Team member)"

### Theme 12

Need for persistence: Situations were described where young people would rail against restrictions and thwarted demands but ultimately comply. While the motivational value of an identifiable goal (such as return home) was recognised, sustaining interest day-to-day was equally important and required delicate judgements from foster carers as the following contrasting approaches indicate: "My young man likes to look at his points on a daily basis so we go through them with him and then we sit down and work out how he's gonna use his rewards and what he's aiming for next. I have to say that I don't sit down and discuss points with [young person] every night because she will just rip it up and throw it at me and tell me what a load of bollocks it is"

### Theme 13

finding and tailoring the right rewards - Equally important, however, was finding the right rewards and appropriate means of earning them (although one young person was said to 'just like getting points'), something that might entail individual tailoring: "She needs to score points really, really highly, so whereas one foster carer might give one of the lads ten points for doing what she did, she may need to earn 50 for it to mean something. (Team member)" If this raises questions of 'inconsistency', it was justified in terms of motivation, individual pathways and progression through the programme (Dore and Mullin, 2006). Similar logic had meant 'massaging' points to prevent a drop in levels, where this might provoke running away or placement breakdown: "I think with some young people they ... just wouldn't manage being on level one and therefore it is slightly adapted to sort of manage that. (Team member)"

#### Theme 14

are normal activities privileges? - Transfer of placements into the programme also raised questions of how far previously 'normal' activities could be recast as privileges to be earned. Over time, this had reportedly given rise to some variations or changes of practice, for example, on televisions in bedrooms or consumption of fizzy drinks.

#### Theme 15

Need for redemption and engagement with point and level system - A key element of the OSLC philosophy is 'turning it around', allowing loss of points to be redeemed by subsequent good behaviour or positive reaction to the deduction. Although (some) foster carers felt this approach potentially made light of misdemeanours, the overall working of the programme was supportive of it: "Instead of giving her five points that she'd normally have I'll say, 'Well, you did that really well. I'll give you 15 for that today.' (Foster carer) You hear them talking about 'I really turned it around today' ... [or] 'I'm working towards my points.' You actually hear the children saying, 'I know I need to be on this programme'. . . they ... have that insight. (Team member)" One young person had reportedly asked his foster carer not to let him out in case he got into trouble and forfeited a much desired holiday, something that was seen as a significant shift in thinking and timescales.

#### Theme 16

A behavioural model or an attachment model? Behavioural programmes are sometimes criticised for lacking depth or concentrating on 'symptoms rather than causes', a debate we explored in interviews. Foster carers tended to focus on their own specific role in dealing with behaviours and saw the addressing of any 'underlying' problems as being the responsibility of others, especially the individual therapist, as in 'I'm just trying to break a pattern but it's not actually solving why they do it.' Also emphasised strongly was the temporal focus on present and future, by comparison with attachment models 'looking backwards'. If in some senses, practice remained firmly within a behavioural framework, this was not seen as precluding consideration of attachment issues, whether at the level of understanding – 'I find it quite hard not to think about things in terms of attachment' – or in outcomes: "I think what's been helpful is people have sort of said, 'Oh, it's not an attachment model' and I just have been able to say to them, 'What do you think actually putting a containing and caring environment around a child does?' ... It's not the kind of ... Pavlov's dogs type thing that everyone thinks about when they think about behavioural models. (Team member)"

#### Theme 17

Importance of appropriate matching: While in principle, behavioural approaches tend to de-emphasise the importance of relationship, the crucial importance of matching (which tended to involve consideration of several young people for one (or two) foster carer vacancies) was widely recognised and seen as a key area of learning within the programme: "I think we're getting it right more often than not and I think that's reflected in the ... reduction of disruptions. When we do get it wrong we get it wrong very spectacularly! (Team member)"

#### Theme 18

Move on placements: Marrying MTFC's twin aims of providing time-limited 'move on' placements while effecting sustainable behavioural change required complex judgements as to the optimal timing of transitions (Cross et al, 2004). Opinion was divided on this (national guidance had suggested a shortening of placements from around 18 to nine months) between those emphasising the time needed to deal with 'long-term damage' or the dangers of 'relapse' and those worried about stagnation, disengagement or young people 'outgrowing the programme'. While practice wisdom and programme data were seen as aiding decision-making, follow-on placements remained a significant problem. In some instances, this had been resolved by the young person remaining with their MTFC (respite) carers, although this usually entailed the latter's loss to the programme. Consideration had also been given to the establishment of 'step-down' placements to provide a more gradual reduction in structure and support (NIT, 2008). However, such provision is challenging in terms of recruitment. Several young people who had left MTFC had subsequently kept in contact, and interestingly this included some early and late leavers as well as graduates.

### Theme 19

Foster carers satisfaction with the level of support and out of hours service - Foster carers were extremely positive about levels of support in MTFC – ‘Just absolutely amazing’, ‘I have to say brilliant. 100 per cent brilliant’ – and some commented on how this had prevented disruptions that might otherwise have occurred. ‘Enhanced’ (relative to ‘mainstream’ fostering) features included higher levels of contact with supervising (and assistant) social workers and a structured pattern of short breaks or ‘respite care’. In addition to their primary role of granting some relief from pressures, these arrangements sometimes evolved into follow-on placements after disruptions, helping to provide important elements of continuity. Another crucial ‘enhanced’ feature was a dedicated out-of-hours service staffed by members of the team, which, though used fairly modestly (typically one or two calls per day), was highly valued for its provision of a crucial safety net: “There’s nothing more reassuring ... that you can ring someone up and actually hear that person on the end of the phone, it’s not some call centre or someone you’ve never met before. (Foster carer)” Use of the out-of-hours service ranged from serious incidents involving offending, (alleged) sexual assaults, suicide concerns and violence or damage in the foster home, to reassurance on medical issues and dealing with difficult behaviours.

### Theme 20

While the roles of therapists and skills workers sometimes raised issues of co-ordination with foster carers, their capacity to ease pressures at times of difficulty was valued by carers.

### Theme 21

the foster carers’ weekly meetings. These served both to ensure fairly prompt attention to issues, but also afforded the opportunity for mutual support and problem-solving

### Theme 22

Success of co-ordinated working - There has been little research on the operation of teamwork within MTFC or its external relations. Despite significant staff turnover and some reworking of roles, the programme had also benefited from continuity in some key positions and a capacity to fill vacancies relatively quickly. From interviews and observation, internal roles appeared to be fairly clear and well co-ordinated, although the team’s relatively small size had inevitably given rise on occasion to questions of flexibility, with tensions between willingness to help out and the maintenance of role boundaries (eg on provision of transport or supervision of contact): “On the whole, given that we have got a bunch of quite disparate professions ... we’ve got a conjoined CAMHS, education and social care team, there’s a lot less conflict than I thought there might be. (Team member)” The workings of MTFC both facilitate and require high levels of communication, combining multifarious opportunities for contact with a need to pass on information regarding ‘eventful’ lives and high levels of activity on the programme. With occasional, and usually fairly specific exceptions, team members regarded communication as very effective, while foster carers were generally positive about their participation: ‘They do value your input and they value your knowledge and your sort of past experience.’

### Theme 23

Leadership of programme supervisors - The role of Programme Supervisor (PS) as key decision-maker – variously referred to as ‘Programme God’ or ‘the final word’ – was crucial within the team. While some team members reported taking time to adapt to this, it was widely acknowledged that the PS and indeed ‘the programme’ could act as a lightning rod to defuse conflicts involving young people and their foster carers: “Always it’s [PS], says’ ... in answer, so my [young person] wishes that [PS] would drop dead at any moment. But that takes a huge amount off of me because it’s not me who’s saying it. That’s absolutely been brilliant. (Foster carer)”

### Theme 24

Clash with the children’s social worker - Like any specialist programme, MTFC has faced challenges in its relationships with CSWs (often exacerbated by turnover among them) regarding the balance between a necessary transfer of responsibility on the part of CSWs while they continue to hold case accountability (Wells and D’Angelo, 1994). Despite routinely sent information and discussions with the PS, almost all CSWs interviewed expressed some concerns, usually involving either not knowing of specific incidents (eg entry to hospital) or more ongoing matters, such as the content of counselling. For some, the concern was simply about being ‘out of the loop’, while for others it was the potential for exclusion from decisionmaking and conflict with statutory duties: “It seemed to me that the treatment fostering team pretty much took on responsibility for the case, which is fine, but if anything goes wrong then don’t make me accountable.” From a programme perspective, there were occasional references to CSWs who ‘found it hard to let go’, or whose misunderstanding caused confusion. As one foster carer put it, ‘they start telling these kids all sorts of things and you’re thinking “no actually, they can’t”’, although it should be noted that some CSWs were viewed very positively. A more common concern, however, was that some CSWs ‘opted out’ once the young person entered MTFC, although this was often acknowledged (on both sides) as understandable given the workload pressures facing children’s social workers: “[. . .] was the sort of child I used to

literally wake up worrying about and I don't now because somebody else is doing that worrying. (CSW)" Encouragingly, CSWs also referred to improving communication, with some plaudits for MTFC being approachable and responsive. The programme had attempted to improve liaison by visiting teams and by inviting children's social workers to attend meetings, although these offers had not been taken up, with CSWs reporting diary clashes and imprecise timings to discuss 'their' charges. It was also noted that the very specific workings and language of MTFC were not always well-integrated into Looked After Children (LAC) review processes.

**Theme 25**

Social workers were positive about the programme - "He was a really, really difficult young man and they've really supported him and provided him with a stable home environment, really, really firm boundaries which he's really needed . . . I think the placement's been fantastic. She would have met the criteria [for secure accommodation] in terms of running off ... self-harming ... And now the self-harming is very ... very limited. It changed his life around to be perfectly honest. Yeah, I'd go that far." This is not, of course, to say that time in MTFC represents any form of panacea, but recognition of its impact in often difficult circumstances: "He's only absconded three times in six months or so and it's only ever been running off from school and he's back by nine o'clock ... whereas before he was missing for days on end. (Team member) There are obviously still concerns about her emotional welfare and there will be, but she was a very, very damaged girl for lots and lots of reasons, but there was a time where I thought she just might ... not survive. (CSW)" The idea that even 'failed' placements might nonetheless carry some residual benefit for young people – particularly those in 'multiple disruption mode' was also expressed by some.

Risk of Bias	Section	Question	Answer
	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Can't tell <i>(Researchers did not discuss how the participants were selected or why these were the most appropriate to access the type of knowledge sought by the study )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Can't tell <i>(Setting was not justified. Methods were not made explicit or justified. Unclear the form of the data and saturation of data is not discussed. )</i>

	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(No evidence that the researcher critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Can't tell <i>(No in-depth description of the analysis process. Unclear if thematic analysis was used. Unclear how the categories/themes were derived from the data. Unclear how the data presented were selected from the original sample to demonstrate the analysis process. Unclear if sufficient data presented to support the findings. Unclear if researcher critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	Can't tell <i>(No adequate discussion of the evidence both for and against the researcher's arguments or the credibility of their findings (e.g. triangulation, respondent validation, more than one analyst))</i>
	Research value	How valuable is the research?	The research has some value <i>(Qualitative findings relate to one specific intervention of interest. Findings are discussed in relation to current policy and practice. )</i>
	Overall risk of bias and directness	Overall risk of bias	High
		Directness	Partially applicable <i>(Data was likely collected prior to 2010)</i>

**Larkins 2021**

<b>Study type</b>	Focus Groups Semi structured interviews
<b>Aim of study</b>	<ol style="list-style-type: none"> <li>1. To adopt a participatory approach, enabling looked after children and young people (LACYYP) to guide and shape research that could inform the work of the NICE LAC Guideline Update Committee.</li> <li>2. To understand LACYYP's perspectives on the themes and questions identified by the NICE committee and to allow understanding of these themes to arise from LACYYP's perspectives</li> <li>3. To promote rights, safety and inclusion - ensuring that looked after children and young people could exercise choice in how they express their views, that a diversity of perspectives are sought, valued and represented.</li> </ol>
<b>Study location</b>	UK
<b>Study setting</b>	looked after children from three UK local authorities
<b>Study methods</b>	<p>Creative methods and thematic interview schedules were developed in consultation with a steering group of young researchers who were LAC. The cocreated research activities eventually used included:</p> <ul style="list-style-type: none"> <li>• Individual interviews (sometimes involving theme card prompts, prioritisation of cards or drawing/collage)</li> <li>• Visual arts-based activities (using paint, fabrics and drawing materials to create representations of wellbeing, and one-to-one discussions about these)</li> <li>• Music-based activities (choosing or writing songs that evoke feelings of wellbeing, and individual and group discussions of these)</li> <li>• Group discussions (usually centred around an undulating line on a 5m length of paper, which represented the progression of a movie script and the ups and downs of life).</li> </ul> <p>All fieldwork activities were audio recorded and transcribed verbatim. A hybrid approach of inductive and deductive thematic analysis with a framework analysis approach was used to ensure that analysis is driven by participants' perspectives. data was listened to, read, looked at and reviewed by multiple researchers, young researchers and GUC members.</p>

<b>Population</b>	Looked after children and young people from 3 areas (10 South, 17 Midlands, 20 North).
<b>Study dates</b>	2020 to 2021
<b>Sources of funding</b>	The National Institute of Health and Care Excellence (NICE)
<b>Inclusion Criteria</b>	Looked after children and young people - The nature of interventions and outcomes for LACYP vary according to geographical and associated differences. Three sites (local authorities or boroughs) were identified for inclusion in the study in order to obtain a spread of experience, according to the factors listed: geography; placement stability; local authority performance; innovation of practice; educational success; socio-economic conditions; numbers of missing children; and ethnicity.
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> 47 LACYP aged 6-17 from 3 areas (10 South, 17 Midlands, 20 North).</p> <p><b>Ethnicity</b> Of these 47 participants, 8 were Black, 3 South Asian, 2 Dual Heritage and 34 were white.</p> <p><b>Type of care</b> 19 in foster care, 6 in kinship care, 5 in residential care, 3 in specialist non-secure care, 4 in semi-supported/semi-independent living, 55 in independent house/flat, 4 not known</p> <p><b>Education</b> 10 reported SEND labels and 3 were in special schools and 3 were home tutored</p> <p><b>Mental and emotional health</b> 4 had EBD; 17 had pronounced mental health or wellbeing concerns,</p> <p><b>Risk of Exploitation</b> 14 were at risk of exploitation; 11 had a history of going missing,</p> <p><b>Parents</b> 11 were young parents,</p>

	<p>Placed out of county 6 were placed out of county,</p> <p>LGBTQ 2 identified as LGBTQ,</p>
<p><b>Relevant themes</b></p>	<p><u>Placement stability</u></p> <p><b>Theme 1</b> Gentle introductions were an essential part of placement stability. These were supported by 'a build-up', receiving information and explanations, welcoming staff or carers and accessible social work support.</p> <p><b>Theme 2</b> Research participants wanted attentive listening from adults who sought to understand and respond to them as individuals. This is achieved by foster carers, residential workers and key workers getting to know children's interests and preferences over time, connecting them to opportunities that responded to these, setting aside preconceptions, ensuring consistency and communication across staff teams and adapting rules to individual situations. "It's like the heart to hearts isn't it, do you know like? ... You [carers and professionals] need to know the words to say to like settle you and calm you down, because your mum's not going to be there and because you mum wasn't there."</p> <p><b>Theme 3</b> Stability (including for participants with HWC, CSEM, SEND, and who are LGBTQI, of BAME heritage and young parents) is related to feeling care is clearly demonstrated, unconditional, based on belief in and knowledge of individuals, and accompanied by the investment of frequent and consistent time, affection and commitment.</p> <p><b>Theme 4</b> Doing things together builds the relationships between children and young people, carers, workers and foster family members and enabled understanding of interests and needs and provision of care. Effective joint activities include making food together and sharing meals, regular and one-off leisure activities and professionals sharing some details of their lives.</p> <p><b>Theme 5</b> Involvement in everyday and care planning decisions is necessary (CSEM, with SEND, placed OOA and parents) and can be achieved through listening and being listened to; communicating and receiving information; practical involvement in moments of discussions and children making decisions for themselves. This requires commitment to involvement from staff, carers and social workers; attention to timing; helping children and young people to understand things; and telling the truth.</p> <p><b>Theme 6</b> In formal settings, support of an advocate is sometimes useful as is information about the meeting, involvement of the IRO and foster carers. Involvement in decisions about placements and other aspects of care requires enabling attitudes, willingness to look into requests, attention to words, provision of ideas and action on the practical matters (plans, transport and passports).</p> <p><b>Theme 7</b> Whole family unit stability appeared to be lacking for many children (particularly south Asian heritage, HWC or SEND). Staying together with family is facilitated by social worker and carer beliefs and commitment to shared placements and by carers efforts in integrating birth family members into placements when they cannot live together or in valuing items given by birth families.</p>

	<p><b>Theme 8</b> Some participants (in foster care and residential care) valued feeling treated like one of the family. This involved being welcomed in by wider foster family members, building bonds with residential staff, sharing activities (particularly holidays) and maintaining family like bonds when these had been established.</p> <p><b>Theme 9</b> Homeliness, connection to outdoor environments (having gardens or being near parks), private space within placements (especially for older, SEND or LGBTQI) and safe spaces that enabled connection to other people (particularly for parents). I've got no reason to [go missing]. I've got my own room. I've got my TV, I've got my phone. I just go to bed and sleep. ... I've got no reason to [run off] have I?</p> <p><b>Theme 10</b> Participants who had experience of CSEM listed appropriate placements, caring relationships, incentives, learning better coping strategies and 24-hour rescue support as the key processes which reduced their incidence of going missing.</p> <p><b>Theme 11</b> Young parents highlighted the need for accessible support, including outside of office hours provided by social workers and leaving care workers, and review meetings in which they felt accepted and understood, rather than judged.</p>		
<b>Risk of bias</b>	<b>Section</b>	<b>Question</b>	<b>Answer</b>
	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes
	Data collection	Was the data collected in a way that addressed the research issue?	Yes
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Yes

	Findings	Is there a clear statement of findings?	Yes

	Overall risk of bias and directness	Overall risk of bias	Low
		Directness	Directly applicable

## Littlechild 2011

<b>Intervention</b>	<p><b>Restorative Justice Methods in residential care (N = 41)</b></p> <p>Restorative justice has been described as: A process whereby all the parties with a stake in a particular offence come together to resolve collectively how to deal with the aftermath of the offence and its implications for the future and a set of principles that may orientate the general practice of any agency or group in relation to crime (Marshall, 1999: 5). Marshall describes these principles as: Making space for the personal involvement of those involved, particularly the offender and victim, and potentially the relevant families and community representatives; Seeing crime problems within their social context; Utilising a preventative or forward-looking problem solving orientation. Restorative justice focuses on the relationship between the offender and the victim, providing an important means to take into account the views, experiences and wishes of the victim. One of the main aims of restorative justice is to facilitate the healing and restoring the effects of conflicts, arguments and rifts between those involved. The victim can explain to the offender the effects of the perpetrator's behaviour and actions, ask for an apology, and/or ask the perpetrator to undertake some form of reparation. In this way, restorative justice claims to put the rights and interests of victims at the heart of its aims for the criminal justice system, which the English and Welsh adversarial criminal justice systems has historically excluded. Restorative justice attempts to deal with the situation of conflict closest to where it has taken place and caused harm. It sets out to repair the fractured relationships arising from the hurt and damage caused by the perpetrator's actions. This is achieved, advocates of restorative justice contend, by ensuring the offender is aware of the effects of their actions, and starting to make some recompense or reparation for the damaging behaviour. Restorative justice normally requires the setting of formal meetings. Such formal processes were used by staff in the units, but informal methods were also developed by them in an extension and revision of the</p>
---------------------	---

	formal justice based approaches included in their training. To be effective, restorative principles normally require that the victim should be able to talk about the incident in a safe forum, where she/he feels emotionally and physically protected in the preparation for the process and during the meeting when the matters are discussed, and also subsequently. However, there are issues to be aware of where abuse and intimidation of the victim may be taking place, especially in relation to bullying.
<b>Study type</b>	Focus Groups Semi structured interviews Subgroup of interest Residential care Evaluation of an intervention Restorative justice principles and techniques
<b>Aim of study</b>	Unclear: to explore how the staff in the residential units studied modified restorative justice approaches to take into account the specific relationships within group care settings
<b>Study location</b>	UK
<b>Study setting</b>	Four residential young people's units in a local authority. Only one of the two residential units for young people with disabilities was included in the evaluation, at the request of the local authority.
<b>Study methods</b>	Semi-structured interviews and focus groups. Focus groups were conducted with staff from each of the 4 units. Eight young people were prepared to be interviewed, and semi-structured interviews were conducted with them in three of the four units. Unclear how analysis of qualitative data was performed.
<b>Population</b>	Unit managers, senior managers, staff and residents
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	The National Society for the Prevention of Cruelty to Children

<b>Inclusion Criteria</b>	None reported
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b></p> <p>Focus groups were conducted with staff from each of the 4 units 33 staff in total. Eight young people aged between 13 and 17 years were prepared to be interviewed, and semi-structured interviews were conducted with them in three of the four units.</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> restorative justice model improving relationships between staff and residents - Staff members stated that restorative justice had helped them learn more about themselves and their work. Before the introduction of restorative justice, staff would often utilise punitive measures, whereas afterwards they tended to use concepts which involved understanding damaging behaviour and its effects, and how this can be dealt with restoratively. The majority thought that a better relationship between staff and young people had developed as a result of the introduction of restorative justice.</p> <p><b>Theme 2</b> staff used restorative justice to demonstrate concern and caring for the young people in practical and acceptable ways - One senior manager in the agency believed that one benefit was that staff used restorative justice to demonstrate concern and caring for the young people in practical and acceptable ways, which had a positive impact on the culture of the units. Staff also stated that restorative justice allows a full discussion of the incident to occur concerning what a young person who acted in a criminal/antisocial way had done and how it had affected other people.</p> <p><b>Theme 3</b> Advantages for young people that working restoratively had included: Learning to manage their anger; d Developing empathy with other people and building relationships; d Developing mutual respect; Giving a sense of responsibility and appropriate levels of guilt/remorse; Learning to be able to behave in a more mature and adult way; Short and long-term positive impact on young people's behaviour; Acknowledging the feelings of victims and giving them a voice; Making young people- victims and perpetrators feel they are cared about, and part of the process of resolving conflicts; Developing young people's understanding of the consequences of their behaviour, and learning more positive ways of resolving difficulties, conflicts, and problems.</p> <p><b>Theme 4</b> A chance to reflect and find out what others felt: One of the main benefits young people spoke of was that it allows people to talk about how they felt and reacted to a situation, and also gave them the chance to find out what the staff members think about situations. "Kids feel better after they have done it. Whoever the victim was, they can see they are sorry."</p> <p><b>Theme 5</b> A chance to say sorry: Several talked of how it helps to say 'sorry', to sit down to talk about problems, and listen to each other. In the main, the young people experienced the meetings as helpful in resolving problems.</p> <p><b>Theme 6</b> Behaviour change: One resident believed restorative justice had helped her change her behaviour in positive ways in dealing with arguments and conflict. Other young people also believed that restorative justice can help positively change the young person who had harmed others in some way.</p>

**Theme 7**

Reparation: In terms of reparation, young people agreed, for example, to carry out repairs to damage physical damage they had caused, for example helping staff to repair damage to the building. Staff found that the young people generally responded well to this kind of initiative.

**Theme 8**

Advantages to restorative justice identified by young people: Restorative justice is a beneficial way of dealing with conflicts. In particular, they believed that restorative justice encouraged them to talk about and understand their feelings; it provided them with the opportunity to understand the perspective of others their behaviour affected; For most young people, for the majority of situations, the young people believed that a mix of formal and informal restorative justice meetings was helpful in resolving difficulties.

**Theme 9**

Difficulty setting up formal conferences: One main disadvantage of using restorative justice within residential units is the problem of trying to organise formal conferences. Many of the staff stated that it can take a relatively long period of time to set up a formal meeting with an independent facilitator; they believed that there needs to be a more rapid response in order to deal with conflict in residential settings satisfactorily. Staff often set up informal meetings with a facilitator from within the staff group rather than wait for a formal process during which time there could be a build-up and/or hardening of the problems. In response to this, the agency reviewed its training package for staff on restorative justice, and the formal conference model subsequently only formed part of the overall training. The majority of the training for staff in the units was refocused to concentrate on the day-to-day issues, both criminal and non-criminal, which arise within the units.

**Theme 10**

Danger of power imbalance between staff and young people: Several of the staff highlighted that careful consideration needs to be given to the 'huge' power imbalance between the staff and the young people when conducting restorative justice, with the same consideration needing to be given in cases of power imbalances and fear between young people when dealing with bullying. Some unit managers and senior managers stated that sometimes staff find it difficult to work in a restorative way which requires objectivity; for example where they had been experiencing constant abuse from young people.

**Theme 11**

Dependence on voluntary participation: Several young people and most of the staff highlighted that the main disadvantage of restorative justice is that it is dependent on whether the parties involved are willing to participate voluntarily. Residents can, the young people thought, sometimes be 'pushed' to do restorative justice when they do not really want to. Some staff and young people stated that there needed to be care taken to ensure that some young people might just pay 'lip service' to the process in order to avoid being subject to any other sanction, and not really engage with important elements of restorative justice.

**Theme 12**

Majority of restorative justice is informal: The evaluation found that the majority of the restorative justice conducted in the units is informal, which allowed staff to look into the reasons behind someone's behaviour, and to encourage positive social development and means of conflict resolution.

**Theme 13**

Among young people with additional needs - Within the unit for children with disabilities the general consensus of staff members was that restorative justice is useful in some situations but not in others for a small proportion of young people within their unit. This was due to certain young people's communication difficulties and/or developmental disability; young people with developmental disabilities, for example, can have a very short attention span. Some of the participants were also of the view that restorative justice may not be fully understood by children and young people with a certain level of learning difficulties, or those with autism.

**Theme 14**

Issue of bullying in residential care was prevalent - In relation to issues of bullying, the majority of the young people interviewed in the study stated that they had been bullied at some point whilst in residential care. Some of them also stated that they had bullied others. In addition, all the staff in the units stated that covert/overt bullying occurred in their units. Levels of awareness of this problem were high. Staff tried to deal with bullying through the use of a variety of different anti-bullying strategies. They found that whilst the

restorative justice approach often worked well with a number of young people and situations, such as theft and criminal damage, particular issues presented themselves in attempting to deal with bullying. The experiences of young people and staff were that bullying was the most difficult form of antisocial behaviour for them to deal with. Young people subject to bullying often feared negative repercussions from the bully if they raise the issue with staff. It can be very difficult for young people who have been bullied to report incidents, and trust that they will be protected from further bullying if any action is taken; victims and staff may not be sure how the bullies are going to react during and after a restorative justice meeting.

#### Theme 15

Need to prevent further victimization following restorative justice for bullying - The power/control relationship between bully and victim needs to be fully understood and used proactively by those implementing a restorative justice approach to ensure that the further victimisation of the victim does not occur. Introducing restorative justice and mediation measures without a full appreciation of the causes and effects of the bullying in the first instance, and then the repercussions of trying to confront it, can have very damaging effects. Thirteen-year-old Laura Rhodes was encouraged to take part in a 'circle time' meeting (not in Hertfordshire) with her alleged bullies at her school as part of a 'no-blame' strategy, as reported in The Observer (2005). Laura took her life after the meeting, amidst concerns from some that discussing the effects of the bullying had given more power to the bullies. Claude Knights of KIDSCAPE (quoted in the Observer article cited above) stated that some 'socially skilled' bullies managed to convey a false sense that they understood the harm they were doing, whilst using information from the meeting to fuel fresh aggression, leaving the victim to feel the system had failed them; they were therefore less likely to report further bullying. This is commensurate with the experiences of some staff, that some young people can pay 'lip service' to restorative justice, but then continue to act in abusive ways. Any restorative justice approaches used in residential group care need to be informed by knowledge of the nature and effects of such pervasive and damaging dynamics in order to ensure victims feel safe to report bullying and harassment, and feel protected within any subsequent processes.

#### Theme 16

Young people had a variety of views on the best ways of responding to bullying within their units. Whilst most thought that RJ can work well for this type of behaviour, a majority also thought that if the perpetrator continued to bully, she/he should be moved out of the unit for the good of the victim, if the restorative process did not protect them.

	<b>Section</b>	<b>Question</b>	<b>Answer</b>
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	No
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Can't tell ( <i>the aims were not clear and the authors did not justify the research design</i> )
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	No ( <i>no discussion of how participants were selected or why these were the most appropriate to provide access to the type of knowledge sought by the study</i> )

	Data collection	Was the data collected in a way that addressed the research issue?	No <i>(no justification of setting for data collection. No justification of methods used. Researcher has not made the methods explicit. Form of the data is unclear . )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	No <i>(Unclear that researcher critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	No <i>(No in-depth description of the analysis process )</i>
	Findings	Is there a clear statement of findings?	Can't tell <i>(no discussion of redibility of their findings (e.g. triangulation, respondent validation, more than one analyst))</i>
	Research value	How valuable is the research?	The research has some value <i>(No discussion of transferability, results relate to a specific model of care )</i>
	Overall risk of bias and directness	Overall risk of bias	High
		Directness	Directly applicable

**Mantovani 2015**

<b>Study type</b>	Unstructured interviews Subgroup of interest BAME mothers in care
<b>Aim of study</b>	The research addressed two questions: what are the experiences of teenage mothers of State care and how do young mothers experience State parenting?
<b>Study location</b>	UK
<b>Study setting</b>	Three London Local Authorities (LAs) selected for their geographical diversity, reported rates of teenage pregnancy and their high concentration of black minority groups.
<b>Study methods</b>	In-depth unstructured interviews. Informants were interviewed in their own homes and interviews were tape-recorded and transcribed verbatim. Data were analysed using a modified grounded theory approach. Transcripts were read a number of times to allow the identification of themes and categories to emerge. The provisional themes were subsequently examined against findings from other transcripts for further verification or rejection.
<b>Population</b>	Mothers in care or left care with black minority ethnicity
<b>Study dates</b>	between 2005 and 2007
<b>Sources of funding</b>	Not reported
<b>Inclusion Criteria</b>	Age age 16 to 19 years old Care Situation

	<p>currently in care or left care</p> <p><b>Time in care</b> in care for a minimum of 1 year</p> <p><b>Ethnicity</b> rom black minority — Black African, Black British, Black Caribbean, Mixed-Heritage</p> <p><b>Parent</b> a mother or currently pregnant</p>
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> 15 participants were interviewed</p> <p><b>Time in care</b> in care for an average of 2 years (range 1–4 years). Two of the mothers entered care aged 14, five aged 15, six aged 16 and two aged 17.</p> <p><b>Type of care</b> The range of State parenting arrangements included foster parent (n = 10), residential children's home (n = 2), residential temporary accommodation (n = 2) and one was temporarily placed with her boyfriend's family.</p> <p><b>Gender</b> All female</p> <p><b>Number of previous placements</b> 11 had experienced one placement and four had experienced multiple placements (foster care, children's home, and mother and baby unit).</p> <p><b>Age</b> At the time of interview, three young mothers were aged 19; five were aged 18; five were aged 17; and two were aged 16.</p> <p><b>Ethnicity</b> Of the 15 participants, two were British nationals and 13 were from the African continent (three from South West Africa, five from West Africa and five from East Africa). Of the 13, two had migrated at a young age with their families, and 11 were unaccompanied minors when they arrived in Britain. Of these 11, two were educational migrants and nine were asylum seekers.</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> UAS experienced a bewildering and traumatic journey to UK and through the immigration and care system - The 11 unaccompanied minors mentioned political, economic, persecution and violence as key reasons for leaving their countries. Although informants were not asked to discuss such emotive issues, some chose to share their stories about being brought to safety to Britain and then abandoned. In search of settlement, they navigated through the immigration maze of solicitors, Home Office officials, Refugee Council</p>

agents, asylum-seeking support teams, and health and social care professionals. As a result of past and present stressors — a lost sense of being in charge of their lives and memories of disintegration following war — four informants received therapeutic sessions (psychiatrists or psychologists).

### Theme 2

Lack of continuity, multiple social workers, too many people - Overall, informants reported mixed experiences of corporate parenting: four recounted supportive care-giving practices (last section), three mixed experiences, and eight disclosed being parented at a distance and via the 'revolving doors' of multiple social workers with whom they had intermittent contacts with long gaps between each contact (see also Driscoll, 2011; Knight and others, 2006). They had different social workers coming in and out of their lives during their care experience, viewing the succession of strangers entering their lives as invasive. The unremitting scrutiny the young women felt under is clearly articulated by Cherie's account: "When I was in care I had a lot of social workers...and it was all new to me. And I just felt that having so many social workers coming and going all these people that know about you, which is really strange. (Cherie)" Frequent changes undermined the quality of care and services informants received, and impacted the consistency of care as informants could not access support when they needed it. This impacted the stability of the relationships with their care-givers, as informants lacked the security they needed to thrive. Twain's excerpt highlights problematic case management when she transitioned from one social worker to another. "The first social worker I had she really did support me very much. Then I got another one and that one she was horrible, she was totally different from the one we I had before. Then after that I got another one, and then I got another one. She was...you could tell her your problems, but you don't seem to get anywhere, but the first I had when I just had my baby I got good support from her eventually. (Twain)"

### Theme 3

Feeling of the absent corporate parent, lack of taking initiative - Intermittent and fragmented contacts with social workers were a common experience among the young women interviewed. Although the informants found it hard to establish contact with their corporate parent, this did not deter them from trying. This 'absent parent' figure generated a feeling of being unsupported and signalled a lack of interest in their welfare. This is encapsulated in Limber's description of how she felt as a result of her social worker's approach to care-giving: "I felt they were pushing me back. If, I don't call, she doesn't know how I am, she doesn't know how I feel, she doesn't know how my son is. She doesn't seem to care about us. It's like she has completely forgotten us. (Limber)" "Social workers should always listen to a social child, because when you don't encourage a young person... you leave her just to get pissed-off. From my own experience I wasn't having any encouragement from my social worker... All the time she is not there for me, I feel like: 'I'm nothing, there is no-one there for me'. It is frustrating because sometime you feel rejected there is no one. And without social services' help you just mess yourself up, again and again and again. (Namuly)"

### Theme 4

Longing for a personal relationship - The nature of these relationships was inconsistent, unstable and unreliable. What informants longed for was a personal relationship with their social worker, someone who invested care and time in them. Indeed, informants saw financial help as important, but knowing someone cared for their well-being was imperative. Raziya said: "You may be giving money, but when you talk to me I'll be fine. (Raziya)"

### Theme 5

Previous experiences of adversity while in care - Being in foster care is often a defining experience in the children's/young adults' lives, and foster care has a major role in community care services for children. Of the 10 fostered young women, six experienced some form of adversity whilst in foster care and four did not. The former experienced financial exploitation, material deprivation and opportunistic attempts to claim more money out of a newly discovered pregnancy, unattended emotional needs and abusive practices. Cherie and Shidah talked about the financial exploitation they experienced while in foster care. The former 'didn't get the money (she) was entitled to, like a personal allowance or coat allowance', while the latter's 'carer used to give (her) less money (she) was entitled to'. These practices 'could destroy a relationship' Shidah commented. "She wasn't good to me...she didn't do anything, really. I couldn't cope. She didn't give me money for bus fares, she didn't give me my pocket money. But the social services do pay her! For my bus fares I had to go to 'X' House to get the money, the amount of travel I did! She did disconnect everything...the gas and she gave me an electric heater. Then she disconnected the phone...disconnected everything! There was nothing in the house! And I was alone. (Raziya)" Pemba spoke of the foster family's attempt to claim more money from the social services once her pregnancy was discovered, and their denial to meet her needs as a result: "I was doing everything; I'm cooking for myself, washing for myself. And they say: 'Oh, we can't give this, we can't give this'. Because my pregnancy became something so big! They wanted more money they're saying I have a baby, but this baby is not born...nobody is looking after him. (Pemba)"

### Theme 6

Loneliness and isolation while in foster care: Twain and Isoke spoke of their sense of isolation and loneliness while in foster care. Isoke, for instance, felt excluded as a result of inadequate and inappropriate interpersonal and environmental interaction with the foster family, which displayed contempt because she was a 'looked after' black African expectant mother: "Emotionally she was terrible. Sometimes I will be in my room and she hasn't seen me for 2 days, and she won't even come to my room and ask if I've eaten. And she knows I'm pregnant... And her children they don't say 'hi' to people, they look down on you. (Isoke)" Another mother spoke of the overt racial abuse when her foster mothers accused her of living off State hand-outs: "Sometimes she would make these ridiculous comments: 'Oh god this government is funny giving you people money, you should be working'. Making comments like that! 'Using the taxpayers money and you...' She made me feel horrible, like making you feel guilty. You're not working, you're eating people's money free money. She really made me feel bad. (Shidah)"

### Theme 7

UAS and parents in care more vulnerable and more susceptible to abuse: The above extracts highlight the multiple disadvantages that the women in this study faced. The discrimination, hardships and poor living conditions they described underline the racial inequalities they experienced as uprooted individuals. The fact that many of them were seeking asylum made them particularly vulnerable to experiencing life as fragile, insecure and exposed to stereotypical remarks.

### Theme 8

Help from key social workers, for both general support and encouragement in education (relationships that go above and beyond) - Four informants identified key social workers who had provided support and encouragement in their education or more widely. In some cases, this relationship was perceived to reach beyond the boundaries of professional duty. Those who spoke positively of their corporate parents felt that they had provided practical assistance when needed. Social workers were seen as helpful when they sorted things out and made a difference, being enablers, advocates and negotiators: "She cooked for me, we would go out for the baby shopping. She helped me with my college, 'cos I couldn't go to college for some weeks... because of the pregnancy. She helped me to phone the college to let them know about it. We went there together before I was about to start back in college.... to get my course.. We went together to see,...we spoke to the course management and they said I should come back. She took the form for the child care, so I will have the child care for the baby, you know, there will be child care for the baby in that college. (Raziya)"

### Theme 9

Corporate parents who came across as friends - Informants responded better to corporate parents who came across to them as friends. Three informants referred to their social worker as 'my friend whom I contact even up to now' for advice or to talk, or as someone to go out 'shopping for food and clothes, and go to the restaurant together'. Having a trusted confidant in their social worker was important as this combined elements of sociability, emotional support and a secure base. The idea that details of what corporate parents do with young people count, emerged from the data: the daily routines, the talents they nurture, the interests they stimulate, make a difference. Having 'somebody there who cares' made Nakato 'feel good'. These little things may foster in a young person the vital sense of belonging, of mattering, of counting. Developing positive and stable relationships with their social workers is vital to promote good outcomes for young people in the care system (McLeod, 2010; McMurray and others, 2011).

### Theme 10

Success dependent on a positive relationship with the foster parents, and after leaving care - The narratives linked with life in a foster family showed that the foster mother's attentive practices promoted the respondents' positive identity. The type of relationship with the foster mother determined the bond between them and whether the informants felt that they could seek support and advice even after moving on to independent living: "I was like part of the family, up until now she's like to a mum to me. Whatever she had she gave it to me. She cares about my relationships and asks: 'Where are your friends? You can bring your friends here'. I'm happy because she introduced me to a very good life. Like, sometimes in the morning she comes to my room and asks: 'You're not coming down to have breakfast, what's wrong with you? Are you having something bad about your home?' She always wants to know. And then, she really teach me how to take care of the house, do some cooking, using washing machine...she showed me how to manage my money. (Namuly)" Being placed in a specialist mother and baby foster placement provided effective support to Namuly. Biehal and others (1995) have noted that this form of support can improve outcomes for young people in care such as maintaining their homes and developing life skills.

