

## Multiple sclerosis in adults: management

**[H1] Appendices for non-pharmacological management of memory and cognitive problems evidence review**

*NICE guideline NG220*

*Evidence reviews underpinning recommendations 1.5.41 to 1.5.44 and research recommendations in the NICE guideline  
June 2022*

*Final*

*National Institute for Health and Care Excellence*

## **Disclaimer**

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the [Welsh Government](#), [Scottish Government](#), and [Northern Ireland Executive](#). All NICE guidance is subject to regular review and may be updated or withdrawn.

## Appendix A – Review protocols

### Review protocol for non-pharmacological management of memory and cognitive problems

ID	Field	Content
0.	PROSPERO registration number	CRD42021244943
1.	Review title	For adults with MS, including people receiving palliative care, what is the clinical and cost effectiveness of interventions for memory and cognitive problems?
2.	Review question	For adults with MS, including people receiving palliative care, what is the clinical and cost effectiveness of non-pharmacological interventions for memory and cognitive problems?
3.	Objective	To determine the most clinically effective nonpharmacological intervention for managing memory and cognitive problems in people with multiple sclerosis.
4.	Searches	<p>The following databases will be searched from inception:</p> <ul style="list-style-type: none"> <li>• Cochrane Central Register of Controlled Trials (CENTRAL)</li> <li>• Cochrane Database of Systematic Reviews (CDSR)</li> <li>• Embase</li> <li>• MEDLINE</li> <li>• PsycINFO</li> <li>• Epistemonikos</li> </ul> <p>Searches will be restricted by:</p> <ul style="list-style-type: none"> <li>• Date limitations: none</li> <li>• English language studies</li> </ul>

		<ul style="list-style-type: none"> <li>• Human studies</li> <li>• Validated study filters for systematic reviews and RCTs</li> </ul> <p>The searches may be re-run 6 weeks before the final committee meeting, and further studies retrieved for inclusion if relevant.</p> <p>The full search strategies will be published in the final review.</p> <p>Medline search strategy to be quality assured using the PRESS evidence-based checklist (see methods chapter for full details).</p>
5.	Condition or domain being studied	Multiple sclerosis
6.	Population	<p>Inclusion:</p> <p>Adults (<math>\geq 18</math> years) with MS, including people receiving palliative care.</p> <p>Exclusion:</p> <p>Children and young people (<math>\leq 18</math> years).</p>
7.	Interventions	<p><b>Multi-domain cognitive/neuropsychological rehabilitation</b></p> <ul style="list-style-type: none"> <li>• Brain Training Apps such as luminosity</li> <li>• Neuropsychological intervention for example neuropsychological Compensatory Training (NCT) Computer aided 'Cognifit Personal Coach' for cognition</li> <li>• MS-Rehab computerised tool</li> <li>• Psychoeducation</li> <li>• Insight and awareness (typically termed as 'metacognitive training or metacognitive strategies')</li> </ul> <p><b>Speed of information processing</b></p>

		<ul style="list-style-type: none"> <li>• Time Pressure Management Training (TPM)</li> </ul> <p><b>Attention and Working Memory</b></p> <ul style="list-style-type: none"> <li>• CogMed Working Memory Training</li> <li>• Attention Process Training (APT)</li> <li>• Computer aided RehaCom module 'Divided Attention' for attention</li> </ul> <p><b>Memory</b></p> <ul style="list-style-type: none"> <li>• External compensatory strategies</li> <li>• Errorless Learning Techniques</li> <li>• Personal assistant apps</li> <li>• Computer aided RehaCom module 'memory and Attention'</li> <li>• Computer aided (VILAT-G 1.0) training for memory</li> <li>• Story memory technique (SMT)</li> <li>• Computer aided memory retraining programme (SCRIP)</li> </ul> <p><b>Executive Function</b></p> <ul style="list-style-type: none"> <li>• Goal Management Training (GMT)</li> <li>• Problem Solving Training</li> <li>• Computer aided RehaCom module 'Plan a Day' for organization and planning</li> <li>• Interventions for apathy</li> </ul> <p><b>Cognition</b></p> <ul style="list-style-type: none"> <li>• Social Cognition Training</li> <li>• Cognitive rehabilitation programmes</li> <li>• Psychotherapy/counselling relating to cognitive impairment</li> </ul> <p><b>Interventions aimed at improving language</b></p> <ul style="list-style-type: none"> <li>• Retraining type approaches</li> <li>• Compensatory type approaches (for example, use of communication aids)</li> </ul> <p><b>Interventions aimed improving perception</b></p>
--	--	--

		<ul style="list-style-type: none"> <li>• Psychoeducation</li> <li>• Retraining type approaches (repeated practice on identifying specific objects/patterns)</li> </ul> <p>Compensatory type approaches (for example, labelling objects)          Combinations may be included as most rehabilitation programmes with a clinician (rather than computerised focus) will be multi-factorial as they will take into account the whole presentation rather than just focus on one part.</p> <p>Report who gave the intervention and whether individual or group</p>
8.	Comparator	<ul style="list-style-type: none"> <li>• Interventions will be compared to each other, placebo/sham, or usual care.</li> <li>• Waiting list control</li> <li>• Supportive therapy (dedicated time with a supportive clinician)</li> </ul>
9.	Types of study to be included	<p>Systematic reviews of RCTs and RCTs will be considered for inclusion.</p> <p>Published NMAs and IPDs will be considered for inclusion.</p>
10.	Other exclusion criteria	<p>Non-English language studies.</p> <p>Cross over trials will be excluded as many interventions are around learning where it would not be possible to do a cross-over trial as the information cannot be 'unlearned'</p> <p>We consider RCT data to be the best evidence for reviews of interventions. In addition, the surveillance review and GC have highlighted the existence of relevant RCTs in this area. Therefore, if no RCT data is available observational data will not be considered due to the risk of confounding variables influencing the study results, reducing our confidence in the overall results of the review.</p>

		Conference abstracts will be excluded because they are unlikely to contain enough information to assess whether the population matches the review question, or enough detail on outcome definitions, or on the methodology to assess the risk of bias of the study.
11.	Context	<p>This review will inform the update of the following recommendations in CG 186:</p> <p>1.5.31 Be aware that the symptoms of MS can include cognitive problems, including memory problems that the person may not immediately recognise or associate with their MS.</p> <p>1.5.32 Be aware that anxiety, depression (see the NICE guideline on depression in adults with a chronic physical health problem), difficulty in sleeping and fatigue can impact on cognitive problems. If a person with MS experiences these symptoms and has problems with memory and cognition, offer them an assessment and treatment.</p> <p>1.5.33 Consider referring people with MS and persisting memory or cognitive problems to both an occupational therapist and a neuropsychologist to assess and manage these symptoms.</p>
12.	Primary outcomes (critical outcomes)	<p>All outcomes are considered equally important for decision making and therefore have all been rated as critical.</p> <ul style="list-style-type: none"> <li>• Objective Measures           <ul style="list-style-type: none"> <li>○ Cognitive functions, such as memory, attention, executive functions, processing speed, for example, symbol digit modality test (SMDT)</li> </ul> </li> <li>• Subjective Measures           <ul style="list-style-type: none"> <li>○ Health-related Quality of Life, for example EQ-5D, SF-36, Leeds MS quality of life scale, MS Impact Scale.</li> <li>○ Patient-reported outcomes, for example symptoms, activities.(for example Canadian Occupational Performance measure, Cognitive failure questionnaire, perceived deficits questionnaire</li> <li>○ Self-efficacy/self-management (MS self-efficacy scale</li> </ul> </li> </ul>

		<ul style="list-style-type: none"> <li>• Functional Measures           <ul style="list-style-type: none"> <li>○ Medication management/ adherence to medication</li> <li>○ Mood</li> <li>○ Fatigue (MS fatigue scale includes cognition (perhaps include this- if score reported separately?))</li> <li>○ Activities of daily living (ADL).</li> </ul> </li> <li>• Vocational Measures           <ul style="list-style-type: none"> <li>○ Employment</li> <li>○ Training</li> <li>○ Social engagement</li> <li>○ Relationship satisfaction/ Impact on carers.</li> </ul> </li> <li>• Engagement Measures           <ul style="list-style-type: none"> <li>○ Completion/adherence rates</li> <li>○ Acceptability</li> <li>○ Satisfaction</li> </ul> </li> </ul> <p>Validated measures will be prioritised. If no evidence is available, non-validated may be considered.</p> <p><b>Follow up:</b></p> <ul style="list-style-type: none"> <li>• 3-6 months (minimum of 3 months but can include 1-3 months and downgrade)</li> <li>• &gt;6 months – 1 year (data from &gt;1 year follow up may be included but will be downgraded)</li> </ul>

14.	Data extraction (selection and coding)	<p>All references identified by the searches and from other sources will be uploaded into EPPI reviewer and de-duplicated. 10% of the abstracts will be reviewed by two reviewers, with any disagreements resolved by discussion or, if necessary, a third independent reviewer. The full text of potentially eligible studies will be retrieved and will be assessed in line with the criteria outlined above.</p> <p>A standardised form will be used to extract data from studies (see <a href="#">Developing NICE guidelines: the manual</a> section 6.4).</p> <p>10% of all evidence reviews are quality assured by a senior research fellow. This includes checking:</p> <ul style="list-style-type: none"> <li>• papers were included /excluded appropriately</li> <li>• a sample of the data extractions</li> <li>• correct methods are used to synthesise data</li> <li>• a sample of the risk of bias assessments</li> </ul> <p>Disagreements between the review authors over the risk of bias in particular studies will be resolved by discussion, with involvement of a third review author where necessary.</p> <p>Study investigators may be contacted for missing data where time and resources allow.</p>
15.	Risk of bias (quality) assessment	<p>Risk of bias will be assessed using the appropriate checklist as described in Developing NICE guidelines: the manual.</p> <p>The following checklist will be used according to study design being assessed:</p> <ul style="list-style-type: none"> <li>• Systematic reviews: Risk of Bias in Systematic Reviews (ROBIS)</li> <li>• Randomised Controlled Trial: Cochrane RoB (2.0)</li> </ul>
16.	Strategy for data synthesis	<p>Pairwise meta-analyses will be performed using Cochrane Review Manager (RevMan5). Fixed-effects (Mantel-Haenszel) techniques will be used to calculate risk ratios for the binary outcomes where possible. Continuous outcomes will be analysed using an inverse variance method for pooling weighted mean differences.</p>

		<p>To maximise the amount of data for meta-analysis, where multiple scales have been used for an outcome such as mobility, fatigue or spasticity, the most commonly reported ones across studies will be extracted and meta-analysed with priority given to those included in CG 186. Where available, outcome data from new studies will be meta-analysed with corresponding data included in CG 186.</p> <p>Heterogeneity between the studies in effect measures will be assessed using the I<sup>2</sup> statistic and visually inspected. An I<sup>2</sup> value greater than 50% will be considered indicative of substantial heterogeneity. Sensitivity analyses will be conducted based on pre-specified subgroups using stratified meta-analysis to explore the heterogeneity in effect estimates. If this does not explain the heterogeneity, the results will be presented pooled using random-effects.</p> <p>GRADEpro will be used to assess the quality of evidence for each outcome, taking into account individual study quality and the meta-analysis results. The 4 main quality elements (risk of bias, indirectness, inconsistency and imprecision) will be appraised for each outcome. Publication bias is tested for when there are more than 5 studies for an outcome.</p> <p>The risk of bias across all available evidence was evaluated for each outcome using an adaptation of the ‘Grading of Recommendations Assessment, Development and Evaluation (GRADE) toolbox’ developed by the international GRADE working group <a href="http://www.gradeworkinggroup.org/">http://www.gradeworkinggroup.org/</a></p> <p>Where meta-analysis is not possible, data will be presented, and quality assessed individually per outcome.</p> <p>If sufficient data is available, meta-regression or NMA-meta-regression will be conducted.</p> <p>WinBUGS will be used for network meta-analysis, if possible, given the data identified.</p>
17.	Analysis of sub-groups	<p>Subgroups that will be investigated if heterogeneity is present:</p> <ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS)</li> </ul>

		<ul style="list-style-type: none"> <li>• According to disability (EDSS &lt;6 and EDSS ≥6)</li> <li>• Severity of cognitive impairment (mild/moderate/severe)</li> <li>• Disease modifying treatment status (currently using and not currently using)</li> <li>• Mood disorders (presence or absence)</li> <li>• Computerised vs clinician led</li> <li>• Group vs individual</li> </ul>

26.	Funding sources/sponsor	This systematic review is being completed by the National Guideline Centre which receives funding from NICE.
27.	Conflicts of interest	All guideline committee members and anyone who has direct input into NICE guidelines (including the evidence review team and expert witnesses) must declare any potential conflicts of interest in line with NICE's code of practice for declaring and dealing with conflicts of interest. Any relevant interests, or changes to interests, will also be declared publicly at the start of each guideline committee meeting. Before each meeting, any potential conflicts of interest will be considered by the guideline committee Chair and a senior member of the development team. Any decisions to exclude a person from all or part of a meeting will be documented. Any changes to a member's declaration of interests will be recorded in the minutes of the meeting. Declarations of interests will be published with the final guideline.
28.	Collaborators	Development of this systematic review will be overseen by an advisory committee who will use the review to inform the development of evidence-based recommendations in line with section 3 of <a href="#">Developing NICE guidelines: the manual</a> . Members of the guideline committee are available on the NICE website.
29.	Other registration details	
30.	Reference/URL for published protocol	
31.	Dissemination plans	NICE may use a range of different methods to raise awareness of the guideline. These include standard approaches such as: <ul style="list-style-type: none"> <li>• notifying registered stakeholders of publication</li> <li>• publicising the guideline through NICE's newsletter and alerts</li> <li>• issuing a press release or briefing as appropriate, posting news articles on the NICE website, using social media channels, and publicising the guideline within NICE.</li> </ul>

## Health economic review protocol

Review question	All questions – health economic evidence
<b>Objectives</b>	To identify health economic studies relevant to any of the review questions.
<b>Search criteria</b>	<ul style="list-style-type: none"> <li>• Populations, interventions and comparators must be as specified in the clinical review protocol above.</li> <li>• Studies must be of a relevant health economic study design (cost–utility analysis, cost-effectiveness analysis, cost–benefit analysis, cost–consequences analysis, comparative cost analysis).</li> <li>• Studies must not be a letter, editorial or commentary, or a review of health economic evaluations. (Recent reviews will be ordered although not reviewed. The bibliographies will be checked for relevant studies, which will then be ordered.)</li> <li>• Unpublished reports will not be considered unless submitted as part of a call for evidence.</li> <li>• Studies must be in English.</li> </ul>
<b>Search strategy</b>	A health economic study search will be undertaken using population-specific terms and a health economic study filter – see appendix B below. For questions being updated, the search will be run from 2014, which was the cut-off date for the searches conducted for NICE guideline CG186.
<b>Review strategy</b>	<p>Studies not meeting any of the search criteria above will be excluded. Studies published before 2005, abstract-only studies and studies from non-OECD countries or the USA will also be excluded.</p> <p>Studies published after 2005 that were included in the previous guideline will be reassessed for inclusion and may be included or selectively excluded based on their relevance to the questions covered in this update and whether more applicable evidence is also identified.</p> <p>Each remaining study will be assessed for applicability and methodological limitations using the NICE economic evaluation checklist which can be found in appendix H of Developing NICE guidelines: the manual (2014).<sup>2</sup></p> <p><b>Inclusion and exclusion criteria</b></p> <ul style="list-style-type: none"> <li>• If a study is rated as both ‘Directly applicable’ and with ‘Minor limitations’, then it will be included in the guideline. A health economic evidence table will be completed, and it will be included in the health economic evidence profile.</li> <li>• If a study is rated as either ‘Not applicable’ or with ‘Very serious limitations’, then it will usually be excluded from the guideline. If it is excluded, then a health economic evidence table will not be completed, and it will not be included in the health economic evidence profile.</li> <li>• If a study is rated as ‘Partially applicable’, with ‘Potentially serious limitations’ or both then there is discretion over whether it should be included.</li> </ul> <p><b>Where there is discretion</b></p> <p>The health economist will make a decision based on the relative applicability and quality of the available evidence for that question, in discussion with the guideline committee if required. The ultimate aim is to include health economic studies that are helpful for decision-making in the context of the guideline and the current NHS setting. If several studies are considered of sufficiently high applicability and methodological quality that they could all be included, then the health economist, in discussion with the committee if required, may decide to include only the most applicable studies and to selectively exclude the remaining studies. All studies excluded on the basis of applicability or methodological limitations will be listed with explanation in the excluded health economic studies appendix below.</p> <p>The health economist will be guided by the following hierarchies.</p>

**Setting:**

- UK NHS (most applicable).
- OECD countries with predominantly public health insurance systems (for example, France, Germany, Sweden).
- OECD countries with predominantly private health insurance systems (for example, Switzerland).
- Studies set in non-OECD countries or in the USA will be excluded before being assessed for applicability and methodological limitations.

**Health economic study type:**

- Cost–utility analysis (most applicable).
- Other type of full economic evaluation (cost–benefit analysis, cost-effectiveness analysis, cost–consequences analysis).
- Comparative cost analysis.
- Non-comparative cost analyses including cost-of-illness studies will be excluded before being assessed for applicability and methodological limitations.

**Year of analysis:**

- The more recent the study, the more applicable it will be.
- Studies published in 2005 or later (including any such studies included in the previous guideline) but that depend on unit costs and resource data entirely or predominantly from before 2005 will be rated as ‘Not applicable’.
- Studies published before 2005 (including any such studies included in the previous guideline) will be excluded before being assessed for applicability and methodological limitations.

**Quality and relevance of effectiveness data used in the health economic analysis:**

- The more closely the clinical effectiveness data used in the health economic analysis match with the outcomes of the studies included in the clinical review the more useful the analysis will be for decision-making in the guideline.

## Appendix B – Literature search strategies

This literature search strategy was used for the following review:

- The clinical and cost effectiveness of non-pharmacological interventions for memory and cognitive problems for adults with MS, including people receiving palliative care.

The literature searches for this review are detailed below and complied with the methodology outlined in Developing NICE guidelines: the manual.<sup>2</sup>

For more information, please see the Methodology review published as part of the accompanying documents for this guideline.

### B.1 Clinical search literature search strategy

Searches were constructed using a PICO framework where population (P) terms were combined with Intervention (I) and in some cases Comparison (C) terms. Outcomes (O) are rarely used in search strategies for interventions as these concepts may not be well described in title, abstract or indexes and therefore difficult to retrieve. Search filters were applied to the search where appropriate.

**Table 1: Database date parameters and filters used**

Database	Dates searched	Search filter used
Medline (OVID)	1946 – 08 September 2021	Randomised controlled trials Systematic review studies  Exclusions (animal studies, letters, comments, children)
Embase (OVID)	1974 – 08 September 2021	Randomised controlled trials Systematic review studies  Exclusions (animal studies, letters, comments, conference abstracts, children)
The Cochrane Library (Wiley)	Cochrane Reviews to 2021 Issue 9 of 12 CENTRAL to 2021 Issue 9 of 12	None  Exclusions (conference abstracts & clinical trials)
PsycINFO (Ovid)	Inception – 08 September 2021	Randomised controlled trials Systematic review studies  Exclusions (conference abstracts & clinical trials)
Epistemonikos (The Epistemonikos Foundation)	Inception to 08 September 2021	Systematic Reviews Exclusions (Cochrane Reviews)

## B.2 Health Economics literature search strategy

Health economic evidence was identified by conducting a broad search with the Multiple Sclerosis population. The following databases were searched: NHS Economic Evaluation Database (NHS EED - this ceased to be updated after 31st March 2015), Health Technology Assessment database (HTA - this ceased to be updated from 31st March 2018) and The International Network of Agencies for Health Technology Assessment (INAHTA). Searches for recent evidence were run on Medline and Embase from 2014 onwards for health economics. Searches for quality-of-life studies were run for general information.

