

## **Older people with social care needs and multiple long term conditions**

### **Appendix B: Critical appraisal and findings tables**

## **Critical appraisal tables**

### ***Review questions***

2.1.1 Assessment and planning of care of older people with multiple long-term conditions (LTCs): What are the effects (benefits and harms) of different types of assessment and planning of personalised care on outcomes for older people with multiple long-term conditions and their carers?

2.1.2 Service delivery: What are the existing frameworks, models and components of care packages for managing multiple LTCs and what outcomes do they deliver?

2.1.5 Self-management support: How effective are different types of support for older people to enable them to self-manage (aspects of) their own conditions?

2.1.6 Social isolation: How can older people with multiple LTCs living in the community or in care home settings be supported to participate in community, family and social activities?

**Battersby M, Harvey P, Mills P, Kalucy E, Pols R, Frith P, McDonald P, Esterman A, Tsourtos G, Donato R, Pearce R, McGowan C, (2007) SA Health-Plus: a controlled trial of a state-wide application of a generic model of chronic illness care**

Research question/study aims	Study design/theoretical approach	Data collection.	Analysis and reporting	Quality assessment
<p>'SA HealthPlus, one of 9 national Australian coordinated care trials, addressed chronic illness care by testing whether coordinated care would improve health outcomes compared with usual care' (p37)</p> <p>Components included – care planning: patient-defined problems and goals, evidence-based guidelines. Goodman C, Drennan V, Manthorpe J, et al (2012) A study of the effectiveness of inter-professional working for community-dwelling older people – final report

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Data collection	Analysis and reporting	Quality assessment
<p>To examine ‘the effectiveness of interprofessional working (IPW) in primary and community care for older people with multiple health and social care needs. It aimed to:</p> <ul style="list-style-type: none"> <li>- Identify appropriate measures of effectiveness from user, professional and organisational perspectives for IPW</li> <li>- ‘Investigate the extent to which contextual factors ... influence the sustainability and effectiveness of IPW and patient, carer and professional outcomes’ (p19)</li> </ul>	<p><b>Methodology</b> Mixed methods</p> <p>Phase 1</p> <ul style="list-style-type: none"> <li>- Systematic review</li> <li>- Exploratory interviews with older people, carers and health and social care providers</li> <li>- A national survey</li> <li>- Consensus event with stakeholders</li> </ul> <p>Phase 2</p> <ul style="list-style-type: none"> <li>- Case studies of three models of IPW for community dwelling older people</li> </ul> <p><b>Is the integration of qualitative and quantitative data (or results) relevant to address the research question?</b></p> <ul style="list-style-type: none"> <li>• Yes</li> </ul>	<p><b>Are the sources of qualitative data (archives, documents, informants, observations) relevant to address the research question?</b></p> <ul style="list-style-type: none"> <li>• Yes: Interviews and case studies</li> </ul> <p><b>Is the mixed methods research design relevant to address the qualitative and quantitative research questions (or objectives), or the qualitative and quantitative aspects of the mixed methods question?</b></p> <ul style="list-style-type: none"> <li>• Yes Mixed methods in this case include qualitative interviews and case studies, a survey of practitioners and a systematic review (Trivedi 2013)</li> </ul>	<p><b>Is the process for analysing qualitative data relevant to address the research question?</b></p> <ul style="list-style-type: none"> <li>• Yes Triangulation with other data sources, and a consensus event to review findings from all strands of methodology</li> </ul> <p><b>Is appropriate consideration given to how findings relate to the context, such as the setting, in which the data were collected?</b></p> <ul style="list-style-type: none"> <li>• Yes Community services and people living in community</li> </ul> <p><b>Is appropriate consideration given to how findings relate to researchers’ influence; for example, though their interactions with participants?</b></p> <ul style="list-style-type: none"> <li>• Unclear</li> </ul>	<p><b>Internal validity</b></p> <ul style="list-style-type: none"> <li>• +</li> </ul> <p><b>Is the setting similar to the UK?</b></p> <ul style="list-style-type: none"> <li>• Yes All qualitative and survey data derived from UK</li> </ul>

Older people with social care needs and multiple long-term conditions: Appendix B

		<p><b>Response rate</b>          The sample size for interviews with older people and carers was small (18). The online survey of professionals was circulated to 292 organisations, 142 LAs and 150 trusts. The response rate of 91 (31%) was disappointing</p>	<p><b>Is appropriate consideration given to the limitations associated with this integration, such as the divergence of qualitative and quantitative data (or results)?</b>          Yes.          The systematic review could not produce a meta-analysis, and reported more on the type of IPW than the effectiveness, because the evidence was weak.           Because of this, and because the perspective of the qualitative work was to prioritise older people's perspectives, there appears to be no conflict in the synthesis of findings.</p>

			<p>(++) (good quality)</p> <p>Comparison groups, study size and follow-up period and rates varied considerably and not all studies provided power calculations</p> <p>The review says little about social care organisation and delivery in relation to IPW</p> <p>The material is largely not contemporary, and not from a UK settings. Some of the populations included are very specific to particular circumstances. Insufficient evidence on context is available</p> <p>A large range of outcomes (e.g. mortality, clinical, acute service use, QoL, mental state, satisfaction and reduction in caregiver burden) and very varied quality of the studies prevented meaningful synthesis</p>	<p>IPW rarely includes social care component</p> <p><b>Is there a clear focus on older adults?</b></p> <ul style="list-style-type: none"> <li>• Yes</li> </ul> <p><b>Is the intervention clearly relevant to social care for OPwLTCs?</b></p> <ul style="list-style-type: none"> <li>• No</li> </ul> <p>Insufficient attention to social and personal care given</p> <p><b>Are the outcomes relevant?</b></p> <ul style="list-style-type: none"> <li>• Yes</li> </ul> <p><b>Does the review have a UK perspective?</b></p> <ul style="list-style-type: none"> <li>• No</li> </ul>

## **Findings tables**

### ***Review questions***

2.1.1 Assessment and planning of care of older people with multiple LTCs: What are the effects (benefits and harms) of different types of assessment and planning of personalised care on outcomes for older people with multiple LTCs and their carers?

2.1.2 Service delivery: What are the existing frameworks, models and components of care packages for managing multiple LTCs and what outcomes do they deliver?

2.1.5 Self-management support: How effective are different types of support for older people to enable them to self-manage (aspects of) their own conditions?

2.1.6 Social isolation: How can older people with multiple LTCs living in the community or in care home settings be supported to participate in community, family and social activities?

**Battersby M, Harvey P, Mills P, Kalucy E, Pols R, Frith P, McDonald P, Esterman A, Tsourtos G, Donato R, Pearce R, McGowan C (2007) SA Health-Plus: a controlled trial of a state-wide application of a generic model of chronic illness care**

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p>‘SA Health Plus, 1 of 9 national Australian coordinated care trials, addressed chronic illness care by testing whether coordinated care would improve health outcomes compared with usual care’ (p37) Components included: care planning: patient-defined problems and goals, evidence-based guidelines. coordination and the continuous learning framework, training and supervision – The Coordinated Care</p>	<p><b>Methodology</b> RCT</p> <p><b>Intervention</b> • Case management The main purpose of the trials was to ‘develop and test different service delivery and funding arrangements, and to determine the extent to which the coordinated care model contributes to: • Improved client outcomes • Better delivery of services, which are individually and collectively more responsive to the clients’ assessed needs</p>	<p><b>Country</b> Australia</p> <p><b>Population?</b> • Older people receiving healthcare, possibly social care</p> <p><b>Source population demographics</b> • Sex Male. 47% intervention group 48% control group and average across all areas</p> <p><b>Sample</b> • Comparison numbers – 1,488 • Intervention number – 3,115</p>	<p>The two-year trial was not able to demonstrate a sufficient reduction in hospital admissions to pay for the costs of coordinated care. The individual health and well-being of some patients with chronic and complex conditions can be improved through patient-centred care involving GPs working with a service coordinator and using the P&amp;G approach and a structured evidence-based care plan</p> <p><b>Barriers and facilitators to implementation</b> It was found that services needed to be coordinated and that service coordinator was a desirable role and one which needed to be created in health provision The person in this role needed to be able to work across sectors and ‘utilize behavioural change skills proved to be critical to the trial’s benefits’ (p63). A coordinator may be able to target coordinated care and help those who were frequently hospitalised to improve self-management skills</p> <p><b>Narrative and impact findings</b> • Personalised care The mid-trial review found that a personalised model of care assisted by a service coordinator was successful in affecting behavioural change in patients around self-care</p> <p><b>Outcomes – costs and consequences</b> • Yes ‘Preventable admissions accounted for 36% of the cost of all</p>	<p><b>Internal validity</b> • + <b>External validity</b> • +</p>

**Challis D, Abendstern M, Clarkson P, Hughes J, Sutcliffe C (2010b) Comprehensive assessment of older people with complex care needs: the multi-disciplinarity of the Single Assessment Process in England**