### Theme 11

Resiliency and self-reliance as a result of unsupportive relationships with the care-giver - Unsupportive relationships with their care-givers presented an occasion to exert their resilient identity — they had the qualities that affected their sense of personal agency, but also they invoked their religious identity which supported them when facing difficult times; when deciding about motherhood over abortion and/or adoption. "... anyway in a way she (foster carer) made me like...you have to go out there and study and get your

qualifications and get your money. In a way...in a harsh way I've learned. (Shidah) The only friend I had was God...I was giving my life to God... to tell God to help me with the situation I was (pregnant). Because I was crying every day. (Abeo)"

### Theme 12

Self-worth being based on being seen as independent/with agency (importance of education) - It was vital for most informants to be seen as independent with some control over their lives as this added to their sense of self-worth. In the face of the many uncertainties that in varying degrees many of the informants experienced, they had all exerted their agency within the context of being women returning to education. They overcame the odds demonstrated by their choice to return to education after childbirth; except for two respondents, all had obtained or were in the process of gaining GCSEs or GNVQs, and many had plans for university education. Informants adjusted successfully to the negative life events underscored by their focus on educational achievement: "I had the 'Young Learner Award' in college, I was the best student in college. (Shidah) I was the best student in my class and got very high grades. (Limber)" These extracts show how important the question of self-worth was for these mothers, not only for themselves but for their children too. Self-worth was derived from both reaching a high level of education and having a professional occupation.

### Theme 13

Education as a path to secure, economically safe, and independent future: Continuing with education after pregnancy was important to mothers, who were 'determined to continue with education' — believing they could 'cope with both education and the baby'. Respondents viewed education as a durable investment that would be their entry to a secure, economically safe and independent future. Informants aspired to being recognised as moral self-reliant individuals: "I want to do something with my life...and I thought I could be capable of doing it (midwifery) and help people. I just want to go to school to get a good sound education so he could be proud of me. (Isoke) I decided to go to school and learn because that is the way to cope. When I came here I said: 'The best I can offer myself and my son is to go to school and learn something, so I can be good to myself. (Namuly)"

	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes
	Data collection	Was the data collected in a way that addressed the research issue?	Can't tell <i>(No justification of study setting, unstructured interviews were used but</i>

			<i>unclear how the interview was conducted (explicitly); no discussion of data saturation )</i>
Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?		Can't tell <i>(Unclear that the researcher critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
Ethical Issues	Have ethical issues been taken into consideration?		Yes
Data analysis	Was the data analysis sufficiently rigorous?		Yes <i>(However, unclear if the researcher critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
Findings	Is there a clear statement of findings?		Can't tell <i>(No discussion of the credibility of findings in terms of triangulation, respondent validation, or the use of more than one analyst)</i>
Research value	How valuable is the research?		The research is valuable
Overall risk of bias and directness	Overall risk of bias		Moderate
	Directness		Partially applicable <i>(Data collection took place earlier than 2010)</i>

**Nixon 2019**

<b>Study type</b>	Semi structured interviews Evaluation of an intervention a large urbanised local authority in Scotland, which had recently introduced SHR training for caregivers (but not all had received the training)
<b>Aim of study</b>	To explore how personal and institutional factors promote or limit caregivers promoting sexual health and relationships (SHR) among looked-after children (LAC). In so doing, develop existing research dominated by atheoretical accounts of the facilitators and barriers of SHR promotion in care settings.
<b>Study location</b>	UK
<b>Study setting</b>	Social services, residential children's homes and foster care. All caregivers were recruited from a large urbanised local authority in Scotland, which had recently introduced sexual health and relationships training for caregivers.
<b>Study methods</b>	Semi-structured interviews explored barriers/facilitators to sexual health and relationships (SHR) discussions, and how these shaped caregivers' experiences of discussing SHR with looked after children. Interviews lasted 45–60 min. Interviews were digitally recorded and transcribed verbatim. Fieldwork notes on body language, facial expressions and emotional responses to questions were added to transcripts to supplement textual meaning. Transcripts were then anonymised and entered into NVivo V.9. Thematic analysis was used to analyse the interview data generated. The coding frame was revised by CN to reflect caregivers' experiences of role ambiguity, conflict and overload. During the coding process it was agreed by the authors that data saturation was occurring, with similar descriptions and narratives being presented by participants.
<b>Population</b>	Caregivers in residential children's homes and foster care.
<b>Study dates</b>	From August to October 2011.

<b>Sources of funding</b>	UK Medical Research Council, the Scottish Government Chief Scientist Office, Edinburgh Napier University and Glasgow Caledonian University.
<b>Inclusion Criteria</b>	<p><b>Carer situation</b> All caregivers were recruited from a large urbanised local authority in Scotland, which had recently introduced SHR training for caregivers. In order to minimise service disruption, it was agreed with the local authority that sampling of social workers would be restricted to those based within one of the three geographically based teams providing care to LAC. Sampling of foster carers was restricted to foster carers supervised by social workers working within that team. Residential carers were not geographically recruited; however, in order to minimise disruption it was agreed that unit managers, rather than front-line residential care staff, would be approached.</p>
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> 22 caregivers</p> <p><b>Gender</b> The caregivers recruited were predominantly female (n=19);</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> Role ambiguity: Provision of sexual health policy and training reduces role ambiguity. Challenges perceived taboos about discussing sex. Institutional. Facilitated SHR discussions by providing guidance and training. Reduced role ambiguity by emphasising that caregivers could and should discuss SHR with LAC. 'We have policies that we follow now in terms of sexual health, and it's something that's been brought to the forefront, where it's no considered taboo' (Shona, social worker/relief residential carer). 'In this industry, social services, there's been a lot of taboo about discussing sexual health. It's a priority now and it's seen as part and parcel of anything. I think that's cos of the policy and training' (Mary, social worker). 'It frees it up. You feel that, aye, it's no this big thing that shouldnae [shouldn't] be talked about. Children need to learn. They need to know that and we need to stop making it this big thing that they need to thing out themselves' (Pat, foster carer).</p> <p><b>Theme 2</b> Provision of sexual health policy and training reduces role ambiguity. A2. Emphasises corporate parenting responsibilities. Institutional. Facilitated SHR discussions by providing guidance and training. Reduced role ambiguity by clarifying expectations around caregiving role. 'We are corporate parents and we would do it with our own kids' (Joanne, residential carer). 'You would talk to your kids about it (sex). And that's what we do as corporate parents. We take on that role and responsibility' (Rachel, social worker). 'If we don't discuss it with a child, I think educate is too strict a term, but if we don't make them aware of it, then how are they gonnae (going to) know?' (Shona, social worker/relief residential carer).</p> <p><b>Theme 3</b> Provision of sexual health policy and training reduces role ambiguity. A3. What it means to be a 'good' corporate parent. Personal. Facilitated SHR by promoting personal involvement in professional task. Reduced role ambiguity as a result of policy focus reflecting personal beliefs about parenting. 'We have a corporate parenting responsibility to all our kids but the key word there is parenting. Any good parent would spend time with their children talking about what is appropriate, when it is appropriate and how they should find out more information. As a parent you are trying to encourage young people to discuss with you that they've got partners, that they are engaged in sexual relationships, that they have got a girlfriend or boyfriend or whatever it may be... It's about reassuring young people that I am asking the exact same questions I ask my own daughter or my own son. You aren't being treated any differently because you live in a unit' (Mark, residential carer).</p>

#### Theme 4

Provision of sexual health policy and training reduces role ambiguity. A4. Policy reflects what usually happens within families. Personal. No perceived effect reported by caregivers for SHR discussions. No effect on caregiver role. 'We don't shy away. If there was a sex scene in a movie or whatever, we quite often discuss it rather than say 'oh my goodness, we shouldn't be watching that, hide your eyes boys!' We just relax about it. It's not something that we try to pretend isn't there' (Alison, foster carer). 'The real conversations we have in here at tea times— and it always starts off with something silly. I had... was it a banana and custard yoghurt I had yesterday? And that started it off — one of them says: 'oh, that looks terrible' and this girl says 'but you can't determine whether you like it or not by looking at it. You've got to taste it'. 'No, I don't'. And this taste thing went on and on and it got into a discussion of peer pressure, didn't it? How it got there, I don't know. We just sit at the table through there and talk' (Ian, foster carer).

#### Theme 5

Provision of sexual health policy and training reduces role ambiguity. A5. Clarifies expectations of role. Institutional. Facilitated SHR discussions by providing guidance and training. Reduced role ambiguity by clarifying expectations around caregiving role. 'Jane [policy developer] came to the unit manager's meeting and was kind of promoting young people's sexual health, what was our responsibility and where did we see our responsibilities being. And the training was very informative. It was very informative and made us look at our own sexual health and relationships. It gave us the tools to go away and... have these discussions wi' (with) young people' (Patricia, residential carer). 'We've never had any form of policy or training towards sexual health. It's something that as a manager I can say to them 'you've been given the information, you've been given the tools to deal with that situation, you have to put it into practice now' (Mark, residential carer). 'The training was mainly sharing stories about sexual health. You know, would you get a young person the morning after pill and what is age appropriate for that? I think we've progressed. A few years ago I was on holiday with a young person and I took her for the morning after pill and I had my bum booted... 'You shouldn't have done that. It wasn't your decision to take. Fortunately we've moved on as a department'' (Joanne, residential carer).

#### Theme 6

Lack of guidance contributes to role ambiguity. A6. Lack of clear guidance on recording/reporting procedures. Institutional. Perceived barrier to LAC approaching caregivers for help and advice. Contributed to role ambiguity by creating confusion about how best to confidentially record SHR discussions. Recording it is very difficult. We have general comms [communication] books which are for everybody's viewing, which is not appropriate, and we have individual logs which aren't appropriate either because the kid is maybe keen to keep something in confidence but then it is written down. It is a grey area' (Mark, residential carer). 'I had a LAC review where there young person, there was issues in terms of she was menstruating and leaving dirty sanitary towels and pants, like planting them places and hiding them. So I had written the report and I made a comment about some hygiene issues and said to my manager beforehand. There was a reason I had made it really vague as I didn't want to embarrass her. Unfortunately the foster carer decided to start talking about it and the girl burst into tears... and what I suppose I'm trying to highlight is that we need to be sensitive to the young person (Agnes, social worker).

#### Theme 7

Role conflict. Balancing competing demands of child protection and preventative SHR work. B1. Monitoring sexual behaviour acts as a barrier to undertaking SHR discussions. Institutional. Barrier to preventative SHR discussions being undertaken due to focus on risk management. Contributed to role conflict. 'Safety is paramount' (Jane, residential carer). 'I was no longer a caregiver — I was a security guard. Keeping young ones out of other one's rooms that weren't supposed to be there, hauling other ones in windows that were trying to get out in the middle of the night, keeping ones out that didn't belong to the unit. We had fifteen year olds that we were hauling out of one room into another and saying 'No. You're not on'' (Karen, foster carer/former residential carer).

#### Theme 8

Balancing competing demands of child protection and preventative SHR work. B2. Undertaking SHR discussions in response to risk rather than preventatively. Institutional. Barrier to preventative SHR discussions being undertaken due to focus on risk management, and facilitated SHR discussions in response to risk-taking by LAC. Contributed to role conflict. There wouldn't always be a major, in-depth discussion if there weren't any major issues... but if a child is sexually active and they're underage, and... running away, having sex wi' men they don't know, coming back the next morning covered in mud, drinking... it would be very high on the agenda' (Agnes, social worker). 'He'd put on his profile something like 'I'm in care and I'm a gay boy and I'm looking for...' One of the older girls had seen his profile and asked him right out in front of us 'why have you got that one your profile'. He was mortified. But that gave us the opportunity to sit down and tell him the reasons why he should have things like that on there. And even if you are gay, it's not the way you would word it, and it was actually our 16 year old who said 'cos you don't know who is sitting looking at that profile and thinking oh he's game'' (Joanne, residential carer).

### Theme 9

Balancing competing demands of child protection and preventative SHR work. B3. Strategies to manage the sexual health of LAC: monitoring relationships. Institutional. Facilitated SHR discussions about appropriate and positive relationships. Reduced role conflict. 'We have a young female (16) who is pregnant and her boyfriend (23) lives locally. He had been over for dinner and he has been involved in the unit and staff have met him and we are clear what our role is. It was quite clear to us that the best way for us to deal with it was to be part of the relationship. I was quite clear that in my role of safeguarding this young girl we had to get to know this young male and find out if there was any ulterior motive or if there was any reasons why he was interested in her, other than you know, a love for each other. So we engaged with him... We have been to his house on a couple of occasions, and we have met with his mum as well. (Mark, residential carer). 'You are trying to encourage the young people to discuss with you that they've got partners and to bring them in so that we know them as a face round the unit. They're not allowed in bedrooms obviously, but they're allowed in the living area with the door open. And I would definitely encourage that unless I thought it was a negative influence' (Joanne, residential carer).

### Theme 10

Balancing competing demands of child protection and preventative SHR work. B4. Strategies to manage the sexual health of LAC: monitoring phone and computer usage. Institutional. Facilitated SHR discussions about internet safety and sexual exploitation. Reduced role conflict. 'I'm no' that good at it, but we went into his facebook and realised the chats he's been having so we've started to speak about safety issues, you know, telling him that this person could be roond (round) the corner fae (from) you. It's a web cam' (Claire, residential carer). 'There was inappropriate material found on her phone, and in the past she's had images sent to her from people that in my opinion are grooming her, but she doesn't accept that she's at risk... So now we've got monitoring sheets. We monitor every shift what kids are doing on the computer and sometimes we think it's a wee bit of an overkill and obviously our internet is kind of sitting in the living room, very open, but we keep a very very close eye... especially when you think they are at risk' (Joanne, residential carer).

### Theme 11

Balancing competing demands of child protection and preventative SHR work. B5. Strategies to manage the sexual health of LAC: risk assessing outings. Institutional. Barrier to preventative SHR discussions being undertaken due to focus on risk management. Reduced role conflict. 'Last summer we stopped taking him to the play park... because he goes to younger children and he wants to pat them and cuddle them. I don't know if he is sexually aware... but he is almost compelled to do it... and he will sneak about to try and get to a wee one to give them a wee pat. So how do you deal with that? We stop taking him' (Pat, foster carer). 'If you've got child protection issues where you've got a young person who's maybe been sexually abused, and then sexually abused younger people, then we have to be dead strict as protecting other young people is also protecting them... I cannae (cannot) let him run aboot (about) just down the road because there's a wee nursery doon (down) the road. I cannae just let him go swimming. There's a whole protection risk assessment to which there' (Patricia, residential carer).

### Theme 12

Balancing competing demands of child protection and preventative SHR work. B6. Strategies to manage the sexual health of LAC: managing space and room allocations. Institutional. Facilitated SHR discussions about privacy. Reduced role conflict. 'We had a serious incident where Craig (13) accused John (8) of more or less sexually abusing him. John was saying things like 'sex, sex, sex' and making thrusting movements because he knew it was upsetting Craig.... Craig couldn't deal with it. We found him urinating on John's bed and then he made this accusation. It was a terrible time for us all, only for it to turn out that Craig had made the whole thing up... as he wanted John moved. So we're very aware now of the two boys being separate. Craig sleeps upstairs and he has his own space up there. John is downstairs in a room along the corridor, and he is not allowed upstairs at all' (Alison, foster carer). 'We've got one young person who most definitely has been sexually abused... and she can display quite predatory behaviour (later clarified by the caregiver stating that the young woman had been groomed into recruiting other LAC for a sex ring). She would encourage the rest of the group to go out drinking, and then make allegations of rape against one or more of the boys... We need to protect her and we need to protect others from her exposing them to inappropriate sexual contact for their age. That's something that we balance all the times in terms of the safety of the group. And that's how we decided her bedroom was best placed in close relation to the office' (Joanne, residential carer).

### Theme 13

Role conflict as a source of caregiver strain. B7. Emotional impacts on caregivers. Personal. No perceived effect reported by caregivers. Consequence of role conflict. 'It's soul-destroying tae (to) try and stop that pattern of behaviour where young people would go met their pals... and be picked up by men that were pimping them... for a packet of cigarettes or a wee bag of sweets. There would be times when they didnae (did not) want to have sex but they were forced and they would come in wi' pretty bad bruising and

faces had been punched... It's pretty hard at times, but I think you've got to be and be professional and say 'we're trying our best... sometimes we just don't succeed' (Patricia, residential carer). 'I had been away shopping and I came back in. The other boy was watching television and he seen me and goes 'I think you should go up the stairs'. Now this has happened on a few occasions, you know? If one of us has been out or distracted they would use that moment. I just put my bag down, didn't even take my coat off, and I ran up the stairs (Jean is visibly shaking and obviously upset). Here was child A and B in the sliding wardrobe, a pillow put down on the inside of the sliding wardrobe. He had the girl on the floor and he was on top of her... that's how quickly' (Jean, foster carer).

#### Theme 14

Concerns about the potential for false allegations being made by LAC. C1. Discussing SHR places caregivers in a position of vulnerability. Personal. Barrier to SHR discussions arising from caregivers' concerns about their own vulnerability. Contributed to role conflict. 'I had to leave the room and when I came back my manager was like 'I needed to come out' and basically he'd been sitting and the boy (who had been groomed and sexually abused by a paedophile ring) had got an erection. He felt really uncomfortable cos obviously he was on his own with him and he didn't want to be on his own with him... so he got up and walked out. As workers we can be quite vulnerable... so we have to be very aware of how we protect ourselves (Agnes, social worker). 'You imagine right that one of the young persons' approached you right and said 'I'm thinking o' having sex wi' my boyfriend. What do you think? And then the next night the nightshift comes on and you're away and they say 'guess what she was saying to me last night. Aw she was doing was talking about sex'. That can be misconstrued and before you know it it's a big fact finding investigation' (Patricia, residential carer). It's worrying... my son's a police officer, my husband works in law enforcement and I work with students – so given that we all have to be vetted and disclosed at work - we have to take extra care'. (Alison, foster carer).

#### Theme 15

Concerns about the potential for false allegations being made by LAC. C2. Strategies to protect caregivers against false allegations: recording conversations. Institutional. Facilitated SHR discussions by providing a safer environment for caregivers. Reduced role conflict. 'Because of the risk that it presents to them as workers in terms of possible allegations or comments being made in future... we need to make sure that any information we are sharing with young people is appropriately recorded, accurately recorded... And if there is anything inappropriate, you know I am thinking, you know, maybe a female resident making a comment to a male member of staff then that's been appropriately recorded and raised and that the staff member and the young person are both supported and discussions are held about what is appropriate and what is not' (Mark, residential carer). 'I think that one of the things we had to obviously highlight was Safe Care and the recording of that sensitive conversation... how do you have that conversation in an environment where you're safe? Because if you're talking about closed doors she could make an allegation against you. So it's about recording the discussion you had, You don't have to do War and Peace but 'she came and she asked me about this and this was the advice I gave her" (Patricia, residential carer).

#### Theme 16

C3. Strategies to protect caregivers against false allegations: having someone else present. Institutional. Facilitated SHR discussions by providing a safer environment for caregivers. Reduced role conflict. 'John had a wee urine infection and his penis was so sore, so it was a case of 'well, let's have a wee look and see if it's all red'... he's comfortable with that and it's all fine, but as a foster carer I'm not gonna go into a room and close a door and have a look at a 10 year old's penis. I'm gonna say 'right, Mark (husband) and I will sit on the bed and you touch it. You show me' and then 'right, ok, here's some cream' (Alison, foster carer). 'You would wait until the house was quieter and maybe do some of that work. 'Why don't we go on the computer next door and we'll shut the dining room door over' but I'll have a member of staff going in and out of the kitchen' (Anna, residential carer).

#### Theme 17

C4. Strategies to protect caregivers against false allegations: household rules. Institutional. Facilitated SHR discussions about privacy and boundaries. Reduced role conflict. 'You need to keep reinforcing what is and is not appropriate behaviour... it is not appropriate to be showing yourself off. It's not appropriate to be going into the toilet with other boys' (Karen, foster carer). 'The wee things that you don't actually think about change, because, you know, it was quite natural for our boys to come down in the morning in their boxer shorts – maybe wear a dressing gown in the summer, maybe not. That changes. That stops. All that stops. You, you have to look at all the risks there are, and your, your children's life changes. Our 7 year-old couldn't come and jump into our bed in the morning because I couldn't allow the other two children to do it – so I couldn't allow him to do it because I didn't want them to feel that he was special' (Pat, foster carer).

#### Theme 18

Personal values and experiences. D1. Religious and moral values as a source of role conflict. Personal. Barrier to SHR discussions, particularly those focused on sex, sexuality and abortion. Contributed to role conflict. 'I'm a practising Catholic. I don't hold the church in any great high esteem but I have faith and as a parent myself I have never brought

my children up tae... all this input of you can go get the pill here, you can go get a jag here and here's what all that's about in such graphic detail. I know this sounds as if its' so traditional and old fashioned but I was never brought up with all this input. I suppose I'm still traditional in my own family home' (Claire, residential carer). 'I've got a Catholic upbringing and you didn't do anything until you were married. It was very strict. I wouldn't force that (talking about sex) on any of the kids that I work with' (Anne-Marie, foster carer). 'Faith based values among staff can sometimes act as a barrier to workers discussing sexual health with young people' (Joanne, residential care). 'It has took me an awful long time tae do all my challenging in myself and asking and prying about [about] how does that fit with my psyche to sit here and talk about things that I ordinarily would not talk about. I went on that course and I found it so challenging. 'Why are we talking about sex to these weans? Why are we no' talking about relationships?' And I got in this pure big debate wi' myself: 'I wouldnae tell my boy that. I wouldnae tell my lassies that' and the trainer was really helpful with me and saying 'yeah, but you need to remember that these kids arenae getting' what your own kids are getting" (Claire, residential carer). 'There can be a clash between what workers may want and what the city council wants...so the training was very much to do with looking at our values, our value base and our knowledge... what was very surprising was the fact that kids are learning so much younger, we were like 'oh my goodness, kids are talking about that (sex) at such a young age" (Laura, residential carer).

### Theme 19

D2. Being allowed to challenge and reflect on values in training. Institutional. Facilitated SHR discussions by challenging pre-existing beliefs and emphasising vulnerability of LAC. Reduced role conflict. 'It has took me an awful long time tae do all my challenging in myself and asking and prying about [about] how does that fit with my psyche to sit here and talk about things that I ordinarily would not talk about. I went on that course and I found it so challenging. 'Why are we talking about sex to these weans? Why are we no' talking about relationships?' And I got in this pure big debate wi' myself: 'I wouldnae tell my boy that. I wouldnae tell my lassies that' and the trainer was really helpful with me and saying 'yeah, but you need to remember that these kids arenae getting' what your own kids are getting" (Claire, residential carer). 'There can be a clash between what workers may want and what the city council wants...so the training was very much to do with looking at our values, our value base and our knowledge... what was very surprising was the fact that kids are learning so much younger, we were like 'oh my goodness, kids are talking about that (sex) at such a young age" (Laura, residential carer).

### Theme 20

D3. Pastoral support as a means of supporting caregivers experiencing role conflict. Institutional. Facilitated SHR discussions by providing caregivers with support to discuss challenging topics or through providing LAC with access to another caregiver to discuss issues with. Reduced role conflict. 'One of the foster carers I work with, she's never been used to talking to children about sex in any way and she asked me to undertake that as I had went on the training' (Anne-Marie, foster carer). 'She was really struggling with the fact that one of the girls in her care had approached her and told her that she was pregnant, but wanted to terminate the pregnancy. She was Catholic and very uncomfortable. My view was that this worker already had a relationship with this girl so it was my job to support her to present all the options to her'. (Joanne, residential care).

### Theme 21

D4. Own experiences of sexual health and relationships as a motivator for discussing SHR. Personal. Facilitated SHR discussions by motivating caregivers to ensure that LAC received better access to information than they had during childhood. Reduced role conflict. 'I went to college at sixteen and... I'm sitting in a class and I'm looking at this film on childbirth and I see where a baby's born from. I thought that they untied your tummy button, took it out, tied it up again and stuck it back in. Now I did bring my children up... from when they were wee tots... I would get them to go and get my sanitary towels and I would tell them what it was' (Pat, foster carer). 'We got told nothing, absolutely nothing, to the stage where the first time I took a period I thought I was dying. And then when I had my first baby I didn't have a clue what was happening or what was going to happen to me so I always thought that if I had children of my own I would prepare them (Anne-Marie, foster carer).

### Theme 22

D5. Having 'parented' around sex. Personal. Facilitated SHR discussions by providing caregivers with parenting experiences to draw on. Reduced role conflict. 'It was always just a natural kind of growing up. We spoke about contraception, and my daughter, I was able to go with her to the doctors when she wanted to start taking the pill. We could just talk about it really openly. Likewise, with John (foster child), we've approached the subject of puberty and changes in the body' (Alison, foster carer).

### Theme 23

Role overload. Workforce capacity. E1. Limited staff numbers in residential care. Institutional. Barrier to SHR discussions due to focus on risk management and having to prioritise resources. Contributed to role overload. 'We're limited wi' [with] staff. We should have two on every shift so if you had a member of the team who was doing that work maybe 2-3 hours a week there is an impact on the other five young people you're looking after' (Patricia, residential carer). 'Children's unit staff are really well-placed to do stuff like that [discuss SHR]. They should be able to spend the time, but sometimes it doesn't seem to happen. I don't know why. I don't know if they're caught up in paperwork and

ordering things, and dealing with incidents that have happened' (Louise, social worker). 'I worked in a 19–23 bedded unit and it was, the work was mostly chaotic. It was like firefighting and you were just going in and trying to contain your shift' (Joanne, residential carer).

#### Theme 24

E2. Competing demands on social workers' time. Institutional. Barrier to SHR discussions due to caregivers having limited time to form trusting relationships with LAC. Contributed to role overload. 'I don't think we have the time to give young people the time they need and the support they need. That's just the way things are going to be. The service is just getting narrower... Sometimes you don't even have time to go to training as you get called to court' (Agnes, social worker). 'As a social worker it's a lot more difficult to really get to know that young person because in residential... you really get to know the young people because you see them for 24 hours periods, and you know a lot more about their life, and what's happening on a daily basis... being a social worker... there's a lot more hidden. You maybe find out a month later that something happened... and it's a lot more difficult to establish what. Spending time wi' young people and building up that relationship is what opens more doors to the speaking to you directly about it (SHR)' (Shona, social worker/relief residential carer). 'a safety plan gets planned and implemented... and focused work carried out that is specific and tailored to that young person's needs and risks... that's something that as the allocated worker I would review and monitor' (Mary, social worker).

#### Theme 25

E3. The importance of interagency working to ensure that LAC receive SHR. Institutional. Facilitated SHR discussions by providing additional supports to undertake concentrated SHR work. Reduced role overload. 'We've got a 12 year old girl... and all her talk and her chat is about paedophiles, and she was going on websites and there was inappropriate material found on phones so obviously our alarm bells are ringing... She's so vulnerable. We've still not got feedback from the police what was on the phone. We give her wee trust exercises back on the computer but then she just tries to go onto these certain websites. She's had images sent to her from people that in my opinion are grooming her and she doesn't see that, she doesn't accept that she's at risk... So, we spoke to her worker at the young woman's project and she's covering a lot of that groundwork with her. And someone here is doing the work about keeping herself safe and making safer choices on the computer' (Joanne, residential carer). 'It's a bit about (about) sharing you know? We kind of all come together. Agency X does the risk assessment work, and they work wi' the young person about why it happened, their feelings, whatever. Agency Y work wi' him to provide socialisation – taking him out because obviously he's not allowed out unsupervised' (Patricia, residential carer).

#### Theme 26

E4. Avoiding duplication of workload. Institutional. No perceived effect reported by caregivers as a barrier/facilitator to SHR discussions. Reduced role overload. 'We've had reports from them and we know what they are doing... so we tend to back off and let one person do that work on sexual health and keeping safe' (Joanne, residential carer). 'Sharing of information is key' (Mary, social worker).

#### Theme 27

Workforce composition. E5. Low proportion of men working in residential care excludes male LAC from SHR discussions. Institutional. Barrier to male LAC accessing SHR information. Contributed to role overload for female caregivers. 'There's no gender balance in residential... for every hundred applicants I can guarantee you that about 84% of them are women' (Patricia, residential carer). 'If there wasnae a male on shift then the boys wouldn't come and talk to us about sex' (Laura, residential carer). 'I dinnae really think boys have really come and speak to ye as much as girls, but then again, they might be more likely tae speak tae like a male, like a male worker' (Shona, social worker/relief residential carer).

#### Theme 28

E6. Male caregivers better placed to talk to male LAC about sex-specific practices. Personal. Facilitated male LAC accessing SHR information when male caregivers were available to discuss issues. Reduced role overload for female caregivers. 'Teaching them how to shave for example, that's not something I can do. So, if I have a male worker, then I get him to come into work unshaven so he can show the boys how to shave properly' (Trisha, residential carer). 'He was always pulling at himself, wasn't he? And I said, 'do you know something? You need, when you're in the shower, you need to get your penis, pull your foreskin back and clean it with soap and water'. And he just stood there, but it cured it, didn't it?' (Ian, foster carer).

#### Theme 29

Not having sufficient skills and knowledge. F1. Caregivers identifying that they need specialist training to undertake SHR discussions. Personal. Barrier to discussing SHR with LAC due to caregivers' perceived lack of knowledge about SHR topics and how to discuss these with LAC. Contributed to role overload. 'if I was in the position of working with a

young person who had a very trusting relationship with me, and who required support with their sexual health and development, then I would like to play a part in that... but I'd like training because I see that as a gap' (Mike, social worker). 'For workers, especially for workers who are not used to working with teenagers there is a need for more formal training, and formal training more often... I mean we do refresher courses for other training, but I can't remember the last time I saw a sexual health awareness or sexual health programme (Agnes, social worker).

### Theme 30

F2. Sexual health and relationships training as a source of knowledge. Personal. Facilitated SHR discussions by providing caregivers with SHR knowledge and the skills needed to discuss these with LAC. Reduced role overload. 'A lot of the training was about words you've not heard since you were a kid... we need to know what these kids mean when they are saying certain things' (Joanne, residential carer). 'the course opens your eyes to it, you know? You can go through life thinking, well, right, ok, I know about Gonorrhoea and this kind of stuff, but I don't know about Chlamydia, and I don't know about this, that and the next thing. And these are all things that children can get, and I need to be able to explain what can happen if they have unprotected sexual relationships' (Ian, foster carer). 'one worker talked about your flower, and if you needed anything sorted you would go to the flower shop... I don't think that things like that really help when talking about going to clinics and your vulva... You need to use the proper names so that everyone is quite clear she could have people thinking 'oh right, I need to go buy some flowers'... because they take you literally' (Laura, residential care).

### Theme 31

F3. Sexual health and relationships training as a source of confidence. Personal. Facilitated SHR discussions by promoting confidence and reducing embarrassment among caregivers. Reduced role overload. 'After I went to the training I found that I was really more confident and I had all the information on hand and booklets to show to the boy... and he said to me at the very end that he'd been having sex education at school, but that I had explained it far better. I put that down to the training' (Anne-Marie, foster carer). 'the training has definitely equipped the staff with confidence' (Tricia, residential carer).

### Theme 32

F4. Using sexual health promotion materials. Institutional. Facilitated SHR discussions by providing caregivers with resources they could access and use with LAC. Reduced role overload. 'If I've no got an answer for them I'll maybe say 'we've got literature on that so just gie me a minute and we'll go and get it and we'll take 5 min to go through it' (Patricia, residential carer). 'to be that if you don't know it, don't pretend that you do but let the kids know that, 'well, look, I don't know about that, but I've got a phone number I can phone' (Ian, foster carer).

### Theme 33

F5. Training highlighted that SHR discussions were routinely happening in care. Personal. No perceived effect reported by caregivers. Contributed to role overload in some cases by creating anxiety that SHR information being provided was correct. 'we were playing Connect 4, and one of the girls said 'how do you get pregnant' and we said 'well, you need to have sex'. 'Aye, I know that... and I know that he cums, but how does that then work?' So we dismantled the Connect 4, and we said 'well it's no square, but you'll have to imagine this is a womb, and these are the fallopian tubes', and we used the wee circles as the sperms and the eggs, and we used that to explain it... Once we were finished I turned to (another caregiver) and said 'did I get that right?'" (Claire, residential carer). 'I remember, certainly, a few years ago having a discussion with an 18 year old girl who wasn't sure what she looked like, erm, err, down below. What her vulva looked like. And about sex, sexual intercourse. She didn't know whether she would be able to partake in that and I do, really remember, just frankly saying to her, why don't you just get a mirror and have a look, you know, oh I can't be doing that, but why can't you be doing that, it's the easiest way to kind of look and have a see, to explore your own bodies and you'll know what's likeable, what's not likeable, what you're happy with people to touch and what you're not happy for people to touch' (Tricia, residential care).

### Theme 34

Pastoral support. G1. Support of management. Institutional. Facilitated SHR discussions by providing caregivers with additional supports. Reduced role overload. 'I found that work really difficult, because I had never had to deal with... trying to manage a child – cos he was a child at the time — who is not only, you know, being abused, but is an abuser... I felt really, you know, unsure of how best to manage that. One of the best things with managing that was that my manager agreed to support me, and we did the work together' (Agnes, social worker)

### Theme 35

	G2. Peer supervision. Institutional. Facilitated SHR discussions by providing caregivers with additional supports and continued informal learning. Reduced role overload. 'We quite often in this team have group supervision... where I might not have had the experience of working with a young person in that situation for a couple of months, someone else probably has or will have without doubt, so it's about other people sharing their experiences and information and sometimes that's the best way to learn because you are speaking about real experiences and examples (Agnes, social worker). 'We deal with it pretty well, but I think with this wee core group of carers that we've got there's always an opportunity for learning... 'I've tried to get this boy to do his bloody homework and he just will not do it' and somebody will say 'try this' and you find that it works. That's where our support is... from other carers in our group. We bounce off each other' (Ian, foster carer).		
<b>Risk of Bias</b>	<b>Section</b>	<b>Question</b>	<b>Answer</b>
	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes <i>(However no discussion regarding whether/if participants chose not to take part. )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Yes
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Yes
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Yes
	Findings	Is there a clear statement of findings?	Yes

	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	Low ( <i>High quality study</i> )
		Directness	Directly applicable

**Ni 2015**

<b>Study type</b>	Qualitative
<b>Aim of study</b>	to examine the extent to which Culturally ‘matched’ placements provide continuity in relation to cultural identity for separated young people
<b>Study location</b>	Two studies, one from England, one from Dublin Ireland
<b>Study setting</b>	four Local Authorities in England/unclear setting for the irish study
<b>Study methods</b>	Three focus groups were held with 19 young people (two male groups and one female group) who had previously lived in foster placements, four social worker focus groups; and four interviews with children’s asylum team managers. All young people were offered an interpreter. Only one young person chose this option; the remaining interviews were conducted in English. Interviews and focus groups were digitally recorded, transcribed and analysed thematically using the software package MAXQDA.
<b>Population</b>	Unaccompanied asylum seekers
<b>Study dates</b>	between 2009 and 2011

<b>Sources of funding</b>	The Irish study was funded by Barnardos, Dublin and the Health Service Executive. The English study was funded by Big Lottery.
<b>Inclusion Criteria</b>	Care Situation Unaccompanied asylum seekers
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> 23 foster carers, 19 young people in their care, four social worker focus groups, four interviews with children's asylum team managers</p> <p><b>Time in care</b> n England between 10 months and five years</p> <p><b>Unaccompanied asylum seekers</b> Four young people had refugee status and the others had 'Discretionary Leave to Remain' (temporary leave to remain usually until the age of 18). Young people who were placed in a range of contexts; from placements with foster carers from the same country of origin and religion to those with white British or Irish foster carers or British or Irish carers from other minority ethnic backgrounds who were also of a different religion to the young person. There were also cases where young people were placed with foster carers of the same religion but a different country of origin and vice versa. In addition, there were placements where one partner in a fostering couple was from the same country of origin but the other partner was not. Coincidentally in both Study A and Study B, four young people were from the same country of origin as one or both foster carers. However, in both studies, even when young people were from the same country of origin as their carers, they were often not from the same ethnic group or religion.</p> <p><b>Gender</b> The focus group participants comprised of a mixture of males and females</p> <p><b>Age</b> 13–18 years old</p> <p><b>Ethnicity</b> The young people originated from seven countries (14 interviewees and 12 focus group participants were Afghan).</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> A great deal of importance attached to their culture - In both studies, it was evident that young people attached great importance to their culture. When speaking about foster placements, they referred to culture as a significant aspect. They observed that culture could provide a sense of continuity in a context where, as Summerfield (1998: 16) has stated, they were experiencing a 'rupture in the narrative threads running through their lives'. Young people spoke of how moving from their countries of origin meant considerable change including loss of family, friends, food, familiar smells, clothing and climate. Thus, it was deemed beneficial to have some similarities available. As one young person in study B stated: "We have different culture when we come here. It's really difficult to adapt with the new culture ... So ... if we are treated maybe in a kind of way that it's similar to our culture because the way we are living in our culture and the way we face things here are different ..."</p>

## Theme 2

Continuity (in a variety of forms) was valued - Participants valued placements where this sense of continuity was facilitated, at least to some extent. In some instances continuity was made possible by carers who were from the same cultural background as young people. However, in other instances, carers of a different background made concerted efforts to meet young people's cultural needs. Both situations were valued by young people.

## Theme 3

Cultural continuity came in many forms - Cultural continuity came in many forms. Different young people highlighted different aspects of culture as being important. Some emphasised food or language, others talked about religion or values, amongst other aspects. One Nigerian young person in Study A spoke about his experience of living with a Nigerian carer: "I think it was all right because she [my foster carer], she's Nigerian and I'm Nigerian as well ... we kind of have the same values and norms so."

## Theme 4

Cross-cultural placements could work very well - in both studies, those living with carers of a different cultural background expressed satisfaction with this arrangement, reflecting findings from Chase et al. (2008: 69) that most young people who participated in their study had 'very positive experiences of cross-cultural placements'. They felt it was not necessary to be with a family of their own nationality in order for their cultural needs to be met. Similarly, social workers in both studies observed that cross-cultural placements could work very well when carers were open to diversity and willing to facilitate the development of a young person's cultural identity. Repeatedly, young people made reference to the fact that what was most important was the personality of the carer. In particular, young people wanted carers who respected their cultural background: "It doesn't matter to me. ... For me, actually, I can live with anybody. I can live with any culture. ... The only thing about it is, like, ... once they respect me for my own belief and whatever I do. ... So, the only thing is if actually I can get on with the person and they can get on with me and, like, they respect me for what, respect what I believe or whatever. (Young person, Study B)"

## Theme 5

Variety attempts to make cross-cultural efforts - In both studies it was evident that cross-cultural carers responded to the cultural needs of the young people to different degrees. Some paid little or no attention to culture whereas others placed particular emphasis on it. In cases where little or no attention was paid, carers sometimes believed that the young person was disinterested and culture was not of particular importance. The carers believed young people had adjusted to their new society and, hence, cultural practices linked to their country of origin were not of much significance. In one case, in Study B, the carer described the young person being 'really integrated into the Irish way of life before he came [to live with me]' and stated that 'culture wasn't a big issue'. In contrast, while the young person appeared very happy in his placement, when asked about his culture he expressed a desire to learn more about it: "YP: Yes. I would love to learn a wee [little] bit more about Nigeria. Like, I only know a few things – that's about it. Yes. I: So you would like to have the opportunity to learn. YP: Just a wee bit. Yes." In general, though, most young people felt that carers attempted to help them hold onto their cultures in different ways. They appreciated this. For example, one young person in Study B stated: "What I like from my last foster mother, she always asked me what kind of food I eat, what kind of music I like, so, and she sometimes takes me to a place where, where there is a cultural programme [from my country], she would take me there, so because ... I always miss something about my own culture ... so she used to do that and I really liked that about them."

## Theme 6

Independence and self-reliance (ultimately) in remaining connected to cultural roots - Yet, while it was acknowledged that carers and social workers could play an important role in facilitating cultural continuity and helping promote cultural identity, some young people felt that it was up to themselves to maintain a connection to their cultural 'roots'. One young person in Study B stated: "I think they can help to a certain extent or because it's really up to you I think. Your culture is in you, its you and where you go, like where I go I keep it to myself that you know what this is who I am, this is where I come from, and you know this is me. ... They can help you by like you know um like, um I don't know, getting you to join things like I don't know, like do things that involve your cultural stuff or something. ... They can do that but at the end of the day it's really up to you, it's up to you how you want to keep your culture yeah."