**Table 2: Database date parameters and filters used**

Database	Dates searched	Search filter used
Medline	01 January 2014 – 07 September 2021	Health economics studies Quality of life studies  Exclusions (animal studies, letters, comments, children)

Database	Dates searched	Search filter used
Embase	01 January 2014 – 07 September 2021	Health economics studies Quality of life studies  Exclusions (animal studies, letters, comments, conference abstracts, children)
Centre for Research and Dissemination (CRD)	HTA – 01 January 2014 – 31 March 2018 NHSEED – 01 January 2014 – March 2015	None
The International Network of Agencies for Health Technology Assessment (INAHTA)	01 January 2018 – 07 September 2021	None

#### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Iran
<b>Study setting</b>	Outpatient - those referred to a brain and cognition clinic
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	No financial support provided.
<b>Inclusion criteria</b>	People with MS referred to Brain and Cognition clinic; and aged 18-65 years.
<b>Exclusion criteria</b>	Sensory aphasia; impaired speech comprehension; hemianopia; visual disturbances; and hand-related mechanical or neuromuscular disorders.
<b>Recruitment / selection of participants</b>	Recruited from those referred to Brain and Cognition Clinic.

<b>Intervention(s)</b>	Verbal fluency intervention - RehaCom cognitive rehabilitation software: comprehensive software to rehabilitate cognitive dysfunctions. Involves 20 modules in English and is auto-adaptive with difficulty increasing and reducing depending on performance of the patient. Therapist can take into account information obtained from assessment of sessions and provide modules to strengthen brain cognitive functions. 10 sessions over 5 weeks (2 per week with each session 1 h duration).
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - description not given but likely no intervention.
<b>Number of participants</b>	60 randomised, 53 analysed at week 10
<b>Duration of follow-up</b>	Up to 10 weeks following start of treatment (5 weeks after the end of treatment).
<b>Indirectness</b>	Outcomes - follow-up <3 months minimum in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - unclear</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (referred to cognition clinic but severity unclear)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear</li> <li>• Computerised vs clinician led - mixed/unclear (computerised software but performed in clinic)</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - those with data (available case analysis) appear to have been reported in paper</p>

## Study arms

### Verbal fluency - RehaCom cognitive rehabilitation software (N = 30)

## Control - no intervention? (N = 30)

### Characteristics

#### Arm-level characteristics

Characteristic	Verbal fluency - RehaCom cognitive rehabilitation software (N = 30)	Control - no intervention? (N = 30)
% Female	n = 21 ; % = 78	n = 22 ; % = 85
Sample size		
Mean age (SD)	37.11 (8.12)	39.23 (7.81)
Mean (SD)		
Ethnicity	NR	NR
Custom value		
Comorbidities	NR	NR
Custom value		

Note data available and analysed for n=27 and n=26 in intervention and control groups, respectively. Baseline values given for those analysed not randomised.

### Outcomes

#### Study timepoints

- Baseline
- 10 week (10 weeks post-baseline (5 weeks after the end of intervention sessions). 5-week time-point not extracted as 10 weeks better fits protocol.)

**Results - final values raw data**

<b>Outcome</b>	<b>Verbal fluency - RehaCom cognitive rehabilitation software, Baseline, N = 27</b>	<b>Verbal fluency - RehaCom cognitive rehabilitation software, 10-week, N = 27</b>	<b>Control - no intervention?, Baseline, N = 26</b>	<b>Control - no intervention?, 10-week, N = 26</b>
<b>CVLT-II</b> California Verbal Learning Test - Second Edition. Measures episodic verbal learning and memory.  Mean (SD)	50.11 (13.43)	54 (14.17)	48.08 (11.22)	46.62 (10.1)
<b>COWAT</b> Controlled Oral Word Association Test. Verbal fluency test.  Mean (SD)	25.22 (8.47)	28.62 (8.62)	24.04 (7.39)	23.73 (7.07)
<b>Optional dropout of treatment</b> Note that this was measured at end of treatment (5 weeks) not 10 weeks as intervention only lasted 5 weeks.  No of events	n = NA ; % = NA	n = 3 ; % = 10	n = NA ; % = NA	n = 4 ; % = 13.3
<b>Optional dropout of treatment</b> Note that this was measured at end of treatment (5 weeks) not 10	NA	30	NA	30

Outcome	Verbal fluency - RehaCom cognitive rehabilitation software, Baseline, N = 27	Verbal fluency - RehaCom cognitive rehabilitation software, 10-week, N = 27	Control - no intervention?, Baseline, N = 26	Control - no intervention?, 10-week, N = 26
weeks as intervention only lasted 5 weeks.				
Number analysed				

CVLT-II - Polarity - Higher values are better

COWAT - Polarity - Higher values are better

Baseline and follow-up results given for those analysed (n=27 and n=27), not those randomised (n=30 per group)

### Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT

### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Iran
<b>Study setting</b>	Outpatient - those receiving occupational therapy services in a public rehabilitation hospital recruited
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	Aged between 20 and 50 years; diagnosis of MS; score <5.0 on EDSS; no history of other psychological disorders (e.g., depression or substance abuse); ability to use the computer; and not receiving corticosteroid medications within last 28 days.
<b>Exclusion criteria</b>	Disease was relapsed; or had not completed the intervention.
<b>Recruitment / selection of participants</b>	People with MS receiving occupational therapy services in a public rehabilitation hospital recruited by phone call as well as people with MS referred to hospital were screened to participate in the study.
<b>Intervention(s)</b>	Cognitive-based rehabilitation focused on processing speed + usual occupational therapy: usual occupational therapy involved several exercises for 30 min in 12 sessions across 4 weeks (bending to sides in standing position, forward bending, toe standing, heel standing, heel cord stretch with bent knee, one leg standing, one leg standing with eyes closed, rotating the head in standing position or while walking, maintaining quadruped position, kneel standing and walking).

	Cognitive-based rehab involved processing speed tasks for 4 weeks (3 sessions per week, each session 30 min). At least two tasks performed in each session.
<b>Population subgroups</b>	None
<b>Comparator</b>	Usual occupational therapy only: usual occupational therapy involved several exercises for 1 h in 12 sessions across 4 weeks (bending to sides in standing position, forward bending, toe standing, heel standing, heel cord stretch with bent knee, one leg standing, one leg standing with eyes closed, rotating the head in standing position or while walking, maintaining quadruped position, kneel standing and walking).
<b>Number of participants</b>	71 randomised, 64 analysed at follow-up (n=4 and n=3 in intervention and control groups, respectively, excluded either because of relapsing symptoms in n=4, falling in n=1 and family problems in n=2).
<b>Duration of follow-up</b>	Up to 2 months following completion of training (3 months following start of intervention)
<b>Indirectness</b>	Population - unclear if they had a cognitive deficit at baseline
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority primary progressive (51%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear whether any cognitive deficit was present at baseline</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - absent (history of psychological disorders an exclusion criterion)</li> <li>• Computerised vs clinician led - clinician-led</li> <li>• Group vs individual - individual</li> </ul> <p>Unclear if results are given for those randomised or those randomised minus those with missing data/excluded</p>

## Study arms

### Blair, 2021

#### Bibliographic Reference

Blair, M.; Goveas, D.; Safi, A.; Marshall, C.; Rosehart, H.; Orenczuk, S.; Morrow, S. A.; Does cognitive training improve attention/working memory in persons with MS? A pilot study using the Cogmed Working Memory Training program; Multiple Sclerosis and Related Disorders; 2021; vol. 49; 102770

#### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Canada
<b>Study setting</b>	Outpatient - recruited from those that had been referred to a tertiary care centre

<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported - Cogmed services/training programmes provided at no cost to the study.
<b>Inclusion criteria</b>	Attending London MS or MS Cognitive Clinic in Canada; reporting cognitive difficulties; relapsing-remitting, primary progressive or secondary progressive MS; aged 18-64 years; EDSS score $\leq 7.0$ ; visual acuity of at least 20/70; and z-score $< -1.5$ on at least 2 of 3 measures (PASAT, SDMT and DKFES Color-Word Interference Test) and therefore characterised as having attention/working memory deficits.
<b>Exclusion criteria</b>	Clinical relapse/corticosteroid treatment for at least 1 month prior to study entry; daily marijuana use; loss of visual acuity; history of bipolar disorder; and other psychiatric illness.
<b>Recruitment / selection of participants</b>	Consecutive people with MS attending London MS or affiliative MS Cognitive Clinic in Canada (tertiary care MS clinic).
<b>Intervention(s)</b>	Computer-assisted working memory training - CogMed: 25 training sessions conducted online. Completed 8 exercises per day taking 30-45 min per session. Lasts 5 weeks with 5 sessions per week. Uses adaptive training approach where difficulty level is adjusted in real time based on performance. Each session involves various tasks targeting different aspects of working memory including visuospatial working memory and verbal working memory tasks. Reinforcement built into program in form of small weekly rewards. Each person had a qualified coach responsible for providing structure, motivation and feedback on training progress to Maximise training gains. Cogmed coaches were trained and certified and overseen by a healthcare professional. Initial in-home visit by coach for first training session followed by tracking of performance online and once weekly phone meetings throughout the 5 weeks. At end of training, coach summarised training with participant and feedback data provided.
<b>Population subgroups</b>	None
<b>Comparator</b>	Treatment as usual - standard medical care group.
<b>Number of participants</b>	30 randomised, 22 analysed at 6-month follow-up
<b>Duration of follow-up</b>	Up to 6 months follow-up (~4-5 months after end of training)

<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (&gt;55%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (median 4.0 or 4.5)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (those with z-score &lt;-1.5 on at least 2 of 3 cognitive measures included)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (psychiatric conditions excluded)</li> <li>• Computerised vs clinician led - computerised with involvement of coach</li> <li>• Group vs individual - individual</li> </ul> <p>Appears to be intention to treat analysis with those dropping out/withdrawing consent removed from analysis. n=4 in training group withdrew before starting training, n=2 in control group withdrew consent prior to completion and n=2 in the control group withdrew consent prior to completing 6-month follow-up.</p>

**Study arms**

Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_WAIS-III Digit Span-backward\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_MSNQ\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_BDI-FS\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_FSS\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>Not specifically cognitive fatigue</i> )

### Results\_HADS-anxiety\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_HADS-depression\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_SF-36\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_DEX\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_CFQ\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_PDQ\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

A.; A novel in-home digital treatment to improve processing speed in people with multiple sclerosis: A pilot study; Multiple Sclerosis Journal; 2021; vol. 27 (no. 5); 778-789

### Study details

<b>Trial name / registration number</b>	NCT03569618
<b>Study location</b>	USA
<b>Study setting</b>	Outpatient - recruited from University of California and Neuroinflammation Center
<b>Study dates</b>	Recruited between March and September 2018
<b>Sources of funding</b>	This research was supported by an unrestricted grant from Akili Interactive. Akili Interactive provided AKL-T03 and AKL-T09 without charge for the study.
<b>Inclusion criteria</b>	Diagnosis of clinically isolated syndrome or MS according to 2010 Revised McDonald criteria; adults with SDMT z-scores between -2 and 1; had WiFi at home; and visual acuity was 20/50 OU or better.
<b>Exclusion criteria</b>	Moderate-severe depression based on self- or clinician-report; and clinical relapse within last 30 days.

<b>Recruitment / selection of participants</b>	Recruited from the University of California San Francisco (UCSF) MS and Neuroinflammation Center between March and September 2018. Participants were either referred by their primary MS clinician or identified through review of their clinician's notes for mention of either patient subjective cognitive complaints or of observed abnormalities on testing.
<b>Intervention(s)</b>	<b>Sensory and motor tasks designed to improve processing speed:</b> In-home, tablet-based video game-like digital treatment (AKL-T03). Asked to complete 25 mins for 5 days each week for 6 weeks. Returned for second evaluation after 6 weeks. Persistence of effect evaluated by further assessments at 8 weeks without further intervention. AKL-T03 is an investigational medical device software developed by Akili Interactive. Uses Selective Stimulus Management Engine engaging patients in two simultaneous sensory and motor tasks and designed to engage frontal neural networks. Closed-loop system with algorithms adapting in real-time and between treatment sessions to automatically adjust level (or dose) for a personalised treatment experience adapted to each patient's needs. Allows real-time monitoring of progress and challenges patient continuously so it is never too easy or too difficult. Treatment locked out at 6 weeks. Average proportion of prescribed sessions played was 0.84.
<b>Population subgroups</b>	None
<b>Comparator</b>	<b>Active control digital game:</b> Administered on digital platform similar to AKL-T03, AKL-T09 is a game where aim is to connect letters on a grid and spell as many words as possible. Points earned by tracing words with two or more letters in any direction based on number of words formed, word length and use of uncommon letters with progressive difficulty. Active placebo control used to provide similar time on task and engagement. Average proportion of prescribed sessions played was 1.06.
<b>Number of participants</b>	44 randomised, 40 analysed in intention to treat population (unclear definition of this)
<b>Duration of follow-up</b>	Up to 8 weeks following the start of treatment (2 weeks after last session) - however, insufficient results provided for 8-week time-point.
<b>Indirectness</b>	Outcome - follow-up less than minimum of 3 months specified in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (&gt;75%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (median 3.5)</li> </ul>

- Severity of cognitive impairment (mild/moderate/severe) - unclear (those with SDMT z-score between -2 and 1 included)
- Disease modifying treatment status (currently using and not currently using) - unclear
- Mood disorders (presence or absence) - unclear (moderate to severe depression excluded)
- Computerised vs clinician led - computerised
- Group vs individual - individual

Analysis - intention to treat analysis (likely those with available data as n differs slightly for each outcome) stated to be used. n=40 returned for visit 2 (6 weeks) and included in intention to treat analysis. n=37 considered to be adherent (92.5%) as had completed at least 50% of prescribed sessions and included in per-protocol analyses. Reasons for study discontinuation included n=1 relapse, n=2 poor compliance to protocol and n=1 concurrent medical complication. n=39 returned for visit 3 at 8 weeks.

## Study arms

### Sensory and motor tablet-based tasks - intervention to improve processing speed (N = 23)

### Active control tablet game (N = 21)

## Characteristics

### Arm-level characteristics

Characteristic	Sensory and motor tablet-based tasks - intervention to improve processing speed (N = 23)	Active control tablet game (N = 21)

<b>Modified Fatigue Impact Scale (MFIS)</b>	42.2 (14.4)	40.2 (18.8)
Mean (SD)		

## Outcomes

### Study timepoints

- Baseline
- 6 week (6-weeks - end of intervention period (included as insufficient reporting of outcomes at 8 weeks))

### Results - change from baseline

Outcome	Sensory and motor tablet-based tasks - intervention to improve processing speed, 6-week vs Baseline , N = 20	Active control tablet game, 6-week vs Baseline , N = 20
<b>SDMT - number correct</b> Symbol Digit Modalities Test. Measure of processing speed. Baseline values were 39.2 (7.9) and 42.7 (8.3), respectively.	6.1 (4.62)	3.55 (7.51)
Mean (SD)		
<b>PASAT - number correct</b> Paced Auditory Serial Addition Test. Measure of processing speed and	18	19

Outcome	Sensory and motor tablet-based tasks - intervention to improve processing speed, 6-week vs Baseline , N = 20	Active control tablet game, 6-week vs Baseline , N = 20
<p>working memory. Baseline values were 41.7 (11.6) and 46.6 (10.7), respectively.</p> <p>Number analysed</p>		
<p><b>PASAT - number correct</b>            Paced Auditory Serial Addition Test. Measure of processing speed and working memory. Baseline values were 41.7 (11.6) and 46.6 (10.7), respectively.</p> <p>Mean (SD)</p>	2.72 (5.41)	2.53 (7.19)
<p><b>BVMT-R - number correct</b>            Brief Visuospatial Memory Test. Measures visual memory. Baseline values were 22.6 (4.3) and 24.1 (6.8), respectively.</p> <p>Mean (SD)</p>	0.7 (4.47)	3.25 (5.23)
<p><b>CVLT-II - number correct</b>            California Verbal Learning Test-II. Measures verbal learning and memory. Baseline values were 56.4 (10.7) and 56.0 (9.1), respectively.</p> <p>Mean (SD)</p>	2.05 (9.14)	5.2 (8.6)
<p><b>PDQ-5</b>            5-item Perceived Deficits Questionnaire. Measures perceived deficits in terms of cognitive functioning. Scale not reported but usually 0-80. Baseline values were 9.6 (2.7) and 11.8 (3.4), respectively.</p>	14	11

Outcome	Sensory and motor tablet-based tasks - intervention to improve processing speed, 6-week vs Baseline , N = 20	Active control tablet game, 6-week vs Baseline , N = 20
Number analysed		
<b>PDQ-5</b> 5-item Perceived Deficits Questionnaire. Measures perceived deficits in terms of cognitive functioning. Scale not reported but usually 0-80. Baseline values were 9.6 (2.7) and 11.8 (3.4), respectively.  Mean (SD)	-0.57 (1.28)	-1.64 (1.63)
<b>CES-D</b> Center for Epidemiologic Studies Depression Scale. Measures depression. Scale not reported but is usually 0-60. Baseline values were 10.7 (7.3) and 14.4 (12.8), respectively.  Number analysed	19	19
<b>CES-D</b> Center for Epidemiologic Studies Depression Scale. Measures depression. Scale not reported but is usually 0-60. Baseline values were 10.7 (7.3) and 14.4 (12.8), respectively.  Mean (SD)	1.11 (6.14)	-0.9 (5.57)
<b>STAI-S</b> State-Trait Anxiety Inventory-State score. Measures anxiety-State. Scale not reported but usually 20-80. Baseline values were 47.2 (6.0) and 46.5 (9.2), respectively.  Number analysed	19	19

Outcome	Sensory and motor tablet-based tasks - intervention to improve processing speed, 6-week vs Baseline , N = 20	Active control tablet game, 6-week vs Baseline , N = 20
<p><b>STAI-S</b>            State-Trait Anxiety Inventory-State score. Measures anxiety-State. Scale not reported but usually 20-80. Baseline values were 47.2 (6.0) and 46.5 (9.2), respectively.</p> <p>Mean (SD)</p>	0.05 (4.64)	0.21 (8.93)
<p><b>STAI-T</b>            State-Trait Anxiety Inventory-Trait score. Measures anxiety-Trait. Scale not reported but usually 20-80. Baseline values were 44.1 (2.8) and 43.7 (3.6), respectively.</p> <p>Number analysed</p>	17	17
<p><b>STAI-T</b>            State-Trait Anxiety Inventory-Trait score. Measures anxiety-Trait. Scale not reported but usually 20-80. Baseline values were 44.1 (2.8) and 43.7 (3.6), respectively.</p> <p>Mean (SD)</p>	0.77 (4.1)	0.35 (3.35)
<p><b>MFIS</b>            Modified Fatigue Impact Scale. Scale not reported but is usually 0-84. Baseline values were 42.2 (14.4) and 40.2 (18.8), respectively.</p> <p>Number analysed</p>	19	19

Outcome	Sensory and motor tablet-based tasks - intervention to improve processing speed, 6-week vs Baseline , N = 20	Active control tablet game, 6-week vs Baseline , N = 20
<b>MFIS</b> Modified Fatigue Impact Scale. Scale not reported but is usually 0-84. Baseline values were 42.2 (14.4) and 40.2 (18.8), respectively.  Mean (SD)	-4.79 (6.27)	-2.95 (9.55)
<b>Average proportion of prescribed sessions played</b>  Average	0.84	1.06

 CES-D - Polarity - Lower values are better  
 STAI-S - Polarity - Lower values are better  
 STAI-T - Polarity - Lower values are better  
 MFIS - Polarity - Lower values are better

Average proportion of prescribed sessions played - Polarity - Higher values are better  
 Results only provided for 6 weeks (end of treatment) and not 8 weeks (2 weeks following end of intervention). Number analysed differed for each outcome and is indicated below if it was not n=20 in each group.

**Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT**  
**Results\_SDMT\_6 weeks change from baseline**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(Reported at time-point &lt;3 months minimum in protocol)</i>

**Results\_PASAT\_6 weeks change from baseline**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable (Reported at time-point <3 months minimum in protocol)

### Results\_BVMT\_6 weeks change from baseline

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable (Reported at time-point <3 months minimum in protocol)

### Results\_CVLT-II\_6 weeks change from baseline

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(Reported at time-point &lt;3 months minimum in protocol)</i>

### Results\_PDQ-5\_6 weeks change from baseline

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	High
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(Reported at time-point &lt;3 months minimum in protocol)</i>

### Results\_CES-D\_6 weeks change from baseline

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(Reported at time-point &lt;3 months minimum in protocol)</i>

### Results\_STAI-S\_6 weeks change from baseline

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(Reported at time-point &lt;3 months minimum in protocol)</i>

### Results\_STAI-T\_6 weeks change from baseline

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable (Reported at time-point <3 months minimum in protocol)

### Results\_MFIS\_6 weeks change from baseline

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(Reported at time-point &lt;3 months minimum in protocol. Also, not specifically cognitive fatigue.)</i>

### Results\_average proportion of sessions played\_intervention period

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

Y.; Forthoffer, N.; Berger, E.; Moreau, T.; De Seze, J.; Morele, E.; Debouverie, M.; Memory improvement in multiple sclerosis after an extensive cognitive rehabilitation program in groups with a multicenter double-blind randomized trial; *Clinical Rehabilitation*; 2020; vol. 34 (no. 6); 754-763

## Study details

<b>Trial name / registration number</b>	NCT01659593
<b>Study location</b>	France
<b>Study setting</b>	Outpatient - recruited from university centres
<b>Study dates</b>	Recruited between September 2012 and December 2016
<b>Sources of funding</b>	No financial support received for research, authorship and/or publication of article

<b>Inclusion criteria</b>	People with MS diagnosis based on McDonald's criteria; 18-60 years old; EDSS score 6.0 or less; disease duration $\leq$ 30 years; cognitive status moderate (at least 2 cognitive functions of neuropsychological examination but not all); oral and written understanding of French; and affiliation to French health insurance system.
<b>Exclusion criteria</b>	Recent neuropsychological evaluation within 2 months prior to inclusion (to avoid re-test effect); no previous participation in a cognitive rehabilitation program; adult participants under guardianship; presence of other chronic or neurological disease and drug abuse; and corticoid treatment within 3 weeks prior to inclusion (limit bias as these treatments could affect cognition positively or negatively).
<b>Recruitment / selection of participants</b>	Recruited from four university centers between September 2012 and December 2016
<b>Intervention(s)</b>	ProCog-SEP cognitive rehabilitation: 13 group sessions over a period of 6 months each lasting 2 h (2 per month) conducted by different neuropsychologist to the one that performed initial assessment. Extended cognitive rehabilitation programme designed for people with MS using facilitation and reorganisation strategies. Functional reorganisation refers to aiming to improve cognitive functioning through treatments that they had not previously used or used infrequently. Combined with facilitation technique aiming to improve performance by building on preserved cognitive abilities. Programme includes psychoeducation advice and cognitive exercises targeting verbal and non-verbal episodic memory, working memory, short-term memory, executive functions and language.
<b>Population subgroups</b>	None
<b>Comparator</b>	Placebo programme: 13 2 h sessions over 6 months including non-cognitive exercises with discussion. No strategies or cognitive advice were provided. Pencil and paper exercises proposed but without memorisation, leaning and/or mental imagery.
<b>Number of participants</b>	128 randomised, 110 with baseline data (3 months post-randomisation) 101 with data at 6-9 months from baseline
<b>Duration of follow-up</b>	Up to 6-9 months from baseline
<b>Indirectness</b>	None

<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - unclear</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (mean 3.5)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - said to include those with moderate impairment</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (excluded other chronic or neurologic disease)</li> <li>• Computerised vs clinician led - clinician-led</li> <li>• Group vs individual - group</li> </ul> <p>Analysis - intention to treat analysis stated to be used however is more like modified intention to treat as excluded those dropping out or not continuing (n=101)</p>
----------------------------	--

### Study arms

#### **ProCog-SEP extended cognitive rehabilitation program (N = 64)**

Includes psychoeducational advices and cognitive exercises which target verbal and non-verbal episodic memory, working memory, short-term memory, executive functions, and language

#### **Placebo programme - non-cognitive exercises and discussion (N = 64)**

### Characteristics

#### Arm-level characteristics

Characteristic	ProCog-SEP extended cognitive rehabilitation program (N = 64)	Placebo programme - non-cognitive exercises and discussion (N = 64)
% Female	n = 38 ; % = 73.1	n = 40 ; % = 81.6
Sample size		

<b>Characteristic</b>	<b>ProCog-SEP extended cognitive rehabilitation program (N = 64)</b>	<b>Placebo programme - non-cognitive exercises and discussion (N = 64)</b>
<b>Mean age (SD)</b>	NR	NR
Custom value		
<b>Ethnicity</b>	NR	NR
Custom value		
<b>Comorbidities</b>	NR	NR
Custom value		
<b>Mean age at onset of disease (years)</b>	47.2 (9)	44.9 (10)
Mean (SD)		
<b>EDSS score</b>	3.5 (1.5)	3.4 (1.7)
Mean (SD)		
<b>Mean disease duration (years)</b>	11.3 (7.5)	12.4 (7.5)
Mean (SD)		
<b>Progressive-relapsing remitting MS</b>	n = 9 ; % = 17.3	n = 13 ; % = 26.5
Sample size		

Note that baseline values are given for those analysed (n=52 and n=49, respectively).

## Outcomes

### Study timepoints

- Baseline
- 6 month (Described as 6-9 months follow-up from baseline assessments.)

### Results - raw data

Outcome	ProCog-SEP extended cognitive rehabilitation program , Baseline, N = 52	ProCog-SEP extended cognitive rehabilitation program , 6-month, N = 52	Placebo programme - non-cognitive exercises and discussion, Baseline, N = 49	Placebo programme - non-cognitive exercises and discussion, 6-month, N = 49
<b>Selective Reminding Test - Mean free recall</b> Measures episodic memory Mean (SD)	10.3 (1.9)	10.6 (2)	10.5 (2)	10.6 (1.8)
<b>Selective Reminding Test - Learning Index</b> Measures episodic memory Mean (SD)	53.8 (21.4)	60.7 (23.8)	55.6 (22.5)	54 (20.3)
<b>Selective Reminding Test - Delayed Recall</b> Measures episodic memory Mean (SD)	11.4 (3.2)	12.1 (3.3)	11.4 (3)	11.6 (3.1)

<b>Outcome</b>	<b>ProCog-SEP extended cognitive rehabilitation program , Baseline, N = 52</b>	<b>ProCog-SEP extended cognitive rehabilitation program , 6-month, N = 52</b>	<b>Placebo programme - non-cognitive exercises and discussion, Baseline, N = 49</b>	<b>Placebo programme - non-cognitive exercises and discussion, 6-month, N = 49</b>
<b>10/36 Spatial Recall Test for episodic memory - Total Score</b> Scale 0-30.  Mean (SD)	17.2 (4.9)	18.6 (5)	16.6 (5.5)	17.1 (4.6)
<b>10/36 Spatial Recall Test for episodic memory - Delayed Recall</b> Scale 0-10.  Mean (SD)	6.1 (2.3)	6.1 (2.3)	5.8 (2.4)	6.2 (2.4)
<b>Digit Span - forward</b> Measures short-term memory  Mean (SD)	5.7 (1.1)	5.8 (1.2)	5.6 (1)	5.7 (1.1)
<b>Digit span - backward</b> Measure working memory  Mean (SD)	4.2 (1.2)	4.8 (1.4)	4.4 (1.1)	4.5 (1.4)
<b>Working Memory domain of Test of Attentional Performance - Omissions</b> Measures working memory  Mean (SD)	4.2 (2.9)	2.8 (2.8)	3 (2.2)	2.9 (2.3)

<b>Outcome</b>	<b>ProCog-SEP extended cognitive rehabilitation program , Baseline, N = 52</b>	<b>ProCog-SEP extended cognitive rehabilitation program , 6-month, N = 52</b>	<b>Placebo programme - non-cognitive exercises and discussion, Baseline, N = 49</b>	<b>Placebo programme - non-cognitive exercises and discussion, 6-month, N = 49</b>
<b>Flexibility domain of Test of Attentional Performance - Correct answers</b> Scale 0-100. Mean (SD)	89.3 (12.1)	91.4 (14.6)	92.7 (12.5)	96 (4.9)
<b>Incompatibility domain of Test of Attentional Performance - Correct answers</b> Scale 0-60. Measures inhibition. Mean (SD)	54 (9.8)	53.2 (12.4)	55.5 (8.2)	56.5 (8.4)
<b>Verbal fluency - letter M</b> Mean (SD)	12.2 (3.9)	13.1 (4.5)	12.2 (4.4)	12.5 (4)
<b>Verbal fluency - Animals</b> Mean (SD)	19.2 (5.4)	20.4 (5.4)	18.3 (4.6)	19 (5.9)
<b>Code - assessing processing speed</b> Mean (SD)	45.3 (9.7)	47.3 (9.6)	46.9 (13.6)	49.2 (12.8)

<b>Outcome</b>	<b>ProCog-SEP extended cognitive rehabilitation program , Baseline, N = 52</b>	<b>ProCog-SEP extended cognitive rehabilitation program , 6-month, N = 52</b>	<b>Placebo programme - non-cognitive exercises and discussion, Baseline, N = 49</b>	<b>Placebo programme - non-cognitive exercises and discussion, 6-month, N = 49</b>
<b>DO80 - Total Score</b> Picture-naming task evaluating language. Scale 0-80.  Mean (SD)	77.3 (2.9)	77.9 (2.2)	77.1 (3.7)	77.5 (2.5)
<b>DO80 - Time (seconds)</b> Assesses language  Mean (SD)	138.6 (46)	133.1 (49.1)	149.9 (61.8)	143.3 (57.2)
<b>Adherence</b> Defined as those that completed full programmes (attending at least 9/13 sessions and underwent neuropsychological assessment before and after intervention).  No of events	n = NA ; % = NA	n = 50 ; % = 78.1	n = NA ; % = NA	n = 44 ; % = 68.8
<b>Adherence</b> Defined as those that completed full programmes (attending at least 9/13 sessions and underwent	NA	64	NA	64

Outcome	ProCog-SEP extended cognitive rehabilitation program , Baseline, N = 52	ProCog-SEP extended cognitive rehabilitation program , 6-month, N = 52	Placebo programme - non-cognitive exercises and discussion, Baseline, N = 49	Placebo programme - non-cognitive exercises and discussion, 6-month, N = 49
neuropsychological assessment before and after intervention.				
Number analysed				
<b>MS International Quality of Life Questionnaire - Index</b> Scale not reported but is usually 0-100 per domain. Index is mean of 9 subdomain scores.  Mean (SD)	48.3 (22.8)	59.5 (12.3)	50.7 (21.6)	58.4 (16.6)

Selective Reminding Test - Mean free recall - Polarity - Higher values are better  
 Selective Reminding Test - Learning Index - Polarity - Higher values are better  
 Selective Reminding Test - Delayed Recall - Polarity - Higher values are better  
 10/36 Spatial Recall Test for episodic memory - Total Score - Polarity - Higher values are better  
 10/36 Spatial Recall Test for episodic memory - Delayed Recall - Polarity - Higher values are better  
 Digit Span - forward - Polarity - Higher values are better  
 Digit span - backward - Polarity - Higher values are better  
 Working Memory domain of Test of Attentional Performance - Omissions - Polarity - Lower values are better  
 Flexibility domain of Test of Attentional Performance - Correct answers - Polarity - Higher values are better  
 Incompatibility domain of Test of Attentional Performance - Correct answers - Polarity - Higher values are better  
 Verbal fluency - letter M - Polarity - Higher values are better  
 Verbal fluency - Animals - Polarity - Higher values are better

Code - assessing processing speed - Polarity - Higher values are better

DO80 - Total Score - Polarity - Higher values are better

DO80 - Time - Polarity - Lower values are better

MS International Quality of Life Questionnaire - Index - Polarity - Higher values are better

Final values reported for continuous outcomes.

N=64 were randomised to each group, but baseline values given for n=52 in intervention and n=49 in placebo group.

**Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT**  
**Results\_selective reminding test mean free recall\_6-9 months**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_selective reminding test learning index\_6-9 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_selective reminding test delayed recall\_6-9 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_10/36 Spatial Recall Test for episodic memory - Total Score\_6-9 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	Some concerns

Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Flexibility domain of Test of Attentional Performance - Correct answers\_6-9 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Incompatibility domain of Test of Attentional Performance - Correct answers\_6-9 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Verbal fluency - letter M\_6-9 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Verbal fluency - Animals\_6-9 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Code - assessing processing speed\_6-9 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_DO80 Total Score\_6-9 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_DO80 - Time\_6-9 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

## Adherence

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(Would be more useful to have adherence to programme among those not lost to follow-up separately rather than combined with those that were lost to follow-up or withdrew)</i>

### Results\_MS International Quality of Life Questionnaire\_6-9 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

## Campbell, 2016

**Bibliographic Reference** Campbell, J.; Langdon, D.; Cercignani, M.; Rashid, W.; A Randomised Controlled Trial of Efficacy of Cognitive Rehabilitation in Multiple Sclerosis: A Cognitive, Behavioural, and MRI Study; Neural Plasticity; 2016; vol. 2016; 4292585

## Study details

<b>Trial name / registration number</b>	ISRCTN54901925.
<b>Study location</b>	UK
<b>Study setting</b>	Unclear - likely outpatient
<b>Study dates</b>	Invited to participate between February 2014 and February 2015
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	Aged between 18 and 65 years; clinically definite MS according to McDonald criteria; EDSS score $\leq 6.5$ ; cognitive impairment defined as scores below 5th percentile for normative data adjusted for age, sex and years of formal education on one or more of Brief International Cognitive Assessment for MS (BICAMS) tests (CVLT-II, BVMT-R and SDMT tests).
<b>Exclusion criteria</b>	History of significant psychiatric disorders; alcohol or substance abuse; visual acuity less than 6/18 corrected; oscillopsia; diplopia that would interfere with testing; had a MS relapse, received corticosteroids or changes made to psychoactive medications within the previous month.

<b>Recruitment / selection of participants</b>	Invited to participate between February 2014 and February 2015.
<b>Intervention(s)</b>	RehaCom cognitive rehabilitation - divided attention, working memory and topological memory modules: 6 weeks of home-based computer-assisted cognitive rehabilitation using RehaCom software (45 min sessions three times weekly). Training in three modules involving working memory, visuospatial memory and divided attention. Difficulty tailored to individual's performance and increases automatically in line with progress. Divided attention module asked to drive simulated car using keyboard inputs with multiple distractions being navigated and speed and direction of vehicle adjusted according to road conditions. As complexity increases more distractors introduced. Working memory module involves remembering series of cards presented briefly on screen. As complexity increases, asked to remember only cards of a value or suit and number of items to remember increases. Higher levels involve remembering them in reverse order. Topological memory module involves visuospatial memory and involves various objects presented briefly on screen with patient asked to remember object and position in the sequence. As complexity increases number of items on screen increases and more abstract shapes introduced.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control group: watched series of natural history DVDs of corresponding duration and frequency for 6 weeks.
<b>Number of participants</b>	38 randomised, 38 analysed at follow-up
<b>Duration of follow-up</b>	Up to 12 weeks following the end of a 6-week intervention (18 weeks)
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (71%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (mean ~4.0 in both groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (those below 5th percentile on one of three cognitive tests included)</li> <li>• Disease modifying treatment status (currently using and not currently using) - majority taking them (53%)</li> </ul>

- Mood disorders (presence or absence) - unclear (excluded if had history of psychiatric disorders)
- Computerised vs clinician led - computerised
- Group vs individual - individual

Analysis - appears to be intention to treat with those with no data removed as n=17 and n=14 included in the two groups at 18 weeks. N=2 in intervention group withdrew due to relapse (n=1) or not completing assessment due to time constraints (n=1). N=5 withdrew from control group due to time constraints meaning they did not complete assessment (n=1), relapse (n=1), unable to tolerate MRI (n=1), moving house (n=1) and no reason given (n=1).

## Study arms

**RehaCom cognitive rehabilitation - divided attention, working memory and topological memory modules (N = 19)**

**Control - natural history DVDs (N = 19)**

## Characteristics

### Arm-level characteristics

## Outcomes

### Study timepoints

- Baseline
- 18 week (18 weeks - 12-weeks following the last intervention session (6-week intervention period). 6-week time-point not extracted as 18 weeks better fits protocol.)

### Results - change from baseline

Outcome	RehaCom cognitive rehabilitation - divided attention, working memory and topological memory modules, 18-week vs Baseline, N = 17	Control - natural history DVDs, 18-week vs Baseline, N = 14
<b>SDMT</b> Symbol Digit Modalities Test. Baseline values were 43.39 (7.39) and 38.21 (11.39)  Mean (SD)	3.35 (4.17)	4.57 (7.21)
<b>CVLT-II</b> California Verbal Learning Test. Baseline values were 45.32 (9.56) and 43.89 (9.73)  Mean (SD)	6.94 (7.01)	7.5 (8.83)
<b>BVMT</b> Brief Visuospatial Memory Test. Baseline values were 20.63 (5.77) 18.05 (7.37)  Mean (SD)	7.29 (5.07)	4.14 (5.32)

SDMT - Polarity - Higher values are better

CVLT-II - Polarity - Higher values are better

BVMT - Polarity - Higher values are better

N=17 and N=14, respectively, analysed in intervention and control groups at 18 weeks.