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p>This study seeks to 'ascertain the degree and nature of comprehensive assessment across England ... It attempts to address whether the multidisciplinary comprehensive assessment practice that emerged corresponded to the policy logic that was its instigation' (p5)</p>	<p><b>Methodology</b> Survey</p> <p><b>Intervention</b> Multidisciplinary or Single Assessment Process (SAP)</p>	<p><b>Country</b> UK Local authorities</p> <p><b>Sample size</b> 122 of 150 surveys completed (82%).</p>	<p>Nurses, social workers and care managers (who may be either) are most commonly involved in SAP</p> <p>Overall, medical consultants, general practitioners, occupational therapists and housing officers were less frequently involved in multidisciplinary comprehensive assessments than social workers/care managers</p> <ul style="list-style-type: none"> <li>• Medical consultants were most frequently involved (in 40% of the authorities) in assessments for placement in a care-home-with nursing</li> <li>• Occupational therapists were most likely to be involved in assessments for intermediate care (25%)</li> <li>• Social workers/care managers were involved in the majority of local authorities for placements in care homes or care homes-with-nursing and for intensive domiciliary care, but less so for intermediate care</li> <li>• Nurses were most frequently involved in assessments for care-homes-with-nursing (77%)</li> </ul>	<p><b>Results can be generalised?</b> Yes, but only apply to 2005–6</p> <p><b>Appropriate attempts made to establish 'reliability' and 'validity' of analysis?</b> The findings are mutually consistent</p> <p><b>Conclusions justified?</b> Yes</p>

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			<p>If multidisciplinary (is defined as) as 3 or more professionals involved in an assessment, it is notable that it occurred in only 1 sector, placements in care-home-with-nursing</p> <p>The analysis reveals that medical practitioners (either consultants or general practitioners) were rarely involved in assessments for other care arrangements. For intermediate care, where the responsibility for the assessment was vested in a single professional, this was just as likely to be a social worker/care manager as a nurse. This contrasts with placements in the care home sector where, if undertaken by a single professional, he or she was most likely a social worker/care manager</p> <p>These within-sector associations tentatively indicated the existence of some grouping of the local authorities in terms of the level of multidisciplinary working. Where particular professionals were involved, one could discern whether they worked with other professionals or largely on their own in a particular sector</p> <p>Table 3 summarises of who assessed with whom and in which setting (p9):</p> <ul style="list-style-type: none"> <li>• Social workers: mainly involved in 3 of the 4 considered settings (domiciliary care, care homes and care-homes-with-nursing), often assessed alone except for in care-homes-with-nursing</li> <li>• Nurses: usually assessed as single professionals for intermediate care and with social workers for care-homes-with-nursing. Little involved in assessments for other settings</li> </ul>	

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			<ul style="list-style-type: none"> <li>• Medical consultants: generally not involved except for care-homes-with-nursing</li> <li>• General practitioners, occupational therapists and housing officers: largely not involved in any setting</li> </ul> <p>There was little evidence of multidisciplinary team working – single, then 2-person assessments were most common. Data is from 2005–6, but shows that SAP is largely not integrated or multidisciplinary. It is unclear if this might be better promoted through different structures, like cross-agency working</p>	

**Counsell S, Callahan, C, Clark D, Tu W, Buttar A, Stump T, Ricketts G (2007) Geriatric case management for low-income seniors: a randomised controlled trial**

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p><b>Study aim</b> ‘To test the effectiveness of a geriatric care management model (GRACE) on improving the quality of care for low-income seniors in primary care (p2623)</p>	<p><b>Methodology</b> • RCT including cluster</p> <p><b>Intervention</b> • Case management Geriatric Resources for Assessment and Care of Elders</p>	<p><b>Country</b> • USA</p> <p><b>Population?</b> Older people living in the community Older people receiving healthcare, possibly social</p>	<p>The GRACE patients made significant improvements compared with usual care patients at 24 months in four of eight SF-36 scales: general health, vitality, social functioning and mental health No group differences were found for activities of daily living or death The cumulative two-year emergency department visit rate per 1000 was lower in the intervention group but hospital admission rates per 1000 were not significantly different between groups ‘At 24 months, overall satisfaction with care was not</p>	<p><b>Internal validity</b> • ++ Appears to be competent on all counts. However, ‘The results of this trial may not be generalizable to different groups of older persons (e.g., those of higher</p>

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
	<p><b>Outcomes</b> Primary outcome measure was the incidence of a major depressive disorder or anxiety disorder during a period of one year (Mini International Neuropsychiatric Interview)</p>	<p>Participants did not meet the diagnostic threshold for depressive or anxiety disorder, but met a minimum score of 8 on the Centre for Epidemiological Studies Depression Scale <b>Sample size</b> N=185</p>	<p>opposite direction, with those participating in the programme reporting around 30% more anxiety disorders than those in the control group. The authors hypothesise that this may in part be because treatment for depression is more developed and tested than those for anxiety, especially in older people. It is also worth noting that the dropout rate for the intervention group was higher than the control groups, which may indicate the intervention was too onerous or otherwise not acceptable to the participants</p>	

**Glendinning C, Arksey H, Jones K, Moran N, Netten A (2009) The individual budgets pilot projects: impact and outcomes for carers**

Research question/study aims.	Study design/theoretical approach.	Population, sample and setting.	Findings (including effect sizes or outcome measures).	Overall quality assessment.
<p>The study aimed to identify the impact and outcomes of IBs on (hitherto) unpaid relatives and other informal carers. Specific questions addressed by the research are:</p> <ul style="list-style-type: none"> <li>• What changes occur in the levels and types of support provided by informal carers following the award of an IB?</li> <li>• Are any patterns identifiable in these changes, for example, among particular groups of carers or among carers</li> </ul>	<p><b>Methodology</b> Structured outcome interviews with carers of people randomised to the IB group and comparison group respectively. Interviews were designed to compare outcomes for carers of people with and without an IB.</p> <p>These interviews used the same outcome measures as the main IBSEN evaluation, plus an additional measure to assess the impact of the care-giving role. Carer demographic information was collected during the interviews. The interviews with</p>	<p><b>Country</b> • UK</p> <p><b>Population?</b> • Carers of older people as well as other groups • Administrators, commissioners, managers</p> <p><b>Sample</b> • Comparison numbers 60 were in IB group, 69 in control. 33 (16 in IB, 17 in non-IB) were carers of older people</p>	<p><b>Findings</b> Views of users, carers, practitioners IB group carers were significantly more likely to have planned support together with the service user than comparison group carers 'None of the carers taking part in the semi-structured interviews had had a separate assessment of their own needs. Nevertheless they reported that in the service user's IB assessment their own needs and circumstances were more likely to be recognised and taken into account' (p71)</p> <p>• <b>Barriers and facilitators to implementation</b> The study showed that some IB sites struggled to integrate the interests of carers but they did improve. The sites varied in their consideration of carer needs. Carers sometimes felt that the focus was too much on the service users and not enough on carers needs. Team leaders agreed that the pressure of implementation meant that carers needs were excluded</p> <p><b>Views of users, carers, practitioners</b> Interviewees commented on the cost of caring and the sources of support to be gained from IBs. 'The average value of funding through IBs for the service users whose carers took part in this study was £270 (median £170) per week, compared with the costs of conventional service packages of £390 (median £350) in the comparison group.</p>	<p><b>Internal validity</b> • +</p> <p><b>Overall assessment of external validity</b> • +</p>

Older people with social care needs and multiple long-term conditions: Appendix B

<p>supporting particular groups of service users?                      • Do IBs affect the well-being and quality of life of carers, compared with carers (and service users) who receive conventional services? If so, in what ways for which groups of carers? (p.9)</p>	<p>carers were conducted after the main IBSEN study had been completed</p> <p><b>Intervention</b>                      IBs                      The study focused on the ‘two largest groups of carers likely to be affected by IBs: carers of older people and carers of people with learning disabilities’ (p12)                      The study looks at nine of the original pilot sites.</p> <p><b>Is this a linked study?</b>                      Glendinning (2008) (Final report of the IBSEN pilots)</p>		<p>‘It appeared that expenditure on services that could provide respite for carers was higher in the IB group than in the comparison group’ (p57)                      ‘Only 14 per cent (six) carers and five other friends and relatives in the structured interview sample were identified as receiving payments from the service user’s IB’ (p58)                      50% of carers said that accepting payment would not be appropriate, even though half the sample were receiving carer’s allowance</p> <p>From the interviews data it appears that positive outcomes resulted from carers having ‘more choice and control over how they spent their time’ (p84) and in relation to their working lives                      ‘Both the benefits and the limitations of IBs appeared to be associated with the level of flexibility that was afforded to carers’ (pp84–5)                      Some carers felt that the IB process had been more holistic and had taken a broader perspective on the needs of people and their carers (p89)</p> <p><b>What works well</b>                      Carers seem to have been empowered by IBs and expressed satisfaction with the arrangements.                      ‘Two-thirds of carers reported having changed their views on what could be achieved in their lives following the offer of an IB to the person they were supporting’ (p89)                      Multivariate analyses of the data suggested that the intervention can be linked to positive impacts on carers’ quality of life, social care outcomes and psychological well-being. (p89)</p>	

Research question/study aims.	Study design/theoretical approach.	Population, sample and setting.	Findings (including effect sizes or outcome measures).	Overall quality assessment.
			<p><b>Caregiver satisfaction</b>                      ‘There were high levels of satisfaction among carers with the value of the IB and how it was paid; and a suggestion of higher levels of satisfaction with support planning compared to conventional care planning’ (p71)</p> <p><b>What can be improved</b>                      The interview data showed that carers of those in the IB group were often more involved in the assessment and planning of the recipients care than a conventional service. Some carers saw this as a positive, but others said that their concerns had been ignored in the support planning process, leading to negative feelings about the service.                      ‘For some older people, the benefits of IBs are experienced as much by carers as by the service user’ (pp90–1)                      ‘For many carers, the IB had created more paperwork and management responsibilities’ (p71). These problems related to a ‘lack of clarity over how the IB could be used; or to support plans that failed to materialise’ (p71)</p> <p><b>Other Impacts</b>                      IBs were shown to be associated with positive impacts on carers:                      - Quality of life, social care outcomes and psychological wellbeing                      ‘Carers of IB users scored higher than carers of people using standard social care services; the difference between the 2 groups of carers was statistically significant in relation to carers’ quality of life’ (p89)                      The COPE index was used to measure the impact of the</p>