## Theme 7

Language a challenge in many cases - For many young people, communication was challenging at the beginning, especially if English was not their first language. While in Ireland young people usually lived in residential care upon arrival and were linked with specialist English language support, in England most young people went straight to foster placements. This often meant that challenges in adjusting to foster care were compounded by communication difficulties as explained by this young person in Study A: "It was

hard, because if you can't speak someone's language and you're, like, you're like blind, you know? Like, you can't talk their language. You don't know what they're saying. And I remember always talked to me and I didn't understand what she say, but I'd be saying, 'Okay, okay', like that [laughter]. I didn't know what she say, good or bad or, I don't know, but I know she don't say a bad word to me. She's a nice lady."

### Theme 8

Young people appreciated carers who made an effort to adapt to the language communication challenge - young people recognised foster carers' efforts to adapt in order to communicate with them. One young person in Study A recalled how he was welcomed to the foster family: "At first they was really welcoming, 'cause they had, Louise, she's 13 now and she [had] drawn a welcome in Albanian ... [laughs] ... in, on a piece of paper. It was really good. It felt, I felt really, you know, welcomed." Other young people spoke about carers who used dictionaries, the internet, interpreters and local networks to communicate, and carers who helped them with their English or organised English teachers for them. In Study B, one participant stated: "Well everybody was new to me and um I had no English and I remember Kate and Frank trying to tell me something but I couldn't understand. It was really good like they helped me a lot for my English so I owe them one [laughs]. So that's how I learned English so they used to help me, talk to me every day."

### Theme 9

Importance of native language - While some young people considered their native language to be of great importance, this was not always the case. Many young people highlighted the benefit of being in an English speaking household where English could be learnt more quickly. "I don't like to speak it, Tigrinya. It's not helpful for jobs. ... That's why I like to speak English. (Young person, Study A)" In contrast, some young people in cross-cultural placements craved opportunities to speak their native language. A participant in Study B, living with an Irish family, stated: "I'd love to meet people like who could speak my language really like that. 'Cause like, 'cause like I don't know like, its different like from English, like when you speak your own language you could say certain things like you know funny things that you can't say in English like you know. ... You can say silly things and like all that but in English when you are trying to say something silly you have to think of how you put it like you can't just say anything yeah if you are used to the language then you can say anything so."

### Theme 10

Benefits of matching by language for continuity - When young people were placed with carers of the same nationality who spoke the same language, they highlighted benefits in terms of language continuity. For one young person in Study B, the common language meant she could trust her carer to a greater extent as communication was more open and transparent than it would be if the languages were different. This is a particularly salient point given the challenges that separated children often have in developing trusting relationships (Ní Raghallaigh, 2013b): "YP: We speak the same language [laughs] I: Ok ... and is that important? YP: Yeah, um, sometimes she might be saying some stuff and then if I don't understand her I just feel like she might be talking about me ... let's say I go to someone's house and they're like Indian or something and they're speaking another language and then ... you would feel like an outsider or something." Continuity of language also meant they did not forget their native language. Indeed, in Study B, several young people who had lived in residential care or in placements with Irish families said they were no longer able to speak their native languages.

### Theme 11

Non-lingual forms of communication differences - Communication went beyond language, however. Participants also spoke about the need for carers to understand diverse ways of communicating in their interactions with the young people. McWilliams (2012) suggests that some cultures emphasise direct and authoritative communication while others emphasise a more indirect and hesitant style. In both studies, participants talked about cultural differences as regards eye contact. For example a young person in Study A spoke about an interaction with his foster carer. The foster carer had asked: "When you're talking to me, why are you not like just exactly looking in my eyes? You should be looking." I said, like, '... I don't know, just I'm not really comfortable with it. ... And just stick my eyes into yours, you know, it's just like it doesn't happen that way." A young person in Study B talked about the need for carers to understand difference and gave an example of how communication or behaviour can be deemed 'rude' or not in different cultural contexts: "Like, when I came new, ... to give me something, I didn't even say 'thank you'; I didn't even say 'please'. ... You know? Because I'm not used to it. ... So, they can have the misunderstanding. Maybe they might think you are rude or something like that, but you are not."

### Theme 12

Importance of food and culture - In both Studies A and B young people indicated that food was very important in creating a sense of welcome within foster placements. For example, a young person in Study B compared two crosscultural foster placements and the attitude of his carers towards his food. In one placement, his carers encouraged him

to cook and they tried food that he made, leading him to 'feel really relaxed and stuff'. In contrast, in the other placement, the carers often complained about the smell of the food, leading the young person to 'feel not really welcome to the house'.

### Theme 13

Food and autonomy - Choice and control are also significant, whether in choosing food from countries of origin or new kinds of 'comfort' food and can indicate the extent to which young people feel a sense of belonging and inclusion in the household (Sirriyeh, 2013a). In both studies, there were examples of many successful food experiences in crosscultural placements. Many carers made concerted efforts to provide food the young people liked and encouraged them to become involved in food choices and preparation.

### Theme 14

Food for "settling in" - In both studies, food was often a first refuge for young people at a time of uncertainty and transition (Kohli et al., 2010). Providing young people with a familiar environment enabled them to feel safe and secure and created a stable base from which to deal with transitions into aspects of life in England or Ireland which may be less familiar. For example, when asked what helped him to settle in his foster placement, one young person in Study B stated the following: "I think it was like um, like, eat the same food that we eat in Nigeria. That was very nice. It made me think back about Nigeria."

### Theme 15

Advantages of matched placements for food - Those young people living with foster carers from the same countries of origin or neighbouring countries with some cultural similarities described the advantage of having some shared cultural knowledge and, in particular, focused on food. As a young person in Study A explained: "think 'cause we've got the same cultural background it made it easier, and probably like have the same kind of food and stuff, you know, yeah, and. There's nothing really major, there's nothing like making it hard really, everything is easy."

### Theme 16

Overcoming cultural cross-over for food - In cross-cultural placements communication difficulties early on in placements sometimes created challenges in negotiating food arrangements, but various methods were used to overcome these. Carers encouraged young people to cook with them. Young people were often included in family food shopping trips and were asked to choose food they liked. This also helped to clarify anxieties and answer questions, as a young person in Study A illustrated: "The first time I eat just I eat take out bread. She [foster carer] ask me what you like? ... She ask me why you not eating? I say no Halal. She don't know Halal. ... After I didn't know if she could do Halal shop. ... She took me to [shops] and she buying food from here. She took me to see. ... I could see she is buying Halal. Everytime I go with her shopping. (Young person, Study A)"

### Theme 17

Importance of cultural sensitivity for religious practices - In Study A, in which there were larger numbers of Muslim young people, the holy month of Ramadan was raised as a point of adjustment for foster carers attempting to provide support for young people while they were fasting. During Ramadan those young people who were fasting needed to eat early in the morning which had an impact on family food routines. This was also evident in Study B, although there were fewer Muslim young people in this study. However, although foster carers mentioned that accommodating young people's food needs during Ramadan could be challenging, most foster carers and young people overcame challenges involved. In both studies some foster carers and/or young people prepared food in advance for young people to heat up when required. In Study A some Afghan young people were placed together in foster care placements or nearby other Afghan young people. Some prepared and ate food together during Ramadan, enabling them to maintain communal aspects of their religious practices: "We can all cook ... For all month ... And our mum love it, she's love it, yeah ... And then, when I go to friend house, he – we're talking, we're cooking food, Afghan food always, like curry, rice and yeah, we just – I'm always going and every night I going to – not every night, but every Sunday, I'm going to my friend house and I stay there and we have, like six, seven friend talking to each other, then yeah, we're cooking and eating. (Young person, Study A)"

	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes
	Data collection	Was the data collected in a way that addressed the research issue?	Can't tell <i>(Researchers do not justify setting for data collection; researcher made the methods explicit (e.g. for interview method, is there an indication of how interviews are conducted, or did they use a topic guide); unclear if data saturation was considered )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(Did the researcher critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Yes

	Findings	Is there a clear statement of findings?	Can't tell <i>(no clear discussion of credibility of findings (e.g. triangulation, respondent validation, more than one analyst))</i>
	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	Moderate
		Directness	Partially applicable <i>(Some data was derived from a study from the republic of Ireland, it is possible that some data were collected prior to 2010)</i>

## November 2020

### Study Characteristics

<b>Study type</b>	Focus Groups Semi structured interviews
<b>Aim of study</b>	to understand the experiences of both parents and carers in order to inform the development of accessible and appropriate online learning resources, which could be accessed by anyone working in the field, and to explore options for better peer support amongst carers.
<b>Study location</b>	UK

<b>Study setting</b>	Parent-and-child foster placements across England
<b>Study methods</b>	Ten focus groups with 32 carers who had parent-and-child experience within the previous two years, eight semi-structured interviews with mothers with experience of parent-and-child placements, and nine semi-structured interviews with supervising social workers. Participants were recruited initially using the social media network of the first author and those of the project's advisory group, drawn from prominent fostering, midwifery, health visiting, and third-sector organizations. Snowball sampling was used to recruit subsequent participants. Focus groups were widely spread across England, including carers from both LAs and independent fostering providers (IFPs). Interviews and focus groups were conducted in foster carers' homes, mothers' homes, and in private rooms within organizations and were recorded and transcribed with participants' written consent. Mothers were asked about their experiences, both positive and negative, of being in a foster home with their child. Foster carers were asked about their experiences, how well supported and trained they felt, and what content areas of additional training they felt they would benefit from. Focus group and interview data were transcribed by the first author and transferred to NVivo version 12 to assist with thematic analysis. Recordings were listened to and read twice by the first author before coding, and major themes and subthemes were identified and discussed with the second author. The number and geographical range in location of carers was such that there was evidence of data saturation, with no new themes emerging.
<b>Population</b>	Carers who had parent-and-child experience, mothers with experience of parent-and-child placements, and supervising social workers
<b>Study dates</b>	March to July 2018
<b>Sources of funding</b>	This study was funded by the Sir Halley Stewart Trust. Jane Sandall is a National Institute for Health Research (NIHR) Senior Investigator and is supported by the National Institute for Health Research (NIHR) Applied Research Collaboration South London (NIHR ARC South London) at King's College Hospital NHS Foundation Trust.
<b>Inclusion Criteria</b>	Carer situation Carers who had parent-and-child experience and supervising social workers

	Parent mothers with experience of parent-and-child placements
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p>Sample size 32 carers who had parent-and-child experience, eight mothers with experience of parent-and-child placements, nine supervising social workers.</p> <p>Parents in care 100%</p> <p>non-white ethnicity Mothers 62.5%</p> <p>Gender Mothers 100% female</p> <p>Carer characteristics 40% independent foster carers, 60% from the local authority</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> Differences in priorities between mothers, carers, and social workers - When asked about their experiences, mothers focussed almost exclusively on the attitudes of carers; how they were made to feel and how much the carer built or eroded their self-esteem. Carer and social work data were more directly related to training and support needs, with an additional strong element being the unique stresses of the parent-and-child role.</p> <p><b>Theme 2</b> Main issues identified by the mother - 1) Not meeting the carer before moving in 2) How she made me feel/the importance of empowering communication 3) “She writes about me and I don’t know what she says”</p> <p><b>Theme 3</b> Current support and unmet support needs of foster carers - 1) Unique stresses of parent-and-child role/need for therapeutic input 2) Isolation and need for peer support 3) Social media peer support networks</p>

#### Theme 4

Current training and unmet training needs of foster carers - 1) Assumed knowledge/focus on skills for assessment 2) Topics identified as important and currently lacking 3) Training solutions; online and face-to-face

#### Theme 5

Not meeting the carer before moving in - All mothers except one had not met the carer until they moved into the placement, a huge source of stress. In defence, social workers explained that placements often had to be found straight from the family court, but this did not account for all examples, many simply being transfers between placements. "They told me to pack my things into boxes as I was moving out of borough to a foster carer I'd never met. I was already in labour and my mum was supposed to be my birth partner. Later, cos the new carer couldn't drive, I had to go by ambulance to a different hospital and my mum couldn't get there on time. She (the carer)'s seen me naked and I don't even like the woman. I wanted my mum there.4 (M8, 18-year-old mother, first child).

#### Theme 6

How she made me feel: The importance of empowering communication - Mothers had a variety of experiences. For some, foster care was their first opportunity for a stable relationship with a caring adult, and they had flourished; for others, the experience was overwhelmingly negative. This was largely related to how intrusive the mother perceived the carer to be and her sensitivity in communication: "The first one was wanting to know everything about my childhood, digging into it. The other one was interested but wasn't pushing it and I felt a lot more comfortable to tell her. And she was always there to support me. (M7, 34-year-old mother with fourth child. First three children removed. Left with child)." Regarding supervision and advice, mothers recounted mixed experiences, feeling either criticized and undermined or engaged and encouraged: "And when I'm doing stuff like bathing C, she's always watching me, saying ... "What's wrong with you? How are you not knowing this? You know not to do that."... I can't deal with that. It's too much for me. I feel too much under pressure, like she's criticises me. (M5, 16-year-old looked-after child). If she had a problem with the way I was doing anything she would just come across in a nice way like "Darling when you're holding the baby just bring him closer"— just little tips like that. She never came across full-on which is what I loved. (M3, 20-year-old, in care with first baby who she kept. Had second baby in the community). There were also examples communication, which were overtly abusive: "I actually got discharged on the Saturday ... and she started shouting at me saying "you've just got out of hospital, you need to pick yourself up, get back on track. Don't you dare put a cup on my couch, it's worth a fortune more than you." So she was just really horrible." (Mother, 17-year-old previously looked-after child). Or where a lack of knowledge, compassion, and sensitivity were a toxic combination: "Once when I was pregnant, the baby wasn't moving so I asked her to take me to hospital. The baby was fine, but then the next day she was saying "ah, I was really angry cos I couldn't go to my son's first parent's evening, and it was a waste of time going to the hospital when there was nothing wrong with the baby." (Mother, 16-year-old looked-after child). For several mothers, although they valued support and practical help, there was a fine line between this and feeling that the carer was too intrusive. This mother's perception was that the carer wanted her to fail so that she could keep the baby and described her efforts to present herself in a way that would not disadvantage her: "She wanted to do a lot of the feeds, dressing my child, taking my child out without me being around ... she wanted my daughter without me. And her family were saying how they'd love to have her. Like "you can go home" sort of thing. They were trying to have that jokey element ... and I had to (respond) jokingly as well because I didn't want to come across as passive aggressive or argumentative. (Mother, 34-year-old mother, fourth child. First three children removed. Left with child)

#### Theme 7

Surveillance - "She writes about me and I don't know what she says" - All carers are used to keeping daily logs; with parent-and-child foster care, these are frequently used as evidence within the family court arena. Although sharing logs with mothers is widely considered best practice (Adams & Dibben, 2011), for several carers, there was no expectation of sharing their logs with the mother, and this was echoed in interviews with mothers: "The only time I saw some of the logs was when I was in court. Other than that I didn't get to see them. (Mother, 34-year-old mother, fourth child. First three children removed. Left with child). In summary, mothers found the idea of a parent-and-child foster placement very stressful, a place where they would be watched and criticized and where they had to prove they were able to look after their babies with little of the normal help that new mothers need. This stress was reduced when the mother moved into the placement before birth or where she had met the carer prior to the move. Mothers felt easily criticized but described some compassionate sensitive communication, where advice was more likely to be taken on board. Mothers feared the consequences of negative written reports about their parenting but rarely challenged policies where this personal data was not shared with them.

#### Theme 8

Current and unmet support needs of parent-and-child carers - Unique stresses of parent-and-child role/need for therapeutic input - Carers described unique stressors over and above those experienced by generalist foster carers and highly valued the opportunity to talk about them: "I asked as well for specific parent-and-child support groups, because parent-and-child is completely different— different worries, different concerns. And if you don't talk to other parent-and-child carers, you're out on a limb. My supervising social worker, the last two, have been very newly qualified. Very young. And I'm not knocking that, but I feel like I'm supporting them in their development and they're not there for me. And sometimes when everybody shuts down at the weekend, that's it! So if something occurs at the weekend who you do talk to you? I've had that several times and it's been absolutely dreadful. (Foster Carer, Female, 50s). Most of these stresses were associated with the tension inherent in the role, between nurturing a vulnerable mother and contributing to the assessment which decides whether she will leave with her child: "Very very different, very specialist ... sometimes they will say "we don't want you doing this for the mum. They are to do it themselves and you are to record everything" ... I think that's quite off-putting for someone who's nurturing by nature." (Foster Carer, Female, 40s). "We've had times when our carers have been accused of "colluding with the mother!" Such negative language—what does that even mean? Aren't we all colluding with the mother?" (Social Worker, CEO of an IFP). Every carer and social worker cited times when, either implicitly or explicitly, the outcome of assessments had been decided by the LA before placing the mother-and-child, with the placement merely satisfying court proceedings. The desire to advocate for a mother whom the carer felt needed additional time and therapeutic input to develop "good enough parenting" skills was a huge source of stress, and the feelings of powerlessness that accompanied this were problematic: "I had a very disturbed mum when she first arrived, and for the first three days couldn't go into the kitchen to make the bottles, cos she was just so overwhelmed ... there was a massive history of DV, so she didn't want to go into the kitchen if K (carer's husband) was in there. And that was really difficult to overcome. I had to work really hard with her initially, and all you've got is a social worker coming and saying "So, you're refusing to feed the baby." You just think "Back off!" And a few days later, this same social worker just said "Tell me when. Tell me when to pull the plug, and she's out!" And that was his exact words. And I said "No, no, give us some time, we're working on it." And do you know, she went on to do 7 months and went home with the baby. But they were prepared to write her off." (Foster Carer, Female, 60s). Other unique stressors involved having another adult (or two) in the house, the intensity of often 24-hr supervision, and "allowing abuse under your roof," when carers were asked not to step into a parent-child interaction in order to provide evidence for separation: "This child, I just felt so sorry for her. You just thought "How long? How long can I leave it?" Cos you know they want the evidence for emotional abuse cos it's very hard to get." (FC 14, Female, 30s). For other carers, very deep issues were raised by their involvement with such troubled families; one couple talked about their 18-year-old son having a breakdown a year after a baby left the family for adoption. Another older carer talked about the pain she experienced when a baby moved on to adoption at 4 months: "When I was with my first husband, we had a little boy and we lost him (to SIDS) at four-and-a-half months. And that was the same age as when the baby was taken away. So I was sort of reliving what had happened all those years ago." (Foster Carer, Female, 60s). Despite the enormous emotional burden clearly being carried by carers in this role, there were no examples of professional therapeutic input or counselling being available as a standard part of parent-and child carers' support package.

### Theme 9

Isolation and lack of face-to-face peer support - With some notable exceptions, there was a dearth of opportunities for peer support amongst parent-and-child carers. Most LAs and IFPs had only a handful in post and the constraints of the role meant that peer support opportunities were difficult to organize; several carers attending focus groups had never met another parent-and-child carer. However, where good peer support was in place, this was used as a first port of call, rather than using their organizational support systems.

### Theme 10

Social media-based peer support - During the research process, the first author became familiar with various social media groups for foster carers. They vary in size, emphasis, and joining criteria. For some carers, these groups were important for instant advice, avoiding the delay involved in using the more established channels: "You post on there ... sometimes it's a really practical thing, like about benefits. It's really helpful. Much more than ringing up your agency or LA and waiting four weeks to get an answer to something." (Foster Carer, Female, 40s). However, there were several instances described of peer support groups, whether in a physical or remote format, becoming overly negative: "We had a Whatsapp group that was really really negative and detrimental. It was really a bitching group." (Social Worker, Female, IFP) "I sometimes wouldn't ask them to look after my dog, let alone a child. Some of the language on the blogs!" (Foster Carer, Female, 40s). There was a feeling that these groups were too much about "normal" fostering, with little understanding of the specialized role with its unique challenges; discussion of a specialist-closed Facebook group was met with enthusiasm. In summary, parent-and-child carers experience some unique stresses and highly value the support of others with mutual experience. There is currently little recognition of the need for additional therapeutic support, despite the huge emotional burden these carers carry. Many are isolated, having fewer opportunities to meet with peers, mostly for logistical reasons; they are often widely spread geographically, and the levels of supervision required for some placements mean that they cannot take time away without respite, which they prefer to use for time with family. Social media is a popular form of peer support, but groups differ in quality of moderation and are all generic, with no specialist forum currently operating.

**Theme 11**

Current training and unmet training needs - Although a minority of participants reported being given high-quality specialist training, the overriding view was that training specific for the parent-and-child role was either absent, ad hoc, or run by generalist trainers without appropriate knowledge: "I've asked for 3 years now for specific parent-and-child training, and it just doesn't happen. There isn't any. "X" is the only place that does any, and its rubbish." (FC 14, Female, 30s) "It's like the blind leading the blind because they haven't got the experience." (FC 16, Female, 50s). They could identify topics within generic training that were relevant but with little or no application to the parent-and-child setting. For example, training on infant attachment was aimed at understanding children who have been separated from a parent rather than promoting attachment between a parent and their infant.

**Theme 12**

Assumed knowledge/focus on skills for assessment - When asked how parent-and-child carers were selected and trained, there was a strong reliance on "previous knowledge" acquired through their own parenting or through experience of "normal" foster care. Carers saw this as insufficient for the role, citing examples of where advice had changed: "I was just using my personal way and experience but that was 35 years out of date" (FC 5, Female, 60s) "I think they think if you're a parent, you can do all these things. It doesn't matter what comes up, they think we know it all. We don't know it all." (Foster Carer, Female, 40s).

**Theme 13**

Topics identified as important and currently lacking - Carers completed a questionnaire where they were asked to rate a number of topics for importance for the parent-and-child role and to identify other areas not currently covered in training. The following areas were identified: 1) Encouraging a healthy pregnancy, birth preparation, and being a birth companion 2) Parent/baby attachment, breastfeeding, and co-sleeping 3) Maternal mental health, the complexity of women with serial removals, maternal drug use, and the effect of alcohol/drugs in newborns 4) Domestic abuse. In discussions around these topics, as well as the need for information, the need for understanding the advocacy role came out strongly: "I would say "It's her human right, and that baby's human right to be fed by its mother. But it caused trouble (when baby was taken to contact with father) and the social workers tried to stop her feeding ... that made me mad." (FC 18, Female, 40s). "The obstetrician had massive hands and she (the mother) took one look at him and had a complete and utter freak. I had to literally take him outside and say, "What are you doing?" ... I had to explain to him that she had a learning difficulty and had been horrifically sexually abused ... and that he needed to change his attitude and come with a much more gentle approach ... to deal with the uniqueness of who she is. (Foster Carer, Female, 50s)

**Theme 14**

How to manage endings—when a baby is removed - "I've had no training on how to remove. That was a really hard thing. I came home (from court) and helped her pack. We spent the day in the park, feeding the swans, taking loads of pictures. And then I had to drop her home with her baby in my car, to her mum. And then her mum went mental cos she didn't want to lose her grandchild. No training! (Foster Carer, Female, 40s)

**Theme 15**

Sharing logs with mothers in a positive way: "(Referring to logs) I always talk through concerns and usually at the end of the day there will be a time where it's like "You did this really well," talking about the positives first. And then saying, "You need a bit of work on this side of things." It's a vital piece of work. You're talking lives!" (Foster Carer, Female, 50s)

**Theme 16**

Working with mothers with learning disabilities and autism: "They allow carers with disabilities to foster, or they're working with children with disabilities, but they'll not train you to work with mums with disabilities." (Foster Carer, 40s)

**Theme 17**

Training solutions: Online and face-to-face - As would be expected, a mixed picture emerged about the relative benefits of face-to-face training versus online learning. A commonly voiced issue with face-to-face training related to the difficulty of being able to attend when the mother-and-child needed 24-hr supervision. Other objections were that the trainer was unlikely to be an expert on the topic and sessions were often boring. However, where carers had attended face-to-face training delivered by an expert trainer, this was very highly valued. Several social workers proposed a blended learning approach so that sessions could be planned around an online module, with activities for group supervision incorporated into

the package. In summary, current parent-and-child training lacks content on supporting the mother's and child's mental and physical health and attachment relationship or on advocacy. Although expertly delivered - face-to-face training is highly valued, it is scarce and localized. Online learning is seen as an acceptable alternative, especially if it covers specialist areas not commonly available. Participants believed that there would be added value and richness if online learning content could also be used in group supervision sessions.

## Risk of Bias

Section	Question	Answer
Aims of the research	Was there a clear statement of the aims of the research?	Yes
Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
Research Design	Was the research design appropriate to address the aims of the research?	Yes
Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes
Data collection	Was the data collected in a way that addressed the research issue?	Yes
Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell
Ethical Issues	Have ethical issues been taken into consideration?	Yes
Data analysis	Was the data analysis sufficiently rigorous?	Yes
Findings	Is there a clear statement of findings?	Yes
Research value	How valuable is the research?	The research is valuable
Overall risk of bias and directness	Overall risk of bias	Low
	Directness	Directly applicable

**Oke 2013**

<b>Study type</b>	Semi structured interviews
<b>Aim of study</b>	To explore Foster carers' perceptions of family, commitment and belonging in successful placements
<b>Study location</b>	UK
<b>Study setting</b>	Foster carers from a single local authority
<b>Study methods</b>	The interview was divided into five main sections as follows: 1. Reflections on the experience of being a foster carer: motivations, rewards and challenges. 2. How childhood experiences might have affected the respondent, as a foster carer now. 3. Reflections on the meanings of 'family' and an examination of the degree to which the fostered child is experienced as 'belonging' in their family. 4. The carer's experience of their relationship with the target child/young person. 5. Reflections on the carer's ideas about the young person's future, and what the carer has learned in retrospect about 'family' through looking after the target child/young person. The interviews were digitally recorded and subsequently transcribed. The interviews were undertaken at the carer's convenience at a venue of their choice and were of between an hour and a half and two hours in duration. The carers' transcribed accounts were analysed in line with IPA practice, moving from individual descriptive detail to interpretive general pattern (Smith, Flowers, & Larkin, 2009). The first author made detailed initial codings of the seven transcripts; themes were subsequently developed by the three authors together.
<b>Population</b>	Foster carers looking after a young person in the age range 12 to 17 years old
<b>Study dates</b>	2007
<b>Sources of funding</b>	Not reported
<b>Inclusion Criteria</b>	Care Situation

	<p>Scrutiny of the Looked After Child (LAC) Statutory Review forms for each child showed social worker appraisal of the placement as 'stable'. The target group of foster carers consisted of those who appeared to be offering a setting that was functioning effectively for the child, despite previous expectations,</p> <p><b>Time in care</b> The 'Looked After' child in question had been in placement with the carer for at least two years, and had been 'looked after' for four or more years.</p> <p><b>Education</b> The LAC Review form showed evidence from educational professionals of current satisfactory educational attendance and progress relative to the child's abilities and needs.</p> <p><b>Carer situation</b> foster carers in a single Local Authority, looking after a young person in the age range 12 to 17 years old. The research endeavour focused on the person defined as the present main foster carer, the status of 'principal carer' being agreed upon by the couple, where there were two foster carers in the household.</p> <p><b>Number of previous placements</b> The history of the child's previous placement/s showed at least one disruption, and difficulties in at least one of the following areas: education; mental health; offending behaviour; relationships with peers.</p> <p><b>Contact</b> There was evidence of ongoing satisfactory contact between the child and members of his or her original family, as rated by the LAC Review group (which may have included the child and parent/s themselves).</p>
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> seven foster carers</p> <p><b>Number of previous placements</b> range 3 to 7 years</p> <p><b>Time in current placement</b> range 2 to 5 years</p> <p><b>Age</b> 14 - 17 years</p> <p><b>Ethnicity</b> All the carers were white and British, as were the seven young people cared for.</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> 'My' child—'clicking', belonging in the family and parental regard. What emerges from all respondents is a sense of parental commitment to the children they cared for. This was claimed as particularly strong in relation to the target child of the investigation and was manifest in the carers' accounts of viewing themselves going beyond the call of duty and</p>

reasonable foster care for these children. There is a common feature of the respondents having 'fallen for' the child at an early stage in the placement. This is presented as a special liking or love for the child, who appears to have called forth a parental dedication or selflessness in the carer. The quote below from Jess is included in its entirety as it usefully sets the tone for all the findings, across the themes. "We had a placement for a young teen. Karl was the 'bad boy' of the choice we were offered. We met him and we really liked him and he moved in here. For Karl this really is his home now. I think that does impact a lot really umm [pause] you do feel a lot more sort of responsible for him and umm you just know that umm [pause] it's funny with Karl because I think he has sort of touched us more than what a lot of children have. With Karl it's almost as if I don't think even / I could let go of him if you know what I mean. I think he would always be part of this family. I suppose it / it's [pause] he's made me aware that you can actually have quite powerful feelings for somebody like Karl that has come into the family quite late but has this / umm power over you to say that he's changed your feelings and that you can actually feel that strongly for somebody that isn't part of your own flesh and blood. I suppose because I must admit / I suppose we've liked lots of children but I don't / I don't think any of them have had the impact that Karl has had on us [pause] how you think about that umm somebody else if you see what I mean. Umm / I don't know whether it's his vulnerability or whether it's what he gives back to the family I don't know but it / it is quite a powerful thing with him ..."

### Theme 2

A compelling and instantaneous connection - As Jess made a quick preference for Karl, so each respondent indicated a compelling and sometimes almost instantaneous connection with the target young person. Their descriptions were imbued with a sense of inevitability and even passivity, in a process of what seemed to be experienced as a particular kind of 'falling in love'. This appeared to sustain setbacks and challenges presented by the child as the placement proceeded: "It is very difficult when they first come in because you don't know them and they don't know you / the whole house not just the child. It's the foster carer as well / it's a whole different routine because we don't know the person and they don't know us. But the click thing is a special liking for them I think, taking to them as soon as they come in [pause] like the one we're thinking about today. Umm I love Sim to bits and he drives me crackers."

### Theme 3

Clicking that carries the carer over the initial adaption period - Thus the 'click thing' appears to carry the carer through the initial adaption period in the household. At the same time the participants reported their perception of the development of a reciprocal sense of commitment to the carer and foster family from the young person, which also appeared to be linked with an emotional distancing from birth parents, or a definite decision on the child's part to put all, or most, of their eggs in the foster care basket for the time being. Children were reported as wanting to 'belong' and the carers wanted to offer that. What Yvonne reports is a good example: "Well Ricky said it / he said it to us: he is perfectly happy / he sees us as his mum and dad. He doesn't want anybody to know otherwise / it is nobody else's business umm [pause] and that's it. What more can he say / he sees us as his mum and dad and he says he belongs here."

### Theme 4

Understanding that the commitment may not be forever - These carers also gave evidence of understanding that the commitment from the child may not be forever. They appeared to be able to accommodate a 'provisional' arrangement and hold on to uncertainty about future relations, including the young person revisiting their relationship with birth family. This is illustrated well in this quote from Natalie: "Um well Louise quite often says 'this is my life and this is my home and this is my family'. She says she doesn't want to keep being reminded of her history / I think at some time in her life she probably will want to go back over that. Perhaps it won't come till she has children of her own / I don't know but right now she seems to have committed herself to being here in this family."

### Theme 5

Claiming of the child - Given the growth of the emotional bond, all respondents referred to the target children as 'theirs'. This claiming of the child was also described as an illicit process that created tensions with social workers, who, from the carers' perspective, were presented as uneasy about the use of the possessive pronoun in this way. The following is typical: "We love them unconditionally. I think that is the thing isn't it? My only / my only hope for anybody but particularly for the kids I bring up is that they will be reasonably happy [pause] whatever they do and I think that's what most parents who care about their kids will say. I do see them as my kids and social workers sometimes pull a bit of a face when I say 'my kids' but they are."

### Theme 6

Stepping into the parent role - A corollary of this parental 'claiming' was that the fostered children were construed as 'family' while in the household. Each respondent made claims eliding differences between genetic and fostering relationships. This was particularly so in connection with the young people targeted in this research. Again, the child being part of the foster family was an idea that carers experienced as subversive in relation to what they imagined social workers might want from them in looking after other

people's children. These strands are combined well in this quote from Aileen: "The fact is that [pause] we don't think about ourselves a lot of the time as foster carers. Social Services would probably die if we said that because you have to be aware of this, have to be aware of that for the Department, but day-to-day I don't feel aware of being a carer. I feel like we are parents. We are a family aren't we / a big family? The family is everyone in the household we are looking after, our own and fostered."

### Theme 7

Claiming a grandparental role - This inclusive sense of family also appeared to apply to future projections of relationship. All seven respondents, in thinking forward to a time when the young person might have children of their own, claimed an expected grandparental position. Diane's comment is to the point and typical: "My foster children related to my mother as nanny / she was nanny to all of my kids. They all still call her nanny. Becky's children would be my grandchildren."

### Theme 8

Consideration to the birth family - At the same time, the participants were equally emphatic about promoting and maintaining the target child's links with birth family members. Helen, in the following excerpt gives an account that encapsulates a theme presented across the study by all the carers: "We try very hard not / to let them forget that they do have family and that we are substitutes. We talk about their family and we listen to what they have to say but we don't accept absolute criticism / of their family because all children are placed in care for whatever reason and it may well be that their family are good people but they just can't deal with that person at that stage in life and therefore you shouldn't / be / tunnel-visioned." Helen was as insistent as the other carers about the foster children being 'hers'. At the same time she speaks for all participants in claiming the necessity of accepting the whole child, their history and birth family included. As carers they appeared to be able to tolerate the ambiguity of the child belonging in two families at once, without this diminishing their own sense of emotional commitment to the child.

### Theme 9

Foster carers are independent practitioners, paid an allowance by the Local Authority to care for children who 'belong' in another family and whose birth family members may be unsupportive or suspicious. The Local Authority sets guidelines and limits to a carer's involvement and shares the legal responsibility for the child with birth parents. A major set of themes reflected the 'compromised' situation of foster carers in relation to their own judgments and decisions about children, which Helen described as being like 'the jam in the sandwich'. In the case of the targeted young people in this study, it was clear that part of the carers' commitment involved them in advocacy for the child over aspects like education and schooling, friendships, limits and rewards. All respondents spoke of acting on behalf of the child as an autonomous parent would. In this respect, they saw their success with a difficult child in placement as requiring some 'disobedience' towards Social Services. This appears to have applied as a generality over the course of their fostering history but especially so in connection with the young people who were the focus of our study.

### Theme 10

Critical empathy for the birth parents - In their relations with birth parents and family members, carers' accounts were marked by what could be described as 'critical empathy'. Here for example is Diane, who can identify with Becky's mother's emotional pain, while having previously indicated that she is well aware of her lapses of parental responsibility for her daughter: "I would imagine she [birth mother] felt very, very rejected umm because her children didn't want her and they openly told her so / that you know she / they told her they were going to a family that did want them. Imagining how Becky's mum feels helps me understand what Becky goes through when she sees her mother." The carers had managed to hold on to positive attitudes about the young person's birth family, or had established a working relationship with birth parent/s that was largely independent of Social Services' brokerage. The carers indicated that if necessary they were willing to put the young person's well-being to the fore, at the expense of their own needs. While this was not expressed in any of their accounts as a complaint—it appeared to be a task voluntarily undertaken for the sake of the child—there were nevertheless indications of the extra burden, unacknowledged by the professional network, which this entailed.

### Theme 11

Independent working from social workers - The trust of social workers in allowing carers to 'get on with the job' was claimed as very important. Social workers who were perceived by carers to be 'solid' emotionally, knowledgeable in practical terms, and veteran in the sense of being 'an old hand', were highly valued: "We had [name of social worker] for years and when she left it wasn't the same and Chris had known her for 10 years. There was something about the fact that she kept going for him / with him that was important. I think when she went / and Chris's mum especially when [social worker] went, mum couldn't cope because / [name of social worker] was a bit like me / one of the old school. She would really put herself out for mum / would go and fetch her to bring her to meetings which the newer ones don't seem to / because the relationship had grown up I think over the years, you get that you know. Chris's mum couldn't get used to it when she left and Chris himself really felt the loss."

### Theme 12

Support and peer support - Given the intensity and complexity of the fostering task, support and practical help and guidance were understandably claimed as vital. The contributions of partners and spouses as well as the support provided by birth children and other, older, foster children were experienced as at least as important as input from social workers. Five of the seven respondents cited another carer with whom the foster carer had a personal friendship as a valued buttress and source of routine and emergency emotional sustenance. At the same time, the descriptions of asking for help were nuanced by a claim of self-sufficiency, which may reflect these carers' idea of themselves as principal welfare providers.

### Theme 13

Rebuilding and repair - A striking feature of the carers' accounts was their interest in communicating how they do the job. This was presented through the metaphor of 'rebuilding' and 'repair'. There was a common theme of 'starting where the child is', with a recognition of the damage that the children's previous care experiences had brought about. Natalie described this as 'having open eyes' in terms of the level of expectation of the child's 'recovery'. There was an understanding of starting a job with compromised materials or of repairing a building with shaky foundations: "But you have to think that they are quite damaged children and if they weren't they wouldn't be here with you [pause] and the longer times go on you think / you can forget about the problems that they've got until / they have an up or down in their life and you have to keep remembering that they do find it difficult to cope with certain situations. Sometimes / some of the basic building blocks are just not there."

### Theme 14

High aspirations - The rebuilding metaphor seems to suggest that their task as they experienced it was quite different from ordinary parenting. In the light of their accounts it would be better described as 're-parenting'. They seemed to be able to use the 'possessive' stance ('my child') as a position for undertaking their craft, which they understood as salvage and reconstruction, while they have the chance. As part of this, the carers identified the fact that they maintained high educational and social aspirations for the young person in the 'rebuilding' process. In the next excerpt, Yvonne exemplifies this in relation to educational opportunity for Ricky: Yes I've really encouraged them even though it means them going beyond what they might have done if they'd stayed with their family, which is hard for them. Ricky wants to go and do a degree. At least he is thinking about it which is great because I don't think / you know, certainly in the natural family, he would never have got as far as he has now / so he is happy that he's got that option there." As in Yvonne's interview, the carers seemed mindful that in applying their own blueprint for the young person's development, they were also promoting potential access to opportunities that the young person would not have gained had they remained within their original family. This was presented as making the best of a compromised start and, while remembering and respecting the child's origins, their attitude was of not letting a child's earlier life circumstances hold them back.

### Theme 15

Proactive skills - In terms of the work of looking after and parenting the young person, the foster carers identified and described 'proactive skills' like limit setting, rewarding, and teaching children new ways of behaving and responding. Natalie's comments about Louise's behaviour are a good example of the recognition shared across the seven respondents of how the children in their care seek to reproduce old established patterns of parent-child relationships: "When Louise came to us we were told she would try and break the placement down because / they explained that she had been let down by so many people she would want to try and be in control of things and she would expect it to break down. She went to great lengths to break it down. So that was a real challenge for us / we had to respond to her positively and firmly and differently to how she wanted us to. It was saying to ourselves 'right lets start again as we do / keep sticking with it'."

### Theme 16

Listening - While the 'proactive' aspects of parenting were claimed as important, they were in fact less often mentioned than the 'receptive skills' of listening and understanding, observing and tolerating behaviour, and accepting the sometimes unpleasant aspects of the child or their experiences. Yvonne speaks for all the respondents in noting this aspect of their job, which sometimes entails hearing about things that are almost unbearable: "Some of the things that Ricky could tell you, things that he's told us about his abuse, would make your blood curdle but you have to listen to that and take it for them, no matter how uncomfortable it makes you feel." Diane emphasizes a common theme expressed across the carers' interviews of their crucial role in facilitating a young person's trust in them. In this context, Diane emphasizes the need to think before saying or doing anything in response to what is communicated: "She tells me everything [pause] good and bad. We sit and we talk / again I've learnt through Becky not to be judgmental umm in some cases but just to listen and rather than umm sparking up when you think something needs correcting oh you know umm [pause] to sit and listen and take it on board and then analyze what you are going to say rather than getting in there with two feet."