**Results - raw data**

<b>Outcome</b>	<b>RehaCom cognitive rehabilitation - divided attention, working memory and topological memory modules, Baseline, N = 17</b>	<b>RehaCom cognitive rehabilitation - divided attention, working memory and topological memory modules, 18-week, N = 17</b>	<b>Control - natural history DVDs, Baseline, N = 14</b>	<b>Control - natural history DVDs, 18-week, N = 14</b>
<b>FAMS</b> Functional Assessment of MS. Quality of life measure. Scale not reported but usually 0-176.  Mean (SD)	85.24 (22.61)	89 (30.99)	102.79 (35.06)	101 (32.4)
<b>PAM-13</b> Patient Activation Measure-13. Measures level of patient engagement in health. Scale not reported but usually 0-100.  Mean (SD)	54.62 (17.13)	58.79 (15.52)	65.58 (14.66)	62.1 (15.9)
<b>EQ-5D</b> Scale appears to be 0-1.  Mean (SD)	0.49 (0.13)	0.53 (0.2)	0.61 (0.22)	0.57 (0.27)
<b>MSNQ-S</b> Multiple Sclerosis	35.65 (13.56)	29.18 (15.14)	34.79 (12.34)	28.93 (13.13)

<b>Outcome</b>	<b>RehaCom cognitive rehabilitation - divided attention, working memory and topological memory modules, Baseline, N = 17</b>	<b>RehaCom cognitive rehabilitation - divided attention, working memory and topological memory modules, 18-week, N = 17</b>	<b>Control - natural history DVDs, Baseline, N = 14</b>	<b>Control - natural history DVDs, 18-week, N = 14</b>
Neuropsychological Questionnaire. Scale unclear but usually 0-60.				
Mean (SD)				
<b>HADS-depression</b> Hospital Anxiety and Depression Scale. Scale not reported but usually 0-21.	9.82 (3.38)	9.35 (2.85)	9.21 (3.38)	8.79 (4.21)
Mean (SD)				
<b>HADS-anxiety</b> Hospital Anxiety and Depression Scale. Scale not reported but usually 0-21.	9.18 (3.8)	8.53 (4.38)	9.86 (5.74)	6.86 (4.93)
Mean (SD)				
<b>FSS</b> Fatigue Severity Scale. Scale not reported but usually 9-63.	52.12 (10.89)	52.53 (11.47)	49.43 (14.18)	49.29 (15.5)
Mean (SD)				

<b>Outcome</b>	<b>RehaCom cognitive rehabilitation - divided attention, working memory and topological memory modules, Baseline, N = 17</b>	<b>RehaCom cognitive rehabilitation - divided attention, working memory and topological memory modules, 18-week, N = 17</b>	<b>Control - natural history DVDs, Baseline, N = 14</b>	<b>Control - natural history DVDs, 18-week, N = 14</b>
<b>USE-MS</b> Unidimensional Self-Efficacy scale for MS. Scale unclear.  Mean (SD)	16 (5.85)	16.47 (5.7)	19 (6.72)	19.31 (8.7)
<b>Completed at least 75% of prescribed sessions</b>  Custom value	NA	16/18 (88.9%)	NA	NR
<b>Completed all prescribed sessions</b>  Custom value	NA	12/18 (66.7%)	NA	NR
<b>0-back errors</b> Measured on N-back test. Measures working memory.  Mean (SD)	3.24 (3.42)	2.53 (3.64)	3.71 (4.92)	2.64 (2.5)
<b>1-back errors</b> Measured on N-back test. Measures working memory.  Mean (SD)	2.71 (3.48)	3.06 (3.27)	4.57 (8.42)	2.14 (1.99)

Outcome	RehaCom cognitive rehabilitation - divided attention, working memory and topological memory modules, Baseline, N = 17	RehaCom cognitive rehabilitation - divided attention, working memory and topological memory modules, 18-week, N = 17	Control - natural history DVDs, Baseline, N = 14	Control - natural history DVDs, 18-week, N = 14
<b>2-back errors</b> Measured on N-back test. Measures working memory.  Mean (SD)	5.24 (4.82)	4.76 (5.76)	6 (9.83)	5.29 (3.83)

FAMS - Polarity - Higher values are better

PAM-13 - Polarity - Higher values are better

EQ-5D - Polarity - Higher values are better

MSNQ-S - Polarity - Lower values are better

HADS-depression - Polarity - Lower values are better

HADS-anxiety - Polarity - Lower values are better

FSS - Polarity - Lower values are better

USE-MS - Polarity - Higher values are better

0-back errors - Polarity - Lower values are better

1-back errors - Polarity - Lower values are better

2-back errors - Polarity - Lower values are better

Includes final values for continuous outcomes

Note that though there were N=19 per group at baseline, baseline values given here for the n=17 and n=14 analysed

### Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT

#### Results\_SDMT change from baseline\_18 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

#### Results\_BVMT change from baseline\_18 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_FAMS\_18 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_PAM-13\_18 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_EQ-5D\_18 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_MSNQ-S\_18 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_HADS-depression\_18 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_HADS-anxiety\_18 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_FSS\_18 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>General fatigue rather than cognitive fatigue specifically</i> )

### Results\_USE-MS\_18 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_adherence 75% sessions\_end of treatment

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	High

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_adherence all sessions\_end of treatment

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	High
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

Carr, S. E.; das Nair, R.; Schwartz, A. F.; Lincoln, N. B.; Group memory rehabilitation for people with multiple sclerosis: a feasibility randomized controlled trial; *Clinical Rehabilitation*; 2014; vol. 28 (no. 6); 552-61

### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	UK
<b>Study setting</b>	Outpatient - recruited from those attending MS clinics
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Supported by a research grant from Biogen Idec Limited, Maidenhead, Berkshire
<b>Inclusion criteria</b>	Reported memory problems in daily life; were more than 12 months since diagnosis; able to give informed consent; able to speak and understand conversational English; and able to attend the outpatient unit where the treatment sessions were delivered
<b>Exclusion criteria</b>	Very severe memory problems who were considered by the consultant clinical psychologist or multiple sclerosis specialist nurse to not be able to cope with group sessions.
<b>Recruitment / selection of participants</b>	Identified from a register of patients who attended Central Surrey Health MS clinics. They were invited to take part in the study by letter, which contained information on the purpose of the study, including the focus on memory problems in daily life, and what participation would involve. Patients who were interested were asked to contact one of the researchers or to complete the consent form and return it in a pre-stamped envelope.
<b>Intervention(s)</b>	Group memory programme: group intervention consisting of 1.5 h sessions and homework over 10-week period (n=8 people per group). If sessions missed, they were invited to attend next session to catch up. Programme included both restitution and compensation strategies. Included one introductory session; three sessions on attention training; three sessions on internal memory strategies; two sessions on external memory aids; and one concluding session to bring

	together everything that had been learned and to reflect on the best strategies for each individual. Homework was recommended at the end of each session. Assistant psychologist delivered the treatment groups based on a manual. Session's video-recorded to check correspondence with manual.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control group - usual care: received their usual care and all other rehabilitation (e.g., physiotherapy, occupational therapy) continued as usual.
<b>Number of participants</b>	48 randomised, number analysed depends on outcome as those with missing data not included
<b>Duration of follow-up</b>	4- and 8-months follow-up reported (1.5-5.5 months after end of sessions)
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority primary progressive or relapsing-remitting (33% each)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (those with very severe problems excluded)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear</li> <li>• Computerised vs clinician led - clinician-led with homework</li> <li>• Group vs individual - group with homework</li> </ul> <p>Analysis - appears to have excluded those where no data available. n=7 in intervention and n=3 in control failed to return outcome questionnaires at 4 months and further n=2 and n=5 respectively failed to return questionnaires at 8 months. Number analysed differs slightly for different outcomes.</p>

## Study arms

**Group memory programme - sessions on attention, internal memory strategies and external memory aids (N = 24)**

**Control - treatment as usual (N = 24)**

## Characteristics

### Arm-level characteristics

Characteristic	Group memory programme - sessions on attention, internal memory strategies and external memory aids (N = 24)	Control - treatment as usual (N = 24)
% Female	n = 17 ; % = 71	n = 16 ; % = 67

### Bibliographic Reference

Charvet, L. E.; Shaw, M. T.; Haider, L.; Melville, P.; Krupp, L. B.; Remotely-delivered cognitive remediation in multiple sclerosis (MS): protocol and results from a pilot study; Multiple Sclerosis Journal Experimental Translational & Clinical; 2015; vol. 1; 2055217315609629

### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	USA
<b>Study setting</b>	Outpatient - those seeking treatment for cognitive impairment as judged by referring neurologist

<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Supported by Novartis AG with support from The Lourie Foundation Inc. The cognitive remediation program was provided by Lumos Labs, Inc.
<b>Inclusion criteria</b>	People seeking treatment for cognitive impairment as judged by referring neurologist; recently initiated on fingolimod treatment; English-speaking; between age of 18 and 70 years; relapsing-remitting MS; and stable disease.
<b>Exclusion criteria</b>	Other major medical conditions: and no recent relapse or associated steroid use in past month.
<b>Recruitment / selection of participants</b>	Enrolled participants seeking treatment for cognitive impairment due to MS, as judged by their referring neurologist. Recruited through the Stony Brook Medicine Multiple Sclerosis Comprehensive Care Center
<b>Intervention(s)</b>	Adaptive cognitive remediation programme: 12-week treatment period with cognitive exercises to be completed 5 times weekly (60 total days across three months). 30 min required per session. Technical support, coaching, and monitoring of computer use were completed remotely by a study technician. Lumosity platform, developed by Lumos Labs, Inc., was chosen as the active adaptive cognitive remediation program. Developed a study-specific portal and set of games that focused on the most common areas of impairment in MS, including speeded information processing and working memory. Games were visually engaging, using simple rules that were explained during a brief instructional phase before participants begin. All games were adaptive as they had the ability to increase difficulty based on the participant's improvement. The program tracked progress using various gameplay parameters, such as unique levels played, and improvements made in the game.
<b>Population subgroups</b>	None
<b>Comparator</b>	Active control - ordinary computer games: computer-based gaming program that would provide the experience of cognitive exercise associated with cognitive benefit but without the key components of the adaptive cognitive remediation programs (i.e., games not developed based on cognitive neuroscience principles to drive neural plasticity). Commercially available Hoyle puzzles and board games program. Participant was given a list of daily exercises to complete that would last the same game play time as the treatment condition. Participants in the active control condition were instructed to play two games for 15 minutes each, according to a set rotational sequence.
<b>Number of participants</b>	20 randomised, 20 analysed (does not mention any drop-out)

<b>Duration of follow-up</b>	Up to end of intervention (12 weeks)
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (median 2 or 2.5 in the two groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (described as having mild-moderate impairments, proportion with each unclear)</li> <li>• Disease modifying treatment status (currently using and not currently using) - using (all had to have recently initiated fingolimod)</li> <li>• Mood disorders (presence or absence) - unclear (other major medical conditions excluded)</li> <li>• Computerised vs clinician led - computerised</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - appears to be intention to treat as no missing data reported</p>

Final values for continuous outcomes

## Results - change from baseline

Outcome	Adaptive cognitive remediation programme - Lumosity games including information processing speed and working memory, 12-week vs Baseline, N = 11	Active control - ordinary computer games, 12-week vs Baseline, N = 9
<b>General cognitive composite</b> Average from other cognitive test measures (WAIS-IV letter-numbering sequencing, visual span (Corsi blocks), SRT learning trials, BVMT-R learning trials). Z-score only.  Mean (SD)	0.46 (0.59)	-0.14 (0.48)

General cognitive composite - Polarity - Higher values are better

## Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT Results\_WAIS-IV letter-numbering sequencing\_12 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Visual span (Corsi blocks)\_12 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_PASAT 2 second trials\_12 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_PASAT 3 second trials\_12 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_DKEFS trail 5\_12 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_DKEFS 2/3 combo\_12 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_SRT learning trials\_12 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_SRT delay\_12 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_BVMT-R learning trials\_12 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_BVMT-R delay\_12 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_adherence % compliance\_12 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_general cognitive composite score\_12 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

#### Study details

Trial name / registration number	NCT02141386
Study location	USA
Study setting	Unclear - likely outpatient

<b>Study dates</b>	Recruitment began September 10, 2013 through June 5, 2015 with last data collection September 9, 2015
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	Diagnosis of MS; scoring one or more standard deviations below published normative data on the Symbol Digit Modalities Test or SDMT; a reading recognition standard score of 85 or above on WRAT-3; learned English by 12 years of age; adequate visual, auditory, and motor capacity to operate computer software; no anticipated medication changes during the course of the three-month study period; and no relapses or steroids in the previous month.
<b>Exclusion criteria</b>	History of any developmental disorders, conditions other than MS associated with cognitive impairment, a primary psychiatric disorder, any serious medical conditions, alcohol or substance use disorder; and also, history of use of computer-based cognitive training developed by Posit Science (the developer of programme used in study).
<b>Recruitment / selection of participants</b>	Recruitment began September 10, 2013 through June 5, 2015 with last data collection September 9, 2015
<b>Intervention(s)</b>	Adaptive cognitive training programme: Training for 1 h per day, 5 days a week for 12 weeks (60 h target use over the period). Online adaptive cognitive training program developed by Posit Science Corporation. Research version of the BrainHQ program, and offered a portal dedicated to the study, central management of study participation and metrics, and a set of 15 exercises targeting speed, attention, working memory, and executive function through the visual and auditory domains. Each exercise was adaptive with a Bayesian algorithm operating on a trial-by-trial basis to increase the challenge as participants performed correctly and to reduce challenge as participants performed incorrectly. Each exercise employed multiple stimulus sets designed to span relevant dimensions of real-world stimuli. For example, auditory exercises employed stimuli related to human speech perception that were initially slowed and later speeded, while visual exercises initially employed simple high contrast stimuli and later provided stimuli that were naturalistic and low contrast. Participants required to attend to stimuli, detect novel stimuli and general receive a reward after a correct trial. Each daily training session consisted of four exercises chosen from an active set of six; when all of the content in an exercise was completed (typically over a number of days), that exercise was withdrawn from the schedule and the next exercise added to the active set of six. Participants had ongoing access to technical support as well as a scheduled weekly check-in phone call.
<b>Population subgroups</b>	None

<b>Comparator</b>	Active control condition: Training for 1 h per day, 5 days a week for 12 weeks (60 h target use over the period). software gaming suite developed by Hoyle Puzzle and Board Games (2008 version). Designed to account for nonspecific treatment effects including interactions with research personnel, and computer-based game-playing. Participants were provided a set gaming schedule and were instructed to play games in an arrangement that mirrored to the active condition, with a schedule of four games per session for 15 minutes each following a set rotational sequence. Games were selected for “face validity” as having cognitive benefit (e.g., word puzzles) but did not include the active condition’s program design features to drive learning or maintain user challenge. Participants had ongoing access to technical support as well as a scheduled weekly check-in phone call.
<b>Number of participants</b>	135 randomised, 135 analysed (despite n=4 in intervention and n=1 in control discontinuing the intervention). Reasons for discontinuation were n=1 documented relapse, n=1 withdrawal, n=1 personal difficulties and n=1 no time to come for follow-up in intervention group and n=1 personal difficulties in control group.
<b>Duration of follow-up</b>	Up to the end of the treatment period (12 weeks).
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (66%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (median 3.5)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (described as having mild-moderate impairments, proportion with each unclear)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (primary psychiatric disorder excluded)</li> <li>• Computerised vs clinician led - computerised</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - appears to be intention to treat as all included in analysis despite some dropping out</p>

## Study arms

**Adaptive cognitive training programme - BrainHQ program focusing on speed, attention, working memory and executive function (N = 74)**

**Active control - ordinary computer games (N = 61)**

Cognitive tasks but without components of adaptive cognitive remediation programmes

## Characteristics

### Arm-level characteristics

Characteristic	Adaptive cognitive training programme - BrainHQ program focusing on speed, attention, working memory and executive function (N = 74)	Active control - ordinary computer games (N = 61)

**Bibliographic Reference** Chiaravalloti, N. D.; Goverover, Y.; Costa, S. L.; DeLuca, J.; A Pilot Study Examining Speed of Processing Training (SPT) to Improve Processing Speed in Persons With Multiple Sclerosis; *Frontiers in neurology* [electronic resource].; 2018; vol. 9; 685

## Study details

<b>Trial name / registration number</b>	NCT01838824
<b>Study location</b>	USA
<b>Study setting</b>	Outpatient - recruited through outpatient clinics, advertisements and through foundation database
<b>Study dates</b>	Study ran from 31/01/2012 to 02/02/2013
<b>Sources of funding</b>	Support from the National Multiple Sclerosis Society (pilot grant RG 4607-A) to NC and funding by the Kessler Foundation.
<b>Inclusion criteria</b>	Clinically definite MS; 18-65 years; free of exacerbations and steroid use for at least 1 month; and impaired processing speed at baseline (performance 1.5 SD below mean of published normative data on SDMT).
<b>Exclusion criteria</b>	Major psychiatric disorder; substance abuse; evidence of significant vision impairment from diplopia, nystagmus or scotomas upon testing (corrected vision in worse eye >20/60 assessed with Snellen Eye Test); or impaired language comprehension on the Token Test.
<b>Recruitment / selection of participants</b>	Recruited from MS Clinics, advertisements and through the Kessler Foundation database of research participants.
<b>Intervention(s)</b>	Speed of processing training (SPT): 10 computerised training sessions over a 5-week period. Initial sessions involve practice on three types of tasks presented on a computer (simple speed of processing, divided attention, and selective attention), with three different central demands (detection, identification, same/different). Training is customized to each participant's ability; an individual's entry point into SPT is determined by current level of PS, evaluated as the speed of stimulus presentation at which the person can correctly identify the stimulus 75% of the time. If this threshold is 30 ms or greater, SPT begins at the most basic level. Training sessions lasted approximately 30–45 min each depending on self-reported fatigue or an observable drop in performance. At level I practice single discrimination task at gradually increasing speeds. Involves either target present or absent, target identification or same/different judgements. Training continues with increasingly more complex discrimination tasks until can perform identification task correctly 75% of time at exposure duration of 17 ms - then progress to level II. Level II involves completing one of tasks described in level I and simultaneously locate a peripheral target. Demand of centre target can vary, and peripheral task demand changed by

	<p>increasing or decreasing distance from centre target. The process of progressing from near peripheral targets to far targets is repeated, at faster speeds, and with increasing difficulty of the centre task. This is repeated until the participant can perform both the foveal identification task and the peripheral localization task (at the furthest eccentricity) with 75% accuracy, at a speed of 50 ms or less, before moving onto Level III. Level III involves selective attention training and requires discrimination task and location of peripheral target embedded among distracters. When the participant is able to perform the selected task correctly 75% of the time, a more demanding task is introduced by manipulating the complexity of the discrimination task, the display duration and/or target eccentricity. Practice continues until 75% correct performance is achieved at a 120 ms exposure, with peripheral targets at the most extreme eccentricity.</p>
<b>Population subgroups</b>	None
<b>Comparator</b>	Control group: no treatment control condition.
<b>Number of participants</b>	21 randomised, 21 analysed (reported to be no dropout)
<b>Duration of follow-up</b>	End of treatment - 5 weeks
<b>Indirectness</b>	Outcome - follow-up <3 months minimum specified in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (performance 1.5 standard deviations or more below the mean of published normative data on the oral Symbol Digit Modalities Test was inclusion criterion)</li> <li>• Disease modifying treatment status (currently using and not currently using) - majority were using one</li> <li>• Mood disorders (presence or absence) - unclear (those with major psychiatric disorder excluded)</li> <li>• Computerised vs clinician led - computerised</li> <li>• Group vs individual - individual</li> </ul>

#### Bibliographic Reference

Chiaravalloti, N. D.; Moore, N. B.; DeLuca, J.; The efficacy of the modified Story Memory Technique in progressive MS; Multiple Sclerosis; 2020; vol. 26 (no. 3); 354-362

#### Study details

Trial name / registration number	NCT02301247
Study location	USA
Study setting	unclear - likely outpatient
Study dates	Recruitment ran from 1 September 2014 to 31 August 2016