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			<ul style="list-style-type: none"> <li>• A study of good quality (Banerjee et al 1996) found an effect on depression from a psychogeriatric team</li> <li>• The Senior Care Connection Model in Sommers (2000) had no overall effect on patient health outcomes</li> </ul> <p>Overall the review found that patients which had more contact with professionals like nurses and social workers had improvements in function. Epstein (1990) found an effect on function at three months. Burn (2000) reported fewer impairments in IADL, improved QoL and cognitive health at follow-up. Phelan found an impact on ADL at 12-month follow-up but this had dropped off by 24-month follow-up.</p> <p>Boult et al (2001) looked at GEM and found that the intervention group lost less functional ability and had less health-related restrictions in ADL. Overall GEM studies had mixed results. Some found no positive impacts (Epstein et 1990; Silverman 1995) and poor results relating to satisfaction. Two studies reported improved reporting improved satisfaction: Morishita (1998) and Engelhardt (1996). Patients reported satisfaction with home palliative care and a good quality study of home palliative care found the users of this were more likely to die at home (Brumley 2007)</p> <p><b>Case management</b></p> <p>Studies focused on interventions that targeted mainly older women with some limitations in ADL, recent discharge and/or high service use</p> <p>There was no evidence of reduced mortality; poor quality studies showed no significant health outcomes except for reduced depression in Geriatric Care Management Model</p>	

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			<p>(p118)</p> <p><b>Conclusions</b>                      There is weak evidence of effectiveness and cost-effectiveness for IPW, although well-integrated and shared care models improved processes of care and have the potential to reduce hospital or nursing/care home use. Study quality varied considerably and high quality evaluations as well as observational studies are needed to identify the key components of effective IPW in relation to user-defined outcomes. Differences in local contexts raise questions about the applicability of the findings and their implications for practice. Trivedi's updated search of systematic reviews since 2008 confirmed sustained interest in IPW and a continuing desire to understand how the components and characteristics of IPW affect outcomes</p>	

## **Critical appraisal tables**

### ***Review questions***

1.1.1 Service users and carers: What are the views and experiences of older people with multiple LTCs and their carers, of the social care services they receive?

1.1.2 Service users and carers: Do service users and carers consider that their care is (a) personalised; (b) integrated or coordinated with healthcare?

1.1.3 Service users and carers: What do they think works well and what needs to change?

1.2.1 Practitioners, managers and commissioners: What are the views and experiences of practitioners, managers and commissioners in health and social care who procure, manage or deliver care to older people with multiple LTCs in community and care home settings?

1.2.2 Practitioners, managers and commissioners: What do they think works well, and what needs to change?

**Abraham C, Gardner,B (2009) What psychological and behaviour changes are initiated by ‘expert patient’ training and what training techniques are most helpful?**

Research question/study aims	Study design/theoretical approach	Data collection	Analysis and reporting	Quality assessment
<p><b>Study aim</b>                      ‘The Expert Patient Programme (EPP) is a lay-led, group-based, self-management training course available through the UK NHS for persons with long-term health conditions. Thirty-two patients who attended EPP courses in East London were interviewed about their experiences ... Thematic analysis was used to theorise and organise participants’ accounts, identifying commonly reported changes, helpful techniques and disappointments and frustrations’ (p1153)</p>	<p><b>Methodology</b>                      • Qualitative study                      Interviews</p>	<p><b>How defensible/rigorous is the research design/methodology?</b>                      • Defensible</p> <p><b>How well was the data collection carried out?</b>                      • Somewhat appropriately</p> <p><b>Is the context clearly described?</b>                      • Clear</p> <p><b>Was the sampling carried out in an appropriate way?</b>                      • Somewhat appropriate</p> <p>It is unclear how Tower Hamlets PCT identified the 54 people from whom the sample arose</p> <p><b>Were the methods reliable?</b>                      • Somewhat reliable</p> <p><b>Study approved by ethics committee?</b>                      • Yes</p> <p><b>How clear and coherent is the reporting of</b></p>	<p><b>Are the data ‘rich’?</b>                      • Rich</p> <p><b>Is the analysis reliable?</b>                      • Reliable</p> <p><b>Are the findings convincing?</b>                      • Convincing</p> <p><b>Are the conclusions adequate?</b>                      • Somewhat adequate</p>	<p><b>As far as can be ascertained from the paper, how well was the study conducted?</b>                      • +</p> <p><b>Relevance to the older people with multiple LTCs</b>                      • Somewhat relevant                      Not all sample were older people, and some had single conditions. The study is too small to adequately separate out views and experiences of our target population</p>

	(included 37 RCTs and concluded 'adherence increased with behavioural interventions which reduced dosing demands')	studies are 1997 to 2007 (however, this topic is probably not that susceptible to change). 16 of the 30 studies included are within our date range (2004–7)	• Yes Relevant to self-management	

**Blickem C, Kennedy A, Vassilev I, Morris R, Brooks H, Jariwala,P, Blakeman T, Rogers A (2013) Linking people with long-term health conditions to healthy community activities: development of Patient-Led Assessment for Network Support (PLANS)**

Research question/study aims	Study design/theoretical approach	Data collection	Analysis and reporting	Quality assessment
'To combine insights from service users with long-term conditions (LTCs) to assist the development of a community referral intervention designed to promote engagement and improve access to health-relevant resources' (p1)	<p><b>Qualitative study</b> Focus groups and interviews with members of community groups about personal and community networks. Five focus groups (to gather perspectives) and 6 participatory workshops (to test the PLANS tool), plus 8 interviews with members of the PPI group</p> <p><b>Is a qualitative approach appropriate?</b> Appropriate for gathering the views and experiences</p>	<p><b>How well was the data collection carried out?</b> Appropriately Focus groups and workshops were with recorded in field note form or recorded</p> <p><b>Is the context clearly described?</b> Unclear There is not detail of the total number of elderly people with LTCs living in the area. We also learn nothing about those not accessing services locally</p>	<p><b>Are the data 'rich'?</b> Mixed Some direct quotes. Data was disseminated and coded and key themes extracted. The findings remain thematic rather than in depth</p> <p><b>Is the analysis reliable?</b> Findings may be biased towards those who already use community resources instead of promoting resource use to those that do not. Limited age range: no very old participants.</p>	<p><b>Relevance to the older people with multiple LTCs</b> A bit relevant</p> <p><b>As far as can be ascertained from the paper, how well was the study conducted? +</b> Some interesting findings and a clear structure. Some transparency about limitations is useful, some serious limitations in describing the locale and available services</p>

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Data collection	Analysis and reporting	Quality assessment
	<p>of individuals with LTCs. The study aimed to involve service users in the development of the piloting and evaluation of a tool to aid participation and access to services</p> <p><b>Is the study clear in what it seeks to do?</b> Mixed The study was designed to use views to help create an intervention to encourage engagement and improve access to health relevant resources. Participants were already using community resources. We don't know what community resources are available, or who the hard to reach groups might be</p> <p><b>How defensible/rigorous is the research design/methodology?</b> Purposive sampling – not representative The second in-depth interviews were less representative of the</p>	<p>nor how many people access services in the area</p> <p><b>Was the sampling carried out in an appropriate way?</b> Mixed The sampling is not representative in terms of diversity</p> <p><b>Were the methods reliable?</b> Somewhat reliable Discussion between researchers on themes and meanings. Focus groups recorded and transcribed. Questionnaire informed by focus groups findings and triangulated with items in the Health Education Impact Questionnaire</p> <p><b>Is the role of the researcher clearly described?</b> Clearly described</p>	<p>A community capacity audit was conducted by internet searches with small number of search terms</p> <p><b>Are the findings convincing?</b> Somewhat convincing Not certain to what degree a web-based list of community activities and resources would be helpful for all older people with multiple LTCs. Tool also intended for use by commissioners and practitioners with referral responsibilities</p> <p><b>Are the conclusions adequate?</b> Somewhat adequate The paper offers a preliminary look at how services may be accessed by old people and one possible tool. Follow-up data on the success of this tool would be essential if it were to be evaluated</p>

## **Findings tables**

### ***Review questions***

1.1.1 Service users and carers: What are the views and experiences of older people with multiple LTCs and their carers of the social care services they receive?

1.1.2 Service users and carers: Do service users and carers consider that their care is (a) personalised; (b) integrated or coordinated with healthcare?

1.1.3 Practitioners, managers and commissioners, service users and carers: What do they think works well and what needs to change?

1.2.1 Practitioners, managers and commissioners: What are the views and experiences of practitioners, managers and commissioners in health and social care who procure, manage or deliver care to older people with multiple LTCs in community and care home settings?