	<p><b>Theme 17</b>                  Perseverence - All respondents spoke of stubbornness, determination, or of a strong desire not to be beaten, in a way that conveyed the foster care task as a struggle, a battle or a long and arduous journey that had to be completed to the satisfaction of the carer for each target child: "We stick at things don't we? We stick at things and see them through. We don't like to give up either of us and I think I'm a little bit worse than Frank (partner) because I don't want to give up on Chris. I don't like [pause] I don't like giving up; I don't like being beaten. I like to keep going and yeh in a way it's sort of big-headedness perhaps it / you think that you will get there eventually / you will. You know 'I can do this; it will work' [pause] Obviously it doesn't always but you don't give up." "Yeh the challenges is I think just living day to day and remaining in place even if you can't do anything about changing / changing their lives too much. We see it's important to just keep going for children. That's one of the best things you can do for them." "Yes no matter how muddled their lives are, if you look at them long and hard you will see there are / there's this specific goodness / and that is what you latch into and when you feel like going in your bedroom and screaming to the top of your lungs because yet again they've done something really bad / you latch on to that one bit left and it brings you back to sanity [pause] it's like a circle isn't it?"</p>		
<p><b>Risk of Bias</b></p>	<p><b>Section</b></p>	<p><b>Question</b></p>	<p><b>Answer</b></p>

		Directness	Partially applicable <i>(Participant data was likely collected prior to 2010)</i>

**Pearce 2011**

<b>Study type</b>	Focus Groups Subgroup of interest Trafficked children and young people
<b>Aim of study</b>	The research aimed to: - explore the different ways that ‘trafficking’ is understood by a range of practitioners from different service agencies;

	<ul style="list-style-type: none"> <li>- look at the obstacles that emerge when trying to identify trafficked young people;</li> <li>- chart the process through which a child or young person first gained access to a support agency; and</li> <li>- identify how the practitioner understood the immediate and longer-term needs of the children and young people concerned.</li> </ul>
<b>Study location</b>	UK
<b>Study setting</b>	Three research sites, each selected to reflect geographical areas with different proximities to international airports
<b>Study methods</b>	Three focus groups were run in each of the three areas. Semi-structured interviews were then carried out with practitioners from each of the three sites, purposeful sampling taking place to include practitioners with experience of working with trafficked young people. Research participants were digitally recorded. thirty-seven case files of trafficked children and young people were studied using a template piloted with NSPCC practitioners and with young people from the NSPCC Child Trafficking Advice and Information Line. The transcripts from the focus groups were thematically analysed manually by the research team. Recordings from semi-structured interviews and information from case study files were analysed using NVivo software. Findings from the three research methods were then triangulated and the final draft report circulated among the Advisory Group for comment.
<b>Population</b>	Focus groups included: social workers; specialist children’s NGO’s and separated children/asylum workers; Police, Crown Prosecution Service staff, Youth Offending Team workers and staff from the UK Borders Agency; residential childcare and statutory children’s centre workers; health workers; and education workers.
<b>Study dates</b>	between 2006 and 2009
<b>Sources of funding</b>	NSPCC
<b>Inclusion Criteria</b>	Carer situation Practitioners working with trafficked children and young children

<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b></p> <p>A total of seventy-two practitioners took part in focus groups and interviews, including social workers (n = 22); specialist children's NGO's and separated children/asylum workers (n = 12); Police, Crown Prosecution Service staff, Youth Offending Team workers and staff from the UK Borders Agency (n = 11); residential childcare and statutory children's centre workers (n = 10); health workers (n = 10); and education workers (n = 7).</p>
<b>Relevant themes</b>	<p><b>Theme 1</b></p> <p>Variations in the definition of trafficking - Our research suggested variations in practitioners' understanding of trafficking. For example, one interviewee noted that: "I have looked at all the different definitions that they have and I realised that there isn't a full definition that everyone sticks to. It can be looked at very differently (Int. 21)." Another suggested that, although they might understand a definition in theory, a lack of experience meant that they had little skill in applying this to practice: "We aren't very good at identification of trafficking . . . I think we are in the early stages of identification (Int. 25)." Another, who was familiar with the Palermo Protocol assertion that the child cannot consent to being trafficked, raised the contentious and contradictory assertion that a child could be 'willingly trafficked': "It must inevitably beg the question whether they were consenting or not . . . the fact that someone doesn't run off may lead people to be a little more suspicious . . . if someone were to be trafficked over here a second time we would have to think long and hard about it . . . some who would say, well, once is a misfortune but to be trafficked twice implies a willingness on your part to be trafficked (Int. 30)."</p> <p><b>Theme 2</b></p> <p>Wall of silence - These confusions about whether a child can consent to being trafficked can result in cases being overlooked or children's accounts of abuse being dismissed. This suggested existence of a 'wall of silence' hiding the identification of trafficked children and young people. On one side of the wall, there were children who found it difficult to talk of the abuse and exploitation that they had experienced. This might be because of language barriers, a fear of talking to a stranger in a position of authority and/or fear that disclosing information could put them at further risk. It could be that keeping quiet feels like the safest coping strategy in an unknown and dangerous situation. On the other side of the wall of silence, there were practitioners who were either unaware of the indicators of trafficking or who found it difficult to believe the child—contributing to a 'culture of disbelief'. For example, one interviewee noted that a child's account of being trafficked for domestic servitude was rejected until health care workers at an accident and emergency clinic became suspicious: "She went through the hands of a number of local authorities who sent her back to her cousin . . . She was saying that he wasn't my cousin, I'm being trafficked, you know they're not treating me nicely . . . before finally presenting at a hospital and one of the medics picked it up this was somebody that's been trafficked (Int. 5)."</p> <p><b>Theme 3</b></p> <p>Suspicion of children leading to hidden cases of trafficking - cases of trafficking were 'hidden' when practitioners suspected that a child had 'chosen' to enter the country to 'manipulate' the benefit system. Case file notes of a fifteen-year-old brought into the country to work in domestic servitude suggest that: "The young person is very intelligent and knows how to work the system to her own benefit and how much information to divulge to keep people involved without giving too much away (CS 004)." A different practitioner expressed her belief that even though a young woman had been made pregnant by her traffickers at the age of fifteen, she may have become pregnant in order to gain additional benefits: "A cynic might say she was trying to get money out of us . . . she was pregnant at the time (Int. 12)."</p> <p><b>Theme 4</b></p> <p>Culture of disbelief leading to failure to prosecute - Even if the practitioner believes the child, and appropriate child protection procedures follow, the culture of disbelief can prevail to prevent cases against the alleged abusers being taken to court. The practitioner below acknowledges that the court may doubt the word of a child against a number of adults who were the alleged perpetrators: "I know that she's been in front of a jury and told a story about being raped over there . . . I know they wouldn't believe that the guy had been trafficking her . . . I get three different accounts of the time she was raped . . . as I say, how much reliance would you put on a witness like that? . . . I mean we are asking the court to believe a 15-year-old girl against, what was it, four or five adults we had here in total, no corroboration, they were all denying everything . . . you look for corroboration, you look for consistency. And where there isn't consistency it makes us less willing to prosecute (Int. 30)."</p>

### Theme 5

Treatment of children as "hot potatoes" - In other cases, practitioners avoided taking responsibility for the trafficked child by referring the case to a different agency, creating a 'hot potato' effect. This 'passing on' of cases has long been of concern to practitioners working with 'problem' young people (Ayer and Preston-Shoot, 2010). The additional worry that practitioners may not be equipped to respond to a victim's trauma compounds this 'hot potato' response. In the current climate of fear of audit and inspection, an agency might prefer to pass the case on rather than be identified as responsible for inadequate interventions: "There is that huge emphasis on accountability . . . there is a culture among different agencies and teams where they don't necessarily want to own decisions and the child is treated like a hot potato (Int. 28)." "There is a tendency to not acknowledge the problem . . . . Because often they are scared that if they acknowledge, they ought to put a response in place and they don't have the resources (CS 010)."

### Theme 6

Need for multiagency working and overuse of voluntary organisations - Consequentially, those agencies with some resources for working with young people who may have been trafficked spoke of being burdened with work that should be shared through multi-agency interventions. Indeed, the worry was that specialist voluntary sector services may be inappropriately used by diminished statutory services to support vulnerable young people. As noted by a voluntary sector provider: ". . . other agencies often use us as their extra resource . . . they will recognise the young people in care have gone missing and will let us know and we then spend all our time running around looking for things that we shouldn't be doing really (Int. 26)."

### Theme 7

A child-centered approach necessary - There was important evidence of practitioners taking a child-centred approach to their work: recognising that young people should be responded to as victims of trafficking, even if they spoke of 'choosing' their circumstances. For example, a practitioner noted that: ". . . just like domestic servitude and illegal working or working in various restaurants—to them that might be something of value and they don't see themselves as being exploited, you know, or abused. So, yeah, there very much can be a discrepancy between what they think is OK in terms of how they're treated and what really is OK (Int. 29)." Another noted that a young woman who initially consented to a proposed marriage in the UK felt that she was responsible for, and therefore had to suffer, the sexual exploitation she subsequently experienced: "Marriage . . . . She said at the time she did not mind this as she thought it would be better than living a miserable life in Africa (CS 001)."

### Theme 8

listening in a child-centred approach, unhelpfulness of the terminology - It was acknowledged that good practice helps the child to understand their experience of abuse while alleviating any sense of responsibility for it. Practitioners who were motivated by a child-centred approach explored the language used by children and young people themselves, listening to how they, the child, understood what had happened to them: ". . . they transfer from the care of a person who suspectedly trafficked them to the care of Social Services . . . . They are then able to compare their life beforehand and their life now, and then they can identify that they have been maltreated. Have I ever heard a young person use the word 'trafficked'? No never (Int. 9)" "She was very annoyed that somebody had betrayed her trust . . . . But, yes, the words 'trafficking' and 'exploitation' are not words that most 14-year-olds would use (CS 001c)." ". . . they will explicitly say things like 'I have been sold' or 'I was given to so and so', and 'I was made to work long hours without rest and with little food' (Int. 29). You certainly don't get children saying that they're exploited or trafficked, you just hear the realities which can be 'I owe this person £20,000' or that 'This horrible man was meant to look after me and instead locked me in a flat and raped me' (Int. 4)."

### Theme 9

distinction between trafficking and smuggling - Case studies showed children 'smuggled' into the country and then later further 'trafficked'. The worry was that if these children are defined as smuggled at the point of entry to the country, the offence of trafficking and the organised crime accompanying it may be overlooked. For example, some practitioners were aware of the distinction between both crimes: "I think for a trafficked child, it's organised crime . . . I also don't think there's a consent to a child that's being trafficked. A child, I guess, that is being smuggled, it's quite difficult I guess because they can be used interchangeably . . . but I think that a trafficked child is much more worrying and they've been exploited (Int. 18)" ". . . [smuggling] it's complicit and you know the child must know that they're going from A to B, they're going to get in the back of the lorry, they know they have to hide and then they're going to get out the other end and somebody will meet them. I think that it's almost as if they [immigration services] consider a smuggled child to be in on it. Whereas a trafficked child to me is a child that is being deceived all the way, as well as their families (Int. 18)."

### Theme 10

Blaming of the child involved in smuggling - a smuggled child may be seen to be 'complicit': that is, the child may be understood to be 'in on it', agreeing to be transported. If considered to be 'in on it', the child may be seen to be responsible for their situation. As a result, they are not necessarily perceived to be as vulnerable as a child who would be defined as trafficked: "I think it gets minimised when somebody labels a child as being smuggled (CS 202)."

#### Theme 11

Trafficking and smuggling part of a continuum - a practitioner explained that case work with trafficked children suggested that many trafficking trajectories did include smuggling: ". . . many people got muddled up, trafficking and smuggling. It was all about sex trafficking . . . and within six months of our team forming we realised that it wasn't all about that . . . we realised that people were bringing kids in under the wire, so smuggling them in but going on to exploit them (Int. 29, p. 71)." Even if the child were smuggled in by 'family', they may be trafficked for benefit fraud purposes or be abused within private foster-care arrangements for domestic servitude: ". . . someone had picked up that this 14-year-old boy was not thriving. He . . . said 'Look, these are not my parents—I was brought here.' So that was a private fostering case and was trafficking (Int. 10)."

#### Theme 12

Internal trafficking - This practitioner was referring to their work with UK citizens under eighteen years of age who are being trafficked for sexual exploitation. They felt that by getting into a car, a sexually exploited young person was being trafficked: ". . . Because they haven't come from overseas . . . doesn't mean they're not trafficked . . . People think that trafficking has got to be foreign nationals coming across international borders, they don't realise about internal trafficking, they don't realise it could be UK nationals (Int. 24)." ". . . when she gets into a car she is immediately trafficked. It's the movement and the travel that defines trafficking . . . the objective of doing these things to these kids is to sexually exploit them (Int. 24)."

#### Theme 13

Some may not be aware of the possibility of internal trafficking - ". . . about indigenous kids being moved from one place to the other, I don't think you'd find anybody here that talks about that as trafficking (Int. 22, p. 74)."

#### Theme 14

Internal trafficking taking priority over trafficking - one practitioner noted concern that children from the UK received better child protection services than those from abroad: "I believe that migrant children get a second rate service in this country, and I don't think they're afforded the same levels of protection (Int. 14)" ". . . it really was a lot of work trying to get these young people the same rights as British children (Int. 25)."

#### Theme 15

Vulnerabilities, and language increasing susceptibility to re-trafficking - children or young people trafficked from abroad, arriving to unfamiliar territory, face problems that may make them specifically vulnerable to 'internal' re-trafficking. This is compounded if there are language difficulties and inadequate interpreter provision: "The number of interpreters was very limited, the number of these specialist language interpreters is fairly limited (Int. 30). . . . the interpreter that we had . . . was obviously shocked by what she was hearing . . . . That was a joint interview I did with a police officer and both of us had the same anxieties about what was being interpreted (Int. 9)."

#### Theme 16

Preoccupation with immigration status meaning young people may turn to traffickers - the young person trafficked from abroad may be preoccupied with concern about their immigration status, wanting to 'run away' or turn to their traffickers (and maybe re-trafficked internally) for fear that they will be returned to their country of origin: "They always have to be dealing with this sort of two-pronged issue. On the one side they are giving this information about themselves because of their asylum claim, which is always a worry for them in terms of what that means, whether they are going to be allowed to stay and what the terms and conditions of that are. On the other side you've got this agency here probing them with similar questions about their background but for reasons of need. Most of the time it is too much for them (Int. 13)."

#### Theme 17

Concern that UK nationals being trafficked are being trafficked by "foreign" nationals - there is concern that UK nationals who are trafficked internally for the purpose of sexual exploitation are young women being exploited by 'foreign' nationals or by men who have recently immigrated to the UK. The following quote notes concern about the ethnic origin

of perpetrators the sexual exploitation: "I referred to them as Albanian but I think we had slightly more nationalities than that floating around . . . They were foreigners and they didn't have a very good command of English and that kind of thing (Int. 15)."

### Theme 18

Sexual exploitation of boys may be overlooked - Another, and final, concern that arose from findings about 'internal' trafficking for sexual exploitation was that the needs of boys and young men may be unrecognised, as the dominant image of female victims of abuse prevails: "I think people do tend to focus on girls for the simple fact that people know more about girls. . . . I think if we were concentrating on sexual exploitation we would recognise that boys are just as vulnerable for that, particularly Chinese boys (Int. 10)."

"Something that is coming more and more to notice now is that it is so much more difficult to get young men to talk about it . . . I've got an African boy at the moment who has got really high emotional needs. Because he is so used to not disclosing anything, he is dealing with it in a completely different way to another girl who is quite used to showing her emotion. They may have been through exactly the same situation but they are dealing with it in completely different ways because that is how they have been brought up (Int. 26)."

	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Can't tell <i>(Unclear recruitment strategy )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Can't tell <i>(interview methods were not explicit )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(unclear that relationship between researcher and participant has been considered )</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes

	Data analysis	Was the data analysis sufficiently rigorous?	Can't tell <i>(Unclear how thematic analysis was performed )</i>
	Findings	Is there a clear statement of findings?	Yes <i>(Triangulation was used to improve credibility )</i>
	Research value	How valuable is the research?	The research has some value <i>(Focus was not on care practices for the care of trafficked children but focused on attitudes of practitioners, unclear generalisability of sample )</i>
	Overall risk of bias and directness	Overall risk of bias	High
		Directness	Partially applicable <i>(Data likely collected prior to 2010)</i>

**Pert 2017**

<b>Study type</b>	Semi structured interviews
<b>Aim of study</b>	To explore how well children understand and take part in looked after children reviews, and what factors impede this.
<b>Study location</b>	UK
<b>Study setting</b>	One local authority in England
<b>Study methods</b>	In-depth interviews (likely semi-structured). Topics covered included 1. How far do looked-after children understand the process and purpose of LAC reviews? 2. How do looked-after children feel about their meetings, and how far do they

	believe that their wishes and feelings are taken into consideration within LAC reviews? 3. What are the barriers to looked-after children participating in and engaging with the review process? Using a purposive sampling method, children and young people were recruited who had attended at least one LAC review within the LA. Interviews were audiorecorded (with participant permission), transcribed and analysed (along with drawings and pictures which children produced or used in interviews).
<b>Population</b>	looked after children and young people in one local authority and foster carers
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported
<b>Inclusion Criteria</b>	Age The target age range was 8–17 years  Care Situation Looked after children from one local authority
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size Twenty-five children and young people; Sixteen foster carers were also interviewed  Time in care The average length of time looked after was 3 years (range 8 months to 9 years).  non-white ethnicity 5 from a minority ethnic background;  Gender 13 girls and 12 boys;  Other recruitment considerations authors aimed to include roughly equal numbers of boys and girls, some sibling groups and a mix of ethnicities representative of the local area.

	<p><b>Age</b> 11 children (8–12 years) and 14 young people (13–17);</p>
<p><b>Relevant themes</b></p>	<p><b>Theme 1</b> children's feelings and understandings of reviews - Almost all children and young people (23) knew that they had review meetings regularly. However, their understanding of the purpose of reviews varied widely: "They are to check up on me. (Young woman aged 14) I think it's to do with school. (Boy aged 8) They are to see how things are going. (Boy aged 10)" None of the children and young people interviewed suggested that meetings were to review care plans or make decisions, although one child did suggest that review meetings were to look forward to the next 6 months.</p> <p><b>Theme 2</b> Feelings about the reviews - participants had mixed feelings about their reviews - eight children said that they felt 'OK' about their meetings, but nine found them too long and boring. Just two felt that meetings were positive: "I like the meetings, I like to have a chat and it's nice to talk about me, (Boy aged 10)" Of the young people, none reported enjoying their meetings. Some young people reported stronger feelings of embarrassment or anger: "The meetings themselves are a bit scary, they are a bit daunting really, so then I'm not in the right frame of mind to talk about anything and it's just . . . embarrassing. (Young man aged 15)" Young people were also more vocal in expressing wishes not to attend, with specific reasons for not doing so.</p> <p><b>Theme 3</b> Meetings boring and repetitive, lacking individuality - For the majority of children and young people, the content of the meetings was repetitive, boring and generalized – lacking in individuality: "It's just tell us about school, how's school? Tell me about your health, are you happy? Tell me about this . . . (Young woman aged 13)"</p> <p><b>Theme 4</b> Resignation about attending meetings - While children and young people were clear that they did not enjoy their meetings, all 25 attended their reviews. They spoke with a sense of resignation about doing so: "They are OK because . . . well they happen. Everything is boring but they have to be done. (Young woman aged 16)"</p> <p><b>Theme 5</b> Disengaging with reviews - Participants reported using strategies to ensure that reviews ended more quickly. Some simply agreed with everything that was said; some disengaged, physically leaving the room, and others spoke as little as possible: "I just sit, I don't say anything. It's weird, I just want them out of the way. (Young man aged 13)"</p> <p><b>Theme 6</b> Benefits of understanding the purpose of reviews - How useful children and young people found their LAC reviews was linked to their understanding of the purpose of reviews, even when this understanding was limited. For example, adolescents made comments about the value of LAC reviews when they had a specific practical task or issue they wished to resolve: "They are helpful in a way because you can put your point across about anything you might want to change. If you didn't have them then you wouldn't know who to see or what to do and nothing would be changed. (Young woman aged 16)" Conversely, adolescents who had some knowledge of the purpose of reviews often saw little value in them. Specifically, this was linked to how settled they felt they were in placement and how long they had been 'in care': "I've been with X and Y (foster carers) for 8 years so it's not really like I need all of that. I don't really need anything. The sooner it comes, the sooner it's over. (Young man aged 16)"</p> <p><b>Theme 7</b> Detached from any tangible benefit of the reviews - In terms of the long-term benefits of LAC reviews, children and young people felt largely detached from any tangible positive or negative effect upon their lives. Only two participants could remember any action points or goals. Adolescents particularly felt disassociated from the outcomes of their LAC review, with high levels of either dissatisfaction or apathy: "What's the point? Nothing ever changes so there is no point. (Young woman aged 16)"</p> <p><b>Theme 8</b></p>

Foster carers found review meetings useful. Many commented that they welcomed a forum to raise action points and ensure that the professionals acted on them. Foster carers were clear, however, that the children they cared for appeared to gain nothing from the meetings themselves: "Personally I don't think the children get a lot out of the reviews, I think they do in the sense that I make sure what we agree actually happens and the goals are then met. (Foster carer of boy aged 11 and young woman aged 17)"

#### Theme 9

Superficial and routine questions - Many foster carers felt that the review meetings were superficial, focusing on routine questions about health or education. Foster carers noted that action points around therapeutic intervention were subject to drift and that this was unchallenged by IROs. Significantly, there was little mention of the purpose of meetings in relation to updating care plans in preventing drift and meeting the child's long-term needs: "I've been to probably 20–30 LAC reviews and nobody has ever turned and said, 'Have you got a copy of the care plan? Has the care plan been updated?' (Foster carer of young women aged 13 and 16)"

#### Theme 10

Meetings make the children feel different - Foster carers also queried the possible long-term negative effects of attending reviews, suggesting that having the meetings made children feel different: "They don't attend; they don't like meetings at all. Their feeling is why should we have meetings? We want to be normal kids, why do we have all this paperwork, why do we have to talk to all these people? (Foster carer of girl aged 8 and young women aged 14 and 17)"

#### Theme 11

Meetings lacking preparation of the input of LACYP - Only two younger children reported that their social worker visited them before the review to ask them what they would like to talk about. None of the children interviewed made mention of their IRO visiting them between reviews. A small number of children and young people recalled being asked to contribute to the agenda via a form sent in the post. Adolescents particularly disliked these forms, commenting that they were repetitive with little consideration of age or maturity. Aside from the use of forms, none of the children and young people interviewed could remember being asked what they would like to talk about at their review. Similarly, none of the children or young people interviewed could recall being offered, on a regular basis, choice in where and when to hold the review: "It's always after school when I'm tired and everyone else is going to the shops and hanging out and that and I'm like oh, I've got to go home . . . but they stop work at 5 so it has to be then, doesn't it? I'd have it on Sunday morning at 9am and make them get up early! (Young man aged 16)"

#### Theme 12

Preferred venues - When where they would like to hold their review meetings, 15 suggested alternative venues, including McDonalds, asked Alton Towers and a bowling alley.

#### Theme 13

Lack of choice who attended reviews, too many people - Lack of choice and control in who attended reviews was the most emotive topic for children and young people. One child counted nine adults at her last review, and when asked whom she would like at her next review, she removed four people. This was not unusual; only eight felt comfortable with who attended their LAC reviews: "At my last review random people starting turning up and I was like, who are you? I didn't know who they were, it was crap. (Young man aged 16)" Many children and young people felt confused about who attended their review meetings. In particular, this was raised in relation to foster carers' social workers. Younger children often could not remember these people's names and suggested that they would not have them at the meeting if they had the choice. One group of siblings thought that the foster carer's social worker was their foster carer's friend.

#### Theme 14

Presence of birth parents at reviews of huge importance - The presence of birth parents at review meetings was of huge importance to both children and young people and foster carers. Children and young people whose parents attended LAC reviews felt much more positively about them. Meanwhile, foster carers felt less positive about the attendance of parents, with a feeling that the child was distracted or less engaged because of their presence: "Sometimes I think the IRO misses important stuff because their mother is there, she adds nothing and makes it all about her. If she wasn't there then we could actually make the meetings about the kids. (Foster carer of boy aged 11 and young woman aged 16)"

#### Theme 15

Foster carers as advocates - The role of foster carers within reviews was highlighted as of importance to children and young people. Children and young people reported that they did feel listened to by the IRO in meetings. However, only three participants said they asked questions or initiated discussion in the LAC reviews; the majority reported that the IRO led the discussion and that the child or young person's agreement (or disagreement) was then sought. Children and young people suggested that their foster carer was key to their voices being heard: "She helps me to say things because . . . well, it's difficult . . . he [IRO] . . . speaks lots and then asks, do you want that? She (foster carer) will push me to speak up. (Young woman aged 17)"

#### Theme 16

Overly professional, contractual feel to the meetings - Foster carers also reported feeling responsible for ensuring their foster child's wishes were heard and considered. This is not a simple task: foster carers noted that children could present as quiet and 'difficult' to engage within their LAC reviews; many suggested that their foster child might engage more if meetings were less professional-centred: "Honestly I'm not sure what they (IROs) could do, it's hard, but they could invest more time planning things instead of going through the motions. There has got to be a better way of doing it. (Foster carer of boy aged 9)"

#### Theme 17

space for challenge and change - While many foster carers recognized that as a forum of 'participation', the review meetings were lacking, as a 'professionals' meeting they were considered to be imperative. The foster carers interviewed clearly valued a forum in which to discuss areas for change or challenge with social workers, and felt responsibility for ensuring that their foster child's needs were accurately considered: "It's always me pushing and pushing. I know they think I'm difficult, so it's hard – because I'm left with [foster child] at the end of the day, so I need to make sure we all get it right. (Foster carer of boy aged 9)"

#### Theme 18

Relational IROs, continuity of staff - Children and young people were largely positive about their IROs (see Note 1). Younger children spoke of IROs playing games with them or taking them out for milkshakes as being memorable. However, six children and young people did not know who their IRO was or what their role was other than to chair the meetings. It is possible that this could be due to multiple staff changes during the interview period. The starkest example was of a child who reported having had eight social workers in three years, with extremely sporadic visits. The foster carer felt that this had not been challenged and the child reported feeling 'forgotten'.

#### Theme 19

no promotion of complaints procedure - other children and young people were dissatisfied with the social work service they had received and with the IRO response. None had considered making formal complaints; foster carers felt that there was little evidence of the IRO promoting this.

#### Theme 20

Delay in completing actions - Examples were given of cases where there had been extensive drift, with actions carried over multiple review meetings. Foster carers felt that not enough was done between reviews to ensure that progress was made.

#### Theme 21

Lack of availability - Similar examples of social workers visiting children at 3-month intervals were commonplace, alongside those who would only visit children at contact sessions: "She [social worker] comes when she feels like it! [When foster child] brought it up with her they had a big row . . . it's been an action point on the agenda for what feels like years now and it's really not fair. (Foster carer of girl aged 8 and young women aged 15 and 17)"

#### Theme 22

Importance of having a positive relationship with the social worker - Some children reported having positive relationships with their social workers. Where children felt that they had got to know their social worker as a 'real person' and not just a professional, they felt much more positively about them and the social work team generally: "Child: She is quite funny really! It's just normal, I don't know like, ummm . . . like when she comes and we do Xbox or Wii . . . Interviewer: So you like it that she comes and plays computer games Child: Yeah, I do . . . it's a good thing that she comes really because things are better now, better than before." (Boy aged 9)" Those children who reported having positive relationships with their social worker also reported less negative feelings about review meetings, suggesting that the social worker–child relationship is important in how the child

<p>engages with the review process. The converse also applies: one foster carer reported that her foster children disliked their social worker so much that they hid from her. This would certainly impede the social worker's ability to prepare these children for reviews, and possibly affect the children's attendance at their LAC reviews.</p> <p><b>Theme 23</b>          Use of advocacy service - The use of the advocacy service was limited (three children and young people), although many did report being offered an advocate and choosing not to use this service. Those who did reported some difficulties in sharing information between social care, the IRO and the advocate: "She [advocate] came, talked to the children and I thought great, that's done but then she didn't come to the review so I thought well where are the children's views? We've lost them. She [IRO] said nothing. (Foster carer of girl aged 8, boy aged 8 and girl aged 10)"</p>			
<b>Risk of Bias</b>	<b>Section</b>	<b>Question</b>	<b>Answer</b>
	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes <i>(However no discussion regarding why/if some participants chose not to take part )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Can't tell <i>(The researcher has not made the methods explicit; setting for data collection is not justified; no discussion of saturation of data )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(Unclear that researchers critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>

	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Can't tell <i>(Unclear how thematic analysis was performed; unclear that sufficient data presented to support the findings; unclear that researchers take into account contradictory data; unclear that researcher critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	No <i>(No discussion of credibility of findings )</i>
	Research value	How valuable is the research?	The research is valuable

### Quarmby 2014

<b>Study type</b>	Semi structured interviews Subgroup of interest Residential children's home
<b>Aim of study</b>	(1) What are the sport and physical activity experiences of looked-after children? (2) What meanings and values do looked-after children ascribe to their engagement in sport and physical activity?

<b>Study location</b>	UK
<b>Study setting</b>	One residential home in England
<b>Study methods</b>	A "mosaic approach": a participatory, multi-method approach whereby young people's own research artefacts (photographs, maps, drawings, etc.,) are joined to talk and observations to gain a deeper understanding of their perspectives and everyday lives. In order to maintain the participatory nature of the research methods, the discussions of these artefacts were led by the participants themselves and formed the basis of peer interviewing. The interview questions were developed in collaboration with the participants, meaning the language and terminology employed was accessible to all of the boys, with topics that reflected the issues that the peer researchers perceived to be critical within the overall frame of research. The resulting discussions were recorded and later transcribed. Peer interview texts, research artefact discussions, observations and field notes were thematically analysed. Since analysis was conducted immediately after a data collection session, participants were asked during the following week to comment on transcriptions.
<b>Population</b>	looked-after children living in residential care
<b>Study dates</b>	February and July 2013
<b>Sources of funding</b>	Not reported
<b>Inclusion Criteria</b>	Care Situation Looked after children living in residential care
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size four looked after children in residential care  Gender All boys

	<p><b>Age</b> Aged between 12 and 17</p>
<p><b>Relevant themes</b></p>	<p><b>Theme 1</b> Disruptive impact of changes in placement and schools on involvement in sporting activities - Changes in placements and consequently schools mean that for the majority of looked-after children, school attendance is problematic (Murray, 2012). As such, looked-after children often miss out on school-based sporting activities and are more dependent on out-of-school activities than other children. What is apparent in this study is that changes in placement may also impact on engagement with sport and physical activity outside of school. For example, during one peer interview about his sport timeline (Figure 1), Matt revealed to Adam that placement moves and subsequent changes in residential home have prevented him playing sport regularly with his cousin, who now lives further away than previously: "Adam: Why did you stop any sports or activities? Matt: Most of them because I, most of them were in school so, obviously I've moved school loads so I've stopped playing them now and I stopped playing rugby with my cousin cos he lives too far away now that I've moved again." Echoed in the voices of Nathan and Pete were further examples of the impact of placement instability. During their discussions of their timelines both reported that moving home was a reason for disengaging from sport and physical activity. Pete, for instance, indicated that he stopped horse riding because he moved care homes and later suggested that this was also a reason why he stopped dance. "Pete: Erm, the dancing is the best so far yeah, so far yeah, but erm I stopped it for two years and I'm gonna be starting it back up again Nathan: Why did you stop it for two years? Pete: I quit because I moved home so couldn't get there anymore and now I'm starting again hopefully in a few weeks' time... at a different place though." During his peer interview with Pete, Nathan also discussed the impact that placement moves have had on his engagement with sport, though unlike the others, he has been fortunate enough to pick up those activities again: 'Yeah, I have stopped football and scouts because I've had to move, but erm, I think I've been lucky to start it again quite quickly but at a different place with people I don't know'.</p> <p><b>Theme 2</b> Lack of agency in schedules with residential homes limiting agency to engage in certain activities - it was evident that agency for these looked-after children was a constant struggle with the broader structures of the field that shaped their lives. For instance, early observations (detailed below) of the children's home indicate that specific rules and routines impact on young people's ability to engage in certain activities: "On several occasions today I witnessed the boys asking permission of care home staff to stay out later, play at the park or go biking with friends after school only to be told that they need to let staff know, the day before (before an allotted time), if they wanted to stay out later. This then needed to be negotiated with the care home manager and recorded on the weekly timetable. However, since dinner is usually served at 17.30, this would mean that the boys needed to be back by then anyway which gave them little time to engage in any sport or physical activity. (Field note entry)" While a lack of time was previously reported to be a key factor restricting leisure activities (including sports and physical activities) (Hollingworth, 2012), like these initial findings, this may result from structural and organisational policies (Gay, Dowda, Saunders, &amp; Evans, 2011). For instance, having to eat evening meals at set times and needing to negotiate time for activities with staff. This was similarly reported by Adam: "Matt: What do you do now and why? Adam: I do biking and cricket inside of school, which I want to do on Wednesdays if I can ask staff if they'll let me. But, it's on Wednesday after school so I probably won't do it; I'll probably just do it out here with Matt [pointing to outside of the house]." This exchange demonstrated Adam's reluctance to ask staff if he could engage in a new activity not currently 'scheduled' for him.</p> <p><b>Theme 3</b> Sport to help develop social networks - Perhaps the biggest 'selling point' for sport and physical activity is that such activities may offer marginalised young people, such as looked-after children, an opportunity to reintegrate into mainstream society and develop social networks. This notion of developing relational networks was evident here whereby sport and physical activity was valued for its instrumental value and as a means to an end. For instance, in his target activity (Figure 2), Pete placed spending time with friends as the most important reason for engaging in sport and physical activity, with 'sport for fun' as one of the least important reasons. During a discussion of his artefact, Pete further commented that: "My most important one, which is on the bulls eye or as call it, which I call it the red spot is to spend time with friends cos I normally spend time alone so first, is to spend time with friends because you have to get, you need to know what they're like and how they, and err you need to know what they're like and what are their favourite hobbies and food and they need to know anything about you. The second is to burn off energy and help my body... The very last one is to have fun." Matt, Adam and Nathan voiced spending time with others as a main reason for engaging in sport and physical activity: "Nathan: Err ... well mainly err that one [pointing to 'to keep my heart pumping'] and definitely that one [pointing to 'to spend time with friends'] cos you would spend time with your friends cos it's normally better. Spend time with your friends cos then you get in there and fit as well and you're getting yourself more exercise. Matt: Yeah, because when I was younger, I didn't do sport a lot but it was good to try and make friends... so I did play to try and make friends."</p>

	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes <i>(However, no discussion regarding why some participants chose not to take part )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(However no justification of the setting or saturation of data )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Yes
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Yes
	Findings	Is there a clear statement of findings?	Yes <i>(Respondent validation was used )</i>
	Research value	How valuable is the research?	The research has some value <i>(The work represents the experiences of only four boys living in</i>

			<i>one residential care home, therefore there are some generalisability issues. )</i>
	Overall risk of bias and directness	Overall risk of bias	Low

**Ridley 2016**

<b>Study type</b>	Semi structured interviews Evaluation of an intervention "Social Work Practices"
<b>Aim of study</b>	Specific questions aimed to gather information about the accessibility and responsiveness of practitioners, continuity of worker, and to assess relationships with practitioners. This included asking about contact with practitioners, whether practitioners listened to them, cared about them, did their best for them, and what help they received and wanted from these practitioners.
<b>Study location</b>	UK
<b>Study setting</b>	Participants in the pilot evaluation of Independent Social Work Practices (SWPs), a new organizational model piloted in some areas of England between 2009 and 2012, were established to enable social workers and other practitioners to spend more time in direct work and thus to improve the practitioner/child/young person relationship.
<b>Study methods</b>	Semi-structured interviews. A Young People's Advisory Group was established to assist in designing research tools and to comment on interpretations of findings. Specific questions aimed to gather information about the accessibility and responsiveness of practitioners, continuity of worker, and to assess relationships with practitioners. The vast majority of

	interviews with LAC and care leavers were digitally recorded and transcribed in full. Transcripts or notes were coded using a thematic framework developed by the team based on the main topic areas that had informed the interview questions, as well as emerging themes. Some quantitisation of closed questions was performed.
<b>Population</b>	Looked after children and care leavers
<b>Study dates</b>	Pilot took place between 2009 and 2012
<b>Sources of funding</b>	the Department for Education
<b>Inclusion Criteria</b>	Care Situation Looked after children or care leavers involved in the pilot sites and a group of comparison children
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> 169 LAC and care leavers participated in the study (121 from SWPs and 48 from comparison sites), with 56 of the 121 SWP participants being interviewed twice with an approximate interval of 1 year.</p> <p><b>Time in care</b> most had been in care for two or more years, with over a quarter having been in care for over 5 years.</p> <p><b>Type of care</b> 65% of those participating in first stage interviews were LAC and 35% were care leavers. The largest proportion (46%) were living in foster care, with another fifth (21%) in independent houses or flats, a tenth were in supported lodgings and others were living with friends, family, parents or were in residential units.</p> <p><b>Special educational needs or learning disability</b> At least a fifth had special educational needs and/or self-identified health conditions or disabilities.</p> <p><b>Parents in care</b> Fourteen interviewees (2 young men and 12 young women) were either parents or were about to become so.</p> <p><b>non-white ethnicity</b> The majority were of white ethnicity (84% pilots; 79% comparisons).</p>

	<p><b>Gender</b> Slightly more males (55%) than females (45%) were included in the sample.</p> <p><b>Other recruitment considerations</b> The sample of LAC and care leavers from the pilot SWPs was selected by applying quotas to the SWPs' population across a range of categories (e.g. individual characteristics, as well as length of time in care, number of moves in last year and placement type). Additionally, black and minority ethnic and young people with disabilities were purposively sampled as they were considered 'hard to reach' groups. The sample from comparison sites was constructed to reflect a similar distribution of key characteristics.</p> <p><b>Age</b> aged between 7 and 23 years</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> continuity of social worker - Achieving greater practitioner continuity was an explicit aim for the SWPs, and LAC and care leavers in SWPs were more likely than those in comparison sites to report having the same practitioner over the last year (either social worker or personal adviser): among SWPs, this ranged from 75% in one pilot to 100% in others, whereas in the comparison sites, as few as 25% had the same practitioner a year later in one site compared with 86% in another. Figures supplied by the pilots confirmed that only one of the five SWPs had experienced high staff turnover, with 43% of its case holding staff leaving in the second year.</p> <p><b>Theme 2</b> Relationship building due to continuous care - Children's and young people's evaluation of the quality of their relationships with practitioners is sometimes linked to the length of time they have known this professional (Schofield &amp; Stevenson 2009). In this study, children and young people were slightly more likely to prefer their current practitioner (even if this was a new practitioner) to their previous one, especially in SWPs: 90% preferred their current practitioner compared with 70% in comparison sites. As LAC and care leavers in SWPs were more likely to have retained the same practitioner over the past year, they were therefore likely to be expressing an opinion about a practitioner they had known for at least a year. Continuity of relationship was an important factor but only if the relationship was positive.</p> <p><b>Theme 3</b> Increasing direct work - Reducing bureaucracy and increasing practitioners' direct contact with children and young people, thereby increasing the opportunities for quality relationships to develop, was another central theme emerging from service reviews and proposed structural reforms. Other children's services pilots in England, notably the CWDC Remodelling SocialWork Project (Baginsky et al. 2011), identified the importance of putting in place adequate administrative support to enable this to happen. During the evaluation period, three SWPs suffered cuts in administrative support, impacting on this capacity. Furthermore, most SWP staff reported that record keeping in relation to statutory responsibilities remained unchanged, although some found it less onerous on account of smaller caseloads.</p> <p><b>Theme 4</b> lower case load for more direct work - Analysis of the staff survey responses across the pilot SWPs, their host local authorities and comparison sites, showed that SWP staff were more likely to report spending enough time in direct work with children, families and carers, and this finding was supported by interviews with other professionals, parents and SWP staff themselves. Survey respondents identified an association between lower caseloads and increased capacity for building relationships with young people and families, despite reporting no reduction in time spent on form filling, meetings and reviews: Having a smaller caseload frees me up to work more directly with not only the young person but with foster carers, parents and other professionals to ensure a holistic approach/positive communication. (SWP practitioner)</p> <p><b>Theme 5</b> planned, not reactive care - Professionals interviewed for the study remarked that where SWPs' direct work with children and young people was good and often better than in the local authority, it was because work was planned rather than taken up with crisis intervention and was more young person-centred and holistic. SWP success was attributed to the skills and creativity of the team as well as to reduced caseloads (typically 15–18 cases), which were repeatedly mentioned as factors leading to better quality relationships.</p>

**Theme 6**

Availability/access - In contrast to other studies that identify a problem with accessibility from young people's perspectives (e.g. Timms & Thoburn 2003), the vast majority of LAC and care leavers interviewed in both SWPs and comparison sites felt they could access their practitioner when they wanted: over half reported finding it easy to contact their social worker, and 70% reported that it was easy to contact their personal adviser. Some LAC and care leavers in SWPs and comparison sites mentioned that their practitioner had given them his/ her personal mobile number. This young person's account typifies positive experiences regarding ease of contacting practitioners: "If I ever need her for anything, I just walk over [to the offices]. But like if it's the weekend or something I'll text her and she'll just text me back or ring me back or something . . . never really a problem in getting in touch with her. (16-year-old male care leaver, SWP)"

**Theme 7**

Support outside of working hours (informal care) - Informal, rather than formal, out-of-hours systems commonly operated in both SWPs and comparison sites. Children and young people from three SWPs as well as three comparison sites described instances of receiving support outside working hours: "I ring his personal mobile but that's something if it's just, that major, you know something happening . . . helped with housing over the weekend . . . He was willing to come and pick me up and help me find somewhere else to go on that same day . . . (19+ year old male care leaver, comparison site) I got pregnant again so I had to ring her . . . I called her out of hours and out of amazement she rang me back within the next twenty minutes . . . She was helpful yeah because I was confused and there was everything going on through my head and I didn't know what to do about it . . . (17-19-year-old female care leaver, SWP)"

**Theme 8**

Personal relationships - Although little difference emerged in the pattern of responses regarding ease of contact with practitioners between SWPs and comparison sites, LAC and care leavers in SWPs were more likely to identify key factors such as small staff teams that demonstrated familiarity with young people, accessible young person-friendly offices and 'friendly staff'. Just over two-thirds of LAC and care leavers in SWPs said they were familiar with, and were known by the other members of the staff team, whilst under half those interviewed in comparison sites reported this. "I know all of them here, I get on with them all. (19+ year old male care leaver, SWP)"

**Theme 9**

Available flexible care - At second stage interviews, a majority (78%) across the whole sample indicated that they saw their practitioner often enough, and a greater proportion (at least 80%) were happy with the length of time their practitioners spent with them. LAC's and care leavers' opinions about how often they wanted to see their practitioner were influenced by their current needs, and whether or not they were receiving support from other sources such as foster carers. 'Enough' contact could refer to weekly contact or to contact once every 6 months, and 'enough time' could be as little as 5 minutes or as long as a whole day. The important factor, as Office for Standards in Education, Children's Services and Skills (2009) found, was that the practitioner was flexible and adjusted contact to the child's or young person's needs. Whilst most children and young people found it relatively easy to contact their practitioner, where this was not the case, a lack of availability or communication could be interpreted as evidence of a lack of care.