<b>Sources of funding</b>	Support from Kessler Foundation, as well as grant support from the International Progressive Multiple Sclerosis Alliance (grant #PA0128) to N.D.C.
<b>Inclusion criteria</b>	New learning and memory impairment (1.5 SD+ compared to normative Open Trial Selective Reminding Test; age 30-68 years; free of exacerbations and steroid use for at least 1 month; no neurologic history other than MS; no history of major depressive disorder, schizophrenia, or bipolar disorder; no history of diagnosed substance use/dependence; intact vision; and intact language comprehension.
<b>Exclusion criteria</b>	None reported.
<b>Recruitment / selection of participants</b>	Recruitment ran from 1 September 2014 to 31 August 2016
<b>Intervention(s)</b>	Modified Story Memory Technique (mSMT): 10 sessions of the mSMT (2 times weekly for 5 weeks), with sessions lasting 45-60 min. The mSMT trains two related skills: imagery and context. Sessions 1-4 present the participants with stories for which they create visual imagery to aid memory. Sessions 5-8 present the participants with word lists for which they embed the words in a story and then visualize that story. Sessions 9 and 10 focus on applying the mSMT to real-world settings (directions, shopping). Treatment is manualised, and the therapist follows a scripted manual. Treatment was administered by a research assistant who was blinded to assessment results and study hypotheses.
<b>Population subgroups</b>	None
<b>Comparator</b>	Placebo control: control group met with the therapist at the same frequency as the treatment group, engaging in non-training-specific tasks to control for professional contact and disease alterations. Tasks included reading the same stories as the treatment group and answering questions about them. The only difference between the groups was that only the treatment group was exposed to the active ingredients of the mSMT (imagery, context).
<b>Number of participants</b>	30 randomised, 28 analysed at end of treatment (5 weeks)
<b>Duration of follow-up</b>	5 weeks - end of treatment (additional 3-month follow-up time-point reported but no useable data reported for this time-point vs. baseline). N=2 dropped out in the control group due to time commitment
<b>Indirectness</b>	Outcome - reported extractable outcomes at time-point <3 months minimum specified in protocol

<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority secondary-progressive (57%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (new learning and memory abilities that were at least 1.5 standard deviations below normative Open Trial Selective Reminding Test data)</li> <li>• Disease modifying treatment status (currently using and not currently using) - majority were using (71%)</li> <li>• Mood disorders (presence or absence) - likely absent (most conditions excluded)</li> <li>• Computerised vs clinician led - clinician-led</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - appears to be intention to treat with those with absent data not included in analysis (modified ITT)</p>
----------------------------	---

Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	High

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point less than minimum 3 months specified in protocol</i> )

### Results\_FrSBe disinhibition after illness\_5 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	High
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Indirectly applicable (time-point less than minimum 3 months specified in protocol)

### Chiaravalloti, 2012

**Bibliographic Reference** Chiaravalloti, N. D.; Wylie, G.; Leavitt, V.; Deluca, J.; Increased cerebral activation after behavioural treatment for memory deficits in MS; Journal of Neurology; 2012; vol. 259 (no. 7); 1337-46

### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	USA
<b>Study setting</b>	Unclear, likely outpatient
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Funded by National Institutes of Health grants (Grant number R01 HD045798 and HD045798-S to N.D.C.); National Multiple Sclerosis Society (training grant-MB0003 to J.D.) and the Kessler Foundation
<b>Inclusion criteria</b>	Clinically definite MS according to McDonald criteria; right-handed; language comprehension intact (Token Test score >26); new learning and memory abilities at least 1.5 SD lower than mean of healthy control group based on Selective Reminding Test; and visual acuity to see test materials.
<b>Exclusion criteria</b>	History of major depressive disorder, schizophrenia or bipolar disorder I or II; and vision significantly impaired by scotomas (<20/60 corrected vision in worse eye), diplopia or nystagmus.

<b>Recruitment / selection of participants</b>	Not reported.
<b>Intervention(s)</b>	Modified Story Memory Technique - focus on memory: 10 sessions of Modified Story Memory Technique (mSMT). Twice weekly sessions for 5 weeks (45-60 min per session). Involves two related skills (imagery and context). Sessions 1-4 taught to utilise imagery to facilitate the learning of verbal information. Sessions 5-8 taught participants to utilise context to facilitate learning. Given the fact that real life rarely requires that one remember a list of words, sessions 9 and 10 focus on applying the mSMT to real-world settings. Real-life situations were addressed. If the participant could not describe two memory-taxing situations unique to their life, real-life situations were provided for them, from which they chose two situations they would most likely encounter, including (1) remembering a lengthy shopping list, (2) recalling a list of errands, and (3) recalling steps in driving directions. The treatment is highly manualized, and the therapist therefore followed a training manual with scripts provided.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control group - placebo intervention sessions met with the treaters at the same frequency as the experimental group, but engaged in verbal tasks to control for professional contact and alterations in the disease process. Tasks consisted of reading the same stories that the experimental group used and answering questions. The placebo task was matched to the training task for duration of contact with the treater, and medium of presentation, specifically via computer.
<b>Number of participants</b>	16 randomised, 16 appear to be analysed as no dropouts reported
<b>Duration of follow-up</b>	End of treatment - 5 weeks.
<b>Indirectness</b>	Outcome - reported at <3 months minimum follow-up in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (69%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (new learning and memory abilities that were at least 1.5 standard deviations below the mean of a healthy control group an inclusion criterion)</li> </ul>

- Disease modifying treatment status (currently using and not currently using) - unclear
- Mood disorders (presence or absence) - likely absent (most conditions excluded)
- Computerised vs clinician led - mixed (met with clinicians but appears to be via computer)
- Group vs individual - individual

Analysis - appears to be intention to treat as no missing data reported

### Study details

<b>Other publications associated with this study included in review</b>	
<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Czech Republic
<b>Study setting</b>	Unclear - likely outpatient
<b>Study dates</b>	Not reported

<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	MS diagnosis: cognitive deficit at baseline (definition not reported); EDSS score 0-6.0; age 18-65 years; functionally dominant upper limb (to use keyboard); and access to a computer with internet connection
<b>Exclusion criteria</b>	History of drug or alcohol abuse; major psychiatric disorders; acute relapses; neurological disorders other than MS; and patients with ongoing rehabilitation.
<b>Recruitment / selection of participants</b>	Not reported
<b>Intervention(s)</b>	Happy Neuron Brain Jogging computer programme - multidomain cognitive programme: received training on it and then asked to work on it at home. Cognitive online training using Happy Neuron Brain Jogging computer program created by ABET HOLDING, a.s. part of French SBT group. Involves 20 different tasks related to memory, concentration, speech, logical thinking, special orientation and other abilities. Different levels of difficulty can be set meaning there is high variability in the exercise. Also include automatic coach able to select appropriate set of exercises to optimise benefits for patients. Training plan involved 4 times weekly sessions (30 min per session) for 8 consecutive weeks (32 training days on predetermined days with a specific training plan). Primary goals of treatment plan included following cognitive functions: memory, attention and concentration, speed and information processing, executive functions, expression and speed comparison and self-orientation and perception. All given training sheet including two exercises with requirement of repeating them three times. For the remaining time participants asked to undertake an exercise of their choice. Patients also informed that it is better to repeat the same exercise multiple times rather than many exercises only once. Required to complete all 32 training blocks. If needed, communication could be facilitated through a designated website. If sessions had not been completed, they were contacted in order to work out why and discuss how to continue with the training.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - no training: received no training but to control for placebo effect they were repeatedly contacted for 2 months (3 times in total) and asked to report their current psychological status by completing a prepared questionnaire.
<b>Number of participants</b>	43 randomised, 43 appear to have been analysed (no dropouts reported)

<b>Duration of follow-up</b>	8-weeks - end of treatment
<b>Indirectness</b>	Outcome - follow-up <3 months minimum specified in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - unclear</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (inclusion criterion)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (had to have cognitive deficit to be included - not defined)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (major psychiatric conditions excluded)</li> <li>• Computerised vs clinician led - computerised</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - appears to be intention to treat as no missing appear to be present based on numbers analysed</p>

## Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Italy
<b>Study setting</b>	Outpatient - recruited from MS Centre
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	LP received consulting fees from Merck Serono, Bayer Schering, and Biogen Idec and speaker honoraria from Biogen Idec, Teva, and Novartis. GB received consulting fees from Merck Serono and speaker honoraria from Bayer Schering, Biogen Idec, Teva, and Novartis. CP received consulting and lecture fees from Sanofi-Aventis, Biogen Idec, Bayer Schering, Merck Serono, and Novartis; he also received research funding from Sanofi-Aventis, Merck Serono, Bayer Schering, and Novartis
<b>Inclusion criteria</b>	MS diagnosed according to revised McDonald criteria; relapsing-remitting MS course; age between 18 and 50 years; at least 8 years of education; failure in at least 1 of the following tests: Stroop Test, PASAT 3-s presentation rate, and Symbol

	Digit Modalities Test (failure on PASAT and SDMT was defined as a score below the fifth percentile of normative data for the Italian population and failure on ST as an equivalent score below 3); regularly attending the MS Centre of S. Andrea Hospital in Rome; and willing to not change or start any disease-modifying drug or symptomatic medication for the entire duration of the study.
<b>Exclusion criteria</b>	Disease exacerbation in the previous 3 months; any motor or visual condition that could interfere with the performance of training; history of seizures; presence of depression and/or anxiety assessed by the Hamilton Depression Scale and the Hamilton Anxiety Scale (cut-off scores for exclusion of 7 and 9, respectively); Mini Mental State Examination equal to or below 24.17 to exclude severely cognitively impaired patients; patients with psychiatric illnesses; history of alcohol or substance abuse; history of medications that may interfere with attentional level; previous cognitive rehabilitation training; treatment with anticholinesterasics; and left-handed patients to ensure uniformity in the performance of ST18 (handedness was assessed by means of the Edinburgh inventory).
<b>Recruitment / selection of participants</b>	Consecutive series of patients diagnosed as affected by MS according to revised McDonald criteria <sup>10</sup> and regularly attending the MS Centre of S. Andrea Hospital in Rome were recruited
<b>Intervention(s)</b>	Nintendo brain training game: 8-week training period with training in games of memory, attention, visuospatial processing, and calculations. The cognitive training was performed at home with the Italian version of the Dr Kawashima's Brain Training (DKBT). Instructed by a psychologist on how to use the console and how to perform the training. They were required to play 30 min daily, 5 days a week for 8 consecutive weeks. They were required also to follow the instructions of the game provided during the training from a virtual guide and to experience all the puzzles proposed. The number of puzzles proposed increased through time. Games included Calculations and Voice Calculations (solve simple mathematical questions that appear on the screen as quickly as possible and write the response on the touch screen or speak the response), Reading aloud (read aloud an excerpt from a classic story as quickly as possible), Low to high (memorise position of numbers appearing on the screen for a short period of time and indicate on the touch screen the position of numbers from lowest number to highest), Syllable count (count number of syllables in each phrase write the response on the screen), Head count (to keep track of the number of people inside a house after people leave and enter the house over time), Triangle math (solve equations involving 3 numbers and 2 mathematical operations as quickly as possible) and Time lapse (calculating the difference in time between 2 analogue clocks). Second visit with the same psychologist was performed 2 weeks after to check the correct use of the device and the correct execution of the training. In case of problems, the psychologist planned a third visit and phone calls were also scheduled every week.

<b>Population subgroups</b>	None
<b>Comparator</b>	Waitlist control group - no definition but presume continued usual care and received no additional intervention.
<b>Number of participants</b>	35 randomised, 34 analysed (n=1 in control group lost to follow-up and said to be not included in analysis)
<b>Duration of follow-up</b>	Up to end of intervention period - 8 weeks
<b>Indirectness</b>	Outcome - time-point <3-month minimum specified in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (median 2.0 or 3.25 in the two groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (mild-moderate as severe cognitive problems said to be excluded, unclear proportion with each)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear (changes or starting new drugs exclusion criterion but unclear proportion already on them)</li> <li>• Mood disorders (presence or absence) - likely absent (most conditions excluded)</li> <li>• Computerised vs clinician led - computerised</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - modified intention to treat (n=1 lost to follow-up and not included in analysis)</p>

## De la Torre, 2020

**Bibliographic Reference** De la Torre GG; Mato I; Doval S; Espinosa R; Moya M; Cantero R; Gonzalez M; Gonzalez C; Garcia MA; Hermans G; González-Torre S; Mestre JM; Hidalgo V; Neurocognitive and emotional status after one-year of mindfulness-based intervention in patients with relapsing-remitting multiple sclerosis.; Applied neuropsychology. Adult; 2020

## Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Spain
<b>Study setting</b>	Outpatient - those that had been referred to neurology unit of hospital after MS diagnosis

<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	Relapsing-remitting MS diagnosis regardless of degree of functional deterioration; and >18 years of age. Cognitive impairment not explicitly stated to be an inclusion criterion, but possible that those selected by neuropsychologists were those who were thought would benefit most from attempt to improve cognitive abilities (very few inclusion criteria mentioned).
<b>Exclusion criteria</b>	Presenting with severe cognitive deterioration.
<b>Recruitment / selection of participants</b>	Recruited from those referred to neurology unit of a university hospital - selected for the work by hospital's neuropsychologists.
<b>Intervention(s)</b>	Mindfulness intervention +pharmacological treatment: 8 weekly (2 h) group sessions of mindfulness using 'Mindfulness-Based Cognitive Therapy for Depression' programme based on Jon Kabat-Zinn's programme adapted for patients with depression. Focused on common problems and worries people with MS have such as functional independent living level, mood, uncertainty and work. Training focused on understanding and becoming aware of the present moment. Guided meditation used to teach participants to become more aware of physical sensations such as breathing and to train the mind to become aware of the body and the emotion they experienced at the present moment. Also used cognitive strategies aimed at recognising and paying attention to pleasant and unpleasant thoughts and feelings by working on acceptance and non-judgemental attitude towards the experience. Carried out in three cycles, within each cycle group of 10 people met for 2 months with each cycle being 2 weeks apart. Meetings outside of working ours to improve attendance. Participants also committed to series of exercises at home at least 1 h per day for 6 days a week (listening to guided meditations as well as doing written exercises related to aspects in each session). Assume usual pharmacological treatment continued for the pharmacological component mentioned in this group.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - no mindfulness intervention. Described as pharmacological treatment only and assume usual pharmacological treatment continued as no further details provided.
<b>Number of participants</b>	60 randomised, assume 60 analysed as no drop out mentioned

<b>Duration of follow-up</b>	Up to 12 months - unclear whether this represents 10 months after the end of the intervention or whether the at-home components were continued for the whole 12 months (suggests group sessions only lasted for 2 months but no mention of at-home exercise duration).
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (unclear if all had impairment at baseline as not explicitly mentioned as an inclusion criterion)</li> <li>• Disease modifying treatment status (currently using and not currently using) - using (based on figure in paper majority appear to have been using one)</li> <li>• Mood disorders (presence or absence) - unclear</li> <li>• Computerised vs clinician led - clinician-led</li> <li>• Group vs individual - mixed (group sessions as well as at-home exercises/tasks)</li> </ul> <p>Analysis - assumed intention to treat as no missing data apparent</p>

### Study arms

**Mindfulness (focus is on cognitive outcomes not solely psychological outcomes) + pharmacological treatment (N = 30)**

**Control - pharmacological treatment only (N = 30)**

## Ernst, 2016

**Bibliographic Reference** Ernst, A.; Sourty, M.; Roquet, D.; Noblet, V.; Gounot, D.; Blanc, F.; De Seze, J.; Manning, L.; Functional and structural cerebral changes in key brain regions after a facilitation programme for episodic future thought in relapsing-remitting multiple sclerosis patients; *Brain & Cognition*; 2016; vol. 105; 34-45

## Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	France
<b>Study setting</b>	Unclear - likely outpatient
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Funding from 'Fondation pour la Recherche sur la Sclérose en Plaques' and Ministry of National Education and Research.
<b>Inclusion criteria</b>	Relapsing-remitting MS; EDSS score $\leq 4.0$ ; no recent MS symptom exacerbation; right-handedness; absence of major signs of depression according to Montgomery and Asberg Depression Rating Scale (score $\leq 15.0$ ); and impaired episodic future thought performance (mild-moderate cognitive impairment in attention and/or executive functions; mean number of internal details $\leq 19$ ).

<b>Exclusion criteria</b>	Not reported
<b>Recruitment / selection of participants</b>	Selected from a group of patients involved in a broader study on autobiographical memory and episodic future thinking (Ernst 2015)
<b>Intervention(s)</b>	Mental visual imagery programme: based on the ability to mentally construct scenes and follows a goal-directed approach. Encompassed six two-hour sessions (once or twice per week), organised in four steps, with mental visualisation exercises of increasing difficulty, during which the neuropsychologist provides a continuous guidance. The screening step aims at probing basic visual imaging abilities and is based on three subtests from the 'Imagery and Perception Battery'. None of the patients showed difficulties to perform these tasks, (ii) The external visualisation includes 10 names of objects to be imagined and described, (iii) The construction phase consists in figuring out complex scenes, bringing into play several characters. Five verbal items were proposed with for each one, a first training step and a subsequent scene, sharing thematic similarities; (iv) the self-visualisation step follows the same procedure, but patients are asked to imagine themselves within a given scenario as they are living the scene.
<b>Population subgroups</b>	None
<b>Comparator</b>	Verbal control programme: based on the role of narrative structure, which provides a scaffold for the evocation of personal events, but which distinctly plays a minor role in mental time travel compared to mental visual imagery. Construct discussions about texts (extracted from websites) with the neuropsychologist's guidance, through steps of increasing difficulty: (i) the external discussion comprises 20 texts and aims at identifying influential variables on text understanding (e.g., clarity, vocabulary used, etc.). (ii) The discussion construction comprises five items, with for each of them, a training and construction steps. So, the two texts of each item were thematically related to enable the reliance on the first to construct the second text, (iii) The self-involved discussion is similar to the previous step, but the exchange is focused on the patient's personal opinion.
<b>Number of participants</b>	17 randomised, unclear number analysed
<b>Duration of follow-up</b>	Unclear - possibly 6-8 weeks (intervention duration) based on previous study
<b>Indirectness</b>	Outcome - time-point <3 months minimum specified in protocol

<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (score &lt;4.0 inclusion criterion)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - mild - reported in study to have mild cognitive impairments</li> <li>• Disease modifying treatment status (currently using and not currently using) - using (both groups reported to be on 1.0 (0.0) DMD treatment overall)</li> <li>• Mood disorders (presence or absence) - unclear (depression excluded)</li> <li>• Computerised vs clinician led - clinician led</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - unclear (number analysed unclear but no dropouts mentioned)</p>

## Outcomes

### Study timepoints

- Baseline
- 6 week (6-8 weeks - likely end of intervention based on similar study by same authors)

### Results - raw data

Outcome	Mental visual imagery - focus on attention and executive functions, Baseline, N = 10	Mental visual imagery - focus on attention and executive functions, 6-week, N = 10	Verbal control programme, Baseline, N = 7	Verbal control programme, 6-week, N = 7
<b>Amount of details provided</b> Measure of mental visualisation ability. This measure extracted as most relevant measure based on study aims.  Mean (SD)	5.6 (1.86)	5.86 (2.28)	6.93 (0.72)	6.41 (2.2)

Amount of details provided - Polarity - Higher values are better  
Final values for continuous outcomes

### Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT Results\_number of details provided\_end of treatment

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>Time-point &lt;3 months minimum in protocol</i> )

### Study details

Trial name / registration number	Not reported
----------------------------------	--------------

<b>Study location</b>	Italy
<b>Study setting</b>	Unclear - possibly outpatient
<b>Study dates</b>	Enrolled between November 2008 and January 2010
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	Relapsing-remitting MS; EDSS score $\leq 4.0$ ; no clinical exacerbations; no disease-modifying treatments during year before study enrolment; deficits in both PASAT (z-scores $< -1.5$ ) and Wisconsin Card Sorting Test (z scores $< -1.5$ in any of test measures); right handedness; normal or corrected-to-normal vision; and no concomitant therapy with antidepressants, psychoactive drugs or steroids.
<b>Exclusion criteria</b>	Ongoing major psychiatric and/or medical disorder; substance abuse; Mini-Mental State Examination score of less than 24; and occurrence of a relapse during the study (n=2 excluded)
<b>Recruitment / selection of participants</b>	Enrolled between November 2008 and January 2010
<b>Intervention(s)</b>	RehaCom cognitive training: performed with the supervision of one neuropsychologist. Intensive computer-assisted cognitive rehabilitation of attention, information processing, and executive functions for 12 weeks, performed by using a software that is part of the RehaCom package. Each session lasted for 1 hour, with a frequency of three sessions per week. The "Plan a Day" procedure trained the patient's ability to organize, plan, and develop solution strategies by employing realistic simulations of a set of scheduled dates and duties to be organized at specific places in a small city map. Times for planning and schedules were registered for each patient at each session, and only improvement and acquisition of sufficient planning abilities for fulfilling all the appointments required were used to ameliorate the level in the subsequent treatment session. In "Divided Attention," the patient was required to simulate the actions of a train driver, carefully observing the control panel of the train and the countryside. Several distractions, including crossing animals and train speed, were added with increasing levels of difficulty. Specific speed information training, consisting of a modified PASAT task with numbers, words, and months of the year, was combined with each "Divided Attention" session.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - no training: control group patients did not receive any rehabilitation

<b>Number of participants</b>	20 said to be randomised, though suggests some excluded post-randomisation, 20 analysed at 3 months (end of treatment)
<b>Duration of follow-up</b>	3 months - end of intervention period
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (score &lt;4.0 inclusion criterion)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> <li>• Disease modifying treatment status (currently using and not currently using) - possibly not using (excluded those that had used them within last year)</li> <li>• Mood disorders (presence or absence) - unclear (excluded major psychiatric conditions)</li> <li>• Computerised vs clinician led - computerised</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - possibly intention to treat as all 20 said to be randomised analysed, but wording suggests some that were randomised may have been excluded during the study due to relapse occurring</p>

### Study arms

**RehaCom cognitive training - focus on executive function, attention and speed of information processing (N = 10)**

**Control - no cognitive training (N = 10)**

## Characteristics

### Arm-level characteristics

Characteristic	RehaCom cognitive training - focus on executive function, attention and speed of information processing (N = 10)	Control - no cognitive training (N = 10)
% Female	n = 10 ; % = 100	n = 10 ; % = 100
Sample size		
<b>Mean age (SD)</b>	44.8 (28-60)	46.7 (25-64)
Mean (range)		
<b>Ethnicity</b>	NR	NR
Custom value		
<b>Comorbidities</b>	NR	NR
Custom value		
<b>Disease duration (years)</b>	15.5 (1-28)	13.5 (1-28)
Median (range)		
<b>EDSS score</b>	2.5 (1.0-4.0)	2.0 (1.5-4.0)
Median (range)		

## Outcomes

### Study timepoints

- Baseline
- 3 month (3 months - end of intervention)
- 9 month (9 months - 6 months after the end of the 3-month intervention)

### Results - raw data

Outcome	RehaCom cognitive training - focus on executive function, attention and speed of information processing, Baseline, N = 10	RehaCom cognitive training - focus on executive function, attention and speed of information processing, 3-month, N = 10	RehaCom cognitive training - focus on executive function, attention and speed of information processing, 9-month, N = 9	Control - no cognitive training, Baseline, N = 10	Control - no cognitive training, 3-month, N = 10	Control - no cognitive training, 9-month, N = 9

## Flachenecker, 2017

**Bibliographic Reference** Flachenecker, P.; Meissner, H.; Frey, R.; Guldin, W.; Neuropsychological Training of Attention Improves MS-Related Fatigue: Results of a Randomized, Placebo-Controlled, Double-Blind Pilot Study; *European Neurology*; 2017; vol. 78 (no. 56); 312-317

## Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Germany
<b>Study setting</b>	Inpatient - admitted to inpatient rehabilitation at Neurological Rehabilitation Centre Quellenhof
<b>Study dates</b>	Admitted between November 2009 and April 2010
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	Diagnosis of MS according to 2005 McDonald criteria; age at least 18 years; experiencing fatigue (as complained by patients); and abnormal results in neuropsychological testing of intensity of attention (T-values of mean reaction times <40).
<b>Exclusion criteria</b>	Relapse and/or received corticosteroids within 30 days of inclusion; experienced overt depression and/or cognitive deficits; and exhibited factors that might influence neuropsychological testing (sedating medication, visual disturbances, hand paresis or intercurrent infections).
<b>Recruitment / selection of participants</b>	Those admitted to inpatient rehabilitation at Neurological Rehabilitation Centre Quellenhof between November 2009 and April 2010
<b>Intervention(s)</b>	Neuropsychological training involving reaction time tasks: 2-week computerised neuropsychological training twice daily for 30 min on five days per week. Supervised by neuropsychologist. Also received usual, goal-oriented, specifically tailored rehabilitation programme. Performed simple reaction time tasks using software packages 'Reaktion' and 'Jeton' by Petra Rigling REHA Software. Each consists of 4 different programmes that allows neuropsychologist to vary demands in two dimensions (time constraints and difficulty) to gradually adapt training tasks according to performance of patient.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - unspecific neuropsychological training without time components: 2-week computerised neuropsychological training twice daily for 30 min on five days per week. Supervised by neuropsychologist. Also received usual, goal-oriented, specifically tailored rehabilitation programme. Software packages 'Bilder', 'Garten', 'Mosaik', 'Partino' and 'Vario' by Petra

	Rigling REHA Software were used. Designed to improve distinct cognitive functions such as selective attention, cognitive flexibility and working memory. Main principle was that there are less time components and patients could work on it without time pressure (unlike intervention group). Training adjusted by neuropsychologist to possibilities and improvements of the patient.
<b>Number of participants</b>	32 randomised, 30 analysed (n=2 excluded in intervention group due to receiving sedating medication during intervention period)
<b>Duration of follow-up</b>	2-weeks - end of treatment period
<b>Indirectness</b>	Outcome - less than minimum of 3 months specified in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (50%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (mean in two groups &lt;6.0)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> <li>• Disease modifying treatment status (currently using and not currently using) - using (majority reported to be using immunotherapy in both groups)</li> <li>• Mood disorders (presence or absence) - unclear (depression excluded)</li> <li>• Computerised vs clinician led - computerised</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - modified intention to treat (some that met exclusion criteria during study excluded)</p>

**Neuropsychological training involving reaction time tasks (N = 16)**

## Control - unspecific neuropsychological training without time components (N = 16)

### Characteristics

#### Arm-level characteristics

Characteristic	Neuropsychological training involving reaction time tasks (N = 16)	Control - unspecific neuropsychological training without time components (N = 16)
% Female	n = 8 ; % = 58	n = 14 ; % = 88
Sample size		
<b>Mean age (SD)</b>	43.3 (7.3)	45.2 (7.1)
Mean (SD)		
<b>Ethnicity</b>	NR	NR
Custom value		
<b>Comorbidities</b>	NR	NR
Custom value		
<b>Disease duration (years)</b>	6.5 (4)	9.4 (7)
Mean (SD)		
<b>EDSS score</b>	3.8 (1.3)	4.7 (1.3)
Mean (SD)		

<b>Characteristic</b>	<b>Neuropsychological training involving reaction time tasks (N = 16)</b>	<b>Control - unspecific neuropsychological training without time components (N = 16)</b>
<b>Relapsing-remitting subtype</b>	n = 6 ; % = 43	n = 9 ; % = 56
Sample size		
<b>Immunotherapy</b>	n = 11 ; % = 79	n = 10 ; % = 63
Sample size		
<b>Alertness (m/s)</b>	389 (88)	388 (126)
Mean (SD)		
<b>WEIMus score</b> Wurzburg Fatigue Inventory for MS	43.4 (10.6)	47.6 (11.7)
Mean (SD)		

Baseline values and results given for those analysed (n=14 vs. n=16) rather than those randomised (n=16 vs. n=16)

## Outcomes

### Study timepoints

- Baseline
- 2 week (2 weeks - end of treatment)

## Results - raw data

Outcome	Neuropsychological training involving reaction time tasks, Baseline, N = 14	Neuropsychological training involving reaction time tasks, 2-week, N = 14	Control - unspecific neuropsychological training without time components, Baseline, N = 16	Control - unspecific neuropsychological training without time components, 2-week, N = 16
<b>Alertness - T-value indicating normal results (<math>\geq 40</math>)</b>	n = 0 ; % = 0	n = 9 ; % = 64	n = 0 ; % = 0	n = 6 ; % = 38
No of events				
<b>WEIMuS score indicating fatigue (above cut-off value of 32)</b>	n = 12 ; % = 86	n = 6 ; % = 43	n = 15 ; % = 94	n = 11 ; % = 69
No of events				
<b>Adherence - completed scheduled training sessions of 10 h total</b>	n = NA ; % = NA	n = 10 ; % = 71	n = NA ; % = NA	n = 8 ; % = 50
No of events				

Despite n=16 being randomised to each group, data only provided for n=14 vs. n=16 at baseline and end of treatment

**Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT**  
**Results\_alertness t-value indicating normal results\_2 weeks**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable (Time-point <3 months minimum in protocol)

**Results\_fatigue score above cut-off value indicating fatigue\_2 weeks**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>Time-point &lt;3 months minimum in protocol. Also, general fatigue rather than specifically cognitive fatigue.</i> )

### Results\_adherence to training\_2 weeks

Section	Question	Answer

Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Directly applicable

## Gich, 2015

**Bibliographic Reference** Gich, J.; Freixanet, J.; Garcia, R.; Vilanova, J. C.; Genis, D.; Silva, Y.; Montalban, X.; Ramio-Torrenta, L.; A randomized, controlled, single-blind, 6-month pilot study to evaluate the efficacy of MS-Line!: a cognitive rehabilitation programme for patients with multiple sclerosis; Multiple Sclerosis; 2015; vol. 21 (no. 10); 1332-43

## Study details

<b>Trial name / registration number</b>	Not reported
---	--------------

<b>Study location</b>	Spain
<b>Study setting</b>	Outpatient - selected from hospital database
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Financial support was provided by Biogen Idec, Merck Serono, Bayer Healthcare, Teva Pharmaceutical Industries, 'La Caixa' (Spain), Fundación Obra Social Caja Madrid (Spain) and Acadèmia de Ciències Mèdiques i de la Salut de Catalunya i de Balears (Spain).
<b>Inclusion criteria</b>	Aged 20–60 years; had clinically defined MS according to the Poser criteria; have had at least a primary education (8 years); and mild cognitive impairment as determined by the neuropsychological assessment (for each of the tests, scores were considered to be impaired if they were 1.5 SD or more below the mean of normative data; cognitive impairment was defined as: mild, between one and three impaired cognitive tests; moderate, four to seven impaired tests; and severe, eight or more impaired tests)
<b>Exclusion criteria</b>	Severe psychiatric disorders; a history of traumatic brain injury; having taken steroids or immunosuppressor medications during the previous month; and having received other cognitive rehabilitation treatment during the previous 6 months.
<b>Recruitment / selection of participants</b>	Randomly chosen from the database of the hospital's MS unit using a random numbers table. Sent information sheet describing study and request to attend a briefing. Following briefing application forms completed and informed consent signed.
<b>Intervention(s)</b>	MS Line! cognitive rehabilitation programme: two 75-minute sessions per week of cognitive rehabilitation with MS-Line! for a 6-month period. Performed at the Dr Josep Trueta University Hospital. Each session combined 25 minutes of written, manipulative and computer-based materials. Patients and family members also had to do a short daily cognitive exercise together at home lasting no more than 5 minutes (chosen from Soma 4, five-piece Tangram, Space Shuttle and Peg-Solitaire Hoppers). Written (e.g., mathematical problems, crosswords and word search puzzles), manipulative (e.g., spatial games with blocks, origami) and computer-based (e.g., logic and reasoning games, working memory games) materials included in MS-Line! were designed and developed by a multidisciplinary team consisting of software engineers, mathematicians, psychologists and linguists. All materials had different levels of difficulty, and clues to resolve the problems were provided.
<b>Population subgroups</b>	None

<b>Comparator</b>	Control - no intervention: Patients in the control group received no treatment.
<b>Number of participants</b>	43 randomised, 41 analysed (n=1 per group discontinued study for unknown reasons)
<b>Duration of follow-up</b>	6 months - end of intervention period
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (&gt;80% in both groups)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (score ~3.0 in both groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - moderate (majority had moderate impairment at baseline)</li> <li>• Disease modifying treatment status (currently using and not currently using) - using (majority, 65%, using these at baseline)</li> <li>• Mood disorders (presence or absence) - unclear (severe psychiatric disorders excluded)</li> <li>• Computerised vs clinician led - clinician led</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - modified intention to treat with some that dropped out excluded</p>

## Study arms

**MS Line! cognitive rehabilitation programme (N = 22)**

**Control - no intervention (N = 21)**

## Characteristics

### Arm-level characteristics

Characteristic	MS Line! cognitive rehabilitation programme (N = 22)	Control - no intervention (N = 21)
<b>% Female</b>	n = 16 ; % = 72.7	n = 13 ; % = 61.9

## Outcomes

### Study timepoints

- Baseline
- 6 month (6 months - end of intervention period)

### Results - ANCOVA results for intervention vs. control for change from baseline scores

Outcome	MS Line! cognitive rehabilitation programme vs Control - no intervention, 6-month vs Baseline, N2 = 20, N1 = 21
<b>SRT-T</b>	1.63 (-2.76 to 6.01)
Selective reminding test – total: sum of trials I–VI	
Mean (95% CI)	

<b>Outcome</b>	<b>MS Line! cognitive rehabilitation programme vs Control - no intervention, 6-month vs Baseline, N2 = 20, N1 = 21</b>
<b>SRT-LTS</b> Selective reminding test – long-term storage  Mean (95% CI)	-0.69 (-8.76 to 7.37)
<b>SRT-CLTR</b> Selective reminding test – consistent long-term retrieval  Mean (95% CI)	1.74 (-3.11 to 11.52)
<b>SRT/DR</b> Selective reminding test – delayed recall  Mean (95% CI)	0.66 (-0.57 to 1.88)
<b>10/36 SPART-T</b> 10/36 Spatial Recall Test - total  Mean (95% CI)	5.62 (2.88 to 8.36)
<b>10/36 SPART-DR</b> Spatial recall test – delayed recall  Mean (95% CI)	2.21 (0.86 to 3.56)
<b>SDMT</b> Symbol digit modalities test  Mean (95% CI)	3.28 (-2.48 to 9.04)

Outcome	MS Line! cognitive rehabilitation programme vs Control - no intervention, 6-month vs Baseline, N2 = 20, N1 = 21
<b>PASAT</b> Paced auditory serial addition test  Mean (95% CI)	3.01 (-1.91 to 7.92)
<b>Word List Generation Test</b>  Mean (95% CI)	3.6 (0.83 to 6.37)
<b>FAS test - verbal fluency</b>  Mean (95% CI)	1.55 (-3.48 to 6.58)
<b>Forward digit span</b> Subtest on Wechsler adult intelligence scale III. Measures working memory  Mean (95% CI)	0.43 (-0.34 to 1.2)
<b>Backward digit span</b> Subtest on Wechsler adult intelligence scale III. Measures working memory  Mean (95% CI)	0.92 (-0.2 to 2.04)
<b>Block design</b> Subtest on Wechsler adult intelligence scale III. Measures perceptual organisation  Mean (95% CI)	4.35 (-1.01 to 9.72)

<b>Outcome</b>	<b>MS Line! cognitive rehabilitation programme vs Control - no intervention, 6-month vs Baseline, N2 = 20, N1 = 21</b>
<b>Letter-number sequencing</b> Subtest on Wechsler adult intelligence scale III. Measures working memory	1.48 (0.06 to 2.89)
Mean (95% CI)	
<b>Boston Naming Test</b>	2.58 (1.16 to 4)
Mean (95% CI)	
<b>Trail Making Test - A</b>	-13.98 (-24.42 to -3.55)
Mean (95% CI)	
<b>Trail Making Test - B</b>	-13.97 (-34.4 to 6.47)
Mean (95% CI)	
<b>HADS - anxiety</b> Scale usually 0-21.	-1.92 (-3.92 to 0.09)
Mean (95% CI)	
<b>HADS - depression</b> Scale usually 0-21.	-1.51 (-3.18 to 0.17)
Mean (95% CI)

Overall bias and Directness	Overall Directness	Directly applicable

### Results\_HADS - depression\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_adherence\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Goverover, 2018

**Bibliographic Reference** Goverover, Y.; Chiaravalloti, N.; Genova, H.; DeLuca, J.; A randomized controlled trial to treat impaired learning and memory in multiple sclerosis: The self-GEN trial; Multiple Sclerosis; 2018; vol. 24 (no. 8); 1096-1104

### Study details

<b>Trial name / registration number</b>	self-GEN trial. NCT02032589.
<b>Study location</b>	USA
<b>Study setting</b>	Unclear - possibly outpatient
<b>Study dates</b>	Recruitment ran from 19 December 2013 to 15 July 2015
<b>Sources of funding</b>	Supported by the National Multiple Sclerosis Society (Grant No. PP2098).
<b>Inclusion criteria</b>	Clinically definite MS; documented memory impairment based on selective memory test (SRT; those scoring at least 0.5 SD less than the mean of healthy control group); between ages of 31 and 65 years; free from history of neurological injuries or illnesses other than MS; no reported history of alcohol or drug abuse and/or major psychiatric illnesses; sufficient vision assessed by paragraph reading; English as primary language; at least 1 month post the most recent exacerbation; and free of corticosteroid use.