1.2.2 What do they think works well, and what needs to change?

**Abraham C, Gardner B (2009) What psychological and behaviour changes are initiated by ‘expert patient’ training and what training techniques are most helpful?**

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p><b>Study aim</b> ‘The Expert Patient Programme (EPP) is a lay-led, group-based, self-management training course available through the UK National Health Service for persons with long-term health conditions. Thirty-two patients who attended EPP courses in East London were interviewed about their experiences ... Thematic analysis was used to theorise and organise participants’ accounts, identifying</p>	<p><b>Methodology</b> • Qualitative study</p> <p><b>Intervention</b> • Self-care support</p> <p>‘An EPP course comprises six weekly structured self-management training sessions delivered to groups of 8–16 patients with heterogeneous health conditions, led by volunteer lay tutors with chronic health conditions ... Patients receive a self-help manual (entitled ‘Living a healthy life with chronic conditions’). The programme provides information and employs a variety of</p>	<p><b>Country</b> • UK</p> <p><b>Population?</b> • Other People who had attended an EPP course, derived from primary care trust records in East London</p> <p><b>Sample</b> Five male and 27 female</p> <p><b>Sample Age</b> 33–79 years, mean age 56.9 years. 14 of the 32 patients were 65 or older</p> <p><b>Ethnicity</b> 20 of the 32</p>	<p><b>Views of users, carers, practitioners</b> Respondents reported challenges of coping with chronic conditions: there was a strong sense of frustration over inability to function, and loss of social confidence leading to social isolation</p> <p><b>Information</b> EPP is designed to disseminate information in group sessions and via the course manual. Although some respondents thought the information was too basic, others found it useful to know about community services, and be reminded of past activities which might still be possible. In general, information provided face-to-face and in group sessions was preferred to written information. Support and instruction on exercise and diet was found useful, especially when personal goal-setting was involved</p> <p>‘The empathetic social context allowed participants not only to understand one another but to establish explicitly shared understandings thereby providing social validation which was seen by many as crucial to improved coping ... social sharing of experiences, social comparisons, social validation and developing empathy created an interpersonal context in which participants felt understood and emotionally supported’ (p1159)</p> <p><b>Goal-setting</b></p>	<p><b>As far as can be ascertained from the paper, how well was the study conducted?</b> • +</p> <p><b>Relevance to the older people with multiple LTCs</b> • Somewhat relevant Not all sample were older people, and some had single conditions. The study is too small to adequately separate out views and experiences of our target population</p>

		<p>Community centre group N=5 (mixed health complaints)</p> <p><b>Gender</b>                      Stage 1 focus groups 2 x all male - 2 x mixed, 1 x female 1 x mainly female                      Stage 2 interviews: 6/8 male, 2/8 female</p> <p><b>Ethnicity</b> 1st stage focus groups: 3 x all white 2 x mixed 1 x all Afro-Caribbean</p>	<p>atmosphere. Groups were seen as a chance to discuss lifestyle and health, share tips and vent frustrations. Participants reported a new a sense of purpose. This community participation was felt to be a motivating factor to be positive about themselves, their lives and their health</p> <p><b>What can be improved</b>                      Participants of the focus groups stated that transport, or a lack of it, could be a key barrier to participation in community activities. Deprived communities might lack the resources to hold community groups. The socially isolated may also lack the connections within their communities to find out about resources in their area</p>	

**Brown K, Stainer K, Stewart J, Clacy R, Parker S (2008) Older people with complex long-term health conditions. Their views on the community matron service: a qualitative study**

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p><b>Study aim</b> The study aims 'To explore the experiences and attitudes of older people who have a community matron so that we can gain an understanding of the successes and failures of this form of case admissions' (p409)</p>	<p><b>Methodology</b> Qualitative study A purposive sample of patients receiving a community matron service were interviewed</p> <p><b>Intervention</b> Community matron. Matrons performed a range of tasks in relation to the patients' health and social care needs. 'Matrons are highly trained nurses, able to diagnose, prescribe and manage patients with long-term conditions within primary care' (p409)</p> <p><b>Is this a linked</b></p>	<p><b>Country</b> UK Two primary care trusts</p> <p><b>Population?</b> The study interviewed 24 older people living in the community and receiving a community matron service. They all had long-term and complex health issues</p> <p><b>Source population demographics</b> Sample has one or more of the following: heart disease, stroke, diabetes, respiratory</p>	<p><b>Views of users, carers, practitioners</b> The views expressed by service users in the study indicate that the community matron service has a positive impact on users' wellbeing, self-management skills and potential positive outcomes in term of reduced hospital admissions and reduced use of GP services</p> <p>The study found that the patients who received the intervention appreciated the social element of the visits from the community matron. Some participants viewed the matron as a source of emotional support, others reported a boost in confidence: 'I think the caring is absolutely priority, I really do. Because [community matron] just takes her work so seriously she's so comforting you know. I mean she always gives me a hug as she leaves you know and as I say she's almost a friend, she really is' (p413) 'Knowing she's there, there's somebody there at the end of the telephone to come to me ... it's a great comfort living on my own ... I don't feel lonely anymore' (p413)</p> <p><b>Satisfaction</b> The participants in the study appear to be overwhelmingly happy with the service. They speak highly of the work of the community matrons on a number of levels and appreciate the organisational and advocacy roles the nurses inhabits. They also speak highly of the nurse's clinical management of their LTCs. The nurses were reliable, flexible and holistic in their approach. Participants</p>	<p><b>As far as can be ascertained from the paper, how well was the study conducted?</b> • + It is a very small study (24 older people) and it is not clear how they were selected</p> <p><b>Relevance to older people with multiple LTCs</b> • Highly relevant</p>

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			<p>case managers if they were based in integrated or primary care teams (pp95–6)</p> <p>‘Very few case managers could assess for local authority funded social care services, of those that could homecare services were the most frequently reported (Table 4.30)’ (p102)</p> <p>‘Only thirteen per cent of case managers could authorise the use of any local authority services, most frequently domiciliary care (Table 4.32), and important indicator of the extent of substantive service integration’ (p103)</p> <p><b>Service delivery qualitative findings</b> This study aims to map and assess the nature of services which target those with LTCs, the findings do not provide information on the impacts or outcomes of such interventions in detail</p> <p><b>Case management tasks</b> Included: assessing needs, care planning, implementation and monitoring of care plan, reviews and patients education and clinical planning (p186)</p> <p>The case management teams were mainly staffed by nurses based in primary care settings or integrated teams; the survey suggested that 80% of case managers were healthcare practitioners. All primary care trusts responding to the survey used nurses as case managers, half used therapists and others used social workers and other professionals. Reviews of care plans were predominantly not routine and tended to be triggered by a health crisis or</p>	

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			<p>event</p> <p><b>Case finding</b>                      Patients were identified as potential recipients of the intervention by a variety of means but most reported was a referral from another professionals. The PARR II case finding tool was also used and the single assessment process                      Respondents to the survey found that referral from other professionals was the most effective method of identification and referral (p186). But the survey suggested that cases were 'allocated on the basis of staff qualification or the predicted intensity of involvement' (p187). The study suggests that case management interventions are often aimed at older people with certain SPECIFIC LTCS, which blurs the line between case management and disease management</p> <p><b>Case management problems</b>                      The survey data suggests that the case management role was seen as very broad and potentially lacking clarity and there was a tension between the need to manage care and also respond to clinical needs (p187)                      Case management is seen as a way to link up services and provide a service that has breadth and is holistic in its approach, involving other health, care and voluntary sector services as necessary. However, it cannot overcome poor capacity or slow responses to referrals into other services. In addition, 'Care plans did not detail the contribution made by primary, intermediate, acute and social care services. Case managers could not assess for or authorise any local</p>

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			<p>authority funded services page' (p137). The survey data also showed that there was little priority given to patients being discharged from the case management intervention and they were not adequately referred on. The study cannot conclude whether this was just a 'teething problem' or a long-term flaw with services like this</p> <p><b>Views of practitioners (in addition to the survey data)</b> Some of the sites showed difficulties between case managers and social care professionals: 'They (social services) are very, very slow in at responding to your phone calls, responding to referrals' (p149); 'They have no sense of urgency ... it's so frustrating when somebody's going to end up in hospital because you can't get carers for them' (p149)</p> <p><b>Views of users and carers, practitioners</b> 'Participants felt the key priorities for a case management service should be to improve the range of services available to care for people at home and to provide more intensive long-term support. Service users clearly placed more import on the meeting of basic needs first, before self-care could be supported' (p181); Users and carers want improved access to social care services; help with housework, shopping, banking; access to social care services; transport. 'There're all sorts of basic needs that aren't being met for people who live by themselves' (p180)</p> <p><b>Findings: self-management</b></p>	

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			<p>There is a good summary of evidence from self-care studies (not within case management) on pp58–9. Evidence of impact is poor in either model – it seems the psychological aspects of the interventions, especially if given in group settings, is more apparent than physical impact</p> <p>The study suggests that case management interventions are often aimed at older people with certain LTCs, which blurs the line between case management and disease management. The survey data suggests that the case management role was seen as very broad and potentially lacking clarity and there was a tension between the need to manage care and also respond to clinical needs (p187). The survey data also showed that there was little priority given to patients being discharged from the case management intervention – including to self-management support – and they were not adequately referred on. The study does not conclude whether this was just a ‘teething problem’ or a long-term flaw with services like this. The survey found that case managers were linking up with other service and were information-sharing with GPs, other health services, social care services and voluntary organisation</p> <p><b>Views of users, carers, practitioners</b> The user consultation event (poorly described) suggests that questions about self-help dominated any discussion. Issues important to respondents, were identified in the wider discussion around service users’ experiences of self-care support, these were information, transport and</p>	