**Theme 10**

importance of a positive relationship for satisfaction - Dissatisfaction occurred when contact with a practitioner was perceived to have a solely negative content, such as dealing with problematic behaviour, or the practitioner appeared 'rushed' and marginalized their needs by focusing exclusively on the foster carer. Only two young people (both from SWPs) said their practitioner spent 'too much time' with them because they did not like the practitioner. Satisfaction with practitioner contact was closely linked to the perceived quality of the relationship, practitioners' responsiveness to the young person's needs and wishes, and the perceived usefulness of the type of support they received. Where the quality of the relationship was poor, any contact was viewed negatively.

**Theme 11**

Essential qualities in the relationship -

**Theme 12**

SWP positive influence on relationships with key practitioners - Overwhelmingly, LAC and care leavers in SWPs were satisfied with the relationship with their key practitioner (social worker or personal adviser). Some compared the commitment and involvement of SWP staff favourably to that of their previous social workers: "She's been out looking for

me at like God knows what time in the morning, you know, trying to look for me, so she, she's not like other social workers who just like, they don't . . . really care. (17-year-old male care leaver, SWP)"

### Theme 13

Going the extra mile - However, LAC and care leavers in both SWPs and comparison sites described practitioners 'going the extra mile' and doing their best for them: "Well I went away . . . when I got my flat and by the time I'd come back for three days, my flat was fully decorated and carpeted and everything and she wasn't even at work, so like she's, she just, she goes out of her way like for people. (17– 19-year-old male care leaver, comparison site)"

### Theme 14

Valued quality of the relationships - The positive relationships described by LAC and care leavers in both the pilots and the comparison sites were found to contain all three forms of recognition, as defined by Honneth (1995): love in primary relationships, rights legally acknowledged by the state, and mutual acknowledgement of uniqueness and worth within a community.

### Theme 15

Love - Although the word love sometimes sits uncomfortably within social work, application of Recognition Theory to social work practice suggests there can be emotional engagement in relationships between practitioners and children (Houston & Dolan 2008), which can be summarized as 'affective acceptance and encouragement' (Honneth 2001, p. 48). LAC and care leavers described workers as 'likeable', 'friendly', 'kind' and 'understanding', and valued a warm, sensitive approach: "She's funny because she's good at like making jokes, and I think she's quite good like, say you're upset. I think she'd be quite good at making you happy again . . . she's just fantastic. (13-year-old looked-after girl, SWP)"

### Theme 16

Listening - A perception of the practitioner as a 'friend and an equal' (McLeod 2010) emerged, particularly from teenagers' responses. Children and young people related better to, and liked those practitioners most, whom they felt took time to understand their situation, and validated their perspective: "I don't know how to describe it, we're not mates, I know we're not mates because she's got to be professional. But, but at the same time like, I know I can talk to her about anything . . . she's always willing to listen, and at the same time she gets in touch with me . . . (16-year-old male care leaver, SWP)"

### Theme 17

Pro-active contact - Practitioners showed children and young people that they cared through their emotional engagement (Leeson 2010), and by pro-active contact: "Because she's always there if I need her and stuff, she's always asking how I am, always making sure I'm okay and how I feel about the placement and stuff, she always makes sure if I'm happy, and if I'm down she'll speak to me and cheer me up . . . (15-year-old looked-after boy, SWP)"

### Theme 18

Contractual rather than genuine relationship - A sense of being cared for, of experiencing affectionate care, emerged as a key aspect of positive relationships. Houston & Dolan (2008, p. 460) emphasized positive regard as a key to enhancing children's resilience and self-confidence. Those children and young people who did not share this sense of their worker caring about them highlighted a number of issues. Some practitioners were perceived to be in the job for the pay rather than their love of work with children. Others described negative personalities or clashes of personality with the practitioner.

### Theme 19

Reliability - Children and young people were appreciative of practitioners who delivered on tasks they had agreed with them, and around 90% of the LAC and care leavers interviewed in both SWPs and comparison sites said that practitioners did their best. Examples of how practitioners did their best included fast and efficient responses to requests for practical support, such as doing paperwork necessary for passports and birth certificates, getting financial resources for equipment needed for work or training and providing access to choices regarding accommodation: "She [worker] looked at the top two semi-independent living places, places in [town] and then obviously [current supported placement] as well, and she took me to the other two and she took me there, she let me decide where I went. (16-year-old male care leaver, SWP)" Approaches of this

sort acknowledge children and young people as rights holders with entitlements to a service or to resources, and encapsulate what Houston & Dolan (2008, p. 463) describe as 'perceived and available concrete, material and advice support', which contributes to development of self-respect.

#### Theme 20

The value of being listened to - In common with other studies (Ward et al. 2005; Morgan 2006, 2012), the value of being listened to emerged as a common theme. Both LAC and care leavers emphasized the importance of practitioners relating to them about topics they were interested in and having normal conversations: "She'll sit there and listen to my hours, hour long ramblings of Paul Wesley and Vampire Diaries and Glee and everything else I talk about . . . even if she doesn't watch them and she sits there and listens and if I have anything to say she'll sit there and listen. (17-year-old female care leaver, comparison site)". Listening also involved paying attention, being prepared to hear difficult things and acknowledging the child's or young person's perspective: "He stops what he's saying and listens to what I have to [say], like if I had a problem and he was talking about something else he, he'd stop and then he'd listen to what I was saying and so he, he obviously cares, he listens. (10-year-old, looked-after boy, SWP)" At least three-quarters of LAC and care leavers from both SWPs and comparison sites felt that their practitioner listened to them and treated them as individuals.

<b>Risk of Bias</b>	<b>Section</b>	<b>Question</b>	<b>Answer</b>

### Roesch-Marsh 2017

<b>Study type</b>	Focus Groups Semi structured interviews
<b>Aim of study</b>	to investigate the role of Independent Reviewing Officers in encouraging children's participation in reviews.
<b>Study location</b>	UK
<b>Study setting</b>	Scotland.
<b>Study methods</b>	Mixed methods. Survey questionnaires and "qualitative interviews" were used. These included individual interviews with young people and a focus group with the independent reviewing officers. Qualitative data was analysed using a thematic approach, with the support of Nvivo software. There were a small number of qualitative interviews and each of these sought to capture the young person's unique participation journey, looking at barriers and enablers to participation and how these changed over time. Barriers and enablers were compared across respondents and notes on each child's journey were compared to understand similarities and differences over time and map intersecting factors such as placement

	stability, family conflict, etc. Data from the survey and the children's interviews was discussed at the focus group with ROs in order to enhance reflection and explore emerging interpretations.
<b>Population</b>	Looked after young people and independent review officers
<b>Study dates</b>	March 2015 to June 2015
<b>Sources of funding</b>	funded by the ESRC, in collaboration with the local authority
<b>Inclusion Criteria</b>	Age Over 10 years of age  Care Situation Looked after and attending reviews in the study period
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Gender four female, six male  Age between 12 and 18 years old
<b>Relevant themes</b>	<p><b>Theme 1</b> Relationships are central to participation - ROs and young people both felt that positive relationships were central to achieving any level of participation in reviews. Relationships were found to be important at every stage of the review cycle including: preparation for the review, the review meeting itself, debriefing from the review and implementing plans. "If they don't have a good relationship with at least one worker, whether the social worker or key worker, that is very difficult and they are less likely to come to the meeting. (RO3, Focus Group) It [the LAAC review] just feels normal. I go into the room with X and Y and can talk about anything. (YP1, Interview)"</p> <p><b>Theme 2</b> Preparation for reviews - In the qualitative interviews we asked young people about who had prepared them for their review and why this was important. They told us that the level of preparation varied, and this often depended on how settled things were for them at the time and the nature of decisions to be made at the meeting. Sometimes preparations were limited to simple reminders about the upcoming meeting and encouragement to review reports and fill in the 'Have Your Say' forms. Most of the young people we spoke to were sent reports by their social workers before their review but few read these reports; some said this was because they were 'too long', 'hard to understand' and 'upsetting'. At other times preparations were much more detailed, involving multiple meetings and discussions with social workers and carers and creative activities to help young</p>

people think about and express their views. Some young people gave examples of how they were helped to prepare emotionally for meetings which often entailed contact with a parent or other family members or difficult decisions, such as those about contact.

### Theme 3

First interview the hardest - Most of the young people spoke about their first reviews as the hardest, this was when they needed the most support to understand what was going on and needed more help to prepare. As one young person explained: "It's pretty like scary to obviously go [to a review for the first time] . . . like they are questioning you about your life and how it's going and all that stuff... I think I first went when I was about 5 and for a 5-year old to have to explain what's going on... you don't know how to... so it's kinda scary. (YP9, Interview)" Young people said it was scary because they were not familiar with the purpose and format of reviews and it was hard to be asked lots of questions by adults. For some it was also hard because they did not know everyone who was there and had not had time to build up the relationships that could support them to participate meaningfully.

### Theme 4

Feelings about reviews impacted by current life situations - Several young people spoke about how their feelings about reviews varied depending on how well other things in their life were going. Sometimes it was easy to go and talk about things and sometimes it was awful. This meant that what they needed from people to prepare them for reviews changed over time. ROs also highlighted how the stability of the young person's placement and how they were feeling around the time of the review could impact on their ability and/or willingness to prepare for and participate in the review. As one reviewing officer explained: "I think sometimes it is just about how things are going for the young person. For example, one young man who used to go to his reviews stopped coming. Things were just really difficult for him and I knew he just couldn't face sitting in a room with everyone going on about everything. And now it's come back and he is coming again and you can hand it [the meeting] over to him. He will decide what we are going to discuss and has control over his plan. (RO2, FG)"

### Theme 5

continuity of relationships - ROs felt reliability and continuity of relationships were important for young people; it meant that people could see them through these difficult times and help them to re-engage with their review meetings, when they were ready. Although this connection between relationships and participation has been highlighted elsewhere, this finding also emphasizes the inter-relationship between factors such as placement stability and other challenges faced by the young person and their engagement with reviews.

### Theme 6

Ability to opt out - findings also suggest that sometimes the supportive thing to do is to allow young people to opt out of formal processes, if this is what they really need and want. So long as the relationships endure, the young person's views can still be shared and the door to more active participation remains open.

### Theme 7

Preparation for reviews - ROs highlighted that a lack of pre-meeting work by social workers, carers and keyworkers was a barrier to the young person's participation in the review. They felt that preparation work with the young person, on the part of these workers, should include: discussing the meeting with the young person in advance; taking time to understand their views and using creative approaches to enhance communication; discussing with them how they wished to participate and if they wanted to come to some or all of the meeting or have their views represented in some other way; giving them a choice about venue and timing, where possible; discussing the invite list and, where possible, ensuring it reflected their preferences; preparing them to deal with the emotional impact of the meeting and planning strategies they might adopt if things got difficult during the meeting.

### Theme 8

Need for information sharing - ROs also highlighted how important it was that social workers provided them with information about family and professional dynamics that might impact on the review. Knowledge of these things could help them to prepare a strategy to manage these dynamics and ensure that the young person's views were not drowned out by other things going on in the meeting.

### Theme 9

Preparation for reviews - ROs also discussed the importance of their own preparation for the review and felt that taking part in the action research had encouraged them to give further consideration to the young person's participation during their preparations for the review. Preparation and support to participate in reviews were not seen by ROs as a one off event, but rather something that should be part of the culture of the organization and the responsibility of everyone working with the child. As one RO explained: "If participation, planning and listening to the child's views are integral to their experience of services, then the review is only one part of that, it's not going to shift all that, so it has got to fit into the culture. (RO1, FG)"

### Theme 10

Number of persons at reviews - Social workers and ROs were asked to comment on what impact they felt the mix of people at the review had on the child's participation. They highlighted that: having a small number of participants worked well for the young person and their willingness/ability to participate in the review; the young person participated well when they knew everyone in the room; having all those who attended engaged in the process helped the child; difficult family relationships inhibited the young person from participating in the review; the child found new people and strangers unsettling. In reflecting on these findings the ROs said in the focus group that they were concerned about the large number of professionals at many reviews, which they felt could be intimidating for young people. Young people also commented on how difficult it was to have large numbers of adults at their review. As one young woman explained: "There are people there and they are all trying to help you and they are all important people but there are still too many people. Like for a ten year old let's say going to a LAAC review having all these tall adults towering over you, there's maybe like six of them, that's really intimidating, that's really hard, even for my age that's tough.(YP10, Interview)"

### Theme 11

The right mix of people (problem with family members) - The other crucial issue with attendance was getting the right mix of people there, particularly in relation to the attendance of family members. Although family were most often missing, the attendance of family members could also be problematic for young people's participation. As one young person explained: "Everyone was arguing and shouting basically and your sitting there like....a wee 11-year-old isn't going to say anything...like I didn't feel like I had anything that was gonna help, even though it was about me. They just had so many views and opinions about what was going on in my life I didn't feel like I could say anything because they were all so strong. (YP9, Interview)" This young person went on to explain how excluding particular family members from her review had made all the difference to her participation and that her RO had been central to making this happen.

### Theme 12

Choice about location - The young people we interviewed all said they preferred to have a choice about where and when their review was held and most said they were given a choice. Some felt very strongly that if a review was held in a particular location, such as their school, they would not want to attend and would feel more embarrassed.

### Theme 13

Understanding of the role of the review officer - All of the young people we interviewed had at least a partial understanding of the role of the RO and most of them felt it was an important role, as the quotes above suggest. Most of them identified that one of the core tasks for the RO was to hear their views, two thirds of them also identified that it included leadership or making sure that things got done: "[It's the Reviewing Officer's job] To make sure I've been safe, staying ok and I'm happy with the placement, they're supporting me as well. (YP2, Interview) It's kinda like leadership about what your life's gonna be and they choose what's going to happen about your life I think. (YP5, Interview)"

### Theme 14

Benefits of reviews according to LACYP - According to the young people we interviewed, there were four principle benefits of reviews: 1. They were a place to get information so you knew what was happening; this was reassuring 2. They could make you feel people really cared and were there to support you 3. They were a place to get your views heard 4. They were a place where you could get things done or changed Several of the young people said they went to their reviews because they did not want to miss out on important information. Surprisingly, several young people also said they felt it was easier to say some things at a review then to say it directly to their carer. Three young people gave examples of really important changes to their care plans that had been initiated through the review meetings and for this reason they felt reviews were a place they could get things done or changed. Finally, half of the young people spoke about how the reviews made them feel cared for.

### Theme 15

Length/complexity of reviews a problem to participation - On the down side, young people felt that reviews were often too long and boring and several said the discussions were confusing for them and they did not always understand what was being said. As one young man said: "When there were big words then I switched off cos I don't like big words, it

makes me feel like, like I don't understand so I just switch off until they ask me and then I just say yes... (YP5, Interview)" This quote suggests that young people may sometimes seem to be participating, when in fact they are 'switched off' and that it can be difficult for young people to admit that they do not understand the discussion or ask for clarification. As this young person explained, it was easier to agree when he was unsure. This finding also highlights how easy it might be to mistake compliance for participation in situations of unequal power, adding strength to the argument that we need inclusion of children in decisionmaking, rather than integration; this means involving children at a much earlier stage and asking 'how do you want to participate?' instead of saying 'this is how we want you to participate'.

#### Theme 16

Creating the space for participation - ROs highlighted that, even when the young person was well prepared and ready to share their views, it could still be a significant challenge to create a space for them to share their views in meetings. There were many reasons for this including: carers and other professionals being overly keen to discuss key problem areas and challenges from their perspective; family dynamics and family conflict; carers or professionals who were too eager to speak for the young person; the needs and difficulties presented by parents.

#### Theme 17

Strategies to improve participation - ROs were most likely to use verbal strategies to encourage participation in reviews. Verbal strategies included things like: directly asking a young person a question; summarizing key issues and checking out that they had understood what was important to the young person; returning to issues that were important to the young person when the discussion became sidetracked by other professionals or family; asking particular group members to wait a moment to allow the young person the space to speak.

#### Theme 18

Structure of meeting to improve participation - The structure of the meeting and the agenda was the other most commonly used strategy. As agreed at the outset of the action research project, ROs would discuss the agenda with the young person before the meeting and would ensure their views and 'Have Your Say' forms were at the top of the agenda. ROs also used seating arrangements to make the young person feel more comfortable.

#### Theme 19

Use of advocates - In most meetings ROs made use of other professionals or advocates to enhance the voice of the young person and encourage participation. They did this by speaking to professionals who knew the young person before the meeting to identify who might be best placed to do this in the meeting. In some cases they would also actively encourage the social worker or key worker to find an independent advocate to support the young person to participate.

#### Theme 20

Someone to talk to after review meetings - All of the young people we interviewed said they had someone to talk to about their review afterwards. Often this was the social worker, other times it was the carer. They said this was important, it allowed them to ask questions and clarify what had been decided. It also helped them deal with any worries they had about the decisions that had been made. Several young people really appreciated how their social workers made a special effort to come and see them shortly after the review to talk about things.

#### Theme 21

"getting things done" most appreciated about reviews - As we have already noted, getting things done or changed was one of the things some young people appreciated most about their reviews. One young woman also spoke about her ongoing disappointment with the lack of action following her reviews. ROs highlighted how important follow-through and action were to ensuring young people's ongoing participation in the planning and review cycle. They saw it as one of their key responsibilities to avoid drift in care planning.

	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Can't tell <i>(Researchers did not clearly explain how participants were selected or why those selected were the most appropriate to provide access to the knowledge sought by the study. Unclear if/why some people chose not to take part )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Can't tell <i>(Interview method was not made explicit. Form of data was not clear. No discussion of saturation of data. )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(Unclear that the researcher critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Can't tell <i>(No in-depth description of the analysis process. Unclear that sufficient data presented to support the findings. Unclear that researcher critically examine</i>

			<i>their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	Can't tell <i>(Unclear that credibility of findings was discussed in terms of the use of triangulation, respondent validation, more than one analyst)</i>
	Research value	How valuable is the research?	The research is valuable <i>(however no discussion RE transferability )</i>
	Overall risk of bias and directness	Overall risk of bias	Low
		Directness	Directly applicable

### Samrai 2011

<b>Study type</b>	Semi structured interviews
<b>Aim of study</b>	To investigate foster carers' experiences of placements and placement support, including their views of what constitutes a successful placement
<b>Study location</b>	UK
<b>Study setting</b>	an English local authority
<b>Study methods</b>	The data were collected using semistructured interviews. The interview consisted of broad questions about views of placement experience, support and 'successful' placements. A schedule was used to guide the process and interviews

	ranged from 40 to 90 minutes in duration. All the interviews were transcribed verbatim and the transcripts were then checked twice for accuracy by the researcher. Grounded theory was used to thematically analyse the transcripts.
<b>Population</b>	Foster carers
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported
<b>Inclusion Criteria</b>	Carer situation foster carers employed by a social services department in the Midlands.
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> Eight foster carers</p> <p><b>Type of care</b> None of the participants were kinship carers. Four were short-term foster carers, one offered short-term and emergency placements and another offered short-term and leaving care placements. One participant offered short-term and long-term placements and another short-term, long-term and respite placements.</p> <p><b>Gender</b> seven female and one male.</p> <p><b>Age</b> ages ranged from 35 to 61 years.</p> <p><b>Ethnicity</b> All the participants described their ethnic background as White British.</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> Support offered by the link worker was essential but respite often unavailable - Support offered by the link worker, as well as financial and practical support from social services, was seen as essential. Although respite was also deemed important, not all participants had access to this. Participant 8 commented: "Support, the basic support is from the link worker – or supervising social worker they call them now – and we've been very fortunate over the years because our support workers have always been brilliant."</p>

**Theme 2**

Training - Training was seen as useful and it was generally felt that training programmes had improved more recently. The practicalities of attending training were highlighted as an issue by Participant 7: "It's difficult for a carer, with young children, because it's not as easy to get the training that they offer [which] is quite often on the other side of . . . for like 9am."

**Theme 3**

Lack of availability of link worker - Participants felt that support was not always available when needed. This was mainly in relation to contacting the link worker. There were also incidents when participants felt support was promised and not delivered, as exemplified by Participant 3: "Like you say, 'Well, we could take this child but we'll need this help,' and you have the initial review meeting and things are promised, and then none of it happens, so the child's got expectations and you've got expectations and it doesn't happen."

**Theme 4**

Back up care, family and friends care, and peer support - It was suggested that more back-up options should be available, although positive experiences were reported when participants contacted the duty team. Meeting up with other foster carers was cited as extremely beneficial. Support from the participants' informal network, particularly from family and friends, was an essential component. Participant 2 reported on her main source of support as 'my son and daughter-in-law; she is actually a nanny so she's very experienced in child care'.

**Theme 5**

Importance of relationship quality with link worker - An important influence on the success and stability of the placement was the professional relationship between participants and their link workers. A good relationship enabled the participant to contact the link worker when required. Participant 1 reported: "Well, my link worker was . . . she did her normal visits, once a month, and was there really if ever I wanted to talk to her about anything." However, a poor relationship with the link worker led to participants feeling that they could not contact them and relationships with different link workers could be variable. The relationship with the child's social worker was also identified as being important in ensuring placement stability. In instances when interviewees felt the relationship with the child's social worker was poor, they felt the social worker was not responsive to the child's needs. Participant 7 recounted her experience: "He didn't sort of stay in touch as much as the other social workers that we've had, and I was sort of having to sort of phone him to chase him for things."

**Theme 6**

Lack of cross communication - Communication from both sets of social workers and social services was highlighted as problematic. Many participants felt that communication between link workers and children's social workers was poor and, at times, they were given mixed messages.

**Theme 7**

Foster carers need for the child's history - They believed it was vital to have background information and details about the child and their history. Some felt information that may have been less favourable about the child was withheld by social workers in order for the placement to go ahead. Participant 3 explained: "We spoke to the carer and found out a whole load of other details and said, 'No, we're not taking her,' but if I hadn't have spoken to the carer, we would have taken her and we would have had problems . . . there's just no point them coming to placements that just, it's just setting the child and you up to fail."

**Theme 8**

Primacy of own family (and positive impact of fostering) - All the participants stated that they enjoyed fostering and found it a positive and worthwhile experience. They were able to acknowledge that if a placement had a profoundly negative effect on their family, their immediate family would come first and a placement might have to end. However, participants reported that the impact of becoming a foster carer on their family was generally positive. Participant 6 explained: "I think my job is more of a passion than a job. If I'm honest with you, like I say, it's very rare you get kids through your door that you don't want to help."

**Theme 9**

Desire to be involved in decision making - A majority of participants wanted social workers to involve them more in decisions related to the child, but found that social workers' expectations of how much participants should be involved varied. Participants also expected children to have an allocated social worker, to ensure the child was well supported. Participant 3 discussed their experience: "I tried to get help on several occasions, but at the time she didn't have a social worker, and the principal social worker kept saying, 'Oh it's no good, she hasn't got a social worker, we'll sort it out, and then you'll get some help,' and this went on for three months."

#### Theme 10

Bias towards the birth family? - The role of different social workers was highlighted as problematic at times, particularly when there appeared to be confusion about the goals of the placement. Participant 1 recounted: 'Sometimes I find that the child's social worker is more representing the needs of the birth family.'

#### Theme 11

Need for more recognition from social services - Some suggested that further recognition for the job they do from social services would be appreciated. Participants' expectations for the children in placement were also important. Many felt that services provided for looked after children were not adequate and had positive, rather than negative, expectations for the children. Participant 8 explained: "I know a lot of children in the care system do get discriminated against and they get disadvantaged and I think a lot of that is because people have low expectations of them, so because we didn't have those low expectations, we just thought, no, this is the difficulties they've got – how are we going to overcome them?"

#### Theme 12

Defining a successful placement - All the participants judged a placement to be a success if it had been seen through until the end and the child moved on to a permanent placement, back home or to a long-term placement. Not everyone agreed with the transitions that were arranged, but it was generally felt that if the child was happy with the arrangements, they would support the move. The relationship between foster carer and child also emerged as important. Participants spoke of wanting the child to be nurtured, cared for and confident, and for them to achieve their potential in the placement setting. They said that if they stayed in contact with the child following the end of a placement that, too, was deemed a success. Participant 9 explained: "We can't help feel it's successful when they keep getting in touch and leaving messages and Christmas cards and things like that. You think, well we did do something for them."

#### Theme 13

Attachment for placement stability - A significant factor that contributed to placement stability, the goals of the placement being achieved, and the placement continuing was the bond formed between the foster carer and the child. Participants all described forming an attachment with children in their care and wanting to meet their emotional as well as their physical needs. In this respect, they often felt that the child's contact with the birth family had a detrimental effect.

#### Theme 14

Feelings of loss - The emotional investment by participants led to mixed feelings when the child moved on. Although the foster carers were often pleased that children were moving to permanent placements, Participant 6 described feelings of loss: "I was sad. They don't realise . . . every time we do it, we have to do it every year, but they say the children get sad and things like that, but so do we as adults." After a child had moved on, there were also positive emotions. If a participant had formed an attachment with a child, then contact between them signalled a continuing relationship. This was something all participants valued, as they wanted to know how the child was progressing and indicated that they still cared about them. However, if a placement had ended abruptly, some expressed a sense of distress. Participant 4 recounted, 'I was devastated, absolutely devastated. I suppose I was a bit hurt.'

#### Theme 15

Need to be involved in transition planning - The ending of a placement or the start of a new one was a variable experience for participants. There was a range of reasons for a child leaving, such as them moving on to a permanent placement, leaving care or due to placement breakdown. The majority of participants reported a sense of loss when a child moved on. They also described the impact of a placement transition being poorly handled. As recounted by Participant 9: "think it pulled us back to perhaps more how we were when we first began fostering, just doing the job more or less, you know, just do what we needed to keep them happy, fed and watered and that was it, whereas fostering is not just that, there's a lot more to it." When a transition was planned, participants wanted to be involved, in which case they felt that it was a much smoother process. Participant 2 recalled: "[I] met with the adopters before the children had moved on, so we'd already covered all the different questions – everything about their care and what they needed and how to respond to the – and the transition was very very smooth."

	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes

### Schofield 2015

<b>Study type</b>	Semi structured interviews RQ2 Mixed methods
<b>Aim of study</b>	To examine the risk and resilience profiles of young people in care who offend, including the role of social cognition characteristics (emotion recognition and hostile and benign attribution bias).
<b>Study location</b>	UK
<b>Study setting</b>	Four UK local authorities from different regions were approached to participate in the study, providing a diverse context: two urban authorities with ethnically diverse populations and two shire counties.
<b>Study methods</b>	The interviews with the sample of 100 young people combined a semi-structured narrative interview, focusing on a range of life experiences, with standardised social cognition and language measures. In the narrative interviews each young

	person was asked about their experiences of school, college and work; where they were living; who they were living with; what they did in their spare time; friends; offending; contact with birth family (if in care); their experience of professionals; and their plans for the future. This qualitative interview data was analysed thematically, coding from the data, but also drawing on the risk and resilience factors discussed above e.g. close relationships, self esteem and self efficacy.
<b>Population</b>	Looked after children with offending history, looked after children without offending history,
<b>Study dates</b>	2013
<b>Sources of funding</b>	Big Lottery Research Programme
<b>Inclusion Criteria</b>	<p><b>Age</b> The target age range was 15–17</p> <p><b>Care Situation</b> Looked after children in contact with the youth justice system; and looked after children without involvement in the justice system. 'Looked after children' were defined as young people who were looked after by the local authority through a care order or voluntarily accommodated under section 20 (Children Act 1989) for at least 12 months.</p>
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> 33 looked after children offenders, 35 looked after children non-offenders</p> <p><b>Type of care</b> Referred young people were in a range of placements e.g. residential care, foster care, secure unit, and semi-independent living.</p> <p><b>Gender</b> A gender ratio of 70:30 boys to girls</p> <p><b>Age</b> age 14–19 (Mean = 17 y, SD = 1 year)</p> <p><b>Ethnicity</b></p>

	<p>an average of 36% black and minority ethnicity (BME) young people across the three groups, with no differences between groups</p>
<p><b>Relevant themes</b></p>	<p><b>Theme 1</b> The key protective elements that emerged from the interviews with the three groups and were supported by the case file histories can be grouped into two broad areas — the importance of positive, trusting relationships and the role of constructive activities, such as school, leisure interests or employment.</p> <p><b>Theme 2</b> The group of looked after children who were not offenders, and some who had previously offended but then desisted, were able to articulate both their own sense of progress in these areas, but also the connection to the quality of care they had received. Underlying these young people's capacity to take advantage of relationships and activity was their ability to reflect on and regulate emotions and behaviour.</p> <p><b>Theme 3</b> Positive activities - For a care population, a sense of belonging is also an important factor in reducing anxiety and supporting pro-social behaviour. The positive activities described included school, college and diverse sports and hobbies, but all were linked to relationships with teachers, foster carers, residential workers and peers who encouraged and supported young people to find success and enjoyment in pro-social activity.</p> <p><b>Theme 4</b> Positive relationships - For the looked after young people who were not offenders and who appeared more stable in placement and in education, the quality of their relationships was central to their development. In this example, it is clear that for young people, sustaining trust in supportive relationships and making prosocial moral choices are linked to support for the capacity to reflect on feelings and behaviour. "My carer (name) she's really nice and supportive and would help me through anything really. I've been here for seven years now. For me it's the best foster home I could have been to. She certainly helped me progress through school and everything. If I was ever in trouble and didn't know anything she'd always be there to back me up and ask why I done it and talked to me...She'd sit me down and say it wasn't a very acceptable thing to have done, what could you have done to be more positive? [16, male, LAC non-offender]" In other cases, relationships are clearly linked to building self-esteem and self-efficacy, enabling children to function more effectively outside as well as within the foster family. "I praise (my foster carers) so much — you just cannot get any better, they are the best ones going. What sort of things do they help you out with? Just everything...it's like emotional support, school life, education wise, friends, they help me to manage my money, how to live my life. They teach you all the basics and more. [15, male, LAC non-offender]"</p> <p><b>Theme 5</b> Residential care relationships can also form a turning point for benefit - Although positive foster care stories predominated amongst nonoffenders, residential care could also provide the turning point that enabled young people to go on to greater stability or to benefit from foster care. In this example, the secure base nature of the relationship (i.e. where trust promotes the capacity to explore) is evident — and the wonder in the natural world that this inspired in this boy continued throughout his adolescence. This is his account as a 15 year old, now in stable long-term foster care, of an expedition with a residential worker when he was 11. "It's amazing what's out there...There was seals in a river that goes out to the sea and it has this wall with all seaweed and a little bit of sand and he said, 'Here, look, do you think there's any life in them rocks?' and we would say 'No, there can't be nothing'...we used to go all through the rocks and find all this weird stuff like crabs and other stuff, it's just amazing. [15, male, LAC non-offender]"</p> <p><b>Theme 6</b> Reconciling the past to benefit from relationships on offer – For many of these more resilient teenagers, it was often the case that coming to terms with their family history allowed them to benefit from the relationships on offer and to develop a sense of belonging as a family member. "I wasn't a good child because my birth family never showed me any love...I was always angry, all the time, and then (foster mother) she saw what was going on and she knew, so she gave me love and she gave me what every mother should give their daughter and I changed my ways and now I don't do drugs or anything bad like that. [16, female, LAC non-offender]" This teenage girl is able to provide a coherent narrative that takes account of her foster mother's feelings and behaviour, and explains the association with improvement in her own behaviour.</p>

	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes <i>(However, no discussion regarding whether/why some participants chose not to take part )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Can't tell <i>(Setting not justified; the researcher has not made the methods explicit; form of data unclear; no discussion of saturation of data )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(Unclear that researcher has critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Can't tell <i>(There was no in-depth description of the analysis process; unclear if sufficient data to support findings/extent of contradictory findings; unclear that</i>

			<i>researchers critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	Can't tell <i>(No apparent discussion of the credibility of the qualitative findings in terms of triangulation, respondent validation, more than one analyst)</i>
	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	High
		Directness	Directly applicable

## Schofield 2019

### Study Characteristics

<b>Study type</b>	Semi structured interviews
<b>Aim of study</b>	study of LGBTQ young people in care in England and focuses on the nature of foster carers' experiences and perspectives on caring for LGBTQ young people.
<b>Study location</b>	England
<b>Study setting</b>	Fostering agencies and local authorities from across the country

<b>Study methods</b>	The semi-structured interview schedule asked foster carers to describe caring for an LGBTQ young person from arrival in placement to the present or to the placement ending and any subsequent relationship. The interview focussed on how carers experienced their role in supporting young people with, for example: foster family, birth family, school and peer group relationships; coming out; and managing their sexual orientation or gender identity. Carers were also asked about training and the support received from social workers and other professionals. The study included a national survey of services in England, three focus groups of professionals, 46 narrative interviews with LGBTQ young people aged 11–26 (m = 19) who were or had been in care, and telephone interviews with 26 foster carers regarding the nature of their experience of caring for LGBTQ young people. Data from the foster carer interviews were transcribed and analysed thematically.
<b>Population</b>	26 foster carers were recruited from fostering agencies and local authorities from across the country, with the majority (17) coming from local authorities who participated in the survey and others through research team agency contacts.
<b>Study dates</b>	2014 - 2017
<b>Sources of funding</b>	the Economic and Social Research Council
<b>Inclusion Criteria</b>	Carer situation Foster carer of a young person who is LGBTQ
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size 26 foster carers  Mean age (SD) young people ranged from 6 to 16 years at entry into their placement (m = 13.5)  Type of care

	<p>They were the subject of very different care plans (e.g., short-term foster care, respite care, and long-term foster care), but these plans had often changed over the placement.</p> <p>Special educational needs or learning disability There were also young people who had diagnoses of autism spectrum disorder and attention deficit hyperactivity disorder.</p> <p>LGBTQ The majority of the young people (18) identified as LGB and 8 identified as trans. Ten had identified as LGBTQ before placement and 16 came out in placement. Those who identified as LGBTQ preplacement included young people whose sexual orientation or gender identity had not been accepted by their birth, foster or adoptive families. But for all young people, the reasons for care combined a number of factors.</p> <p>Exploitation or maltreatment Young people had a range of adverse experiences of abuse, neglect and loss common to the wider population of foster children</p>
<p><b>Relevant themes</b></p>	<p><b>Theme 1</b> Building trust and understanding behaviour - Building trust for all young people in care requires foster carers to offer practical, emotional and psychological availability that reduces anxiety, builds trust, promotes exploration and is specific to each individual young person's needs (Schofield &amp; Beek, 2018). For LGBTQ young people, trust in caregivers was often said by carers to have been damaged by previous adverse experiences that included abuse, neglect, separation and loss. Lack of trust for some young people had been compounded by moves linked to rejection of their sexual orientation or trans identity by birth, foster or adoptive parents. Most young people therefore were reported to have had difficulty in trusting in the general capacity of caregivers to understand and meet their needs but also the specific capacity to be available and accepting in relation to sexuality and gender identity. The capacity to be available and build a young person's trust will depend on the sense the caregiver makes of the young person's behaviour and needs—and in particular why the young person may lack trust (Schofield &amp; Beek, 2009, 2018). In the current study one carer had identified that the young person in their care, who identified as bisexual, suffered from high levels of anxiety and described him as “too eager to please.” She attributed his anxiety to abuse in his birth family and described him as having been “bullied from birth.” However, she felt that in her home, he had built a capacity to trust and could begin to accept his identity. "He can relax and feel safe and have his needs met and not have to worry about where he is going to get a piece of food - and he has been able to be himself."</p> <p><b>Theme 2</b> Availability - Availability was described as linked to emotional closeness but also needed to be linked to acceptance of young people's sexual orientation or gender identity. "She always feels, no matter what, I love her and we are always there. I think she can feel security and acceptance."</p> <p><b>Theme 3</b> Gradual discussion of sexual issues and going at the young person's pace - LGB carers or carers with LGB family members felt confident in demonstrating that they could be trusted, as the young person had evidence that LGB identities were accepted and could be talked about. But here, too, there was an emphasis on going at the young person's pace. "My son is openly gay ... so there is quite often gay chatter going on at home. I would not specifically sit down and say to (the young person) 'Right I want you to talk with me about your</p>

sexuality' because I do not think that is appropriate. I think it is the sort of thing that a young person will come to you with when they are ready ..." For many young people, the process of exploring sexual orientation or gender was gradual and needed continuous availability by carers. This carer for a trans young person talked about how she managed to build the young person's trust. "If he wants to broach it we will talk about it and we have talked at length. He will say how he sort of hates his body and cannot bear the thought of it. He is now on tablets that stop his period but he feels like his whole life is on countdown to when his next period would start ... He has said I am one of the few people he can trust and he said he feels he can be himself and talk about things." Availability for LGBTQ young people meant carers establishing a trusting relationship enabling the young person to talk about and explore their sexual orientation or gender identity at their own pace.