<b>Exclusion criteria</b>	No further criteria reported.
<b>Recruitment / selection of participants</b>	Participants were recruited through advertisements, support groups, and a database at Kessler Foundation. Recruitment ran from 19 December 2013 to 15 July 2015.
<b>Intervention(s)</b>	Self-generation learning programme focused on memory: six 60 min sessions of individualised treatment (two per week over 3 weeks), each including four parts: 1. items that were to be learned were presented in provided and self-generated conditions (order was counterbalanced within session). In the self-generated condition, the items were presented with a sentence, word pair, or picture. However, the word or the item to be learned was missing, as indicated by a blank line; participants were asked to fill in the blank with the most logical choice. For the provided condition, items to be learned were provided with a sentence/step/word-pair underlined, and participants were asked to remember the underlined item. Task presentations were followed by immediate free recall, in which participants were asked to verbally recall the items they learned. 2. participants asked which of the previous two they remembered better and what helped them to remember that list better. After answering, recall results were presented to participants and researcher explained by self-generation has potential to enhance memory and recall. 3. parts 1 and 2 repeated with similar but different stimuli. 4. participants presented with new items/words to remember and asked how self-generation strategy can be used. Then asked to apply self-generation strategy to recall the items. Asked to recall the items/words learned immediately after learning. After part 4, participants asked to complete short journal summarising the activity session, what was learned and what was helpful. Each of six sessions followed same format but presented different stimuli to be learned as follows: 1. words within sentences; 2. paired associated words; 3. names; 4. dates, appointments and object locations; 5. cooking and finances; and 6. choice of a personal task to learn (included creating an email account, storing information on i-cloud or learning a new language).
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - memory tasks without self-generation element: placebo control met with the researcher at the same frequency and for the same duration as the treatment group and performed the same memory tasks. However, they were not exposed to the active ingredients of the treatment: self-generated learning and transfer instructions. They were asked to simply remember items. Included three components within each of the sessions. Participants were presented with (1) items to be learned in a provided condition only and were asked to recall them. (2) Similar but different stimuli to learn in a provided condition. (3) New items to be remembered: participants were asked to learn and recall them later (same as the self-GEN

	groups). For the sixth session, participants were given a finance management task to perform and did not choose a personal task to learn.
<b>Number of participants</b>	35 randomised, 35 appear to have been analysed
<b>Duration of follow-up</b>	3-4 weeks - end of intervention period (measured within a week of completion)
<b>Indirectness</b>	Outcome - time-point <3 months minimum in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (&gt;60% in both groups)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear (only PDDS reported - 2.9 or 3.8 in the two groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (major psychiatric conditions excluded)</li> <li>• Computerised vs clinician led - clinician led</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - intention to treat likely as no dropouts mentioned</p>

### Study arms

**Self-generation learning programme focused on memory (N = 19)**

**Control - memory tasks without self-generation element (N = 16)**

## Characteristics

### Arm-level characteristics

Characteristic	Self-generation learning programme focused on memory (N = 19)	Control - memory tasks without self-generation element (N = 16)
<b>% Female</b>	n = 13 ; % = 70	n = 13 ; % = 80
Sample size		
<b>Mean age (SD)</b>	50.15 (9.12)	48.5 (8.8)
Mean (SD)		
<b>Caucasian</b>	n = 11 ; % = 60	n = 8 ; % = 50
Sample size		
<b>African American</b>	n = 8 ; % = 40	n = 5 ; % = 31.3
Sample size		
<b>Hispanic</b>	n = 0 ; % = 0	n = 3 ; % = 18.8
Sample size		
<b>Comorbidities</b>	NR	NR
Custom value		
<b>Time since diagnosis (years)</b>	11.1 (6.5)	11.4 (7.1)
Mean (SD)		

<b>Characteristic</b>	<b>Self-generation learning programme focused on memory (N = 19)</b>	<b>Control - memory tasks without self-generation element (N = 16)</b>
<b>Relapsing-remitting</b>	n = 12 ; % = 63.2	n = 12 ; % = 75
Sample size		
<b>Secondary progressive</b>	n = 2 ; % = 10.5	n = 2 ; % = 12.5
Sample size		
<b>Primary progressive</b>	n = 5 ; % = 26.3	n = 2 ; % = 12.5
Sample size		
<b>PDDS</b> Patient Determined Disease Steps	3.8 (1.8)	2.9 (1.4)
Mean (SD)		
<b>SRT % of words recalled over six learning trials</b> Selective memory/reminding test	65.5 (14.6)	62.9 (15.8)
Mean (SD)		

## Outcomes

### Study timepoints

- Baseline
- 3 week (3-4 weeks - end of intervention)

## Results - raw data

Outcome	Self-generation learning programme focused on memory, Baseline, N = 19	Self-generation learning programme focused on memory, 3-week, N = 19	Control - memory tasks without self-generation element, Baseline, N = 16	Control - memory tasks without self-generation element, 3-week, N = 16
<b>CVLT-II raw (five trials sum)</b> California Verbal Learning Test 2nd Edition  Mean (SD)	50.5 (11.8)	53.5 (10.5)	45.5 (9.9)	52.1 (10.6)
<b>CVLT-II raw (long delay)</b> California Verbal Learning Test 2nd Edition  Mean (SD)	10.1 (3.9)	11.6 (3.4)	8.8 (3.7)	10.5 (4)

Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_MIST prospective memory\_3 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_MFQ\_3 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3 months minimum in protocol)</i>

### Results\_self-awareness questionnaire\_3 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3 months minimum in protocol)</i>

### Results\_self-regulation skills interview\_3 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_verbal fluency - executive function\_3 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_actual reality total errors\_3 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_actual reality cognitive score\_3 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3 months minimum in protocol)</i>

### Results\_FBP\_3 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3 months minimum in protocol)</i>

### Results\_FAMS\_3 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3 months minimum in protocol)</i>

### Results\_STAI trait anxiety\_3 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_CDMI depression\_3 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_satisfaction with life scale\_3 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	Low
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

#### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Italy
<b>Study setting</b>	Inpatient - those admitted to Santa Lucia Foundation for multidisciplinary rehabilitation
<b>Study dates</b>	Screened between January 2015 and May 2016
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	Meeting McDonald diagnosis criteria for MS
<b>Exclusion criteria</b>	Age <18 years or >65 years; education <8 years; ongoing major psychiatric disorders; exacerbations in 3 months prior to enrolment; immunomodulant or immunosuppressant treatment started 3 months before enrolment; cognitive rehabilitation in 6 months before enrolment; MMSE score >24 (those with up to mild impairment only included); and psychotropic drugs and

	drugs for spasticity, tremor, bladder disturbances and fatigue could not be prescribed (if already being taken, doses and schedules needed to remain constant over study period).
<b>Recruitment / selection of participants</b>	Recruited from those admitted to Santa Lucia Foundation for rehabilitation. Consecutive patients screened between January 2015 and May 2016.
<b>Intervention(s)</b>	Cognitive training + multidisciplinary rehabilitation: 3 times weekly for 3 months by qualified cognitive rehabilitation specialist. Individualised, goal-oriented multidisciplinary inpatient programme performed, which for this group included cognitive training. Each patient assessed to determine needs for rehabilitation programme. Standard rehabilitation programme involved 3 h daily for 5 days per week, including 2 daily physiotherapy sessions (aimed at improving movements on paretic side and at upper-limb exercises as well as improving balance, standing, sitting and transferring). Cognitive training involved intensive computer-assisted cognitive rehabilitation for attention, information processing and executive functions. Based on Attention Processing Training program (APT) - consists of group of hierarchically organised tasks that exercise different components of attention that are commonly impaired after brain injury including sustained, selective, alternating and divided attention. Tasks place increasing demands on complex attentional control and working memory systems.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - multidisciplinary rehabilitation without cognitive training: Individualised, goal-oriented multidisciplinary inpatient programme performed, which for this group included cognitive training. Each patient assessed to determine needs for rehabilitation programme. Standard rehabilitation programme involved 3 h daily for 5 days per week, including 2 daily physiotherapy sessions (aimed at improving movements on paretic side and at upper-limb exercises as well as improving balance, standing, sitting and transferring). Control group received standard occupational therapy sessions instead of computer-assisted cognitive rehabilitation 3 times weekly for 3 months so that intervention group did not receive additional rehabilitation time than the control group - underwent nonspecific computer training consisting of series of nonspecific exercises including text and newspaper article reading and comprehension, description of pictures etc.
<b>Number of participants</b>	34 randomised, assume 34 analysed as no dropout mentioned
<b>Duration of follow-up</b>	Up to 6 months (3 months following the end of intervention)

<b>Indirectness</b>	Population - cognitive impairment doesn't appear to have been a requirement for every participant included
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (47.1%) followed by secondary progressive (44%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &gt;6.0 (mean score 7.5)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (at most mild impairment but many may not have impairment at baseline)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear (new use excluded)</li> <li>• Mood disorders (presence or absence) - unclear</li> <li>• Computerised vs clinician led - mix clinician led/computerised</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - unclear (number analysed unclear but no dropouts mentioned)</p>

## Study arms

**Cognitive training + multidisciplinary rehabilitation (N = 17)**

**Control - multidisciplinary rehabilitation without cognitive training (N = 17)**

## Characteristics

### Arm-level characteristics

Characteristic	Cognitive training + multidisciplinary rehabilitation (N = 17)	Control - multidisciplinary rehabilitation without cognitive training (N = 17)
% Female	n = 11 ; % = 64.7	n = 11 ; % = 64.7

<b>Characteristic</b>	<b>Cognitive training + multidisciplinary rehabilitation (N = 17)</b>	<b>Control - multidisciplinary rehabilitation without cognitive training (N = 17)</b>
Sample size

Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_SDMT\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_PASAT 3 seconds\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_PASAT 2 seconds\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Word List Generation\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Stroop Test\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Montgomery Asberg Depression Scale\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Barthel Index activities of daily living\_6 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

## Hancock, 2015

**Bibliographic Reference** Hancock, L. M.; Bruce, J. M.; Bruce, A. S.; Lynch, S. G.; Processing speed and working memory training in multiple sclerosis: a double-blind randomized controlled pilot study; Journal of Clinical & Experimental Neuropsychology: Official Journal of the International Neuropsychological Society; 2015; vol. 37 (no. 2); 113-27

### Study details

<b>Other publications associated with this study included in review</b>	<ul style="list-style-type: none"> <li>Hancock, Laura Mitchell (2014) Processing speed and working memory training in multiple sclerosis: A blinded randomized controlled trial. Dissertation Abstracts International: Section B: The Sciences and Engineering 74(10be): nopaginationspecified - <b>outcomes and characteristics extracted from this paper as did not appear to exclude those that did not meet 80% adherence criterion, whereas these were excluded in the 2015 paper</b></li> </ul>
<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	USA
<b>Study setting</b>	Outpatient - recruited from MS specialty clinic and metropolitan community
<b>Study dates</b>	Recruitment for the study began in 08/2011, and the last study participant completed all study appointments in 10/2012
<b>Sources of funding</b>	Funded by University of Kansas Endowment: Boelte Family Fund for Multiple Sclerosis.
<b>Inclusion criteria</b>	MS diagnosis; no history of alcohol/drug abuse; no nervous system disorder other than MS; no sensory impairments that might interfere significantly with cognitive testing or training; no developmental history of learning disability or attention-deficit/hyperactivity disorder; no relapse and/or corticosteroid use within four weeks of initial assessment; absence of severe physical/neurological impairment that would make testing or training insurmountable; a working home computer with internet access; between the ages of 18 and 60 years; and presence of subjectively reported cognitive complaints
<b>Exclusion criteria</b>	No further criteria reported

<b>Recruitment / selection of participants</b>	Recruited from both a large MS specialty clinic at the University of Kansas Medical Center and from the Kansas City metropolitan community
<b>Intervention(s)</b>	Processing speed and working memory training: computerised cognitive training in their homes using Posit Science InSight and Brain Twister visual n-back programs. The Brain Twister software includes a visual n-back task to train working memory. Asked to engage in training six days per week, for 30-minute intervals, for a six-week period. They spent three days per week engaged in processing speed training and three days per week engaged in working memory training. Received detailed instructions regarding which modules to complete and how to use the software. Additionally, they received contact information for a research assistant who could assist them with technical or logistical software problems as they engaged in the training process. Processing tasks used were PositScience's Sweet Seeker and Road Tour - presented in game format where points were earned for performance. <b>For the active training group, game continually challenged participants by increasing speed of stimuli presentation and making discriminations more difficult.</b> Working memory tasks were PositScience's Master Gardener and the Brain Twister N-Back Task - played single modality visual n-back game. <b>Active training group tasks increased in difficulty.</b>
<b>Population subgroups</b>	None
<b>Comparator</b>	Sham training group: computerised cognitive training in their homes using Posit Science InSight and Brain Twister visual n-back programs. The Brain Twister software includes a visual n-back task to train working memory. Asked to engage in training six days per week, for 30-minute intervals, for a six-week period. They spent three days per week engaged in processing speed training and three days per week engaged in working memory training. Received detailed instructions regarding which modules to complete and how to use the software. Additionally, they received contact information for a research assistant who could assist them with technical or logistical software problems as they engaged in the training process. Processing tasks used were PositScience's Sweet Seeker and Road Tour - presented in game format where points were earned for performance. <b>For sham control, games stayed at a simple introductory level of difficulty.</b> Working memory tasks were PositScience's Master Gardener and the Brain Twister N-Back Task - played single modality visual n-back game. <b>Sham control group tasks did not increase in difficulty and played a 0-back version of the game (n-back task in sham group created specifically for this study).</b>
<b>Number of participants</b>	71 randomised, 40 analysed at end of treatment (n=21 withdrew - 30% work demands, 25% not being able to do the training consistently, 25% family demands and 20% loss to follow-up)

<b>Duration of follow-up</b>	6 weeks - end of treatment
<b>Indirectness</b>	Outcome - follow-up <3 months minimum specified in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting in both groups (&gt;60%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear</li> <li>• Computerised vs clinician led - computerised</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - modified intention to treat (2014 paper), with those lost to follow-up or withdrawing excluded (2015 paper additionally excludes those not meeting adherence criterion)</p>

### Study arms

**Processing speed and working memory training - tasks increasing in difficulty (N = 34)**

**Sham training - constant difficulty level processing speed and working memory tasks (N = 37)**

## Characteristics

### Arm-level characteristics

Characteristic	Processing speed and working memory training - tasks increasing in difficulty (N = 34)	Sham training - constant difficulty level processing speed and working memory tasks (N = 37)
% Female	n = 18 ; % = 90	n = 17 ; % = 85
Sample size		
Mean age (SD)	48.45 (8.1)	49.15 (10.41)
Mean (SD)		
European-American	n = 17 ; % = 85	n = 19 ; % = 95
Sample size		
Comorbidities	NR	NR
Custom value		
Relapsing-remitting MS	n = 13 ; % = 65	n = 15 ; % = 75
Sample size		
Disease duration (Months)	126.75 (65.25)	167.1 (94.4)
Mean (SD)		

Said to have analysed N=20 per group, assuming characteristics given for this population rather than number randomised

## Outcomes

### Study timepoints

- Baseline
- 6 week (6-weeks - end of treatment period)

### Results - raw data

Outcome	Processing speed and working memory training - tasks increasing in difficulty, Baseline, N = 20	Processing speed and working memory training - tasks increasing in difficulty, 6-week, N = 20	Sham training - constant difficulty level processing speed and working memory tasks, Baseline, N = 20	Sham training - constant difficulty level processing speed and working memory tasks, 6-week, N = 20
<b>PASAT</b> Paced Auditory Serial Addition Test  Mean (SD)	76.95 (18.47)	88.05 (21.59)	74.61 (24.64)	76.67 (22.4)
<b>SDMT</b> Symbol Digit Modalities Test  Mean (SD)	48.45 (11.12)	50.85 (11.52)	49.15 (16.72)	50.5 (15.14)
<b>Stroop Test</b>  Mean (SD)	33 (6.94)	35.6 (7.52)	30.37 (7.86)	32.16 (7.54)
<b>Letter-number sequencing</b>	10.15 (2.35)	11.15 (2.39)	10.7 (3.2)	10.95 (2.91)

<b>Outcome</b>	<b>Processing speed and working memory training - tasks increasing in difficulty, Baseline, N = 20</b>	<b>Processing speed and working memory training - tasks increasing in difficulty, 6-week, N = 20</b>	<b>Sham training - constant difficulty level processing speed and working memory tasks, Baseline, N = 20</b>	<b>Sham training - constant difficulty level processing speed and working memory tasks, 6-week, N = 20</b>
Mean (SD)				
<b>Digits backward</b>	4.95 (1.88)	5.05 (1.73)	4.8 (1.82)	5.1 (2.25)
Mean (SD)				
<b>Raven's Advanced Progressive Matrices</b> Test of fluid intelligence.	8.84 (4.13)	9.32 (3.47)	9.31 (4.03)	10.44 (4.35)
Mean (SD)				
<b>BVMT</b> Brief Visuospatial Memory Test Trials 1–3	18.1 (4.84)	21.45 (4.87)	18.63 (7.09)	20.05 (6.81)
Mean (SD)				
<b>COWAT</b> Controlled Oral Word Associations Test	37.1 (9.68)	42.15 (15.23)	39.5 (15.54)	37.95 (14.23)
Mean (SD)				
<b>Conners' Continuous Performance Task Commissions T-score</b>	53.06 (8.84)	48 (9.85)	50.81 (11.7)	49.5 (12.3)

<b>Outcome</b>	<b>Processing speed and working memory training - tasks increasing in difficulty, Baseline, N = 20</b>	<b>Processing speed and working memory training - tasks increasing in difficulty, 6-week, N = 20</b>	<b>Sham training - constant difficulty level processing speed and working memory tasks, Baseline, N = 20</b>	<b>Sham training - constant difficulty level processing speed and working memory tasks, 6-week, N = 20</b>
Sustained attention and response inhibition. Speed measured.				
Mean (SD)				
<b>AVLT</b> Auditory Verbal Learning Task Trials 1–5.	48.05 (9.42)	52.65 (9.55)	42.3 (9.63)	45.95 (11.49)
Mean (SD)				
<b>STAI - state</b> State-Trait Personality Inventory. Scale usually 20-80.	46.15 (5.08)	45.6 (6.29)	43.93 (7.41)	44.33 (5.73)
Mean (SD)				
<b>STAI - trait</b> State-Trait Personality Inventory. Scale usually 20-80.	44.72 (3.97)	45.5 (5.11)	43.57 (6.45)	44.64 (5.71)
Mean (SD)				

<b>Outcome</b>	<b>Processing speed and working memory training - tasks increasing in difficulty, Baseline, N = 20</b>	<b>Processing speed and working memory training - tasks increasing in difficulty, 6-week, N = 20</b>	<b>Sham training - constant difficulty level processing speed and working memory tasks, Baseline, N = 20</b>	<b>Sham training - constant difficulty level processing speed and working memory tasks, 6-week, N = 20</b>
<b>BDI-FS</b> Beck Depression Inventory Fast Screen. Scale 0-21.  Mean (SD)	4.42 (2.8)	4 (2.79)	3.47 (3.68)	2.6 (2.47)
<b>MFIS</b> Modified Fatigue Impact Scale. Scale usually 0-84.  Mean (SD)	45.6 (12)	43.95 (17.45)	51.8 (16.81)	43.6 (18.98)
<b>MSQoL-54</b> MS Quality of Life Questionnaire. Scale usually 0-100.  Mean (SD)	66.75 (9.97)	70.5 (12.77)	71.33 (19.45)	75.45 (15.12)
<b>Adherence - % training completed (objective report)</b>  Mean (SD)	NA (NA)	94.63 (12.58)	NA (NA)	95.3 (12.01)

Outcome	Processing speed and working memory training - tasks increasing in difficulty, Baseline, N = 20	Processing speed and working memory training - tasks increasing in difficulty, 6-week, N = 20	Sham training - constant difficulty level processing speed and working memory tasks, Baseline, N = 20	Sham training - constant difficulty level processing speed and working memory tasks, 6-week, N = 20
<b>Satisfaction - proportion very satisfied with overall experience in study</b> Measured using 4-point Likert scale  No of events	n = NA ; % = NA	n = 12 ; % = 61	n = NA ; % = NA	n = 17 ; % = 83

PASAT - Polarity - Higher values are better

--------------------------------	---

## Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Norway
<b>Study setting</b>	Inpatient - people undergoing inpatient rehabilitation
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Received financial support from the following legacies associated with the Norwegian MS Society: Per. B. Larsens Legater and Hørlands legat. The project was also awarded funding from MSCH and the Kristiansand and vicinity MS Association.
<b>Inclusion criteria</b>	Subjective complaints about cognitive problems; motivation for working with cognitive problems to increase coping in everyday life; adequate language skills to participate in group discussions without any need for an interpreter; no central

	nervous system injury or disease other than MS; no psychopathology that would negatively interfere with participation in the cognitive rehabilitation; and no general cognitive impairment defined as a scores from 24 and below on the Mini Mental State Examination
<b>Exclusion criteria</b>	No further criteria reported
<b>Recruitment / selection of participants</b>	Recruited from participants undergoing multidisciplinary inpatient rehabilitation programmes of 4-week duration that were offered for people with MS
<b>Intervention(s)</b>	Cognitive sessions + multidisciplinary rehabilitation: Cognitive rehabilitation in addition to usual rehabilitation offered by the centre. Cognitive rehabilitation involved guidance through the process of formulating Goal Attainment Scaling (GAS) goals for coping with cognitive problems in everyday life. GAS is a method for quantifying the attainment of individualised goals set in rehabilitation (five different levels - lower values indicate worse goal attainment compared to expectations, for example -2 indicates goal attainment worse than expected, 0 as expected and +2 much better than expected). During first week, neuropsychological assessment performed with a feedback session. To facilitate metacognitive awareness, cognitive strengths and symptoms were discussed with the patient and related to everyday challenges. Cognitive strengths and symptoms summarised in a form that contained general advice for coping with cognitive problems and sections in which the patient could enter goals and operationalize behaviours required to reach them. The form was continually updated by the patient, under supervision of the neuropsychologist and the occupational therapist, as the goal setting proceeded during the rehabilitation stay. Before discharge, the most important goals were converted into GAS goals. During inpatient stay, took part in three cognitive group (3-6 participants) sessions to increase awareness of their cognitive strengths, problems and coping strategies. Sessions conducted by study neuropsychologist and study occupational therapist. Sessions included lectures, practical exercises, and discussions. Main theme of first session was cognitive functions and principles of goal setting. The second session included a lecture about executive functions, a group exercise related to planning, and a discussion of strategies for keeping track of appointments and belongings. The third session dealt with how cognitive symptoms can affect communication, how to cope with such challenges, and how to communicate about MS. Second and third weeks of rehabilitation stay involved individual sessions with a neuropsychologist and occupational therapist. Motivational interviewing and cognitive behavioural therapy methods used to support goal setting process. For 3 months following discharge, six biweekly phone calls were arranged to focus on attainment of GAS goals set during rehabilitation period.