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			<p>practical help. Information about both the condition and the support services available was perceived as being useful but not always available. It was thought that health professionals did not always provide this and it was often not available in other languages if appropriate. Many participants had found information available on the internet but acknowledged that not everybody has access to internet resources.</p> <p>Overall, the willingness of service users to engage with self-care support was there, but the potential for participation was limited by the more practical barriers of transport and lack of day to day help with activities of daily living: 'I think it's about mobility and transport more than anything, I don't think it's just about age, that's not an issue. But if they can't get there, there is a problem' (p180)</p> <p>Focus group discussions in the case study sites and within the service user consultation exercise revealed a concern about the suitability of self-care support services for case managed patients, due to their age, severity of conditions, subsequent limited mobility and overall frailty.</p> <p>Practical help was a recurrent theme in the interviews. Older people needed help with banking, shopping and around the home. Some were concerned about help following a spell in hospital. Older people placed more emphasis on these basic needs than supported self-care.</p> <p>'There're all sorts of basic needs that aren't being met for people who live by themselves' (p180)</p>	

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			<p>‘That’s another problem, getting to the bank ...’ (p.180)                      ‘I’m not looking forward to 6 weeks after the operation when they’ve told me I mustn’t do anything, I live on my own, I’ll have to do something’ (p180–1)</p> <p><b>What can be improved</b>                      Access to social care services, especially help with housework, shopping, banking, etc. Information about access to social care services. Transport, especially to healthcare appointments, especially in rural areas. In this study it was noted that self-care support for people with complex needs currently does not explicitly address the needs of carers. The incorporation of a carer perspective into the commissioning of self-care services is an area of enquiry worthy of further consideration</p> <p><b>Satisfaction</b>                      From focus groups: self-care service priorities (N= 47)                      100%                      Alternative therapies (N=26) 55%                      Being able to talk to someone (N=26) 55%                      Special equipment (N=20) 43%                      A course for people with the same condition (N=19) 43%                      Information leaflets (N=18) 38%                      An informal self-help group (N=16) 34%                      A course for people with all types of conditions (N=10) 21%</p> <p>There were mixed views on whether people should be expected to take part in self-care activities. Some participants thought that professionals did not have high expectations of patients’ ability to understand and be able to</p>

Fenlon D, Foster C, Brooks C, Coleman P, Payne S, Seymour J, Simmonds P, Stephens R, Frankland K, Foster C, Brooks C, Coleman P, Payne S, Seymour J, Simmonds P, Stephens R (2013) Living into old age with the consequences of breast cancer

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p>'This study aimed to explore older women's experience of living with breast cancer alongside other health conditions, and to identify their information and support needs and preferences' (p311)</p>	<p><b>Qualitative study</b></p> <p><b>Methods</b> Qualitative interviews and focus groups</p> <p><b>Is a qualitative approach appropriate?</b> Appropriate</p>	<p><b>Country</b> • UK</p> <p><b>Source population demographics</b> 100% female</p> <p><b>Socioeconomic position</b> Postcodes were used to promote inclusion of people from different income groups</p> <p><b>Sample</b> Older people living in the community, all breast cancer survivors</p> <p><b>Sample size</b> 28 semi-structured interviews and two focus groups</p>	<p><b>Views of users, carers, practitioners</b> Interview questions focussed on the experience of cancer care and follow-up care (diagnosis varied from 1977–2008), while the focus groups examined information and support needs (10 interviewees took part in the groups as well). Only data on treatment since 2002 was analysed</p> <p>There were different views on how breast cancer diagnosis of older woman should vary from that of younger women. One woman felt she was offered less support (p313), while others felt more philosophical and tended to think that at their time of life it was less of an issue. Older women were less likely to attend counselling and support groups</p> <p>Only two of the women had had reconstructive surgery, and of those who had mastectomies (number unclear), most used prostheses. Some felt uncomfortable with their body images. Although most women were relatively relaxed about their body shape, many had discomfort in relation to bras, prostheses and back-fastening bras, and they did not know how to get advice. Some activities of daily living (e.g. lifting) were impeded</p> <p>Some felt they should have been offered reconstruction, although this might not even have been raised as possible: 'Because he was aware of my back condition, no question of reconstruction came up. I have bitterly regretted that every day, I still haven't coped with it' (G400, diagnosed 2003, p314)</p>	<p><b>As far as can be ascertained from the paper, how well was the study conducted?</b> • ++</p> <p><b>Relevance to older people with multiple LTCs</b></p> <p>• Somewhat relevant as not confined to assessment of older people with multiple LTCs</p>

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
		<p>32 different women took part (10 in groups and interviews).</p> <p><b>Sample age</b> 70–90</p> <p><b>Health Status</b> 13 had three or more comorbidities 15 had less than 3</p> <p>Conditions: cardiac conditions, hypertension, diabetes, sight and hearing loss</p>	<p>Older women had little access to information, and were unlikely to have access to, or believe, internet sources. Their preferred sources of support were the breast nurses and information from peers (including the focus groups). The women had difficulty in knowing what to look for in recurrence of cancer issues, and how to distinguish this from their other health issues. Some had been surprised to have been diagnosed at a late age and felt more public health messages should be targeted at this group. They also wanted more images on what mastectomies looked like and meant for the patient. There was no information in this paper on assessment by health or social services, so arguably it could be excluded, but lack of comprehensive assessment is an issue</p> <p><b>What can be improved</b> Some of the participants felt the trauma of later life diagnosis of breast cancer was not acknowledged as it was with younger women, and that they were offered less support, and little if any discussion of reconstructive surgery. There should be no assumption made that body image is not important to older people. Information about causes, signs of recurrence, and how the cancer and/or surgery impacted on other conditions was difficult for them to access</p> <p>The paper was not very specific about physical and social functioning, though hints that this is impeded by cancer and surgery. In conclusion authors state: ‘As older women are more dependent than younger women on communication with their health professionals, and they may have more</p>	

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			complex needs due to their physical and social circumstances, more time needs to be given to assessing their needs in a holistic and comprehensive fashion' (p315)	

**Goodman C, Drennan V, Manthorpe J, et al (2012) A study of the effectiveness of inter-professional working for community-dwelling older people – final report**

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p>To examine ‘the effectiveness of inter-professional working (IPW) in primary and community care for older people with multiple health and social care needs. It aimed to:</p> <ul style="list-style-type: none"> <li>- Identify appropriate measures of effectiveness from user, professional and organisational perspectives for IPW</li> <li>- To investigate the extent to which contextual factors ... influence the sustainability and</li> </ul>	<p><b>Mixed methods</b> Phase 1 - Systematic review - Exploratory interviews with older people, carers and health and social care providers - A national survey - Consensus event with stakeholders</p> <p>Phase 2 - Case studies of three models of IPW for community dwelling older people</p> <p><b>Intervention</b> IPW</p>	<p><b>Country</b> • UK – fieldwork element • Range of countries – systematic review element</p> <p><b>Population?</b> • Older people living in the community • Older people receiving healthcare, possibly social care • Carers of older people • Healthcare workers</p> <p><b>Source population demographics</b> • None reported</p>	<p><b>Views of users, carers, practitioners</b></p> <p><b>What works well</b> A named professional coordinating care, accessible to the person, and able to advocate for the service user and respond to changed circumstances. Good involvement of both users and carers in decisions around what will be provided by whom. Written agreements to reflect this, and flexibility when circumstances and needs changed</p> <p><b>Outcomes of good IPW</b> Study found service recipient to be more relaxed, not depressed, and less anxious. Users and carers are involved in decision-making and specific desires are met (eg ability to die at home). Carers are acknowledged and supported by services, and their needs are assessed and provided for</p> <p><b>• What can be improved</b> - Discharge planning often poorly handled, putting additional pressure on carers to plug the gaps - GPs can be out of the loop, and not in communication with other providers, including social services - Staff turnover prevents good planning and delivery - Staff turnover among those delivering personal care caused embarrassment and loss of dignity - There is a disjunction between health and social care, with practitioners saying that particular issues were outside their remit</p>	<p><b>E. Internal validity</b> • +</p> <p><b>f. Overall assessment of external validity</b> • + Conclusions are credible, and come from a service user perspective</p>

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p>effectiveness of IPW and patient, carer and professional outcomes' (p19)</p>		<p>• <b>Sample age</b> Older people over 65 (interviews)</p> <p>• <b>Sample size</b> 18 older people (12 women). 3 service users, 13 were relatives. Service users had multiple LTCs. Interviews were also conducted with the leads of seven third-sector organisations</p> <p>21 people (undefined) joined the research team for a consensus event</p>	<p>- Practitioners not being easily accessible, even in a crisis. Conclusions are somewhat limited, as no evidence was found to support organisational effectiveness, which was one aim of the study</p>	

**Granville G, Runnicles D, Barker S, Lee M, Wilkins A, Bowers H (2010) Increasing the voice, choice and control of older people with high support needs: a research findings paper from the South East Regional Initiative (SERI)**