#### Theme 4

Sensitivity, flexibility, and reflective caregiving - Sensitivity in attachment theory is defined as the caregiver's capacity to reflect on the mind of the young person, tuning in to their thoughts and feelings, seeing the world from their point of view and making links to their behaviour, but caregivers also need to be able to reflect on their own thoughts, feelings and behaviour. Important here is the foster carer's flexibility and willingness to tune into how this particular LGBTQ young person thinks and feels and to identify how best to support them. "I'm learning how to anticipate things and understand things better and I'm getting more of a grasp on who she is ... so there's a way of being and I'm learning it." It was necessary for carers to reflect flexibly on connections between young people's thoughts, feelings and behaviour, as there were a number of factors that had to be considered. One carer expressed her concern that for LGBTQ young people, suppressed and concealed emotions about coming into care could be exacerbated by the additional burden of concealing their sexuality. "When you go into foster care it must be daunting, you must be suppressing so much other stuff and you have got to suppress your sexuality as well. You've got to live that lie." Carers described needing to be sensitive to the difficult choices facing young people about how open they wanted to be about sexuality or gender, especially when they were anxious about being rejected or moved. "She was afraid to come out to me and I did not understand ... But she's afraid of losing her home and felt vulnerable and scared to say..." Flexibility and sensitive thinking about the young person's mind and behaviour often meant recognizing the additional stigma faced by LGBTQ young people. "He was quite explicit about what people had said and how it had affected him, how isolating it had been, how therefore he had dropped out of school." As well as ongoing availability during a gradual process of coming out or gender transition, it was said to be important to be sensitive and responsive to children's thoughts and feelings at each stage, as this carer of a trans young person (aged 9 at placement) describes. "When he first came he mentioned it then. I thought probably he's a tom boy, he does not like to be dressed like a girl, he just likes to be dressed in boys' stuff. We went out and bought more boys' clothes, tried to make him comfy in his own body. It did not seem to be enough and within four, five, six weeks, we were talking about something and he literally just broke down, crashed down against a wall and started crying. He said, 'I'm not right, I'm not right, I hate my body'." Once his gender identity was explored and accepted by the carers and a process of social transition was started, this young person's mood and capacity to manage his feelings changed and he was "like a different child."

#### Theme 5

The challenge of staying tuned in to helping young people, despite challenging behaviour, was a common theme - The challenge of staying tuned in to and helping young people who had multiple unresolved difficulties and fears was a common theme. Some carers described young people's problem behaviour as an understandable stage on the way to "coming to terms with" themselves. "He used to throw things at me and we did once have to call the police out to him because he kept trying to attack me ... He'd been caught shop-lifting ... I think it were his confused stage. You know he needed more attention but he could not tell us why. I think he was coming to terms with himself." The question of whether young people were "confused" was talked about in different ways, some more sensitive than others. Carers talking about "confusion" might be reassuring for a young person if it reflected their feelings. However, some carers seemed to assume that confusion was inevitable, and this might be a less helpful response for a young person who was clear about their sexual orientation or gender identity. Some carer interpretations of why young people might come out as LGBTQ, however, seemed not only to question the truth of young people's communications but to be actively dismissive. "You sometimes find that kids want to shock you and that is a good way of trying to shock." From these examples, it was clear that foster carers needed to have the capacity to reflect sensitively not only on young people's feelings but also on their own feelings and values and to be supported with this. In some cases, social workers will need to work with and challenge carers' attitudes and approach, in order to ensure that LGBTQ young people's needs are understood and met.

#### Theme 6

Acceptance and building the young persons self-esteem - Acceptance can be defined as accepting the young person unconditionally in ways that help to build the young person's self-esteem, enabling them to accept and value themselves while also coping with setbacks. Acceptance by the foster carer needs to be linked to support to be accepted by the birth family, peers and the community and is central to the caregiving that LGBTQ young people need for healthy development. In this study, the same sense of positive belief that should be extended to all children in care often underpinned a carer's acceptance of the LGBTQ young person in their care. "We knew he was a good kid. And he did not have a good start. But

you can see potential in kids, in how they respond to their care ...I said just be the best person you can. And he really has, he's come a long way." When asked about specific issues facing LGBTQ young people in care, carers named acceptance as key, especially in relation to coming out. "Feeling accepted I think - being accepted by their family and friends I think to come out. I think that's the worst for them ...the uncertainty of whether they are going to be accepted." Some young people were described as already very accepting of themselves and their LGBTQ identity when they arrived in placement. "I think that she is always going to identify as gender fluid. It seems like she always has. She does not seem to be at odds with who she is in any way ...She has days when she feels like a boy and days when she feels like a girl and she seems to be quite comfortable with that." But for most LGBTQ young people, carers recognized that feeling comfortable about exploring their identity would take time. "I do feel that he has not really had an opportunity to explore different things, you know. I just want him to feel accepted, which he is, and really find out who he is and be comfortable with it. I do not think he is there yet." One statement often made by foster carers to suggest what they meant by acceptance was that the young person's sexual orientation or gender identity "does not make any difference," but this was understood in varied ways. This statement could be positive, conveying that sexual orientation or gender identity did not affect the carer's feelings for the young person or threaten their relationship. However, in a few cases, particularly in relation to sexual orientation, the assertion that it made no difference appeared to underestimate the challenges that would in fact be experienced by the young person, in terms of the risk of bullying, stigma and homophobia. There could even be a sense of "blaming" the young person for any negative consequences of their identity. "It does not make a difference - I think it's how the child makes an issue of it. If you want it to be a problem, you can make it a problem." There must be concerns about foster families where carers seem dismissive about the risks of stigma or, as was the case in one family, where family members were homophobic or engaged in "banter" about a young person's sexual orientation.

### Theme 7

Understanding the meaning and origin of sexual orientation - Even where carers were seemingly accepting of LGBTQ identities, their theories about the meaning and origins of the young person's sexual orientation or gender identity needed further exploration. A number of carers theorized about the possible connections between young people's sexual orientation or gender identities and their previous experiences of abuse and harmful relationships. It is relevant to consider the impact of abuse on adolescent or adult experiences of intimacy, whatever a person's sexual orientation or gender identity. However, if the carer implicitly or explicitly suggests that a young person's LGB or trans identity is the result of harmful experiences, this inevitably pathologizes their sexual orientation or gender identity. In this example, a carer talks about a young woman who had experienced sexual abuse and identified as lesbian. "I think deep down I do not know whether she would have not been heterosexual had she not had these sexual experiences of her childhood.... It was the path that was easier for her." Another carer also explained a young person's sexual orientation as being a result of sexual abuse early in childhood. This explanation suggested that the carer did not accept the young person's LGB identity as authentic. "He'd been abused by a male perpetrator all his life. He just thought that he would always be gay...So he had no, he did not really have a choice, he did not have any freedom."

### Theme 8

Balance between supporting young people facing stigma while not making them feel that their sexual orientation or gender variance was a negative or limiting factor in their lives - In terms of building self-esteem, it was thought by carers to be important to get the balance right between supporting young people facing stigma, while not making them feel that their sexual orientation or gender variance was a negative or limiting factor in their lives. A gay carer commented that there was a risk of overemphasizing the negatives. "People have confused views about what it means to be gay and they are projecting that onto their children as well, so their children or foster children ...are going to grow up filled with fear. They're not going to have the validation." Accepting LGBTQ young people and building their self-esteem required foster carers to understand the risks that might affect young people in the community but also to promote opportunities and value each young person's potential. Foster carers talked, however, of feeling that the social work support available was often not giving them either the specific information or the emotional support they needed to manage this task. Carers needed to manage a number of tensions when parenting cooperatively to build a young person's confidence and sense of agency. As with other foster care research, some carers tended to limit young people's options and opportunities with a view to protecting them. But the majority of carers expressed concerns about how to get these approaches right for each LGBTQ young person and would have liked more specific guidance from professional support networks.

### Theme 9

Co-operation, agency, and helping a young person to feel effective - Young people in care often feel powerless to assert themselves or make decisions about their lives, both as a result of difficult birth family experiences and, too often, experiences of moves in care. Wijedasa (2017) found that foster children tend to experience a greater sense of external locus of control than either adopted children or disadvantaged children in the community. Carers therefore have the task of building young people's sense of self-efficacy or agency, often initially through offering opportunities to make choices. But carers described how for LGBTQ young people there were difficult choices to be made, such as who to come out to and

how to express their identities, when they lacked trust in others and faced possible rejection. For young people in care who were exploring their sexual orientation and gender, parenting cooperatively meant foster carers also drawing on the other Secure Base dimensions, offering availability and acceptance while sensitively tuning in to the young person's needs. In this example, the carer shows how these dimensions worked together, with the focus on the trans young person having choices and setting the pace and agenda of even the most difficult conversations. "I tried to make it sort of centred on him really – how he wanted to progress with it. Sometimes he would just come into the kitchen and would slam things around and I would just stand and wait...to see if he would want to talk about it. A couple of times he walked in the door and just threw his arms around me and cuddled me and just told me life was completely unfair. Then we would sit somewhere private and he would talk about what had happened in the day, whether it was a problem to do with that or something to do with transgender."

### Theme 10

Helping LGBTQ manage discrimination, stigma and bullying - One of the important areas for helping LGBTQ young people to feel more effective was in managing discrimination, stigma and bullying. Carers reported particular dilemmas in supporting young people in care to feel confident in expressing their LGBTQ identities while simultaneously protecting them and helping them to protect themselves from bullying. "I think you have got to allow young people to express themselves and safely, but it is about keeping them safe... If he had the confidence ...he would be more likely to get away with it, but because he is quite nervous with it, it worries me that he could be a victim quite easily."

### Theme 11

Agency with regard to confidentiality and information sharing - An important area for young people to develop agency was within the care system itself, in particular around confidentiality and information sharing in relation to their sexual orientation and gender identity at looked after children (LAC) statutory reviews. "I do not think it needs to be brought up at reviews ... a LAC review could have like parents. It could have brothers. She might not want all her teachers to know her personal stuff. The LAC review is about your plan for the life ahead, but you know that's personal, your sexuality." There were situations where young people were at risk of harm from birth families if their sexual orientation was known, and with review minutes going to birth parents, carers needed to help young people to feel in control of information. For one young person who identified as gay and whose family was from a homophobic religious and cultural background, his sexual orientation could not be mentioned at statutory reviews and his LGBTQ youth group was referred to as a youth club. "He does not want his mother knowing nothing. There's a big code around who he is, you know his sexuality. ...He's in control of that."

### Theme 12

Support from social workers for certain decisions - Carers talked of an absence of support from some social workers regarding making certain decisions, especially in relation to LGBTQ young people wishing to have sleepovers. As a result, young people's choices about their social lives could be curtailed. For example, in the absence of clear guidance from the local authority, some carers felt the need to be cautious about sleepovers. "Normally with a foster young person if they wanted a friend to stay, I would let them stay. But if the girl is lesbian I cannot let her friends stay." Other carers commented that this was another area where LGBTQ young people in care were disadvantaged. As one carer put it, if young people were not allowed sleepovers, "That then makes them different again."

### Theme 13

Family membership and belonging - Family membership contributes in important ways to providing a secure base for exploration for all young people. A supportive, accepting family has been argued to be an important protective factor in dealing with the stigma of an LGBTQ identity. For young people in care, offering a sense of belonging in a supportive, accepting foster family reduces anxiety and enables young people to feel confident to try new experiences and have the resilience to withstand pressures from the outside world, a significant benefit for LGBTQ young people. However, a sense of identity and belonging as part of the foster family needs also to be understood in the context of the young person's simultaneous and often complex membership of the birth or adoptive family. For most LGBTQ young people in this study, the extent to which they were seen by carers as being a member of their foster family was linked to acceptance of their LGBTQ identity. Foster carers commented on how this message of acceptance was linked to confirming a young person's place as a family member. "It does not change anything. We still look at him as one of our own." The meaning of family membership to carers and young people, as in other research, included both the quality of the commitment of foster carers to including the young person as part of the family and the young person having confidence that carers would be available for them while in care and, ideally, after they left care. "I've seen her grow with our nurturing...She says she belongs here. Her family, they are family but she calls this her family. She said if she went into the navy which she would like to do, she said the first place I'm going to come, I'm going to come straight here." One young person had officially left the placement at 18 and was away at college, but the foster family remained his secure base emotionally as well as a source of family membership. "His sense of belonging is here...he still seeks our approval when he's doing something or you know if he's got problems... Be it at college or his personal life, he'll run it by me and (foster father). 'I'm coming home,

aren't I, for Christmas?" Carers talked with pride of the way in which young people treated them as parents, and often recognized the additional element of security that accepting young people's LGBTQ identity contributed to a sense of family belonging. "He came home and brought me a box of chocolates and he said, 'I know you are not my mum, but you do play the part of my mum ... so I'd like you to have these'. So I think he feels very safe here." The few LGB carers in the study valued what they could offer young people in terms of models of family life. In one case a gay young person who had been sexually exploited was said to have been challenged to think differently about gay relationships and possibilities. "He was able to see gay relationships and love and family in a positive way ... At the same time this was a challenge for him because I suppose it threw what his idea of that was, which was very sexualised and dirty, if that's a word I can use, you know, like seedy ... and this world is not like that, my life is not like that."

#### Theme 14

Building positive relationships with the birth families - Some LGBTQ young people were able to retain or build positive relationships with their birth families, and supporting this was seen as an important role for foster carers. One foster carer who had himself struggled to accept a young person in a long-term placement coming out as trans was then able to work with the birth family. "I think the aunt was very uncomfortable with it to start off with, but once she realised that I'd coped with it I think she accepted it a bit more.... We talk as if we are on the same side, you know." But carers also spoke of the challenges of supporting young people who held on to the hope of living with, or at least being accepted by, their birth family. "He's got this fantasy ... but when I say, 'Would you ever like to live back with your mum?' he said, 'Yes, I would love to, but she will not have me and she will never have me again.'" For others, there were real grounds for fear in relation to the birth family. "He's terrified. He said he'd love to tell her (his mother), but just daren't because she might send me back to Africa. ...and he said, they'll kill me." As with all young people in care, the carer has a key role in helping LGBTQ young people to manage memories of harm or a sense of rejection from the birth or adoptive family, supporting contact with birth families where appropriate, while also promoting a sense of membership of the foster family. This task is challenging cognitively and emotionally. For some LGBTQ young people there was anxiety about whether any family would accept them as a member because of their sexual orientation or gender identity. Where foster carers had helped LGBTQ young people to feel fully accepted as family members, this gave them greater confidence in other areas of their lives.

#### Risk of Bias

Section	Question	Answer
Aims of the research	Was there a clear statement of the aims of the research?	Yes
Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
Research Design	Was the research design appropriate to address the aims of the research?	Yes
Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Can't tell <i>(There was a lack of clarity regarding how participants were selected and why their views in particular addressed the aims of the study)</i>

Section	Question	Answer
Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(However no discussion of data saturation or)</i>
Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	No
Ethical Issues	Have ethical issues been taken into consideration?	Yes
Data analysis	Was the data analysis sufficiently rigorous?	Can't tell <i>(There was no in-depth description of the method of thematic analysis)</i>
Findings	Is there a clear statement of findings?	Yes
Research value	How valuable is the research?	The research is valuable
Overall risk of bias and directness	Overall risk of bias	Moderate
	Directness	Directly applicable

## Sen 2011

<b>Study type</b>	Focus Groups
	Semi structured interviews
	See also Sen 2010
	RQ2

<b>Aim of study</b>	To explore contact for children outside parental care in a Scottish context
<b>Study location</b>	UK
<b>Study setting</b>	one large urban Scottish local authority
<b>Study methods</b>	The study mainly consisted of semi-structured interviews with 19 social work professionals in one large urban Scottish local authority and three Reporters to the Children’s Hearing system. These were supplemented by a focus group with five of the social work respondents. The purpose of the focus group was to get beyond the research interview as a one-off event, allowing respondents to see initial thematic findings and provide feedback on them. It thereby allowed for some element of triangulation. All data were recorded, transcribed and analysed manually using a form of thematic coding known as ‘template analysis’.
<b>Population</b>	Social work professionals and reporters to the children's hearing system
<b>Study dates</b>	Data gathered in 2009
<b>Sources of funding</b>	Glasgow School of Social Work Research Pump Priming Fund
<b>Inclusion Criteria</b>	Carer situation social work professionals in one large urban Scottish local authority and three Reporters to the Children's Hearing system.
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	Sample size 19 social work professionals in one large urban Scottish local authority and three Reporters to the Children's Hearing system.  Type of care Of the 19 social work staff, one worked in a team specialising in youth justice work with young people aged 12 upwards who had been placed outside parental care, usually in residential or secure care, due to concern about their own (offending) behaviour. The primary experience of contact for the rest was through working with children under 12, most of whom had been placed outside parental care due to care and protection issues. These children tended to be placed in foster care, or less often kinship care, rather than residential care.

	<p><b>Gender</b> Sixteen of the 22 respondents were female</p> <p><b>Other recruitment considerations</b> Social work staff known to have extensive experience of managing contact were initially targeted, until three participants from each of the five geographical areas covered by the authority had been obtained. Three respondents with considerable experience as supervising social workers for foster carers were also identified alongside one respondent from a city-wide resource with particular knowledge of contact. One of the social work respondents also had considerable experience as a foster carer.</p> <p><b>Ethnicity</b> one respondent was Asian British Pakistani, all the others were White Scottish, White Irish or White Other British.</p>
<p><b>Relevant themes</b></p>	<p><b>Theme 1</b> Foster carers involvement in contact (location) - Rather than being the 'most usual' form of contact (DOH 1991) participants in this study revealed that the foster home was rarely, if ever, used as a venue for contact with birth parents. Eleven out of 22 participants had either little or no experience of contact with birth parents occurring in the foster home. Three practitioners with more than seven years' practice experience and two more newly qualified workers did not appear to have considered the foster home as a possible venue: "Social worker: I have had carers who will facilitate contact within their home but it is very, very rare. It is not something that is explored on a regular basis and certainly not something that is offered. Researcher: Okay and have you seen contact taking place in foster carers' homes? Social work manager: Rarely, if ever, a good question actually. I don't think so, it is not springing to mind so I suppose the answer would be no as far as I can recall." Where parental contact did take place within the foster home, it was an exceptional event rather than a regular arrangement: for example, a social worker described a contact which took place at the foster home following the death of a child's mother in order to allow the child's father to explain to them what had happened.</p> <p><b>Theme 2</b> Situations where foster carers became more involved in contact - Participants reported that there was no significant difference in carers' involvement in contact arrangements in long-term as opposed to short-term care. However, there were two situations in which some carers appeared to be more involved. Firstly, where there was a definite plan for a child to be rehabilitated to parental care, parents were more likely to pick up and drop off children for contact at the foster placement. The reasons for this difference were unclear, but it might be that in such cases there were fewer fears about birth parents' hostility. Secondly, carers tended to be more involved in sibling contact than parental contact. While there was variability between carers' involvement in sibling contact, they were more likely to play a role in escorting children, hosting contact and supervising contact. This difference could indicate carers had more positive attitudes towards sibling contact than parental contact.</p> <p><b>Theme 3</b> Roles of foster carers in contact - There were two other main roles carers undertook in respect of parental contact. Firstly, some carers escorted children to and from contact. While there was again widespread variation between carers, and no expectation that carers would fulfil this role, there was greater involvement than in hosting parental contact. Secondly, carers had a role in terms of facilitating indirect contact, typically by phone, but occasionally also by email. Several participants noted that they themselves discouraged carers from facilitating telephone contact in cases where there were concerns about parental behaviour due to difficulties supervising what was said to children during telephone calls. However, some carers excelled at trying to include birth parents while ensuring the welfare of children: one example was of a carer who used the 'speakerphone' option on their phone, turning the conversation into a three way dialogue. Other carers negotiated the difficulty of telephone contact by themselves calling parents on a regular basis to keep them informed about what their child had been doing. This kind of inclusiveness did not increase the likelihood of parental contact occurring in the foster home itself though: "Reporter: there is certainly a few foster carers that I have seen that are fantastic . . . and the foster carer phones mum and dad to say 'this is what we have done today' and they build good relationships . . . but there's still no contact in the [foster] home."</p> <p><b>Theme 4</b> The move away from foster carers being involved in contact - It appeared there had been a cultural shift within the local authority organisation away from carers' involvement in contact. Four participants who had worked in the authority for over 20 years remembered previous cases where foster carers had been significantly more involved in contact.</p>

This involvement included both hosting and helping assess the quality of contact, in some cases supporting parents, especially young, vulnerable parents to develop parenting skills: "Link worker: there was certainly more of openness to for carers to be perhaps at the nub end of contact. Social work manager: when I first joined the council over twenty years ago, it was routine that carers were expected to be able to provide contact in their own home and I can certainly remember some cases where that was absolutely first class contact."

### Theme 5

Non-disclosure of foster carers address to the birth parent - One factor which participants identified behind this shift away from carers' involvement were rulings by Children's Hearing panels that there should be nondisclosure of a carer's address to the birth family. This not only prevented the foster home being used as a contact venue but also meant birth family members could never visit their child's placement. A number of participants, including all three Reporters, stated that while such a decision could be made at the request of a social worker due to concerns about a child's safety it was not unusual for the request appeared to be based around a carer or fostering agency's preference for default non-disclosure of the placement address. Two social workers described cases where such non-disclosure meant birth family members escorting their children back from contact outside the foster home had to meet the carer in a central venue rather than at the carer's home. While the preference for non-disclosure may have related to foster carers' previous negative experience of address disclosure, the practice of withholding the placement address from birth families as a matter of course, where there were no identified risks, does raise questions about how fully birth parents could be included in their children's lives.

### Theme 6

Multiple children in carer home as a barrier to contact - A second barrier participants identified was that many carers had multiple children on placement, making contact both impractical in terms of carers' obligations and commitments, and meaning there would be a lack of confidentiality and privacy for parents and children if contact were to take place in the foster home. However even where foster carers' greater involvement in contact was feasible, social workers were reluctant to challenge carers who were resistant to playing a greater role in contact: "Reporter: we have now got foster carers that just will refuse to have a placement if there is the thought that their, you know, their address might be disclosed. Social worker: it is not within their role that the foster carers have to do that so it is not an issue that is forced or progressed."

### Theme 7

Training as a barrier to contact - One participant with previous experience as a link worker also believed the shift away from carers' involvement in contact had been underpinned by the messages given to carers in preparation and training groups: "Social work manager: I'm very clear that some of the messages given to carers now err on the side of caution, start from the standpoint of it will never happen [contact in the foster home] and then as you get to know individual parents and individual circumstances you can then take a step back and widen up that option." The five social work staff in the focus group session believed that negative stereotypes about birth parents, typically involving beliefs and fears about their involvement in substance misuse and community violence, underlay some carers' reluctance to be more involved in birth parental contact. While a number of parents were involved in both these things, they felt the risks were exaggerated and negative stereotypes could be generalised by some carers to include to all parents.

### Theme 8

Disruption from contact in the foster home - Participants also raised the potential of disruption from contact in the foster home as a serious concern. One participant with detailed, and predominantly very positive, experience of the foster home as contact venue from a number of years previously, also recounted two negative incidents: "Social work manager: a carer was very upset that the parents arrived very seriously under the influence of drugs and found that very aggressive scenario very difficult for them, and really distressing for the child they were caring for, because they closed the door on that parent effectively and so that kind of impacted on the relationship between the child and the carer. And in another instance I can remember a carer being really distressed because although a parent turned up appearing to be fine she then injected heroin in that carer's bathroom and the carer really felt completely isolated and vulnerable and wasn't sure how to then handle what ensued."

### Theme 9

Lack of preparation for contact to foster carers - Moyers et al. (2006) found that poor-quality contact increased likelihood of placement breakdown: if such poor-quality contact were in the foster home it would seem likely to place even greater strain on the placement. However, a Reporter also felt that managing such difficult situations should not be beyond the remit of skilled carers and was critical of what she felt was the lack of work done with foster carers in the authority to support and prepare them for such roles and tasks.

### Theme 10

	<p>Risks involved with responsibility for contact being devolved to the foster carer - Another identified risk involved the responsibility for contact being devolved to carers. Two social work managers felt that, where contact involved an assessment element, social workers would need firsthand experience of what occurred during contact in order to complete a reliable assessment. They therefore suggested that members of the social work team would need to remain involved in contact to some degree. On the other hand, concern was raised by three frontline workers' experience of contact arrangements in kinship care. In some cases relationships between kinship carers and birth parents had been collusive leading to questions about the accuracy of information given to the social work team about what had happened during contact. In others there had been a marked deterioration in the relationships between carers and birth parents arising from the carers' role in managing contact arrangements themselves.</p> <p><b>Theme 11</b> Advantages to contact in the foster home - The primary advantage participants identified was in that children would be less likely to feel the need to 'split' their loyalty to their birth family from their allegiance to their foster family: "Social worker: I think it would be good for some children to see that . . . everybody is working together for the best thing for them" "Social work manager: if [the children are] most comfortable in their surroundings in the foster care, they can have it [contact] where they are comfortable, that they can see maybe their family and the foster carers interacting and the relationship there and I think that can be positive for kids"</p> <p><b>Theme 12</b> Advantages to contact in the foster home - One participant emphasised that contact in the foster home also supported inclusiveness of birth parents, by allowing them to see the environment in which their child was living and to be reassured that belongings they had passed on for their child were available to them. While this is a reasonable view, it does contrast with Cleaver's (2000) finding that birth parents found contact in the foster home a difficult experience, feeling their role had been taken over by carers and resenting carers' supervision of their contact. Where children's foster placement was some distance from their home area, it was also suggested that contact in the foster home would obviate the need for children to travel long distances, instead placing the obligation, more appropriately, on parents to travel to contact. Finally some participants suggested that foster carers' involvement might relieve some of the pressures on hard pressed social work teams tasked with facilitating contact.</p> <p><b>Theme 13</b> Only one participant, a social work manager, disagreed that contact in the foster home should be a possibility. She felt that it could potentially compromise the foster placement as a safe environment for the child but did agree that birth parents should be able to see the foster home where their child was staying — something which was not routinely occurring in the local authority.</p>		
<p><b>Risk of Bias</b></p>	<p><b>Section</b></p>	<p><b>Question</b></p>	<p><b>Answer</b></p>
	<p>Aims of the research</p>	<p>Was there a clear statement of the aims of the research?</p>	<p>Yes</p>
	<p>Appropriateness of methodology</p>	<p>Is a qualitative methodology appropriate?</p>	<p>Yes</p>
	<p>Research Design</p>	<p>Was the research design appropriate to address the aims of the research?</p>	<p>Yes</p>

	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes <i>(However, no discussions regarding why some participants chose not to take part)</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Can't tell <i>(No justification for the data collection setting, interview methods were not explicit; unclear form of data; no discussion of data saturation.)</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(Unclear that researchers critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Can't tell <i>(No in-depth discussion of analytical process - unclear that researchers critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	Yes <i>(Respondent validation was used)</i>
	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	Moderate
		Directness	Partially applicable <i>(data for this study were collected prior to 2010. In addition, foster carer's</i>

			<i>views were not sought, which is unusual in research about foster carers themselves )</i>

**Sidery 2019**

<b>Study type</b>	Semi structured interviews Subgroup of interest UAS
<b>Aim of study</b>	to attain the carers' perspectives on the resource and support needs particular to caring for Unaccompanied Asylum Seekers
<b>Study location</b>	UK
<b>Study setting</b>	a semi-rural county in the South West of England with a considerably lower level of ethnic diversity than the national average
<b>Study methods</b>	Semi-structured interviews. Participants chose the locations of the interviews; most took place in carers' homes or at the local refugee support agency. Interviews lasted between 50 minutes and one hour and 40 minutes. Carers were interviewed about the needs of the unaccompanied young people previously or currently in their care and their perception of their preparedness for fostering them. They were also asked about their views on what training, support and resources had been, or would have been, useful to them. The interviews were transcribed verbatim. A process of inductive thematic analysis was then applied to the transcriptions to identify themes arising from the data.
<b>Population</b>	Foster carers with experience of fostering unaccompanied young people
<b>Study dates</b>	2016–2017

<b>Sources of funding</b>	None reported
<b>Inclusion Criteria</b>	Carer situation local foster carers with experience of fostering at least one unaccompanied young person
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> 11 foster carers</p> <p><b>Time in care</b> Participants had been fostering between two months and over 20 years and had looked after between one and 20 unaccompanied young people each, predominantly male, in a mixture of emergency, respite and longterm placements.</p> <p><b>Gender</b> four men and seven women</p> <p><b>Ethnicity</b> One carer was Asian and the other 10 were British</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> Different from fostering in general - Ten of the 11 foster carers interviewed had experience of fostering both unaccompanied young people and others from the local area. Each of them emphasised that the needs of unaccompanied young people had differed considerably from those of others they had fostered. Indeed, there was a sense of 'otherness' commonly reflected in carers' narratives, which framed looking after unaccompanied young people as 'signing-up' for a different kind of task from fostering in general.</p> <p><b>Theme 2</b> Five main areas of need - Carers' reflections on the needs of the unaccompanied young people they had cared for drew attention to five common areas of need: (1) cultural needs, including those pertaining to religion and food; (2) needs related to adjusting to life in England, e.g. learning to use a new currency and engaging in the English education system; (3) communication needs resulting from language barriers; (4) advocacy needs often related to accessing services; and (5) needs pertaining to the asylum seeking process, including recovery from trauma, emotional support and practical assistance to attend appointments.</p> <p><b>Theme 3</b> Need for training - Carers' reflections on their initial experiences of fostering unaccompanied young people indicated that many of these needs had been unfamiliar to them in the sense that they had not been anticipated, or that they had felt unsure how to meet them in practice. As one carer commented: "For someone who's from a completely different country, I think the foster carers should have a lot more support." At the time of the study, none of the carers had been offered the opportunity to attend any training about fostering unaccompanied young people in particular. Ten of the 11 carers proposed that a course specifically focusing on this topic was very much needed. Three carers articulated a sense of abandonment by their respective fostering services regarding the lack of training and preparation they had received: "Food, culture, language, you have no training whatsoever. These children are brought to you. The social worker comes back in a week, 'Are they OK?' or maybe phones, 'How are they?' Comes back in a week to see how they are, then they have a review within a couple of weeks. You have nothing. A lot of carers say we've just literally had the children placed here and we don't know what to do next."</p>

#### Theme 4

Contents of training - Several carers referred to rumours or misinformation being perpetuated by carers and social workers in the area about particular challenges – or conversely relative ease – associated with fostering unaccompanied young people. Correspondingly, there was a strong emphasis placed on needing to have a clear, honest and well-informed overview of fostering unaccompanied young people in the context of training: "I think we need training of what looking after an asylum seeker incurs, you know, the court process, the travelling, food, where they pray, Ramadan." Training about the asylum seeking process was frequently proposed as being essential: "I think you do need to know that little bit of background [regarding the asylum seeking process] because that's all going on in their mind. All the time." Several carers wanted training on potential cultural and religious differences and the expectations around family life that unaccompanied young people may hold. A range of additional topics for training were proposed by smaller numbers of carers and related to specific challenges they had each encountered. These included: assisting young people in learning English, communicating across language barriers, how to open a bank account, dealing with particular health needs, supporting access to education, providing emotional support following Home Office interviews, supporting those who have suffered multiple bereavements and caring for young people with post traumatic stress disorder.

#### Theme 5

Who should deliver the training - A clear message that stood out from the interviews was that carers wanted training to be delivered by people with relevant expertise. Those they saw as fitting this description included people who work with asylum seekers, foster carers who have fostered this group over a long period and young people themselves. One carer suggested, for example, that training about the legal process be delivered by a foster carer with experience of supporting multiple young people through this together with a young person who could share their first-hand experience of the process.

#### Theme 6

How much training - Carers tended to suggest that all of the key topics could be covered in one training session. Those who considered the frequency of training to be important shared the view that any course should run repeatedly through the year. One highlighted the benefits of this in terms of increasing the likelihood of carers being able to access the training before taking responsibility for an unaccompanied young person. Others emphasised the value of being able to attend a training session more than once, as a 'refresher' when needed.

#### Theme 7

Implications of not having training/information (lack of preparation) - Carers' reflections highlighted some of the implications of not having had training or some other form of introductory preparation. Most recalled knowing very little, if anything, about unaccompanied asylum seeking young people before their first placement. A prominent theme was not knowing quite what to expect before the young person arrived: "Well, I'll tell you the very first thing, when Adeel 1 came, we had no idea [what to expect]. This was our first asylum seeker. I looked up [online] about the unaccompanied children . . . it was a lot of research in a very short time. So, I don't think I really had any expectations. . . I had no idea. [After being given a few hours' notice that an unaccompanied young person was coming into placement with her]" Only two out of the 11 carers described feeling somewhat prepared the first time they had an unaccompanied young person arrive in placement. Of those two, one had some previous experience of working with asylum seeking children abroad and the other had intentionally set out to learn quite extensively about countries where unaccompanied young people commonly come from, why they leave, characteristics of their journeys and the needs they might have. Still, both referred to a level of apprehension around the 'unknown' aspects of a young person arriving in placement. One carer commented: "We don't know what they've been through, we don't know what their background is or their family or anything, do we. So we do take a big risk in taking them." Five carers alluded to a similar sense of risk they had felt before a young person arrived, largely related to the limited information known about them.

#### Theme 8

Fears associated with the "unknown" - Another carer referred to the 'fear of the unknown' in a broader sense: fostering an unaccompanied young person was her first experience of caring for a young person from another country and from a religion with which she was unfamiliar. She recalled her initial impression, before she had fostered an unaccompanied young person herself: "Maybe it's because I was a single carer, I was a bit frightened of the unknown, not having come across Muslims at all to be honest. Where I live there isn't a mixed culture. So . . . it's sort of the unknown isn't it a little bit. But I would definitely have one again." Initially, when she had provided respite for an unaccompanied young person for the first time, one of her relatives had expressed concern: "Cath: She was particularly concerned about my safety. Now you see, but that again, I was a single carer having a foreign person, a refugee . . . how do I . . . Interviewer: Was she concerned about your safety in terms of fostering generally? As in, you could have young people with quite complex backgrounds. Cath: No. . . Interviewer: So it was something to do with the unknown aspect. . . Cath: It was the unknown of having a refugee.

Yeah. Definitely. And that is fear of the unknown, isn't it? Luckily, he was such a presentable young man, everyone who met him . . . Interviewer: Was won over? Cath: Completely! I mean he's extremely good looking, with a wonderful smile and very, very polite. So yeah, they were won over by him. Straight away."

### Theme 9

Negative views of others and the surrounding culture - Having bridged the 'unknown', her sense of fear had subsided. However, she spoke of being very conscious of those she talked to about fostering him, because controversies over immigration had been in the media a lot at the time. Negative attitudes expressed by others within the local community were referred to by carers in two other interviews. Seven carers cited the news, often war reports, as being their only initial source of knowledge about the countries the unaccompanied young people came from. In some instances, false expectations had been influenced by the media. As one couple recalled: 'We were expecting a Syrian refugee. Coz that's what you hear on the media really.'

### Theme 10

Resources for information - the internet - Although one carer mentioned not having time to look for resources online, carers in six of the eight interviews referred to searching on the internet for information. Most commonly, they had sought to learn about particular countries, cultures and religions but some also spoke of searching to find out about unaccompanied young people in general. For the majority of carers, it was after receiving a phone call asking them to provide an emergency or respite placement that they had started to look for information. This was often at short notice and the internet had been an easily accessible resource for quick research: 'When I was asked to have them on respite, I was frantically looking up things.' While some valuable facts and guidance had been found, the usefulness of information discovered on the internet had been limited in two ways. Firstly, on occasion carers had formed expectations about young people based on information they had learned online that were very generalised and did not take into account the uniqueness of each young person's preferences. For example, one carer recounted that having read that Muslims eat Halal food, she had gone to great lengths to find and use Halal meat for the young person in her care. However, after some time, she realised that he regularly ate non-Halal food away from home; when she asked him about this he explained that he did not need to be so restricted in his diet. Further limitations of the internet as a resource were apparent in scenarios where information that carers found online conflicted with what young people had told them about their religious or cultural needs or wishes. Three carers gave examples of this. One, who had fostered predominantly Muslim unaccompanied young people, described how she had managed to build a relationship with someone at a local mosque who had been able to help her to navigate this type of challenge: "There's another little holiday of about 12 days – well, not a holiday. It's like Ramadan but it's not. And at the end there's another Eid. Well, I had no idea what that was. So trying to find out, and actually I've got another friend who had a friend at the mosque and I'm like right, OK, so I've discovered lots of contacts of my own that I can then speak to and ask for advice. Coz they were also, they weren't eating at that time either. They were fasting. And when I looked it up on the internet, I couldn't see that they should be fasting. So I was really confused as to why they were doing this. [I later understood that] they had missed some days in the original Ramadan."

### Theme 11

Sources of information - Refugee Support Organisations - Around half of the carers referred to a local refugee support project as a prominent local source of information regarding the legal process, religion, culture and family tracing opportunities. In this respect, two carers referred to it as 'a Godsend' and 'a lifeline'. One commented that they were lucky to live in a town with this type of a project. Not all carers had been aware of this resource when they first started fostering unaccompanied young people. Carers who had accessed this organisation for information also spoke about attending group sessions there, specifically hosted for foster carers to be able to discuss and learn about fostering unaccompanied young people. Two couples and a single carer in particular had highly valued the opportunity the group had afforded to ask questions to a child psychologist and a specialist support worker. Although some had clearly been glad of the opportunity to ask other carers for advice within that context, various challenges in the group dynamics were also highlighted.

### Theme 12

Sources of information - support from social workers - A few of the carers had approached young people's social workers or their own social workers at some point for information regarding, for example, the asylum seeking process, specific cultural differences or the rights of the unaccompanied young people in their care. They encountered considerable variation in the levels of knowledge displayed by the social workers they approached. All but one shared examples of social workers having given them incorrect or contradictory information or having made assumptions about young people's needs that were not accurate. These scenarios highlighted gaps in some of the social workers' knowledge around unaccompanied young people, including their rights, cultural needs and the asylum process.

### Theme 13

Expected level of social carer knowledge - Carers' perspectives on the knowledge that social workers should be expected to have varied considerably. Almost half felt that there should be a better level of knowledge across all social workers: "Social workers could do more. Like our fostering social worker, they don't know much about asylum seekers. They need to have a really thorough working knowledge of all of the aspects of this, so they can have the confidence to educate people like us."

#### Theme 14

The possibility of specialist teams - However, the majority proposed that it would be preferable, or more achievable, to have a particular social worker or team with specialist knowledge who could be a point of contact for those fostering unaccompanied young people. This view was influenced by a variety of factors. Some referred to how busy social workers are. One carer felt that social workers could not be expected to all become experts in such a vast topic area. Similarly, another emphasised that this group of young people differ very much from the families and young people with whom most social workers have been trained to work.

#### Theme 15

Sources of information - Foster carer peer support - Commonly, where foster carers knew of other carers who had experience of fostering unaccompanied young people, they had made contact to ask for advice at the outset. This tended to relate to practical matters, such as where to buy international food locally, and to gain insight on how others had managed to succeed in tasks such as opening a bank account, attaining a driving licence or securing a school place for a young person, which some had been involved in arranging. Carers often described such tasks as involving many 'hoops' to be jumped through, more so than for other young people in their care. Two carers elaborated on the benefits they saw in talking to carers rather than social workers, when faced with particular challenges: "I think when you are in a difficult situation to be able to ring another carer that actually understands is invaluable. Talking to a social worker is fine, but they're not living and breathing it. And they work roughly 9 to 5. I think I got my support from the other two foster carers in [town] who I could pick the phone up to, and that was a plus. And that was partly because they knew exactly what I was going through because they had gone through it. While maybe a social worker wouldn't have done." However, not all carers in the study shared positive experiences of peer support. One recalled being given incorrect information by another and it was clear from a range of narratives that there had been conflicting views among carers about how to respond to particular situations or challenges. One couple spoke about their disappointment at being put in touch with carers whom they felt could not relate to them in terms of their age and stage in fostering.

#### Theme 16

Not knowing others who had fostered UAS - At the point of their first placement, around half of the carers had not known any others who had fostered an unaccompanied young person: "Talk to other foster carers . . . That's easier said than done. You know we've only been in the area at that point just about a year. Fostering about six months at that point. We don't have a network." A few had been given contact details of people with relevant experience by their social workers, but most had not and wanted a means of more easily connecting with others.

#### Theme 17

Sources of information LANGUAGE - Local Community Contacts - A few carers had made particular efforts to find people who were from the same country as a young person in order to gain insight on aspects of culture and religion or to help them communicate with young people who didn't speak English. This happened more often at the start of a placement. Where young people spoke English, carers had been able to ask them about their needs and wishes directly. However, the majority emphasised that the presence of a language barrier often prevented this. Carers' accounts of particular challenges in the first week were very similar: they described that young people's needs had not yet been assessed and the first opportunity to access an interpreter would be the placement planning meeting, a week later. In some cases, carers had called upon people they knew from the local community who spoke the young person's language to help them communicate at this point. At times, these were people they had met only once or twice previously or 'friends of friends'. One couple described the sense of urgency they had felt about finding a way to communicate with a newly arrived young man: "We had a friend who spoke a bit of their language and I rung him and I said, 'We're in an awful situation, can you help us?' He came up and saw us and he also brought a friend . . . and so he explained things to them and he was telling us, which was very helpful. Because otherwise we were left, and that was it."

#### Theme 18

Filling knowledge gaps using a translator - Another carer illustrated the sort of questions she tends to ask young people when she finds someone willing to translate: "Give us a bit of background, on your country and, you know, stuff. So we've just got a little idea. So we're not blind. And they've told us about their country, their family, their traditions, their religions. What's normal to them, how their families were. So that we can sort of try to understand where they're coming from." Carers had also been able to fill knowledge gaps

by asking questions to people they met in various meetings related to the young people. Multiple carers referred to the opportunity afforded when interpreters attended meetings to learn from their insight regarding, for example, particular cultures.

#### Theme 19

Building an information network - One carer spoke of how much she had learned by chatting to a social worker on journeys to court and another described a key conversation with a solicitor: "Jen: My knowledge came from the solicitor [who] was absolutely brilliant. Interviewer: So they gave you a lot of info about . . . Jen: All about the court proceedings, for instance. And I asked lots of questions. I said, 'I'm really sorry. I have no idea about any of this stuff so can you help me.' And he was really good." What such examples had in common was that they demonstrated ad-hoc opportunities for carers to learn. It was clear that carers' ability to access useful information improved as they developed networks of people who had knowledge they could draw on. One couple who had cared for unaccompanied young people for 14 years reflected: 'When we first started this, we didn't have any connections. Over the years, we've grown a phenomenal network.'

#### Theme 20

Sources of information - Printed resources - Most of the carers referred to printed resources they would find useful. Suggestions included print-outs of recipes from relevant countries, a list of websites with more information about life in different countries, a booklet designed for foster carers with details of particular religious customs and festivals and a flowchart of the asylum seeking process. Only one couple mentioned having come across The Fostering Network's (2016) booklet about fostering unaccompanied young people, which contains some of that information. Multiple carers also commented that it would have been helpful to have some locally tailored information, such as a list of where to buy Halal food nearby. One couple discussed their view that social workers ought to provide carers with a list of local groups or activities for young people, in particular places where they could meet and socialise with others from the same country. Over time, they had found out about such activities but when reflecting on the impact of not having been told about them, one described how 'There was no navigation for us. We were in the middle of the ocean left wondering which way do you go.'

	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes (However no discussions regarding why/if some participants chose not to take part )
	Data collection	Was the data collected in a way that addressed the research issue?	Yes (However, no discussion of data saturation )

	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Can't tell <i>(Unclear that researcher has considered their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Can't tell <i>(Unclear that researchers critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
	Findings	Is there a clear statement of findings?	Can't tell <i>(No discussion of credibility of findings in terms of triangulation, respondent validation, more than one analyst. However, findings were explicit and contradictory evidence was presented)</i>
	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	Moderate
		Directness	Directly applicable

**Thomas 2012**

<b>Study type</b>	Focus Groups
-------------------	--------------

	<p>Evaluation of an intervention Children in Care Councils</p> <p>In-depth interviews</p>
<b>Aim of study</b>	To see how far local authorities had been able to develop processes and structures that enabled children to exercise their minimum rights under the Convention on the Rights of the Child, and also looked for examples that went beyond this to achieve elements of shared decision-making.
<b>Study location</b>	UK
<b>Study setting</b>	Boroughs around the city of London
<b>Study methods</b>	Interviews and focus groups. Interviews lasted just over an hour and covered questions about participation structures and their purpose, patterns of work and activity, successes and challenges, and open questions about the future. Following the interviews, focus groups were planned and undertaken with young people, participation workers, managers and elected members. These were conducted as action inquiry groups, and explored participants' experiences and understandings in terms of successes and challenges.
<b>Population</b>	Ten young people, four participation workers, four managers and three elected members, from a total of 12 boroughs
<b>Study dates</b>	between May and September 2010
<b>Sources of funding</b>	Not reported
<b>Inclusion Criteria</b>	<p>Involvement in an intervention</p> <p>Young people were recruited through an open invitation to all Children in Care Councils sent via the participation worker.</p>
<b>Exclusion criteria</b>	None reported

<b>Sample characteristics</b>	<p><b>Sample size</b> Ten young people, four participation workers, four managers and three elected members, from a total of 12 boroughs</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> The purpose of Children in care councils (CCCs) - The purpose of CiCCs was generally seen to involve representing the voices of children in care and care leavers through a variety of consultative mechanisms, influencing those who make decisions about services and monitoring the delivery of the 'Pledge' and other policies. The Pledge, introduced in Care Matters, is developed in each local authority, with input from children, to ensure that children in care are aware of their rights and opportunities (Department for Education and Skills 2007, p. 22). The boroughs had worked together to produce a London Pledge (Young London Matters 2008), complementing the local Pledge in each borough. Young people saw the CiCC as an opportunity to 'have their own voice' and take a lead. They emphasized the importance of achieving tangible improvements in services, not only for themselves but also for younger children: "I don't want them to go through what I've been through". (Care leaver)"</p> <p><b>Theme 2</b> Representativeness of the CCS - Although a majority of authorities had set up a CiCC, the fact that most had fewer than 20 young people raises questions about their effectiveness, given the general lack of mechanisms to ensure democratic representation and communication with other children in care. Members tended to be seen as 'the voice of children in care' simply because they had been in care themselves. Some groups did make concerted efforts to engage with other children in care, as the following comment illustrates: "'We're doing a fun day soon, a lot of us older ones chatting with them playing with them, finding things out, then coming back and writing things up and voicing what they've said'. (CiCC member)"</p> <p><b>Theme 3</b> Common activities of the CCC - Direct involvement in local authority services Many CiCCs were involved in staff recruitment, induction and training, and some in inspections of services. These were opportunities for young people to influence directly how services are provided, and were experienced by them as meaningful participation.</p> <p><b>Theme 4</b> Common activities of the CCC - Consultation activities Consulting other children and participating in national consultations were common activities. Responding to consultations is one way in which young people can participate in decisions about services. At the same time, young people were clear that there was a need for more direct involvement in decision-making through dialogue and regular meetings with the corporate parenting board and elected members.</p> <p><b>Theme 5</b> Common activities of the CCC - Publicity, promotion, information and campaigning CiCC members saw helping to write the local Pledge and producing information about how young people can participate (newsletters, magazines, websites and videos) as important ways to become involved. Some had organized events for children in care and campaigned around specific issues such as meeting Pledge commitments.</p> <p><b>Theme 6</b> Common activities of the CCC - Developing personal skills Participation tends to be seen in terms of young people having a say in decisions. However, this research also showed the importance of activities that supported personal development of members, e.g. work experience, gaining qualifications, volunteering and social activities, which provided opportunities for developing identity and building social capital. Most boroughs rewarded participants in their CiCCs, often using vouchers or an hourly payment. Office holders such as Chairs might have sessional contracts, and members were paid for providing training.</p> <p><b>Theme 7</b> The primary role of participation workers was seen as to facilitate the operation of CiCCs and wider participation of children in care and care leavers. This included finding venues, navigating local authority systems, being a researcher for the CiCC and an advocate for the group. Participation workers wanted young people to be at the centre of decision-making about services, and saw it as their role to support that. As one put it, the role: "'can't be just a job, it has to be a passion. It takes a lot of different skills, reflective</p>

people who are tenacious, very involved – and fundraisers'. (Participation worker)" There was some tension between facilitating and supporting young people to speak directly to decisionmakers and actually speaking on their behalf. How this was resolved reflected a combination of factors: the stage of development of the CiCC and members' skills and confidence; how well participation was embedded with political and professional leadership in the borough; and the skill and understanding of the participation worker.

#### Theme 8

Social workers were frequently seen as less supportive of young people's participation. It was suggested that many had limited understanding of the purpose or value of the CiCC, and were reluctant to make referrals. Young people attributed this to frequent changes of worker, use of agency staff, unmanageable workloads and, in some cases, to a lack of interest in young people. It should be emphasized that social workers did not participate directly in this research. "And he's there holding this social worker's hand and then the social worker leaves, and then we get another social worker, and just as we start to trust him, "Bye" ." (Young person)"

#### Theme 9

Concerns were also expressed in relation to the commitment of social work managers. One CiCC member noted: 'We have a better relationship with Directors than with team managers'. Where good relationships had been established with heads of service, there was evidence that participation had more impact. There were some tensions around the potential for young people to say something 'difficult'; service managers were sometimes thought to be wary of putting young people in front of Directors or elected members because 'young people don't always say things diplomatically' (Participation worker). Young people questioned how well some professionals were able to engage with them, provide appropriate settings and opportunities for them to participate, and treat them with respect and understanding.

#### Theme 10

As for relationships with elected members, the fact that 17 CiCCs met with councillors was encouraging. However, there was a feeling that public decisionmaking structures were not conducive to participation of young people. In one case, it was suggested that the political cycle did not support continuity and consistency, with frequent changes of the lead member. However, in the same authority, a councillor from each political group attended every meeting of the CiCC, with young people leading the meetings. Some young people were very positive about their experience of contact with political leaders: "We secured funding from the mayor. Originally he said no but we turned around and went to him and said we're your corporate kids, would you deprive your child from using your living room? So why are you depriving us? So we sort of put it to him like that and he couldn't say no after that'. (Young person)" Elected members showed high levels of commitment to the participation of young people, but admitted needing more support and learning to make participation effective. Similarly, it was apparent with heads of service and managers that the need for support in embedding participation within their systems constituted a major barrier to involving children in care in design, development and review of services.

#### Theme 11

How the CCC was involved in decision making - Focus group participants were invited to reflect on how the CiCC was actively engaged in decisionmaking, using a 'decision-making cycle' with the following stages: 1. Identifying issues 2. Inquiry and discussion 3. Decision-making 4. Action 5. Evaluation and review. Although patterns varied from issue to issue, participants usually identified some combination of stages 1, 2, 4 and 5 as points where the CiCC or its members would be engaged. No adult participant identified stage 3, but several young people did, giving the example of recruitment panels. This suggests that issues where young people were able to participate most fully were not around strategic or operational management, but in 'niche' areas such as recruitment, induction and training. Young people saw this as an example of active participation in something that directly affected them; e.g. a 'buddying' scheme in one borough which partnered newly qualified social workers with children in care over their first year of service.

#### Theme 12

Elsewhere, young people's participation was expressed in campaigns around particular issues such as a failure to implement the Pledge, housing policy for care leavers or 'bin bag moves'. However, these remain isolated examples, rather than systematic evidence of profound impact. Given the newness of some CiCCs, it is understandable that their role is underdeveloped. However, even where CiCCs have been established for longer, it was often unclear what systematic influence the group had beyond recruitment and training of front-line staff.

#### Theme 13

For local authorities, there may be a tension between empowering young people and meeting performance targets for corporate parenting; although, as one borough informed us, those targets may not reflect what young people need. A more responsive approach to service provision can be achieved through participation perceived as dialogue and joint inquiry (see Percy-Smith & Weil 2003; Fielding 2006).

#### Theme 14

Personal benefit to LACYP of taking part - While being committed to make things better for all children in care, young people also emphasized the personal benefits they got from taking part: developing confidence and self-esteem, pride, independence and self-advocacy. Psycho-social benefits included a sense of identity and agency derived from meeting other young people in care, sharing experiences and providing peer support; practical benefits included direct support services and social goods such as driving lessons, money, information about their rights and access to education and apprenticeship opportunities: "It's not just that it's our Council – we are all really good friends'. (Young person)"

#### Theme 15

Participants were asked to point to the main challenges and barriers to the development of CiCCs. Four issues emerged: funding and resources, continuity and succession planning, engaging with hard to reach groups and embedding participation in organizational culture.

#### Theme 16

With public spending cuts looming, funding was raised as a matter of grave concern. The general view was that the funding required to support an effective CiCC was relatively small, but a basic level was essential to enable it to meet regularly, engage in activities, reward young people and promote its work. Employing participation workers was critically important. Young people and staff saw lack of funds as the main factor holding back their work. It is evident that the development of CiCCs will depend on the ability of local authorities to protect a minimum level of spending to enable them to function, and to find efficient ways of using, perhaps sharing, resources.

#### Theme 17

Succession planning and continuity were an area of concern: in many boroughs there was no clear route for new participants to get involved, with a high level of dependence on the participation worker. Where the membership had been long-established and stable, there were concerns about an absence of new and younger members coming through to take the lead. The 'feeder group' model, which in some boroughs supported a smooth transition for younger children on to the CiCC, seemed to offer one way forward. However, this is more difficult for the many children placed out of borough. Concern about succession planning and continuity was connected to the issue of future funding: young people suggested that where CiCCs were still in early stages of development, the lack of established infrastructure compounded financial uncertainty. The participation worker was seen as the lynchpin, keeping children and young people engaged and interested, organizing meetings and events and advocating for the CiCC across the local authority. Yet investment in this resource was feared to be at risk as cuts begin to bite.

#### Theme 18

Hard to reach groups - The challenge of engaging 'hard to reach' groups may refer to, for example, disabled children, younger children, refugee children, young mums, young offenders, young people involved in gangs, young people not in education, employment or training, or those who are unwilling to engage. Experiences of engaging with these groups are localized and contextual, with some local authorities finding it hard to engage a particular group such as asylum seekers, while others found them easy to work with (in one CiCC this was the dominant group). This issue, then, demanded local solutions such as activities tailored to particular groups and targeted entry routes such as football or dance classes, as well as ensuring that staff were aware of the CiCC and actively encouraged young people to engage. Young people and participation workers were aware that those currently participating were often self-selecting, and made constant efforts to seek wider views. The most 'hard to reach', however, were those placed 'out of borough', of whom there are a high proportion in every part of London. In some cases, this means being placed in a neighbouring borough, which can present its own challenges: a visit to young people in a children's home in north London revealed that none of them had heard of their CiCC or knew the participation worker from their home authority, although when they heard of the successes of CiCCs, they expressed an interest in being involved, either by attending meetings or via the Internet. However, many children are placed outside London, often in Wales, Scotland or Northern England, and for them it is not practicable to attend meetings in London. Alternative methods of engagement such as social networks and websites have been suggested, but appeared to present difficulty because of professional anxieties about using the Internet to communicate with children. In only one borough were staff allowed to use a private Facebook group for their CiCC. It is of concern that children and young people placed 'out of borough' are not benefiting from opportunities to influence decision-making or participate with others. More work is needed to explore what effective participation for all young people in care might mean.

#### Theme 19

A culture of participation - Participants generally considered that embedding a culture of participation remains the fundamental task in the long term. As one worker put it, participation must be 'an ingredient in the cake', not merely the icing. At one level, this is about challenging the culture of participation as consultation, and uncertainty about how

best to integrate young people's views into local authority systems. However, through the systemic inquiry process that participants engaged in, there was a realization that part of the challenge relates to developing an understanding of participation as 'learning for change', through dialogue and critically reflexive practice that enables systems to adapt and change in response to young people

**Theme 20**

Embedding participation - Embedding participation means that all practitioners adopt participatory practices, rather than leaving it to the participation worker. Social workers' attitudes were seen as a key element in this. With the legal obligation to take account of children's wishes and feelings, their commitment to a broader participatory approach is critical to making children's engagement a reality. Yet there was felt to be a tension between being a good corporate parent and empowering young people, and also 'between championing young people and ticking Ofsted boxes': "A highly performance-focused local authority will be hierarchical, top-down and undemocratic and one that does not support what we are trying to achieve, but is driven by the inspection regime'. (Social work manager)"

**Theme 21**

Hopes for CCCs in the future - At the conclusion of the research, young people and their participation workers were invited to reflect on their hopes for CiCCs in the future, in response to these challenges. They expressed an ambition to deepen and widen their influence across local authority services and decision-making processes by firming up procedures, increasing their impact on policy development and corporate parenting, having more face-to-face contact with decision-makers and more creative involvement in strategic planning, and generally becoming more vocal and empowered. As one young person put it, the CiCC wanted to become 'statutory'.

**Theme 22**

Pride in accomplishments/anxiety for the future of CCCs - In all our contact with young people involved in CiCCs, it was evident that there was a great deal of pride in their achievements. This was reflected in their motivation and commitment, and their concern to ensure the work would continue. At the same time, there was anxiety about dependence on others to secure the future existence of the CiCC. "I think it takes certain kinds of people – who better to do that than people in care because we have faced those challenges?' (Young person)"

<b>Risk of Bias</b>	<b>Section</b>	<b>Question</b>	<b>Answer</b>
	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Can't tell <i>(Research methods are not justified )</i>
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	No <i>(Researchers did not explain how participants were selected or why the</i>

			<i>participants they selected were the most appropriate to provide access to the type of knowledge sought by the study)</i>
Data collection	Was the data collected in a way that addressed the research issue?		No <i>(No justification of study setting or explicit description of how interviews were performed )</i>
Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?		Can't tell <i>(Unclear that researchers critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location)</i>
Ethical Issues	Have ethical issues been taken into consideration?		Can't tell
Data analysis	Was the data analysis sufficiently rigorous?		Can't tell <i>(no description of thematic analysis; unclear that the researcher critically examine their own role, potential bias and influence during analysis and selection of data for presentation)</i>
Findings	Is there a clear statement of findings?		Can't tell <i>(It is likely some triangulation took place since interviews and focus groups took place, however there was no discussion of the credibility of these findings in terms of triangulation, respondent validation, more than one analyst)</i>
Research value	How valuable is the research?		The research is valuable
Overall risk of bias and directness	Overall risk of bias		High
	Directness		Directly applicable

**Thompson 2016**

<b>Study type</b>	Semi structured interviews In-depth interviews
<b>Aim of study</b>	to examine in depth the views of foster carers on the impact of fostering on parent–child relationships.
<b>Study location</b>	UK
<b>Study setting</b>	Foster care homes
<b>Study methods</b>	Semi-structured interviews. Data were analysed using constructivist grounded theory methods. An initial interview guide was developed in consultation with staff from the foster agency, with the aim of allowing exploration of parent–child relationships over time and from different perspectives. Audio recording of interviews and transcription. Thematic analysis was performed. All foster carers who participated or volunteered to take part in the research initially were sent a four-page summary of the findings and asked to either write or call the first researcher with any comments they had about the findings.
<b>Population</b>	Foster carers recruited through one foster agency only
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Health Education East of England
<b>Inclusion Criteria</b>	Carer situation participants had to be foster mothers or foster fathers who had at least one birth child and foster child currently living at home.
<b>Exclusion criteria</b>	None reported

<p><b>Sample characteristics</b></p>	<p><b>Sample size</b> Nine foster carers</p> <p><b>Time in care</b> their length of fostering experience ranged from 2 weeks to 9 years, with a mean of 2 years</p> <p><b>Gender</b> Participants consisted of three couples, one married female and two females who had separated from their partners since fostering.</p> <p><b>Number of previous placements</b> all had fostered at least two children. Three had experienced a placement breakdown but were currently fostering; four were considering stopping fostering.</p> <p><b>Other recruitment considerations</b> Using the principles of theoretical sampling, the researcher could follow up on any questions generated from each interview through purposeful recruitment of subsequent participants, including the recruitment of foster carers who had stopped fostering and those who had fostered for different lengths of time. The principles of theoretical sampling can lead to the final sample being relatively diverse, unlike in some qualitative methods in which the aim is to have a more homogeneous sample.</p> <p><b>Age</b> aged between 30 and 60</p> <p><b>Ethnicity</b> "various ethnic backgrounds"</p>
<p><b>Relevant themes</b></p>	<p><b>Theme 1</b> Position of the birth child matters - The position of the birth child within the family system and how this is altered by a foster child arriving have an important role in relationships between foster carers and their birth children. When discussing fostering with their children in advance, some foster carers found that their birth child specifically wanted the foster child to be older or younger than themselves: "He liked being the oldest child . . . he wouldn't want someone older than him to come into my home, he wants to be the big brother. (Sharon, In. 320–322) [Eleven year old birth child] had said 'OK well if you're going to do fostering can you try and get them older than me', cos she always wants to be the youngest. Um but it just so happened that the first one I got was eight years old. (Marsha, In. 129–132)" These examples indicate that it may be important to birth children to maintain a particular position in the family system that they value in some way. Such preferences may give clues as to what makes birth children feel secure in their relationship with their parents, and these conversations demonstrate how birth children can be included in the process to preserve their sense of emotional security. Foster carers also reported that where the foster child was a similar age to the birth child, this was experienced as being a particular difficulty: "I think if you go for the same age group and age range I think you could have a lot of problems as a foster carer . . . cos your children might be doing something with that foster child. So I think it's important that you keep that age gap. (Sharon, In. 491–495) Looking back that was difficult because they were the same age . . . they fought like cat and dog. (Katrina, In. 630–632)" Most foster carers felt that fostering children of different ages to their birth children worked better for the birth child: "I think if you've got kids in the foster family you should try and keep the kids you're fostering . . . lower in age. (Stuart, has older birth children, In. 305–307)"</p> <p><b>Theme 2</b> However, foster carers also had to consider the practical implications of fostering a child of a different age: "We didn't want to take another 'child' [referring to younger foster children] we didn't want to add to the stress because we've got all our three kids in the same school and we didn't want to have a child where . . . she's running around elsewhere going to another school. (Carl, In. 350–353)"</p>

### Theme 3

Involvement of birth children in the decision making process - Foster carers generally appeared to have thought about how much to consult their birth child and include them in the fostering process. This sometimes depended on the birth child's age and the parent's understanding of how much their child wanted to be involved. It seemed to be thought important to involve older birth children, whereas with young children it was thought better to explain and inform, but not to involve them too much: "Your children, in your decision to become a foster carer, have to be involved in it. And if your child has any doubts don't do it. (Sharon, whose birth child was older, In. 461–463) Our way of dealing with it is basically explaining to the children rather than just sweeping it under the carpet and . . . not getting them involved in what's going on because of course they're young children. (Petula, In. 139–142)"

### Theme 4

Jealousy/rivalry - In keeping with studies of sibling relationships which demonstrate a link between higher levels of conflict/hostility between siblings and competition for parental interest and affection (e.g. Dunn, 1992), analysis revealed that when a foster child arrives, foster carers perceive there to be competing demands for parental resources between the birth and foster child. This included foster carers perceiving there to be rivalry for parental time and affection, as well as practical parental input, and could lead to distancing in parent-child relationships. For example, Marsha described how she perceived that her birth child became jealous of her relationship with the foster child, was angry that the foster child was treated differently and had subsequently withdrawn from the family. Similarly, other foster carers seemed to perceive a degree of jealousy: "As soon as that young girl [foster child] sat and wanted to cuddle at night I instantly saw [birth child's] face and I knew, no we can't do this . . . Instantly I knew [birth child] didn't like it. . . . I knew he was fazed by how close that young girl wanted to be to his mum. (Sharon, In. 337–354) They're seeing mummy's not around but this young lady's suddenly come into our house and we don't know about her but she's taken away our mummy . . . usually mummy's at home with us in the week you know in the evenings helping us with our homework or just you know playing with us. (Petula, In. 103–108) [Birth child] became a little bit quieter because he wasn't gonna get as much attention . . . He was quite attention seeking and he was also quite distant with them [foster children], he didn't really want to talk to them. (Jenifer, In. 162–168)"

### Theme 5

Feeling overstretched -Rivalry was perceived to be played out frequently. Foster carers felt that the birth child and the foster child wanted what the other had and this led to them feeling stretched: "That was really hard because they just played up, all of them, they all wanted my attention, and it was like having four children all the same age you know, quadruplets . . . my children were kind of worried, not having their place with me, not having as much attention. (Jenifer, In. 45–49)"

### Theme 6

Setting boundaries for what could be offered - At times, this meant that the children wanted more from the foster carer than they felt able to give and either putting in a lot of effort or setting a boundary around what could be offered: "They demanded a lot from [husband], they demanded a lot from me . . . I managed it . . . only for a weekend, at the end of the week they said would we take them for longer and we said we couldn't. (Jenifer, In. 55–57) If you ended up having a full time placement . . . it's a huge impact on your life, so that's when we decided, that's why we're foster parents and we don't adopt. (Stuart, In. 200–203) Foster kids have a different psyche and a different outlook on life are er you try and train them otherwise but er it takes time. (Marsha, In. 159–161)"

### Theme 7

Changing parenting style leading to feeling overwhelmed - Simultaneously, foster carers felt that they had to change their parenting style which placed a further demand on them. For example, Katrina described how she would usually bathe her birth children together or withhold their pocket money if they had been naughty, but could not parent in these ways when fostering. It seemed that foster carers felt compelled to work harder to get it right for the children by trying to balance everybody's needs. They described their efforts to juggle their time and attention: "[Foster child] was very much sort of vying for my attention . . . it was hard to juggle that cos I didn't wanna obviously, want to make [birth child] feel left out at any time, but it was quite hard. (Peter, In. 107–109) I had so many children I had to put a limit on what I could take, so I had a rule, everyone in their rooms at nine o'clock. (Jenifer, In. 179–181)"

### Theme 8

Making sacrifices - Participants talked about having to make sacrifices in order to foster. These included feeling tired and stressed from working hard and never having time off, losing their freedom/social life and having less time and energy for their birth child: "I could sit down, maybe play little games with them, while other times I didn't have the time or the energy. (Katrina, In. 65–66) I had lots of appointments with [foster child], so I did miss out on a lot of my own children's activities. (Sharon, In. 146–147)"

### Theme 9

Changing relationship with birth child - Foster carers seemed aware that despite their efforts to work harder and do more, this was often insufficient, and their relationships with the birth child changed initially in ways they did not want: "I just feel that . . . we don't have that same connection that we did have when he was younger, and . . . I don't feel that he opens up to me as much as he used to. (Katrina, In. 112–114) We've become more . . . a bit like work colleagues or something you know, it's like working together. (Magda, In. 26–27)" Some foster carers noticed these relational changes when the foster child left: "I mean particularly when [foster child] left . . . we were sort of like re-bonding again . . . you know like spoiling ourselves as a family, doing things together. (Peter, In. 148–151)"

### Theme 10

Female foster carers reported feeling more overstretched - It was noticeable that the female foster carers reported feeling overstretched more often than the males in this study. Where foster carers were part of a couple, males identified their roles and responsibilities differently to females: "Normally I'm not here within certain hours so you know I just leave my wife and my wife does everything . . . she cooks, she cleans, she looks after the kids . . . when I'm here I do my bit as well. (Carl, In. 345–349) My point of view is I'm [wife's] support network . . . that is the role unfortunately. (Stuart, In. 478–479)"

### Theme 11

Under circumstances of perceived rivalry and sometimes feeling overstretched in their parenting capacity, foster carers seemed ultimately to want to protect their birth child and the biological family system: "My kids aren't going to come second you know they have to come first and [foster child] has to come second it's as simple as that, because if they don't agree with that well then I'll end the placement. (Katrina, In. 367–369) I'm always asking [birth child] if she's okay . . . it's your family and you want to know that your children are okay. (Carl, In. 228–233)" This highlights that, from the foster carers' perspectives, the relationship with their birth child and the preservation of the biological family system were often a priority, be it conscious or unconscious.

### Theme 12

Relationships can survive and improve - In many instances, it was felt that the relationship with the birth child could survive this strain and the relationship was preserved or strengthened in the longer term. Positive changes derived from making more effort to show their love for their birth child, not taking them for granted, giving them individual time, increased communication, considering their feelings more, being at home more and spending more time together. Some foster carers reported that the relationship had improved because the birth child became more appreciative. Also, some foster carers talked about their parenting skills improving, which impacted positively on their relationship with their birth child: "I think now it's made me a better Dad . . . I make more time to go to their sports, make some more time to talk to them, before you used just to be tied up in work, come home, eat me dinner, have a bath, watch the telly, go to sleep, go to work; so the family element of it, I think I'm . . . a better dad, more understanding now. (Stuart, In. 502–508) If I wasn't a foster carer I'd probably be like every other mum who shouts and screams, and not have to think, you know in fostering you've got to think on your feet all the time that you can't raise a voice. (Sharon, In. 60–62)"

### Theme 13

Change in perspective - Positive changes in this relationship were also reported due to foster carers looking at their birth child differently as they realised the importance of a stable upbringing. Foster carers became more aware of their own importance to their birth children: "It sort of makes you hold onto them stronger cos you just know how, how vulnerable . . . children are. (Peter, In. 86–87) I'm just so relieved that we now have this great family and um I'm really sorry for all the kids that don't. So yeah it's made me more grateful to have them. (Magda, In. 51–53)"

### Theme 14

Concern for the birth child's emotional security - Despite these positive impacts on family relationships, concern for the birth child's emotional security was expressed: "That's growing up before you have to grow up, hearing about the dark side before you have to. So those things are implications. (Jenifer, In. 264–265) [Foster child] is a boy and he had to go away, daddy is a boy, does he have to go away? (Magda, paraphrasing her 5 year old birth child, In. 136–138)"

### Theme 15

Unconscious bias toward the birth child - Foster carers differed in the extent to which they were reflective about changes in their relationship with their birth child, acting in ways that preserved the biological family without being consciously aware of it at the time. For example, Katrina acknowledged that when she first started fostering both she and her birth child changed, but at the time she lacked awareness of it: "You know . . . I never really looked at it, how . . . it affected him when he was younger (67–68). . . . I think because he was my own son I could see no wrong in him, and every time they fought I know myself I always I took [birth child's] side. (Katrina, ln. 153–155)"

#### Theme 16

Importance of reflecting on preserving family dynamics - But when foster carers did reflect on this, it seemed that the importance of considering family dynamics before fostering was acknowledged and was helpful for preserving relationships during the placement: "I think it's important that you do, depending on the type of child, then you sort of assess how you're gonna deal . . . with . . . any change in family dynamics. (Petula, ln. 771–773) You've got to be very aware what you want to do, what age limit . . . you can cope with and what age limit your family can cope with, in the environment you live in. (Stuart, ln. 399–401)"

#### Theme 17

Reflecting leading to actions - It was apparent that the result of these reflections on the changing family dynamics had implications for the foster placement – whether the family continued fostering, put restrictions on the type of foster child they would take in future or whether the birth child became more independent from the family. There were particular instances where foster carers reflected on unwanted changes within the family and re-evaluated their own role, their motivations to foster and whether fostering was right for the family: "Well it's a wrestling with . . . Am I damaging my own family? . . . Am I doing this for me not for them? (Jenifer, ln. 134–135) There was a concern when [17 year old birth child] said she wanted to leave, is it that because she has been anaesthetised to people just coming and going. That's what worries me. (Stuart, ln. 72–74)"

#### Theme 18

A wish for family relationships to return to normal after the placement - This illustrates how reflecting on family relationships would often give precedence to preservation of the biological family. Consequently, many foster carers expressed the wish for family relationships to return to 'normal' at the end of a placement: "I think it was relief really, to be honest, even though we all said a proper goodbye we went for a meal the night before and all that, but I think for everyone concerned it was phew, we can go back to normal now. (Jenifer, ln. 311–313) When [the foster children] did go it was brilliant because we did go the cinema, we used to go swimming then I used to sit here and even draw or watch a movie together or something, we did have more time which was which was brilliant it was really good. (Katrina, ln. 306–310)"

	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes

	Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(However, no justification of setting or discussion of data saturation )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Yes
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Yes
	Findings	Is there a clear statement of findings?	Yes <i>(respondent validation and more than one analyst were used )</i>
	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	Low
		Directness	Directly applicable

### Valentine 2019

#### Study Characteristics

<b>Study type</b>	Semi structured interviews
-------------------	----------------------------

<b>Aim of study</b>	to provide an exploratory account of foster carers' lived experience of ending adolescent foster placements
<b>Study location</b>	UK
<b>Study setting</b>	foster carers from three fostering organisations (2 independent fostering agencies, 1 local authority)
<b>Study methods</b>	Semi-structured interviews were recorded and transcribed. The research aims were explored through an interview guide structured around themes delineated from the literature review: expectations of the foster carer; foster carer experience of forming an attachment to the foster child; foster carer views on parenting LAC and their experience of challenges within the placement; foster carer emotional wellbeing following the placement breakdown. The research design was piloted through interviewing a married couple with a shared experience of placement breakdown. Interpretative Phenomenological Analysis was used to analyse the themes. Anonymised transcripts and themes were discussed with researchers with expertise in the area; queries and corrections were integrated where appropriate. Further, six local authority foster carers attended a group feedback session. A bracketing interview was conducted prior to data collection in order to offer a curious and non-judgmental space to explore and discuss the researcher's feelings about the area of research.
<b>Population</b>	Foster carers
<b>Study dates</b>	not reported
<b>Sources of funding</b>	no financial support
<b>Inclusion Criteria</b>	Age Foster child aged 11 or above at the time of the placement breakdown Care Situation

	<p>Foster carer terminated foster placement. Foster carers with experience of foster placement breakdown within approximately 6 months and 3 years ago. Considered on an individual basis</p> <p>Carer situation Registered foster carers who hold approved foster carer status.</p> <p>Gender Male and female foster carers with experience of male or female placement breakdowns.</p>
<b>Exclusion criteria</b>	<p>Care situation Kinship carers. Special guardians. Other care arrangements. Experience of foster placement breakdown outside of foster carers' control</p> <p>Care plan meant placement was intended to be short-term. Short-term placements. Placement breakdowns that occurred historically. Carers with limited memory of their experience of foster placement breakdown.</p> <p>Age primary school age children</p>
<b>Sample characteristics</b>	<p>Sample size 7 foster carers</p> <p>Time in care experience of carers was 6 to 20+ years</p> <p>Type of care four couples were from an independent fostering agency, three from a local authority</p> <p>Age age range 35 - 64</p>

	<p>child's age at breakdown: 13 - 18</p> <p>Carer characteristics All participants were in couples</p>
<p><b>Relevant themes</b></p>	<p><b>Theme 1</b> Emotional aftermath - In account of their experiences of foster placement breakdown, participants described a range of immediate difficult feelings and longer-term emotional consequences. Holding mixed emotions - Most participants described feeling relieved accompanied by other difficult emotions. David felt being sad and relieved at the same time represented an “emotional rollercoaster”. Joan described relief in not “having all the trauma every day”. Similarly, Simon described the relief as grounded in the absence of on-going worry and stress “on me”. Most participants described this sense of relief following placement breakdown as a “cruel” and “horrible” thing to say, indicating a sense of shame around positive feelings, as Jane’s description highlights: Jane: I was overjoyed. I don’t mind admitting that. Interviewer: Mmm. Jane: I am absolutely honest about that, I probably felt the biggest weight had left off and took off my shoulders that I had never been so relieved to see the back of a child. Jane’s language of “honesty” indicates uncertainty about the acceptability of her feelings. This implies Jane perceived the potential to be criticised but also indicates an internal view of herself as ‘wrong’ or ‘bad’ for the admission of those feelings. Christine noted an overall sense of herself as “bad”, with increasing reassuring thoughts to herself that she is a “good foster carer” in spite of her decision to end the placement. Simon too noticed that by “admitting defeat”, there was an element of questioning his capacity as a foster carer, particularly as he felt judged by others. Similarly, David attempted to reassure himself by stating “no one in their right mind would put up with this”. David indicates he was creating commonality with others as a means to alleviate shame. David also offers this as a statement, suggesting some finality in his reflections, perhaps indicating a long process of circularity of his thinking between blame and reassurance. In spite of feeling relieved, participants also noted sadness: It... it broke my heart it really did &lt;pause&gt;. I don’t cry often but I did that day. David’s description of his heart as broken seems to symbolise the experience of placement breakdown as distressing. David further illuminates this by describing that immediately after the breakdown he was “in a slump”, feeling “awful, really awful”.</p> <p><b>Theme 2</b> Ripples of loss - Most participants identified grief as a consequence of the placement ending, either through the labelling of their immediate emotional experience or identifying ripples of ‘loss’ that continued longer-term. David identified that his family continue to miss the young person. Joan and Simon reflected the same but caveated this with the notion that they cope by focusing primarily on the positive memories which served to remind them that they had not failed. Most participants talked about how grieving the placement breakdown had led to or at least involved acceptance. It seemed to resonate with participants that the ending of a close relationship is likely to lead to loss regardless of the circumstances, further indicating the longer-term emotional impact of placement breakdown. “We’re only human” This theme helps develop understanding of a complex mixture of reflections from across the interviews; the self and the family are changed in light of placement breakdown. “You’ve developed, it’s different” Some participants contrasted a current view of self to that before fostering in explaining the personal impact of the foster placement ending. Given that many of the participants likened the period prior to placement ending as fraught with battles, whether this be within the placement or with the wider system, often the personal impact had been in bolstering the participant’s voice and opening up. For example, David described his transition from shy and reserved to being increasingly opinionated and vocal about his beliefs. Like other participants, he also reflected that the process has “brought a lot out of him”, implying those qualities were always present but had become more prominent following the placement ending. For Jane, it was her husband’s reflections that encouraged her to consider how she had changed: Years and years back when you first started, fostering was so important that... it was everything but now... you’ve developed, it’s different. Jane’s extract emphasises the development of self as a journey; in experiencing ending a placement and surviving this, the outcome of which was seemed to be a reduction in fear. Simon describes development within his capacity to share his emotions and to receive support. This indicates an acknowledgement of himself as potentially fragile, only recognised as part of ending the placement. This development was incredibly important to Simon, as he described the opening of opportunities to seek psychological support when the placement ultimately broke down.</p> <p><b>Theme 3</b> Meaning making - This theme draws on participants’ experiences of making sense of the placement breakdown. Most participants discussed having tried to sustain the placement, reinforcing to themselves that they couldn’t have done any more and that as Joan said, they had made “the right decision”: I’m so proud of ourselves because it could have gone the</p>

other way, but we made sure it was positive for her, which meant that we didn't feel as guilty. Joan's identification that she acted in the best interests of the young person contrasts with a sense of concurrent guilt. This is characteristic of most participants' meaning making of what happened, supporting the notion of accepting that it had not worked despite lots of effort. However, Jane's narrative about the placement breakdown is characterised more positively. She referred to the potential long-term benefit of the placement that broke down: I think there will always be later on in that kid's life, something that you might have done. This suggests a view that amongst the distress and difficulties, the placement was still of worth. This might have served as an important protective factor for Jane; perhaps it is particularly damaging to feel one's hard work and investment is worthless or rubbish. David reflected on his experience of being "blamed" and feeling "really small". His meaning making in the aftermath seems to have bolstered his fragile self through accepting that he was not to blame. Jane adds to this interpretation by reflecting that the young person had been so deeply affected by trauma that his "walls had gone up and were never coming down". This seemed to further protect Jane, by identifying the problem not with her but within an unchangeable past. This is strengthened in other extracts, including Christine's: We are only human you know. I learnt not to beat myself up so much about it. By identifying herself as 'human', this emphasises that it was important that Christine came to understand she was not to blame. Further, it seems that Christine has wondered whether she could have done more, and that making meaning involved disentangling herself from unreasonable expectations to be 'superhuman'. Simon reflected that he could not have done any more, but that things could have been different in an "ideal world" – this too links to the notion of readjusting expectations as part of understanding what happened. Overall, meaning making appeared to appease the idea of placement breakdown as their fault; this lessened their sense of guilt and lowered their expectations of what could have been achieved. Most participants reflected on the strength they had relied upon in their marriages in order to "survive" the placement breakdowns. Amanda, John, Joan and Simon echoed sentiments of their spouses as being their "rock", this seemed to offer recognition of the positive amongst the negatives.

#### Theme 4

Moving on - This theme encapsulates coping with grief and moving forward following placement breakdown. David noted this as "a breath of fresh air" and identified a restored normality wherein he could reconnect with his home as an enjoyable space. Joan reflected that the emotional journey ended with acceptance: The initial feeling of abandoning someone, did change, because we had to realise we had done and took it as far as we could. For most participants, acceptance represented a genuine belief that the placement ending was "for the best", and this was important to moving on. For others this involved processing and remembering that the young person was a child: I mean after her, you would have thought we would never have had teenagers but as I say, you get to the stage where you think they are still a child. John's account indicates that remembering the young person as a child diluted the strength of feeling about the placement breakdown. Overall, the period of coping with the emotional experience associated with placement breakdown, but also in reclaiming the family home, involved re-connection to loved ones, the home environment or to the profession of fostering. Acceptance may mark the end of or a latter part of grieving, and this seemed to provide participants with an ability to acknowledge what has happened in a non-judgemental way.