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p>The research focused on 2 main questions:</p> <p>1. 'What are the experiences and feelings of voice, choice and control like now amongst these 2 populations; and what are the key influences on these experiences and feelings?' (p5)</p> <p>2. 'What is changing or has changed as a result of the mechanisms, interventions, options and opportunities for increasing the voice, choice and control of older</p>	<p><b>Qualitative study</b> Interviews and focus groups</p> <p><b>Intervention</b> The study followed up on the South East Regional Initiative (SERI) designed to 'demonstrate and measure the effectiveness of investing in independent living for older people with high support needs' (p3) The research aimed to build the evidence base of what works in increasing the voice, choice and control of older people with high support needs</p>	<p><b>Country</b> • UK</p> <p><b>Population?</b> • Older people receiving social care. 50% in care homes 50% in community. Sites were Portsmouth, Oxfordshire and West Sussex</p> <p><b>Sample</b> 63 older people with high support</p> <p><b>Gender</b> Women (63%)</p> <p><b>Sample age</b> 41% 80 or over. 32% were younger than 80. 27% 90 or older</p>	<p><b>Views of users, carers, practitioners</b> The qualitative methods in the paper revealed that isolation and loneliness are a 'significant issue for older people with high support needs – both for those living in care homes and those living at home' (p69). Loss of peers (relatives and friends) had reduced social networks. Relatives and friends had died or they had lost contact. Participants felt isolated from their local communities and 'normal life'. Some had left their home and could no longer access local facilities and community activities, and this led to a sense of disconnection</p> <p>A key finding was that older people living in care home also felt isolated and lonely. It was found that this isolation was 'frequently unrecognised by care professionals, families and wider community members' (p69). People in care homes who maintained a networks of friends and family retained 'more of their own sense of identity and have more meaning in their lives' (p69)</p> <p><b>What works well?</b> The report makes some recommendations that 'emphasise the importance of visibility and retaining/strengthening personal and social networks as people age' (p80). The report recommends further development of approaches such as 'circles of support, time banking, home-share, and other forms of mutual support' (p80). The report surmises that enabling older people to live a</p>	<p><b>As far as can be ascertained from the paper, how well was the study conducted?</b></p> <ul style="list-style-type: none"> <li>• +</li> </ul> <p>Useful data on social isolation but not a huge amount of specific data on how LTCs affects social isolation and the specific impacts on service use</p> <p><b>Relevance to the Older people with multiple LTCs</b></p> <ul style="list-style-type: none"> <li>• Somewhat relevant</li> </ul>

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p>people with high support needs? What has helped or hindered?' (p5)</p> <p>Domains examined:                      1. Personal identity and self-esteem                      2. Meaningful relationships                      3. Personal control and autonomy                      4. Home and personal surroundings                      5. A meaningful daily and community life                      6. Personalised support and care (p6)</p>		<p><b>Ethnicity</b>                      One Caribbean, three non-British, European extraction</p> <p><b>Source population demographics</b>                      • 38% had dementia, or another cognitive impairment</p>	<p>normal and meaningful life can mean supporting them in simple ways to perform daily routines many of us take for granted. Effective support can result in outcomes like a reduced risk of nursing home admission and improving the voice and control of older people</p> <p><b>What can be improved?</b>                      Mobility and transport was shown to be essential to maintaining social networks and community links. There is a need to develop a 'wider range of transport options and assistance' (p32)</p> <p>People wanted to interact with a range of people outside their age group. 'Having friends of diverse ages and with varying levels of need for support themselves might help people maintain fuller social lives' (p32)</p> <p>A woman living on her own in sheltered housing commented: 'Having lots of young people around is very important and helpful' (p31). Some informants commented on the importance of maintaining social activities outside the home, in the community, like visiting a pub, going to the shops, etc.</p>	

**Gridley K, Brooks, J, Glendinning C (2014) Good practice in social care: the views of people with severe and complex needs and those who support them**

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p><b>Study aim</b> ‘The aim of the qualitative study was to identify the features of social care services and support arrangements desired by adults and older people with complex needs’ ( p589)</p> <p><b>Source of funding</b> Funding Councils NIHR School for Social Care Research</p>	<p><b>Methodology</b> • Qualitative study</p> <p><b>Intervention</b> Scoping good practice in social care provision. This includes integrated working, person-centred support, specialist workers etc.</p> <p><b>Is this a linked study?</b> No</p> <p><b>Social care outcomes?</b> Outcomes specified by users and carers</p>	<p><b>Country</b> • UK</p> <p><b>Population?</b> • Older people receiving social care in the community The study looks at adults and older people with complex or severe needs. The older population is specified as older people with dementia and complex needs</p> <p><b>Source population demographics</b> • Health status Older people with dementia and complex needs</p> <p><b>Sample size</b> 10</p>	<p><b>Views of users, carers, practitioners</b></p> <p><b>What works well</b> The participants were most concerned about everyday support. The interviewees talked about person-centred ways of working which were individualised. Participants wanted support workers to take the time to get to know them and their needs. The study found that people wanted their care to be flexible and responsive to their preferences</p> <p>‘[R]ather than putting them all in pigeonholes, “This person’s got dementia, we’ll do this, this, this and this” ...it doesn’t always fit that that is going to work for that person’ (p591)</p> <p>‘We wanted somebody who would understand. He had his turban and he had his peculiarities, but ... it’s about seeing the person, trying to get to know them, find out about them and building relationships with them’ ( p591)</p> <p>Another factor was meeting practical, emotional and social needs. Interviewees wanted support to extend beyond basic personal care and extend into other ADL such as: finances, transport, socialising and occupation. People also said that they wanted help to maintain skills, someone to talk to and participate in the community and maintain social links. Some interviewees said that their care staff were friends: ‘... you can talk to them [his personal assistants] ... that’s nice sometimes just to get stuff off your chest without, like, not just your mum or whatever ... that’s</p>	<p><b>As far as can be ascertained from the paper, how well was the study conducted?</b> • ++</p> <p><b>Relevance to older people with multiple LTCs</b> • A bit relevant Older people with dementia and complex needs. Not clear how many of this group would be older people with multiple long term conditions. Study was about three groups who had complex needs</p>

Older people with social care needs and multiple long-term conditions: Appendix B

		<p>helpful. It's just being company sometimes' (p592)</p> <p>Some people found support at groups where they met others with similar conditions: 'We all understand each other because, although we've all got different problems, we've all got the same problem' (p592)</p> <p>'It's good to come here and everybody's so – well, they respect me and I respect them ... Staff and the people who use the service' (p592)</p> <p>Staff attitude and inter personal skills were important to informants, and the study found this was more important than training: 'I need to have somebody around that I can relate to on some level or other. Even though it's a working relationship, the boundaries get very blurred between where work starts [and ends] and there needs to be some sort of personal relationship as well' (p592)</p> <p>Another key theme was reliability. Interviewees said that unreliable services had serious impacts on their anxiety levels. Family members and carers were concerned that unreliable staff would miss crisis events like falls: 'he could be on the floor all night long and they wouldn't even [know] – they don't even carry out their own procedures' (p593)</p> <p>Linked to the findings about building relationship with care staff was the theme of continuity of support. Interviewees said that continuity of care helped them have confidence in their services.</p> <p>People commented that it took time for new staff to get to know them and their complex needs. With a high turnover they had to repeatedly try and build relationships and give instructions: 'You just can't start again. By the time you've gone through everything you had to tell them and plus, by then, [husband] was very – if I wasn't here, it needed to be somebody that he knew otherwise he would be ang – you</p>	
--	--	---	--

Older people with social care needs and multiple long-term conditions: Appendix B

			<p>could see in his face the anxiety' (p593)</p> <p>The study found that people with complex needs and their carers wanted services to be organised according to the following principles.</p> <p>Flexibility, with a timely proactive approach, with specialist expertise and information and potentially using interventions like case-management and co-ordination.</p> <p>'the more complex the needs the more unique they are ... they do take up a lot of professional time and they need extra planning, but if you get it right it saves so much time' (p.594)</p> <p>'If we'd had four visits much more quickly, then probably we'd have been able to keep the situation under control for longer instead of it turning into a crisis' (p.594)</p> <p>'...[social worker] was very young and very inexperienced and we were classed as the most complicated case in the area at the time and we had lots of clashes ... I think, probably, they should have put some more input in with ... somebody that knew what they were doing more' (p. 5.94)</p> <p>'Key worker or somebody who co-ordinates, an advocate for the young person I think is essential, and that's where you see really good practice. Where someone who's got the time to help that young person, get the right people around the table at the various points to look at joint assessment and joint planning, that really works well' (p.594)</p>

**Horrocks S, Somerset M, Stoddart H, Peters T (2004) What prevents older people from seeking treatment for urinary incontinence? A qualitative exploration of barriers to the use of community continence services**

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p><b>Study aim</b>                      ‘To explore reasons why older people living in the community do not present for help with problems of urinary incontinence and to identify ways in which they may be assisted to access continence services’ (.689)</p> <p>‘It was hoped to explore in depth the reasons why older people do not access community continence services. A further aim was to establish how they could be assisted to access such services’ (p690)</p>	<p><b>Methodology</b>  <b>Qualitative study</b>                      In-depth interviews with 20 people</p>	<p><b>Country</b>                      UK</p> <p><b>Population</b>                      Older people living in the community</p> <p><b>Health status</b>                      It is NOT clear that this sample had LTCs. Two men had permanent catheters. Six people had used urinary incontinence (UI) services in the past, but only three still did, mainly for continence pads. UI was related to childbirth and/or hypertension, stroke, heart and prostate problems</p>	<p><b>Views of users, carers, practitioners</b>                      ‘Self-management’ of UI was the rule, but the question addressed by the study was why older people did not seek help from primary care. Reasons:                      1. Older people had reduced health expectations. They saw UI as a ‘natural’ consequence of aging                      2. They were ashamed and too embarrassed to seek help                      3. Some had taken measures themselves to ‘contain’ the problem, but at some social and psychological cost: restricting fluid intake, wearing certain clothing, avoiding social situations. Some did use pads (and one described an embarrassing and public disclosure when she went to pick them up)</p> <p><b>What can be improved?</b>                      People did not ask for help from GPs and nurses (all saw GPs, some had nurse visits), clinicians had never asked if they had problems with UI</p> <p>Primary care staff could be more proactive in asking older patients about UI, with a view to supporting them to address the issue. (However, other than incontinence pads, there is no information about how practitioners can help older people with UI)</p>	<p><b>As far as can be ascertained from the paper, how well was the study conducted?</b>                      +</p> <p><b>Relevance to older people with multiple LTCs</b>                      Somewhat relevant. Relevance depends on whether the sample had LTCs, which is not stated</p>