#### Risk of Bias

Section	Question	Answer
Aims of the research	Was there a clear statement of the aims of the research?	Yes
Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
Research Design	Was the research design appropriate to address the aims of the research?	Yes

Section	Question	Answer
Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes
Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(although no discussion of saturation of data or setting)</i>
Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Yes <i>(a literature review fed into the research questions. researcher bias was considered.)</i>
Ethical Issues	Have ethical issues been taken into consideration?	Yes
Data analysis	Was the data analysis sufficiently rigorous?	Yes
Findings	Is there a clear statement of findings?	Yes <i>(respondent validation was used)</i>
Research value	How valuable is the research?	The research is valuable
Overall risk of bias and directness	Overall risk of bias	Low
	Directness	Directly applicable

Study type	Subgroup of interest mental health problems
------------	--

	RQ3 self-harm in looked-after young people
<b>Aim of study</b>	to gain insight into looked-after young people's perceptions and experiences of factors related to self-harm, and of interventions and services received, in order to improve future service provision.
<b>Study location</b>	UK
<b>Study setting</b>	Young people in foster homes or residential homes in the East Midlands region
<b>Study methods</b>	Semi-structured interviews. Interpretative Phenomenological Analysis (IPA) study. Young people were asked about their experiences and perceptions of the first and most recent episodes of self-harm, repeated self-harm, stopping self-harm, and how they viewed the supports and services they received. The interviews were audio-recorded, transcribed, and subjected to IPA. The themes reported were present in at least half of the participants' accounts, and prevalence counts are given in order to demonstrate the validity of the findings.
<b>Population</b>	Looked-after young people in residential and foster care, care leavers were also included in this study
<b>Study dates</b>	March 2014 and April 2015
<b>Sources of funding</b>	Department of Health
<b>Inclusion Criteria</b>	Age 11 to 21 years  Care Situation Young people with experience of living in foster care or residential homes  Mental health self-harmed in the previous 6 months

	<p><b>Location</b> in the East Midlands region</p>
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> Twenty-four looked-after young people participated (including 8 care leavers).</p> <p><b>Mean age (SD)</b> aged between 14 to 21 years (M = 16)</p> <p><b>Time in care</b> Most participants (66.7%) reported going into care between the ages of 13 and 15 years with the remainder (29.2%, data missing for 1 participant) reporting first being accommodated in care between the age of 0 and 9 years.</p> <p><b>Type of care</b> In terms of the looked-after young people's current care placement, 10 lived in residential homes, 5 in foster care, and 1 in supported accommodation. Of the 8 care leavers, 2 lived in foster care homes, 1 in supported accommodation, 2 had returned to their biological parents(s), and 3 lived independently.</p> <p><b>Mental health problems</b> Ten were recruited in the community (via a self-harm support organization and wider advertising), 8 through Child and Adolescent Mental Health Services (CAMHS), and 6 via social care</p> <p><b>Gender</b> Four were male</p> <p><b>Number of previous placements</b> The majority (75.0%) of participants had lived in two or more care placements; half had lived in between two and five care placements and a quarter reported having six or more placements. Of those with more than one placement, most had lived in different types (e.g., foster care and residential). Thus, the majority of the sample had multiple care placements and in multiple settings.</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> 1) changes in care placement (either as cause or consequence of self-harm) - results indicated changes in care placement are perceived as highly relevant to self-harm (either as cause or consequence; n = 15). Many participants reported that they had self-harmed because they had moved care placement or at around the same time as a change in placement: "When I went back into care, last year, I started cutting" (ID 20). This young person had returned to foster care after a breakdown in his relationship with his adoptive parents, and described the impact of this move in terms of the loss of important relationships: "I wasn't living at home, wasn't having much contact with my parents, I was missing school, all my friends were leaving me because I couldn't come out at nine o'clock to come to see them, or meet up after school because I had to get in my taxi and go back to school, go back to my care placements. So, everything sort of was going wrong. (ID 20)".</p> <p><b>Theme 2</b></p>

1) changes in care placement (either as cause or consequence of self-harm) - This is important, not least because most of the young people interviewed had gone through at least one transition in care, some of which did not go well from the young person's perspective: "... they integrated me back [into care] in January this year and it didn't go very well and I ended up walking out and I ended up overdosing on the dinner money that I'd been given" (ID 17). From this young person's perspective, this incident resulted in a significant curtailment in privileges (not being allowed money, possessions removed from her room, not being allowed out on her own—"everything had been taken off me"), leading to further frustration and further self-harm.

### Theme 3

Self-harm as an expression of agency - In the context of moving to a different placement being experienced as losing control (in terms of independence) and losing support (in terms of significant relationships), self-harm was something, at least, that the young person could still have control over. For example, ID 41 reported that she first self-harmed (cutting, ligature, and overdose) after moving to a remote placement due (she believed) to her getting into trouble with the police: "... they moved me to the middle of nowhere. So, I couldn't see my mum, I couldn't do nothing, couldn't walk out the house without someone being there. So, I couldn't literally have nothing. So, I think that triggered it [self-harm] off. (ID 41)" Similarly, ID 38 reported that she first self-harmed when she moved to a new foster placement and was no longer able to live with her siblings or near her mother: "... it was just because I'd moved to a different placement and everything was moving so fast, and I just didn't have no control into my life. And everyone was making choices for me and that [self-harm] was my only way of controlling anything. That was my choice to do it or not, and that was the only thing I could control, everything else was controlled by people. (ID 38)"

### Theme 4

Placement change as a result of self-harm - A small number of the young people understood that their placement had been changed as a direct result of their self-harm: "I moved from my foster placement because I tried hanging myself, and she [foster carer] walked in ... she said that she couldn't cope with it any more" (ID 33); "And then my foster placement sort of stopped, which was massive, massive, massive shock for me ... my foster carer decided she wasn't going to have me anymore" (ID 34). Thus, self-harm was perceived to be both a consequence of a change in care arrangements (where a loss of autonomy and/or loss of social support was experienced), and in some cases a reason why a young person lost their placement.

### Theme 5

Feelings of anger and turning it on the self - Participants expressed feelings of anger (and turning anger on self; N = 16). "I remember one time I'd smashed up the kitchen in my old care home, completely wrecked everything [laugh]. And it was, I think, that was a way of me trying to say, "I don't want to self-harm but I want to get this anger out." (ID 37)" When participants spoke about feelings associated with self-harm, anger predominated. Self-harm helped to get rid of feelings of anger—"I just remember how I was really, really angry and then I cut myself, and then all of a sudden I just wasn't angry anymore" (ID 35), or had been used to replace anger—"I used to be extremely angry. I used to like punch things, smash things, and everything. And then I just stopped, and went to hurt myself" (ID 39). In some cases, the acts of self-harm described by participants appeared to be a physical manifestation of anger: "And things that they were saying ... was getting me pumped up, making me angry, making me want to destroy something. ... I can remember just walking out the front door, going to the side of the house and just f\*\*\*ing smashing the s\*\*t out of the wall. To the point where all my knuckles were bleeding, cut open, blood everywhere, to the point where it physically hurt to even hit the wall or touch the wall with my knuckles. (ID 43)"

### Theme 6

Protecting others from harm - Self-harming in anger was also described as having a protective function; by turning anger on themselves in the form of self-harm, they felt they were able to protect others from being hurt by their anger. For example, "I'm not very good at getting outwardly angry. It's always, I might be feeling angry at someone but I never get angry at another person, I always take my anger out at that person out on myself" (ID 28). "I do it [self-harm] for stress as well and pain relief, but then I do it as well so I don't hurt people. Because like, if you look in my record I've hurt quite a lot of people, so like, if you don't cause pain to others you can cause pain to yourself to make you feel a bit better. (ID 41)" These young people wanted to avoid hurting other people and getting into "bad situations" (ID 40), as they had done in the past. Furthermore, self-harm was regarded by few young people as a quiet or non-disruptive way of expressing their anger, e.g., "... I thought if I just do this [self-harm], then it's, I can release my anger, but it's quiet" (ID 29), "if I made a noise, that would make my mum more violent. And I don't know where the idea came from, but I just thought about using a pair of scissors [to cut] and I remember, it was quiet" (ID 28).

### Theme 7

Not able to talk about self-harm - Some participants said they did not want to talk about self-harm and their distress, or felt they were not able to talk about it (not wanting to talk; not feeling able to talk; N = 22). "I can find it extremely difficult to talk to people ... I couldn't, I don't, I'm finding it very difficult now; but I couldn't talk to people at my worst, I just couldn't talk to; it just wouldn't, it just wasn't happening. I still find it very difficult, but I suppose, if my life's in danger then I have to, otherwise I'm going to die. (ID 34)"

#### Theme 8

talking results in consequences - "I've never really spoke to anyone about it, like why I do it and why I did it. I just like to be, like keep everything to myself" (ID 38). This young person preferred not to speak to people (for instance, social workers) about self-harm because speaking to people resulted in consequences, "... they [will have to] get involved and get someone else involved" (ID 38).

#### Theme 9

Difficulty of talking to others - Talking about self-harm was extremely difficult. Some did not want to talk to people because they did not trust anyone —"I can't stand there and talk to someone, because I get really anxious and I can't do it... just don't trust anyone" (ID 41), or they did not want to burden others —"because I don't really like talking to people and bothering people, and it [selfharm] happened" (ID 42). The vast majority of young people interviewed indicated a reluctance to talk about self-harm, but it was not possible from their accounts to distinguish not wanting to talk (perhaps as a result of previous negative reactions from others) and not being able to talk about their experiences (for example, in the case of traumatic experiences).

#### Theme 10

Difficulty trusting others with intimate information - These young people seem to have difficulties in trusting anyone with intimate information about their emotional state. This makes sense considering that most of them have had a life experience with repeated rejections and no consistent reliable adult figure. This unwillingness to talk, however, inevitably had an impact on the potential to seek help when needed. "My problem is that I don't branch out to actually get help. Like, all the mental health services here ... they always say like "you need to branch [reach] out when you're feeling distressed, branch out and get help" but I think that's a problem for me. I think because I've never had somebody in my life who I know I can actually rely on, and who will be there. I've never felt I can actually trust somebody to reach out, so I don't. And I know there's people there, but I don't seek their help. (ID 01)"

#### Theme 11

Difficulty communicating with professionals in clinical settings - It also has implications for how difficult a young person might find it to interact with professionals in clinical settings. For example, in describing an experience of a clinical appointment, ID 41 explained "I wasn't listening; all I thought of was walking out and hitting them. The staff member what were with me, she just spoke and I just sat there [said nothing]."

#### Theme 12

Coping techniques - Benefits of art, music, and exercise - Activities like art, music and going for a walk reportedly helped them to delay and distract from self-harm: "I've got new things that I've learnt, to, how to deal with things like drawing and stuff like that" (ID 39). "I do have my strategies of ways not to cut, and who to talk to, and who I can trust in my life and all that ... just carry on the way I'm doing now, writing things down, talking. ... I came up with writing poetry myself really. (ID 33)"

#### Theme 13

Reliance on self-help - This reliance on self-help seemed more salient to the young people than clinical services, and was generally preferred, "I prefer to do things independently so try and do my distractions, do my delay tactic, and then like if the thoughts really, really aren't going, then try and call a friend or something." (ID 28)

#### Theme 14

Negative coping strategies - Generally, the young people used positive strategies when trying not to selfharm, but three of them reported that they used smoking as a way of coping with selfharm: "Smoking was the healthy option, because you don't die straight away from smoking. It takes years and years and years to die from smoking. But one slit of the vein, and you're dead." (ID 25)

#### Theme 15

	<p>Feeling patronized at CAMHS - Feeling Patronized. When discussing their experience of receiving help through CAMHS, some young people felt patronized by the individual they were seeing (N = 8): “ ... although the lady I was talking to was, she was nice, but she was just incredibly patronizing. And it made me feel a bit like a child, it’s like I’m 18 years old, not eight” (ID 37), “I mean I had CAMHS before, but I found them a bit patronising like.” (ID 08) “I used to go CAMHS, but I always thought they treated you like a little kid. Yeah, like obviously I’m 16, and they always like show you a piece of paper saying “look at this blob, what do you feel today?” I’m, like, that’s summat what you would do with younger people. (ID 33)”</p> <p><b>Theme 16</b> Not being listened to at CAMHS - Some young people also did not feel they were being listened to during their sessions with CAMHS—“ ... she doesn’t listen to what I say ... I don’t know, she twists things I say to ... I don’t know how to explain it, but it’s like nothing seems important to her that I say” (ID 27), or that there was a lack of interaction—“And I feel it sometimes when they’re there, they don’t really interact with you, they just sit there with their notebook. They don’t look at you, just sit there with the notebook and pen” (ID 33).</p> <p><b>Theme 17</b> Sense of nothing being done - A notable criticism in looked-after young people’s experience of CAMHS was that they did not have a sense that anything was being done to help them (N = 8). As such, they struggled to see “the point” of their time with CAMHS. For example: “They haven’t done anything. And I don’t know what to expect, because they haven’t, I can’t see any changes. I don’t think when I’m doing something ‘oh, what would CAMHS say?’” (ID 20) “Every time I see my CAMHS worker I do talk to her about stuff, but, I don’t feel like they do anything about it, she just, we just talk, and then we have another session next week or whatever. It doesn’t help, it’s just annoying because it’s in, you do the same thing every week and every week, and you just talk about it, but nothing happens. (ID 38)”</p> <p><b>Theme 18</b> Positive experiences (feeling comfortable) - However, some positive experiences with CAMHS were also reported, and these were attributed to having a positive relationship with the professional involved. Particularly, positive experiences related to clinicians making an effort to make the young person feel comfortable and therefore feeling willing to talk (N = 9). “And she went out of her way to make me feel comfortable, and I never felt like I was talking to a professional, she’d always make me feel like she was, like she was really, she was so good.” (ID 29) ““We actually do, like, activities, so I can express how I feel sometimes, which I find a bit easier. And there’s things that I can fiddle with, things that I can do while I’m there. And she, she doesn’t sit there and stare at you like “I know how you feel,” she’s just realistic. So, I find it quite easy talking to her, and she said, she always said to me, “I understand if there are some days you can just sit here and not say a word, I don’t mind.” (ID 08)”</p>		
<p><b>Risk of Bias</b></p>	<p><b>Section</b></p>	<p><b>Question</b></p>	<p><b>Answer</b></p>
	<p>Aims of the research</p>	<p>Was there a clear statement of the aims of the research?</p>	<p>Yes</p>
	<p>Appropriateness of methodology</p>	<p>Is a qualitative methodology appropriate?</p>	<p>Yes</p>
	<p>Research Design</p>	<p>Was the research design appropriate to address the aims of the research?</p>	<p>Yes</p>

	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes <i>(However, no discussion regarding why some chose not to take part )</i>
	Data collection	Was the data collected in a way that addressed the research issue?	Yes <i>(However, setting not justified and saturation of data not discussed )</i>
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Yes <i>(The interview schedule was created in collaboration with an advisory group of young people who had self-harmed in the past)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Yes
	Findings	Is there a clear statement of findings?	Can't tell <i>(Credibility of findings not adequately addressed in terms of the use of triangulation, respondent validation, more than one analyst)</i>
	Research value	How valuable is the research?	The research is valuable
	Overall risk of bias and directness	Overall risk of bias	Low
		Directness	Directly applicable

**York 2017**

<b>Study type</b>	Semi structured interviews
<b>Aim of study</b>	To elicit views of foster carers regarding the mental health needs of children and adolescents in their care and their experiences of accessing mental health services.
<b>Study location</b>	UK
<b>Study setting</b>	a single, inner city, local authority in England.
<b>Study methods</b>	Semi-structured interviews. A grounded theory approach was used. Grounded theory involves a systematic and inductive approach to constructing theory from empirical data ‘bottom up’, with researchers moving backwards and forwards between their data and the emerging findings. Grounded theory includes the concurrent collection of data and ongoing analysis; the sampling of participants being guided by the emergent findings, known as ‘theoretical sampling’; and the method of data analysis which is known as the ‘constant comparative method’. Semistructured interviews were conducted with the participants by WY, in a convenient location for the foster carer. The interviews were audio-recorded and lasted between 45 and 90 minutes. A topic guide directed the interviews and included questions on the following topics: the experience of being a foster carer; whether they have fostered children with emotional and behavioural difficulties and/or mental health issues; challenges the foster carer’s encountered and strategies developed; when they might ask for help and from where; what is their understanding of CAMHS; and their experiences of using this service. Prior to the interviews, the proposed topic guide was piloted with two people working in caring professions and their feedback was elicited. The interview data were then analysed using the constant comparative approach. The data were coded, and from these initial codes, categories began to emerge. To ensure that a true account of the interview had been captured, the individual transcripts and an interim summary of the data analysis were shared with the participants.
<b>Population</b>	Foster carers
<b>Study dates</b>	Not reported

<b>Sources of funding</b>	Not reported
<b>Inclusion Criteria</b>	Carer situation foster carers who had looked after at least one child or young person with mental health difficulties
<b>Exclusion criteria</b>	None reported
<b>Sample characteristics</b>	<p><b>Sample size</b> Ten foster carers</p> <p><b>Type of care</b> nine in foster care and one in kinship care</p> <p><b>Gender</b> All carers were women</p> <p><b>Ethnicity</b> Four participants were white British, five were Black Caribbean, one was Black British</p>
<b>Relevant themes</b>	<p><b>Theme 1</b> the challenge of being a foster carer - One interesting observation was that the experience of being a foster carer has many contradictions. For instance, when asked what it is like to be a foster carer, most identified the rewarding nature and at the same time the challenges, as the quotations below illustrate: "It's hectic, emotional and rewarding. (Dorcas) You have your highs and lows. It can be quite challenging and at the same time quite rewarding. (Mary) Fostering is hard but rewarding. (Cathy)"</p> <p><b>Theme 2</b> Prevalence of mental health difficulties in foster children - All the participants talked about the mental health difficulties experienced by the children and young people they cared for, which included depression, anxiety, attention deficit hyperactivity disorder (ADHD), conduct disorder, bipolar disorder, attachment difficulties, obsessive compulsive disorder (OCD), self-harm (including cutting and the taking of overdoses), suicidal ideation and hearing voices.</p> <p><b>Theme 3</b> Challenging behaviour - emotional problems - The foster carers had all experienced behaviour that they found challenging in some way. In particular, the children and young people displayed emotional and behavioural difficulties which the foster carers then had to make sense of, trying to interpret meaning. The emotional problems reported included frequent changes in mood, as described by Cathy when talking about a child she fosters: "She'll be smiling and then she'll start crying. She blows from hot to cold in five minutes"</p> <p><b>Theme 4</b> Challenging and oppositional behaviour - From the interviews, it was evident that many of the foster children exhibited oppositional behaviour including kicking, punching, biting and spitting. A need to control their environment was identified by the foster carers as well as the children wanting their own way, as described by Anna: "A lack of control can contribute to behaviour problems. Often they try to regain control when everything has been taken away from them." The foster carers also reported violent outbursts with</p>

aggression, damage to property and destructive behaviours as well as the more passive behaviours of ignoring the carer or not speaking. Some young people absconded both from home and school, sometimes for days at a time which was a huge concern, often resulting in the placement becoming untenable.

#### Theme 5

Understanding poor behaviour - The foster carers articulated many reasons for the challenging behaviours exhibited by the children they cared for, demonstrating their awareness, empathy and depth of psychological understanding, which can be conceptualized as mental health literacy as shown by the following quotations: "Early life experiences contribute to her current behaviour (Michelle) A difficult background will mean understandably some kind of behavioural or emotional problem (Jill)"

#### Theme 6

Emotional difficulties linked to biological parents - Many of the reasons elicited for the children's difficulties were connected to their biological parents. Parental physical and mental health problems and learning difficulties were identified, as well as drug and alcohol issues and criminality: "They [children] had such a poor home life and they [parents] weren't giving them their all. There was a mixture there of mental health problems with the parents, disability with the mum. You know that had an impact on the children (Jill)"

#### Theme 7

Impact of early life experiences - According to the foster carers, early life experiences including loss, trauma and the separation from their parents have also impacted hugely on the children and young people, likewise rejection, neglect and abuse. In addition to this, many of the foster carers acknowledged how difficult it is for the child when first arriving at their home. "Often children coming into care are fearful. . . Imagine being ripped away from parents and ending up with strangers (Josie)"

#### Theme 8

Process of referral to CAMHS was smooth and straightforward - The foster carers all had frequent contact with a number of different agencies, including the local CAMHS, with at least one child under their care. Referral to CAMHS for the looked after children was generally made via social services, through either the foster carer's supervising social worker or the child's social worker. Overall, the experience of the referral process was reported to be good as the following quotations illustrate: "Straight forward process. [The] referral was made, appointment arrived followed by an interview and assessment (Emma) [I] would use it for other children. Smooth and straightforward [referral process]. . . . Not have to wait long for appointment (Mary)"

#### Theme 9

Once a referral had been made, however, a number of problems were identified relating to: waiting times; not being listened to; engagement; and times of transition.

#### Theme 10

Waiting times a frustration - The waiting list for treatment was a huge frustration for the foster carers and could cause great anxiety. Waiting lists were generally for long-term treatment or a specialist assessment for conditions such as ADHD, as explained below: "It took a year for everything to be diagnosed properly [ADHD]. . . . The wait can be problematic because there are issues or behaviours that you don't know how to deal with and the child needs help with them. And even to the point that this placement is going to break down if you don't get help soon. It's not a threat because if you're saying something like that you're at your wits end. (Jill) But obviously there is anger and she needs to deal with the anger, I mean I am not qualified to, I don't know how to, I manage what I can. . . . Eventually the child was seen for assessment – then placed on long waiting list (2 year wait) for psychotherapy. (Michelle)"

#### Theme 11

CAMHS responsive where risk was involved - More positively, though, the CAMH service was reported to be more responsive where risk was involved, for example the therapeutic follow-up after a psychiatric emergency: "Good response from CAMHS following overdose. No wait. Lots of follow up. The counsellor rings her on the day of the appointment to remind her of appt. The counsellor then calls me if she does not answer. I then remind her of her appointment. She attends regularly. (Dorcas)" What is evident from the interviews is that whilst there are clearly barriers to accessing mental health services, they are not at the point of referral but occur once within the mental health system itself.

#### Theme 12

Not being listened to - lack of involvement of foster carers - Not being listened to by professionals across the different agencies was another frustration reported by the foster carers. The foster carers expressed the view that they know the child better than most of the professionals involved, but that this is often not heard or valued, as the following quotations illustrate: "As a foster carer you have this child 24 hours a day – you know the child – they [social worker] come and see them once every six weeks. [ . . . ] They don't really know that child but they're not prepared to listen to what the carers have to say. (Josie) We're everything to that child: we're a mother, we're a father, you know, we could be a nurse when they're not well, you're there looking after them, you know, you can also be a therapist to them but you're also punch bag. . . .and everything else, more than just a social worker, so you'd think they would listen. (Michelle)"

### Theme 13

Transitions as a time of anxiety provoking change - CAMHS service in a new area, a new school, foster care back to biological family or foster care to independent or semi-independent living. Transitions are representative of yet another change for the child and are often anxietyprovoking situations as the following quotations show: "At times of change there is a risk that children can fall through the net. . . . .There should be a bridge between CAMHS services in different areas – a good handover –not struggling in this grey quagmire of nothingness. (Lorna) I was really worried about her going to secondary school, just how she'd cope really with everything. Because she had big attachments to two mentors in primary school and they don't have mentors in secondary. And oh my gosh, we are now going backwards. (Michelle) He's due to move out to semi-independent [supported accommodation], so you know. . . .that's going to be a bit of a hard time because he's been a part of the family for 10 years. His brother moved out last year and he's struggling and we don't want that for this one. (Jill)"

### Theme 14

Disengagement and non-attendance - The foster carers also explained that sometimes the young people themselves disengage from the service and stop attending and as a consequence, they get lost in the system and are not followed up. "After the assessment there was a change in professional – the girl didn't go back. . . .they lost her. . . .you can lose a teenager by turning him or her over to someone else. . . . .For this girl her story was horrific to start with and she says she didn't want to relive it with somebody else. It was bad enough doing it the first time. (Josie)"

### Theme 15

Foster carers need for support and an accessible point of contact - All of the foster carers expressed that having support and to be able to ask for help from an accessible point of contact are imperative to their role, which can be emotionally and physically demanding. "All foster carers need to be able to ask for help and not feel a failure if unable to manage a particular child, otherwise you can feel very isolated. (Jill) Mentally it can really drain you. Especially when you have new situations that are right outside of the box, that you have no personal experience of and you think how on earth do I deal with that? (Anna)"

### Theme 16

A support network (peers) and good relationship with social worker is key - The foster carers discussed the different kinds of supports that they access, from more professional sources to that from their peers in formal settings such as an organized group or more informally. Everyone described their relationship with their social worker as fundamental, especially through the more difficult times: "Having a good support worker – that's brilliant. You know you've got someone who is always there for you, you know, at the end of the phone. Especially if you've got difficult children. (Miriam) I have my support network, the forum, supporting one another. I always go to my social worker first or the fostering network. (Cathy)"

### Theme 17

Friends who are foster carers as support - Several foster carers mentioned having friends who are also foster carers as well as the support groups and talked about the value of having this shared experience as described below: "My support network is my friends who are foster carers, not necessarily in this borough (area). They can be a good source of help and more information like if you're in a crisis or not sure what to do. Your ordinary friends who don't do what you do have no idea, they wouldn't relate. (Anna) There is the group and some of us have already made friends any way so we can just call each other and that is very good. My cousin, she is also a foster carer and so we're also there for each other. (Miriam)"

	Section	Question	Answer
<b>Risk of Bias</b>	Aims of the research	Was there a clear statement of the aims of the research?	Yes
	Appropriateness of methodology	Is a qualitative methodology appropriate?	Yes
	Research Design	Was the research design appropriate to address the aims of the research?	Yes
	Recruitment Strategy	Was the recruitment strategy appropriate to the aims of the research?	Yes
	Data collection	Was the data collected in a way that addressed the research issue?	Yes
	Researcher and participant relationship	Has the relationship between researcher and participants been adequately considered?	Yes <i>(topic guide was constructed in collaboration with carers. Setting justified.)</i>
	Ethical Issues	Have ethical issues been taken into consideration?	Yes
	Data analysis	Was the data analysis sufficiently rigorous?	Yes
	Findings	Is there a clear statement of findings?	Yes <i>(respondent validation and multiple analysts were used)</i>
	Research value	How valuable is the research?	The research is valuable

---

	Overall risk of bias and directness	Overall risk of bias	Low
		Directness	Directly applicable

## Appendix E – Forest plots

No forest plots were produced for this review question as meta-analysis was not attempted.

## Appendix F –CERQual tables

Theme	Studies	Methodological limitations	Coherence	Adequacy	Relevance	Confidence
Detrimental impact of placement moves and history of placement moves on educational, emotional, mental health, and relational stability. Stability may also improve participation in care processes.	13	<b>No concerns</b> The majority of studies were either low or moderate risk of bias. Studies were mostly marked down for either limited or largely unclear description of their methods of data collection, analysis, and synthesis. Six studies were “low” risk of bias, four were “moderate” risk of bias, and three “high” risk of bias.	<b>No concerns</b>	<b>No concerns</b>	<b>No concerns</b> Three studies (fewer than a third) reported partially indirect evidence (e.g. recruitment likely occurred prior to 2010)	High
Carers benefitted from mutual support and problem-solving among peer groups. And from engaging wider social networks e.g. family. Use of internet systems could help connect social workers and broader foster parent groups.	12	<b>No concerns</b> The majority of studies were either low or moderate risk of bias. Studies were mostly marked down for either limited or largely unclear description of their methods of data collection, analysis, and synthesis. Five studies were “low” risk of bias, four were “moderate” risk of bias, and three “high” risk of bias.	<b>Minor concerns</b> Once study reported the views of a foster carer who received incorrect information or could not relate to other foster carers in a different situation (unaccompanied asylum seekers). Downsides of internet system: impersonal computer systems that need training for use. Upsides, long distance connection, confidentiality,	<b>No concerns</b>	<b>No concerns</b> Three studies (less than a third) reported partially indirect evidence (e.g. recruitment likely occurred prior to 2010)	Moderate

Theme	Studies	Methodological limitations	Coherence	Adequacy	Relevance	Confidence
			streamline booking training, record logs, reduced paper, accessibility			
Resource constraints, high case load, lack of funding led to stretched services, information gaps, and reactive not responsive care (“fire-fighting”). Lower caseloads led to more direct care. Foster carers reported having to fight for resources e.g. an allocated social worker, respite care, or other placement support services. Carers felt that they were not informed of all services available upfront for support. Voluntary organisations were turned to too fill in the gaps left in statutory care.	11	<b>No concerns</b> The majority of studies were either low or moderate risk of bias. Studies were mostly marked down for either limited or largely unclear description of their methods of data collection, analysis, and synthesis. three studies were “low” risk of bias, four were “moderate” risk of bias, and three “high” risk of bias.	<b>Minor concerns</b> Resource constraints were felt to be a problem across the board, however, this manifested in a variety of ways described by included studies. Also studies often did not link these problems directly to placement stability.	<b>No concerns</b>	<b>No concerns</b> Two studies (fewer than a third) reported partially indirect evidence (e.g. recruitment likely occurred prior to 2010)	Moderate
Lack of agency/ input/ inclusion/ information sharing as professionals for foster carers. The opposite was valued. For example, the sharing of background information and details about the child and their history.	10	<b>No concerns</b> The majority of included studies were low risk of bias. six were “low” risk of bias, two were “moderate” risk of bias, and two “high” risk of bias.	<b>Moderate concerns</b> Touched on different aspects e.g. social workers taking advice from carers, informing, and including them. Involvement in transition planning. Some contradictory views e.g. about	<b>No concerns</b>	<b>No concerns</b> Four studies reported partially indirect evidence (e.g. recruitment likely occurred prior to 2010)	Low

Theme	Studies	Methodological limitations	Coherence	Adequacy	Relevance	Confidence
			losing more foster carers who simply want to “care for children” and don’t want more paperwork. And concerns about taking on roles such as sexual health education.			
Availability and reliability of support. Foster carer’s valued accessibility of their link workers, particularly where the matter is urgent. Out of hours availability (safety net) was appreciated and planned respite care (structured pattern of breaks). Calls and text were preferred to email for access. Proactive allocated social workers were appreciated (ones which planned ahead and took initiative with regular contact – “staying in touch”). Absence and delay of action interpreted as lack of care, e.g. delay waiting for mental health services/ interventions which may impact placement stability.	8	<b>No concerns</b> The majority of studies were either low or moderate risk of bias. Studies were mostly marked down for either limited or largely unclear description of their methods of data collection, analysis, and synthesis. Two studies were “low” risk of bias, four were “moderate” risk of bias, and two “high” risk of bias.	<b>Moderate concerns</b> While the direction of this theme was consistent between studies (accessible and proactive care, with few delays was good). The specifics of how this could be delivered (e.g. planned respite, increased administrative support) were variable between studies.	<b>No concerns</b>	<b>No concerns</b> Three studies reported partially indirect evidence (e.g. recruitment likely occurred prior to 2010)	Low

Theme	Studies	Methodological limitations	Coherence	Adequacy	Relevance	Confidence
Flexibility of work, reduced case load, and administrative support could help practitioners be available as and when needed.						
Bespoke care tailored to the specific needs of the child. For example, the usefulness of good placement matching with carers based on personality (“clicking”) or culture/language in the case of UAS (although this was not always necessary, particularly when carers made an effort to bridge the cultural gap). Participants felt the approach of one intervention or type of care for all was not appropriate – e.g. accessible options for those with learning disabilities. Inclusion in decision making was useful to support this.	7	<b>No concerns</b> More than half the included studies were high risk of bias. Studies were mostly marked down for either limited or largely unclear description of their methods of data collection, analysis, and synthesis. Two studies were “low” risk of bias, one was “moderate” risk of bias, and four “high” risk of bias.	<b>Minor concerns</b> The principle of bespoke care was consistently stressed, however, the need to “match” carers by similar characteristics was not always considered necessary.	<b>No concerns</b>	<b>Minor concerns</b> Five studies (more than a half) reported partially indirect evidence (e.g. recruitment likely occurred prior to 2010)	Low
LACYP wished to be included in, listened to, and supported in decision making processes (shared decision making). Failing to do so had implications	8	<b>No concerns</b> The majority of studies were either low or moderate risk of bias. Studies were mostly marked down for either limited or largely unclear description	<b>Moderate concerns</b> The variety of ways LACYP may be assisted in shared decision making made the theme less	<b>No concerns</b>	<b>No concerns</b> One study (fewer than a third) reported partially indirect evidence (e.g. recruitment likely	Low

Theme	Studies	Methodological limitations	Coherence	Adequacy	Relevance	Confidence
for placement stability. Unsuccessful attempts to influence events resulted in apathy and disengagement from care processes. For example, review meetings were aided by good preparation, direct questions, space in the meeting to check understanding and for the LACYP to be heard, and agency with decisions such as location and time of review meetings. At a higher level, children in care councils were used to influence policy, structural change, and recruitment. However, failure to recruit hard to reach groups and financial concerns were a barrier to these. Children with a lack of agency may try to control their environments by other means e.g. behavioural problems.		of their methods of data collection, analysis, and synthesis. two studies were “low” risk of bias, one was “moderate” risk of bias, and three “high” risk of bias.	coherent. Agency was broadly seen as a good thing although with some push back that a looked after child may not always know what is in their own best interest. The relevance of this theme to placement stability is indirect.		occurred prior to 2010)	
Importance of better multiagency working and information sharing. For example: proper incorporation of advocacy services into review	5	<b>No concerns</b> The majority of studies were either low or moderate risk of bias. Studies were mostly marked down for either limited or largely unclear description	<b>Minor concerns</b> Most studies reported the benefits of increased multiagency working and information	<b>No concerns</b> Only five studies contributed to this theme	<b>No concerns</b> One study (fewer than a third) reported partially indirect evidence (e.g. recruitment likely	Moderate

Theme	Studies	Methodological limitations	Coherence	Adequacy	Relevance	Confidence
meetings, sharing of information between social workers and IROs to aid preparation for review meetings, shared information between social workers and link workers. For groups where specialist knowledge was needed, the need for a worker or team with specialist knowledge to contact was suggested (e.g. unaccompanied asylum seekers). However, inappropriate use of voluntary services was a fear.		of their methods of data collection, analysis, and synthesis. One study was “low” risk of bias, three were “moderate” risk of bias, and one “high” risk of bias.	sharing, however, an example of the inappropriate use of voluntary services to fill in the gaps left by deficient social services was raised.		occurred prior to 2010)	
Upon arrival UAS experienced a series of bewildering and destabilising systems of surveillance and control. For many, learning English was a starting point to order, routine and security which enabled more control e.g. solicitors, healthcare, education. For carers, bridging the communication barrier was important. Other areas of need included – cultural needs (religion and food);	3	<b>Minor concerns</b> The majority of studies were moderate risk of bias. Studies were mostly marked down for either limited or largely unclear description of their methods of data collection, analysis, and synthesis. Two studies were “moderate” risk of bias, and one “high” risk of bias.	<b>Moderate concerns</b> Studies touched on many aspects of caring for unaccompanied asylum seekers. However, it was consistent that unaccompanied asylum seekers were found to be a very distinctive group for whom training and information was needed both for	<b>Minor concerns</b> Only three studies contributed to this theme	<b>Minor concerns</b> Two studies (over one half) reported partially indirect evidence (e.g. recruitment likely occurred prior to 2010)	Very Low

Theme	Studies	Methodological limitations	Coherence	Adequacy	Relevance	Confidence
needs related to adjusting to life in England (e.g. learning to use a new currency and engaging in the English education system); advocacy needs often related to accessing services; needs pertaining to the asylum seeking process, (including recovery from trauma, emotional support and practical assistance to attend appointment). The needs of asylum seeking children were felt to be considerably different to those of other looked after children so carers felt the need for training (which could be as little as one day). Information was also lacking, even from social workers who had little expertise themselves. There was a need for an information network for fostering UAS.			carers and support workers.			
Preference for residential care in some cases. "Everyone has something in common." This was a concept which linked to looked after children's	2	<b>Major concerns</b> Both studies were high risk for bias, this was largely because of poor description of methods, recruitment, and data analysis.	<b>Minor concerns</b> One study merely touched on the positive outcomes occurring as a result of residential care.	<b>Moderate concerns</b> Only two studies contributed to this outcome	<b>Minor concerns</b> One of these studies (over half) came from partially indirect evidence	Very Low

Theme	Studies	Methodological limitations	Coherence	Adequacy	Relevance	Confidence
preferences being taken into account (shared decision making) when planning placements.						
Usefulness of respite support for carers.	2	<b>Minor concerns</b> Both studies were either high or moderate risk of bias, this was largely because of poor description of methods, recruitment, and data analysis.	<b>No concerns</b>	<b>Moderate concerns</b> Only two studies contributed to this theme	<b>Minor concerns</b> One of these studies (half) came from partially indirect evidence	Very Low
Information gap between LACYF and carers lead to apathy, e.g. with looked after children review meetings. Knowledge of the reason for reviews, decisions made, and the roles of the professionals involved was useful for participation.	3	<b>No concerns</b> One study was low risk of bias, another study was moderate risk of bias. This study did not make methods for data collection or data analysis clear.	<b>No concerns</b>	<b>Moderate concerns</b> Only two studies contributed to this theme	<b>No concerns</b> No indirect evidence	Low
The primacy of the natural family for carers, despite the desire to treat foster child "as one of own". Benefit of careful matching of existing birth children to foster placement (e.g. older/younger child). Shared decision making that includes the birth child. Rivalry for attention between foster child and	2	<b>No concerns</b> One study was low risk of bias, another study was moderate risk of bias. This study did not make methods for data analysis clear.	<b>No concerns</b>	<b>Moderate concerns</b> Only two studies contributed to this theme	<b>No concerns</b> No indirect evidence	Low

Theme	Studies	Methodological limitations	Coherence	Adequacy	Relevance	Confidence
birth child, and need for different parenting techniques, deteriorating relationship between carer and birth children - a source of feeling overwhelmed. Implications for placement stability. Positive changes could also occur for existing family relationships as a result of fostering.						
<p><b>Unique stresses for carers in parent-and-child placements</b></p> <p>Most of these stresses were associated with the tension inherent in the role, between nurturing a vulnerable mother and contributing to the assessment which decides whether she will leave with her child. Every carer and social worker cited times when, either implicitly or explicitly, the outcome of assessments had been decided by the LA before placing the mother-and-child, with the placement merely satisfying court proceedings. The desire to</p>	1	<p><b>No concerns</b></p> <p>One study which was low risk of bias</p>	<b>No concerns</b>	<p><b>Serious concerns</b></p> <p>Only one study contributed to this theme</p>	<p><b>No concerns</b></p> <p>No indirect evidence</p>	Very Low

Theme	Studies	Methodological limitations	Coherence	Adequacy	Relevance	Confidence
<p>advocate for a mother whom the carer felt needed additional time and therapeutic input to develop “good enough parenting” skills was a huge source of stress, and the feelings of powerlessness that accompanied this were problematic. For other carers, very deep issues were raised by their involvement with such troubled families; one couple talked about their 18-year-old son having a breakdown a year after a baby left the family for adoption. Another older carer talked about the pain she experienced when a baby moved on to adoption at 4 months. Aspects of training for this role that carers would have welcomed included: How to manage endings—when a baby is removed; Sharing logs with mothers in a positive way; Working with mothers with learning disabilities and autism.</p>						

## **Appendix G – Economic evidence study selection**

This question was not considered in the review of existing economic studies given its focus on qualitative evidence.

## **Appendix H – Economic evidence tables**

No economic evidence was identified for this review question.

## **Appendix I – Health economic model**

No economic modelling was undertaken for this review question.

## Appendix J – Excluded studies