		<p><b>Sample</b>                      Sample size                      20 people over 65 living in the community, 'purposively selected from a sample of patients who volunteered to be interviewed'</p> <p>11 female</p> <p>Seven people lived alone, 2 with relatives, 9 with partners</p> <p><b>Sample age</b>                      Range 66–94</p> <p><b>Is this a linked study?</b>                      No</p>		

**Keefe B, Geron S, Enguidanos S (2009) Integrating social workers into primary care: physician and nurse perceptions of roles, benefits, and challenges**

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p><b>Study aim</b>                      'The primary aim of this article is to identify, from the perspective of primary care physicians and nurses, the challenges encountered in provision of health care to older adults and to identify potential roles, challenges and benefits of integrating social workers into primary care teams' (p580)</p>	<p><b>Methodology</b>                      • Qualitative study</p> <p><b>Intervention</b>                      • IPW</p> <p><b>Is this a linked study?</b>                      • No</p>	<p><b>Country</b>                      US</p> <p><b>Population?</b>                      • Healthcare workers                      Nurses and physicians</p> <p><b>Sample</b>                      Physicians N=13                      Nurses N=11                      Nurse practitioners N=1</p> <p><b>Sex</b>                      Physicians 23% female                      Nurses and nurse practitioners 100% female</p> <p><b>Ethnicity</b>                      Physicians N=13: African American one, Caucasian three, Latino two,</p>	<p><b>Views of users, carers, practitioners</b>                      Four primary themes:                      1. Patient problems                      Both physicians and nurse identified unmet needs in their patients. Most prominent were: need for a consistent caregiver, high rates of social isolation and depression. Access to community resources – transport as a principal barrier impeding patient's access to primary care. Lack of financial resources – unable to meet multiple co-payments. Patients would save up symptoms for one visit, or prioritise medications for conditions</p> <p>2. Provider challenges in serving older adults time constraints 'we have 15 minutes to listen to the patient, diagnose and treat' (p587). The multitude of chronic conditions and psychological problems exacerbate time pressures. Insufficient time limited physicians and nurses ability to effectively education the patients on their medical conditions, medications and follow-up plans. Physicians also believed that lack of disclosure from older patients about their wellbeing may be due to withholding information in fear the physician would deem them incompetent and recommend they no longer live independently</p> <p>3. Perceived role of the social worker in general positive, especially from the physician who had previous experience of working with one. Physicians and nurses felt the social worker could 'check out the home situations' (p589)                      Some physicians felt that social workers 'had all the time in the</p>	<p><b>As far as can be ascertained from the paper, how well was the study conducted?</b>                      • ++</p> <p><b>Relevance to older people with multiple LTCs</b>                      • Highly relevant</p>

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
		<p>Asian seven, other one</p> <p>Nurses N=11 African American six, Caucasian one, Latino two, Asian one</p> <p>Nurse practitioner Caucasian one</p>	<p>world, which I don't' which would complement the work of the physicians and nurses. 'You're the social worker. Do your social thing and we will do our medical thing'</p> <p>4) Challenges of having a social worker some physicians were concerned that the extra time to interact with the social worker would be a distraction. 'I would prefer the email route rather than very long winding conversations' (p590). On the other hand many felt that it could only work if the social worker was on site at all times (not part time sited elsewhere)</p> <ul style="list-style-type: none"> <li>• <b>What works well</b> Meeting the psychosocial needs of the patients where the nurses and physicians feel they are unable to do adequately due to time constraints</li> <li>• <b>What can be improved</b> Physicians' understanding of the roles and responsibilities of social workers</li> </ul>	

**King G, O'Donnell C, Boddy D, Smith F, Heaney D, Mair F, et al (2012) Boundaries and e-health implementation in health and social care**

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p><b>Study aim</b>                      'To explore the ways in which structural, professional and geographical boundaries have affected e-health implementation in health and social care through an empirical study of the implementation of an electronic version of the Single Share Assessment (SSA) in Scotland' (p1)</p>	<p><b>Qualitative study</b>                      Telephone interviews with 11 data-sharing managers (DSMs) responsible for promoting cross-boundary information exchange in 11 of the 14 Scottish health board areas</p> <p><b>Intervention</b>                      • Multidisciplinary or SAP                      SSA introduced in Scotland</p>	<p><b>Country</b>                      UK</p> <p><b>Sample size</b>                      30 health and social care professionals at 6 sites.</p> <p><b>Is this a linked study?</b>                      • No</p>	<p><b>Views of users, carers, practitioners</b></p> <p>SSA aimed to create a holistic record of patient condition and circumstances, which H&amp;SC staff could use to assess care needs; reduce number of times people were asked questions; reduce duplication of records and be more accurate.</p> <p><b>Practitioner experiences</b>                      Electronic SSAs (drawn from paper version) were in use, but only 2 of 11 DSMs said they were shared across social work and health, in some areas there was little or no sharing. In one area, only social workers could enter data, so other professionals had to send data to that team. Momentum was lost and practitioners suggested it was pointless unless shared IT systems underpinned the document</p> <p>How did structural boundaries affect data sharing? Those most likely to be relevant were those delineating the delivery of health and social care. Competing priorities (such as government focus on enablement and outcomes focused working), differences in IT systems (with no interface between them) and infrastructure (said to be poorest in health service), financial arrangements (when original implementation grant was removed) all hampered implementation</p> <p>How did professional boundaries affect electronic data sharing? 'Professional boundaries between health and social care workers affected their understanding and acceptance of the aims of SSA, the information they require and whether they</p>	<p><b>As far as can be ascertained from the paper, how well was the study conducted?</b>                      • ++</p> <p><b>Relevance to older people with multiple LTCs</b>                      • Highly relevant to integrated working with all care recipients, though not confined to assessment of older people with multiple LTCs</p>

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			<p>see SSA as consistent with their culture' (p6)</p> <p>History of cooperation/collaborative working was not encouraging: 'a naive political vision' (p6) failed to acknowledge that separation of social work and healthcare was ever thus: authors report that frontline staff said 'that's the way it's always been, and that it is unlikely that it will change' (p6)</p> <p>There was some evidence that barriers to joint working could be overcome: one example given was of attempt to create 'virtual teams' with communication events to surface and discuss paperwork</p> <p>Understanding and acceptance of SSA – a range of views given, with staff understanding the theory and purpose of SSAs, but, because the rule was made that only an SSA could secure access to other services, it was largely used as a referral tool only</p> <p>Information requirements and culture: professionals have different beliefs about the information needed to do their work. 'It's more a social work document than a health document' (p7)</p> <p>Nurses suggested that "Doing a financial assessment might affect a nurse's relationship with their patient – asking to see their bank book, or asking how much their house is worth" (p7)</p> <p>Health service staff thought some data (e.g. benefits, house care) should only be considered by social workers, and that they did not want to record more than minimal health detail (presumably for confidentiality reasons)</p> <p>How did geographical boundaries affect data-sharing?</p>	

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
			<p>Geographical challenges noted at all sites. SSA could be a solution to joint working over distance, e.g. in rural areas, especially where there was a small defined cohesive 'hub' of professionals to communicate with (though these areas could be poorly served for broadband connection to assist information capture and communication). Some study sites did have co-located teams which could facilitate joint discussions (though these were not always sustained): 'Commonly, there were several SSAs completed for the same patient as practitioners were unaware if one had been started' (p8)</p> <p>Primary/secondary care settings: 'from a hospital point of view, we never used it' (p8); others stated it was easier to complete an SSA in hospital when relatives, patient and professionals were all more accessible</p> <p><b>Summary views of users, carers, practitioners</b></p> <p><b>What works well</b>                      Little on this: co-located teams made some advances in use of SSAs, especially if patients were assessed in integrated teams. SSAs easier to share in some rural areas where there was a limited number of professionals involved</p> <p><b>What could be improved</b>                      Generally, IT interfaces were the main problem. In addition, the narrative findings suggest that SSAs were being conducted by one individual or service, often nurses, who did not want to show too much clinical detail, and objected to collecting information (such as financial) required by social workers.</p>

interventions' (p2)			<p>be strong enough to change professionals' opinions: 'The most important thing is that it has to deliver real benefits. It's not just for it to be a difference was of doing something, almost for the sake of it' (p8)</p> <p>Suppliers and social care providers were less convinced by evidence from large scale academic studies that the healthcare providers were insisting were necessary to prove the case for safety and effectiveness of telecare. Service users reported not being informed on how telecare may impact on other technologies in the home – and there was little opportunity to individualise the system, the workings of the machine forced the user to adapt to that. There was a sense of a lack of purpose in collecting the kind of information demanded by the systems</p> <p>For some service users telecare was 'stepping up' what they were already doing: '... basically, I mean what this system has done is emphasised and built on the previous knowledge I had ... and has made me more aware of my condition daily ... And so it confirms okay, that I'm feeling better or I'm not feeling better having a good day or a bad day ... but it gives you that feeling of security to know that somebody else is also looking' (p8)</p> <p>From service users' perspective the system provided a fast-track route to access to professional care as and when required</p>	

**Rogers A, Kennedy A, Bower P, Gardner C, Gately C, Lee V, Reeves D, Richardson G (2008) The United Kingdom Expert Patients Programme: results and implications from a national evaluation**

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p><b>Study aim</b> The Expert Patients Programme (EPP) 'aims to deliver self-management support and improve the quality of life of people with long-term conditions by developing generic self-management skills and improving people's confidence and motivation to take more effective control over their lives and illnesses' (p21)</p> <p>This national evaluation of the EPP contains</p>	<p><b>Methodology</b> Mixed methods A range of methods was used for the national evaluation of the EPP</p> <p>1. An RCT to find out whether the course improved patients' outcomes and was cost-effective for the NHS (see Kennedy 2007 for report on RCT)</p> <p>2. A personal experience study to examine patients' experience of undertaking the EPP training and to compare the experience, ways of living with an LTC, personal self-</p>	<p><b>Country</b> UK</p> <p><b>Population?</b> Health care workers, administrators and managers involved in the case study and implementation aspects and PCT survey.</p> <p>People with at least one chronic and long term condition - not necessarily older people. See Kennedy 2007 for more detail.</p> <p><b>Source population demographics</b> None reported</p>	<p><b>Primary outcomes from the RCT.</b> <b>Adjusted difference (95% CI)--P--ES</b></p> <p><b>Self-efficacy 8.0 (6.2 to 11.5) &lt;0.001 0.44</b> <b>Energy 3.7 (1.2 to 6.3) &lt;0.001 0.18</b> <b>Routine health services utilisation -0.2 (-1.4 to 1.0) 0.73 0.03</b></p> <p><b>Narrative findings</b> From the personal experience aspect of the study: 'The rises reported in self-efficacy appear to be about people feeling better about themselves and what they were already doing as a result of social comparisons and value attributed to sharing of experience in a group setting ... The course re-enforced and legitimised existing self-management behaviours' (pii)</p> <p>However, there was less behaviour change than might have been expected, and reports seemed to show that the generic nature of the programme was not always relevant to people with different conditions (eg capacity to exercise)</p> <p>Among the reasons the data suggests for no behaviour change were established patterns in utilisation of health services (i.e. people did what they felt was necessary to maintain health), and lack of social and material resource to change behaviour. Attendees wanted welfare benefits advice as part of the EPP (but it was not included)</p>	<p><b>Internal validity</b> +</p> <p><b>Overall assessment of external validity</b> +</p>

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach	Population, sample and setting	Findings (including effect sizes or outcome measures)	Overall quality assessment
<p>linked research studies designed to:</p> <p>1. Examine the implementation of the EPP within the structures and locality contexts of the NHS in England (PREPP)</p> <p>2. Evaluate whether the intervention is clinically cost-effective (the RCTI outcome evaluation)</p> <p>3. Examine personal experience of being recruited to and undertaking the EPP intervention against the background of peoples' pre-existing ways of managing and</p>	<p>management strategies and use of services prior to and after attending the training programme.</p> <p>3. A process evaluation to study implementation by PCTs and to find out how differing local contexts influenced the running of the programme, using surveys</p> <p><b>Costs and consequences</b> Full economic evaluation not analysed further: see also Kennedy (2007)</p>	<p>See Kennedy (2007) for comparison of RCT sample with general health service</p> <p><b>Sample</b> 629 patients included in RCT</p> <p><b>Intervention</b> Self-care support</p> <p><b>Is this a linked study?</b> Yes This is the full report of the evaluation of the pilot phase of the EPP</p>	<p>The data also suggests that the primary reasons for attending the course were to combat social isolation, to help others and to share experience: 'Opinions on the course were distinctly positive with over 80% of respondents giving strongly positive or positive responses to their rating of the course organisation, content and usefulness (see Table 10). About two-thirds of participants found the course relevant to them and motivating (Table 11). People also responded positively to the questions on their experience within the EPP group with nearly 90% agreeing or strongly agreeing with the statement "I enjoyed being part of my EPP group" (p26)</p> <p><b>Action planning</b> The EPP course encouraged people to create action plans: 'Each week people were asked to state an action they planned to undertake throughout the next week. During the following week they told the group about their success (or lack of success). Less than half the participants (n=84) were continuing to use action plans' (p26)</p> <p>There were also comments on the influence of the facilitator in including all participants, and not allowing some members to dominate discussion; on the course content, and on overall experience</p> <p>There were examples of positive comments: 'Enjoyable, increased confidence and motivation, provided strategies, group bonding, allowed reframing of self-view of condition, reinforced existing self-care actions, allowed comparisons, helped acceptance and "moving on", taught better way to communicate with doctors'; and examples of negative</p>

**Sargent P, Pickard S, Sheaff R, Boaden R (2007) Patient and carer perceptions of case management for long-term conditions**

Research question/study aims	Study design/theoretical approach.	Population, sample and setting.	Findings (including effect sizes or outcome measures).	Overall quality assessment.
<p><b>Study aim</b> The aim of the study was to use qualitative methods to find out how case management, by community matrons is being delivered to older people with LTCs. The study aims to</p>	<p><b>Methodology</b> Qualitative in-depth interviews with a purposive sample of older people with complex needs and also carers. Interviews were led by a thematic interview guide, which had</p>	<p><b>Country</b> • UK Participants were taken from 6 primary care trusts</p> <p><b>Population?</b> • Older people receiving care from a community matron.</p>	<p><b>Views of users, carers, practitioners</b> The study found that community matrons provide five groups of care tasks: clinical care, care coordination, education, advocacy and psychological support</p> <p><b>What works well</b> Clinical care – patients 'felt cared for' and that their conditions were being monitored properly These regular checks contributed to peace of mind, 'gave the confidence they were in stable health' (p514) 'It gives me confidence in my health, because she takes my blood pressure and its ok and my heartbeat is ok ... she gives</p>	<p><b>As far as can be ascertained from the paper, how well was the study conducted?</b> • + <b>Relevance to older people with multiple LTCs</b> • Highly relevant</p>

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach.	Population, sample and setting.	Findings (including effect sizes or outcome measures).	Overall quality assessment.
<p>'describe care management from the perspective of patients and carers' (p511)</p>	<p>been piloted and questions were designed to gather detailed data on patients care and attitudes towards this care</p> <p><b>Intervention</b> All participants were receiving care from a community matron. Matrons were working on five main categories of tasks with patients: clinical care, care coordination, education, advocacy and psychosocial support (p514)</p>	<p>Participants referred by community matrons. All participants had: 'a good level of cognitive functioning, moderate hearing ability, willingness to talk at length about their personal experiences of care management and an ability to critically reflect on their care' (p513)</p> <ul style="list-style-type: none"> <li>• Carers of older people – carers interviewed were selected in the same way as the those receiving services</li> </ul> <p><b>Sample</b> 72 patients 52 carers</p>	<p>me confidence' (p.514)</p> <p>Matrons assisted with taking medications and helping to organise changes in dose etc. One patients said this monitoring stopped 'getting mixed up. Or running out' (p514)</p> <p>Service users valued the coordinating role matrons took on, organising medication and liaising with GPs and other professionals and how matrons were able to resolve issues. 'She's a great link up between all the services, she has made a difference to the efficiency of getting things done' (p514)</p> <p>Matrons provided advice and information about services, medications and other issues. One patient commented that they could have an 'open dialogue of information sharing ... She will advise me, she won't tell me, she'll advise me' (p514) The study suggests that this information giving might facilitate self-care in patients. Carers particularly commented on this: 'She has shown [patient] how to use his inhaler properly'</p> <p>Matrons advocated for the patients with other professionals and services. Patients were positive about ability of this service to improve the level of their care. 'She has helped me get equipment ... when I was getting nowhere with the social worker (p515)</p> <p>Psychosocial support – the study emphasises the particular positive views people has about the social aspect of the visits. 'Mentally ... it means so much knowing that [community matron] is there for me ... it has made a big difference to me' (p515)</p>	

Older people with social care needs and multiple long-term conditions: Appendix B

Research question/study aims	Study design/theoretical approach.	Population, sample and setting.	Findings (including effect sizes or outcome measures).	Overall quality assessment.
		<p><b>Sample age</b> Range 52 to 99 Mean 79</p>	<p>'I look forward to her coming and having little chats and everything ... it was nice to have someone to talk to, to be honest ... It stopped me feeling sorry for myself' (p515)</p> <p><b>Satisfaction</b> Generally speaking the study reports that the people interviewed were satisfied with the service they received from community matrons. Patients were positive about the range of health and social care services provided by the community matrons. They reported that their health needs are well monitored, they were receiving help with more practical issues and also reported improvements in mood and sense of wellbeing.</p> <p><b>Caregiver satisfaction</b> The study found, that as well as providing a potentially valuable service to patients there were also positive outcomes for carers. Carers in the sample reported community matrons acting as a source of 'advice, practical and emotional support' (p517) and also as a helping in coping with the strain of caring</p> <p>Carers commented that the community matrons helped 'take the pressure off' and find out how they were coping. Carers said that they felt isolated and unsupported before the intervention and they felt supported by the matron and could ask questions</p>