<b>Population subgroups</b>	None
<b>Comparator</b>	Control - multidisciplinary rehabilitation only: offered neuropsychological assessment, including feedback, and otherwise participated in the ordinary 4-week rehabilitation program of individual follow-up by a multidisciplinary team: neurologist, physiotherapist, social worker, occupational therapist, and nursing staff. Physical activities and lectures about MS-related topics were offered daily. As part of the ordinary rehabilitation program, participants in the control group had the opportunity to consult a clinical psychologist and attend lectures on cognitive and psychological aspects of MS.
<b>Number of participants</b>	120 randomised, 103 analysed at 4 months post-start of rehabilitation, 101 analysed at 7 months post-start of rehab (3- and 6-months following discharge, respectively)
<b>Duration of follow-up</b>	Up to 7 months following start of rehabilitation (6 months post-discharge)
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (49%) followed by secondary progressive (28%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (mean score ~4.0 in both groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (psychopathology that could interfere with cognitive rehabilitation excluded)</li> <li>• Computerised vs clinician led - clinician led</li> <li>• Group vs individual - individual/group mixture</li> </ul> <p>Analysis - possibly modified intention to treat with those with missing data not included</p>

S.; The effects of video-game training on broad cognitive transfer in multiple sclerosis: A pilot randomized controlled trial; Journal of Clinical & Experimental Neuropsychology: Official Journal of the International Neuropsychological Society; 2015; vol. 37 (no. 3); 285-302

### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	USA
<b>Study setting</b>	Outpatient - recruited from local community
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	20/40 visual acuity or better; dominant right-handedness as measured by the Edinburgh Handedness Inventory; absence of depression as measured by a score of 18 or less on the Beck Depression Inventory–II; absence of relapse and corticosteroid use for the last 30 days; age 30–59 years; a score higher than 23 on the Mini Mental Status Examination; videogame usage of less than 4 hours/week; absence of any other neurological or psychological disorders; and a score greater than 1 on the Expanded Disability Status Scale.
<b>Exclusion criteria</b>	No further criteria reported
<b>Recruitment / selection of participants</b>	Recruited from the local community via advertisements in the media, North American Research Commission on MS, promotional flyers, Research Match, the National MS Society and the Multiple Sclerosis Treatment Centre affiliated with the research laboratory's larger institution
<b>Intervention(s)</b>	Video-game training with cognitive-focused Space Fortress game: the first assessment included an introduction to the Space Fortress game. Participants shown instructional videos outlining all rules, tips for success, and instructions for the Space Fortress game. To ensure that each participant understood the rules governing the Space Fortress game, a 15-

	<p>question quiz was administered directly after the instructional videos, and further clarification was provided, if necessary. Space Fortress game used to implement <b>hybrid-variable priority training</b>. Designed by cognitive psychologists to examine the influence of various training strategies on skill acquisition rates. First 10 one-hour training sessions required participants to practice part-task training. This learning approach divided the Space Fortress game into 14-part tasks, each about 2 min long, which focused on different aspects of the game. Initially three full-emphasis games (games not altered from original Space Fortress format) followed by 14 part-task games and another three full-emphasis games. Following 10 one-hour sessions consisted of variable priority training - highlighted different aspects of the game, with varying emphasis on each sub score to minimize overall cognitive load, while integrating previously trained part-tasks. Participants completed six variable priority games, with a varying, counterbalanced emphasis order of points, control, speed, velocity, and total scores, bookended by three full emphasis games at the beginning and end of each session.</p>
<b>Population subgroups</b>	None
<b>Comparator</b>	Waitlist control: contacted every two weeks to ensure good health and compliance with study guidelines. Participants were requested to refrain from engaging in any other experimental trials and were required to attend two training sessions at Weeks 4 and 8 to obtain comparison game-play data for skill acquisition analysis.
<b>Number of participants</b>	34 randomised, 28 analysed (intervention, n=2 lost to relapse and n=1 excluded due to prolonged training; waitlist, n=2 lost to attrition and n=1 excluded due to prolonged waitlist control period).
<b>Duration of follow-up</b>	Up to 8 weeks - end of intervention
<b>Indirectness</b>	<p>Outcome - time-point &lt;3-month minimum in protocol</p> <p>Population - having a cognitive impairment was not an inclusion criterion</p>
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting MS</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &gt;6.0 (mean score 2.7 and 2.9 in the two groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (having an impairment was not an inclusion criterion)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> </ul>

- Mood disorders (presence or absence) - unclear
- Computerised vs clinician led - computerised
- Group vs individual - individual

Analysis - per protocol (those with missing data excluded and also excluded some that did not complete within specified time)

## Study arms

**Hybrid-variable priority training (HVT) - Video-game training with cognitive-focused Space Fortress game (N = 17)**

Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_SDMT\_8 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_SRT-LTS\_8 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_SRT-CLTR\_8 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_SRT Delayed\_8 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_10/36 Spatial Recall - correct\_8 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_10/36 Spatial Recall - delayed\_8 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_Word List Generation Test\_8 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns

### Study details

<b>Trial name / registration number</b>	NCT03453125
<b>Study location</b>	Mexico
<b>Study setting</b>	Outpatient - recruited from Foundation for MS in Mexico (Guadalajara)
<b>Study dates</b>	Recruitment period from 1st April 2015 to 31st November 2015
<b>Sources of funding</b>	Grant from National Institute on Disability, Independent Living and Rehabilitation Research (NIDILRR - centre within Administration for Community Living of Department of Health and Human Services).
<b>Inclusion criteria</b>	Aged 18-70 years; free of exacerbations for at least 1 month prior to participation; intact language comprehension (Verbal Comprehension subscales of Bilingual Aphasia Test); impaired new learning (measured by failing to achieve perfect recall on 2 consecutive trials by trial 7 on Open Trial administration of Selective Reminding Test); and no significant neurological history other than MS.
<b>Exclusion criteria</b>	Currently using steroids, benzodiazepines or neuroleptics; significant history of major depressive disorder, schizophrenia or bipolar disorder that could affect learning; and scotomas, diplopia or nystagmus that may affect seeing stimuli.
<b>Recruitment / selection of participants</b>	Recruited from Foundation for MS in Guadalajara.

<b>Intervention(s)</b>	Modified Story Memory Technique (mSMT) for learning in MS: translated from English to Spanish version by bilingual researcher. 10-session computer-assisted manualised intervention delivered in presence of a trainer. Imagery used in first 4 sessions and use of context trained in sessions 5-8, with generalisation of newly learned skills to everyday activities in the final 2 sessions. Training sessions ~45 min duration two times weekly for 5 weeks.
<b>Population subgroups</b>	None
<b>Comparator</b>	Placebo control: Manualised and delivered by computer in presence of a trainer. Stimulus content and presentation of control sessions matched to the treatment sessions - exposed to same stories and target words but were not taught how to apply imagery and context to the material. Training sessions ~45 min duration two times weekly for 5 weeks.
<b>Number of participants</b>	20 randomised, 20 analysed
<b>Duration of follow-up</b>	5-weeks - end of treatment period
<b>Indirectness</b>	Outcome - time-point <3 months minimum in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (depression and bipolar excluded)</li> <li>• Computerised vs clinician led - computerised</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - intention to treat (appear to be no dropouts)</p>

## Study arms

**Modified Story Memory Technique (mSMT) for learning in MS (N = 10)**

**Placebo control - similar training but without being taught how to apply imagery and context (N = 10)**

## Characteristics

### Arm-level characteristics

Characteristic	Modified Story Memory Technique (mSMT) for learning in MS (N = 10)	Placebo control - similar training but without being taught how to apply imagery and context (N = 10)
% Female	n = 5 ; % = 50	n = 5 ; % = 50
Sample size		
<b>Mean age (SD)</b>	33.8 (12.3)	39.5 (10.8)
Mean (SD)		
<b>Ethnicity</b>	NR	NR
Custom value		
<b>Comorbidities</b>	NR	NR
Custom value		
<b>Months since diagnosis</b>	70.1 (55.8)	65.2 (39.5)
Mean (SD)		

Characteristic	Modified Story Memory Technique (mSMT) for learning in MS (N = 10)	Placebo control - similar training but without being taught how to apply imagery and context (N = 10)
Months since most recent exacerbation	11.2 (3.2)	13.2 (2.4)
Mean (SD)		

## Outcomes

### Study timepoints

- Baseline
- 5 week (5-weeks - end of intervention period)

### Results - raw data

Outcome	Modified Story Memory Technique (mSMT) for learning in MS, Baseline, N = 10	Modified Story Memory Technique (mSMT) for learning in MS, 5-week, N = 10	Placebo control - similar training but without being taught how to apply imagery and context, Baseline, N = 10	Placebo control - similar training but without being taught how to apply imagery and context, 5-week, N = 10
<b>HVLT-R Total Learning Trials 1-3</b> Hopkins Verbal Learning Test-Revised. Assesses verbal learning and memory. Only 95% CI reported and mean can be calculated from CI and number analysed. Baseline values for raw scores not reported but z-scores reported to be -0.92 (0.87) and -0.02	NR	22.66-27.88	NR	19.33-24.54

<b>Outcome</b>	<b>Modified Story Memory Technique (mSMT) for learning in MS, Baseline, N = 10</b>	<b>Modified Story Memory Technique (mSMT) for learning in MS, 5-week, N = 10</b>	<b>Placebo control - similar training but without being taught how to apply imagery and context, Baseline, N = 10</b>	<b>Placebo control - similar training but without being taught how to apply imagery and context, 5-week, N = 10</b>
(0.98) - significant difference at baseline but 95% CI values given are possibly those adjusted for baseline values.  95% CI				
<b>Memory Functioning Questionnaire - Spanish version</b> Self-reported measure of memory complaints. Scale 31-217. Only 95% CI reported and mean can be calculated from CI and number analysed. Baseline values for raw scores reported as mean (SD): 109.0 (18.33) vs. 108.60 (16.79). 95% CI values given are possibly those adjusted for baseline values.  95% CI	NR	99.36-112.44	NR	104.26-117.34
<b>Life satisfaction - Satisfaction With Life Scale</b> Scale usually 5-35. Only 95% CI reported and mean can be calculated from CI and number analysed. Baseline values for raw scores reported as mean (SD): 23.20 (6.03) vs. 19.70 (5.31). 95% CI values given are possibly those adjusted for baseline values.	NR	21.04-26.14	NR	17.76-22.86

Outcome	Modified Story Memory Technique (mSMT) for learning in MS, Baseline, N = 10	Modified Story Memory Technique (mSMT) for learning in MS, 5-week, N = 10	Placebo control - similar training but without being taught how to apply imagery and context, Baseline, N = 10	Placebo control - similar training but without being taught how to apply imagery and context, 5-week, N = 10
95% CI				
<b>Patient-reported</b> Baseline values for raw scores reported as mean (SD): 101.40 (9.88) VS. 95.80 (9.59). 95% CI values given are possibly those adjusted for baseline values.	NR	92.14-104.53	NR	91.47-103.86
95% CI				
<b>Family-reported</b> Baseline values for raw scores reported as mean (SD): 104.20 (11.0) vs. 103.0 (11.94). 95% CI values given are possibly those adjusted for baseline values.	NR	100.12-104.70	NR	102.50-107.08
95% CI				

HVLT-R Total Learning Trials 1-3 - Polarity - Higher values are better  
 Memory Functioning Questionnaire - Spanish version - Polarity - Lower values are better  
 Life satisfaction - Satisfaction With Life Scale - Polarity - Higher values are better  
 Patient Competency Rating Scale (PCRS) - Polarity - Higher values are better  
 Final values for continuous outcomes

**Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT**  
**Results\_HVLT-R Total Learning Trials 1-3\_5 weeks**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3-month minimum in protocol)</i>

## Lamargue, 2020

**Bibliographic Reference** Lamargue, D.; Koubiyr, I.; Deloire, M.; Saubusse, A.; Charre-Morin, J.; Moroso, A.; Coupe, P.; Brochet, B.; Ruet, A.; Effect of cognitive rehabilitation on neuropsychological and semiecolological testing and on daily cognitive functioning in multiple sclerosis: The REACTIV randomized controlled study; Journal of the Neurological Sciences; 2020; vol. 415; 116929

## Study details

<b>Trial name / registration number</b>	NCT01207856
<b>Study location</b>	France
<b>Study setting</b>	Outpatients - recruited during outpatient visits
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Funded by ARSEP Foundation (Association pour la Recherche contre la Sclerose en Plaques), ANR-10-LABX-57 Translational Research and Advanced Imaging Cluster of Excellence and a grant from Merck.
<b>Inclusion criteria</b>	MS according to McDonald criteria of any phenotype; age 18-55 years; disease duration >6 months and ≤15.0 years; right-handedness; having a driver's license; and cognitive criterion of mild cognitive impairment (at least 3 scores <1 SD on tests measuring information processing speed, attention, working memory and executive function); complaining of discomfort in daily lives due to cognitive problems.
<b>Exclusion criteria</b>	Previous history of other neurological or psychiatric disorders; visual, oculomotor, auditory or motor impairments precluding ability to perform computerised tasks; addictive behaviour; MS attack and/or corticosteroid pulse therapy in 2 months prior to screening; severe cognitive deficits or dementia (Mini-Mental Status Examination <27); moderate-severe visuospatial incapacity (raw score <28 on copy trial of Rey-Osterrieth Figure Test); and moderate-severe depression (BDI >27).

<b>Recruitment / selection of participants</b>	People complaining of discomfort in their daily lives due to cognitive problems during routine outpatient visits for MS were recruited.
<b>Intervention(s)</b>	REACTIV specific cognitive rehabilitation covering multiple cognitive domains: Total of 50 sessions (45 min duration each) delivered three times weekly for 4 months. Supervised by specifically trained speech therapists or neuropsychologists. Individual sessions only. Designed for mild-moderate impairment and focused on certain fundamental cognitive processes: information processing speed (using feedback from reaction times in computerised and timed tasks); attention (particularly selective, sustained and divided attention); executive function (mainly inhibition and flexibility processes, control processes, the allocation and coordination of attentional resources or checking strategies); working memory (particularly central executive and storage capacity; and metacognition. Progressive programme including general framework with work on attention, information processing and executive function that was tailored to level of deficits for each patient. Progression controlled by validation of consecutive levels of difficulty. REACTIV used wide range of exercises of increasing complexity to limit familiarisation, maintain interest and novelty and stimulate attention, including computerised standardised exercises, pen and pencil exercises and rehabilitation games. Tasks performed across different modalities (visual or auditory, verbal or non-verbal, written or oral or motor). Provided time for work focusing on difficulties in daily life and for metacognitive deep thinking.
<b>Population subgroups</b>	None
<b>Comparator</b>	Non-specific cognitive intervention: Total of 50 sessions (45 min duration each) delivered three times weekly for 4 months. Supervised by specifically trained speech therapists or neuropsychologists. Focused on information about disease, its symptoms and management, relaxation, physical activity coaching and global cognitive stimulation (including 10 sessions with focus on semantic memory, autobiographical memory and verbal and visual episodic memory).
<b>Number of participants</b>	35 randomised, 35 randomised at 4- and 8-month time-points (end of intervention and 4-month post-intervention completion)
<b>Duration of follow-up</b>	Outcomes reported at 4- and 8-month time-points (end of intervention and 4-month post-intervention completion)
<b>Indirectness</b>	None

<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (83%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (median score 2.0 and 3.0 in two groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (mild-moderate included, proportion with each unclear)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - likely absent (history of psychiatric disorders excluded)</li> <li>• Computerised vs clinician led - mix clinician led/computerised</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - intention to treat (all of those randomised analysed)</p>
----------------------------	--

## Study arms

**REACTIV specific cognitive rehabilitation covering multiple cognitive domains (N = 18)**

**Non-specific cognitive intervention - information about disease, relaxation, physical activity coaching and global cognitive stimulation with special focus on memory (N = 17)**

## Characteristics

### Arm-level characteristics

Characteristic	REACTIV specific cognitive rehabilitation covering multiple cognitive domains (N = 18)	Non-specific cognitive intervention - information about disease, relaxation, physical activity coaching and global cognitive stimulation with special focus on memory (N = 17)

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_visual scanning TAP correct answers with a target\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_visual scanning TAP correct answers with a target\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_visual scanning TAP correct answers without a target\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_visual scanning TAP correct answers without a target\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

#### Results\_Divided attention (visual) TAP reaction time - simple task condition\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (visual) TAP reaction time - simple task condition\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (visual) TAP reaction time - dual task condition\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (visual) TAP reaction time - dual task condition\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (auditory) TAP reaction time - simple task condition\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (auditory) TAP reaction time - simple task condition\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (auditory) TAP reaction time - dual task condition\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (auditory) TAP reaction time - dual task condition\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (visual) TAP correct answers - simple task condition\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (visual) TAP correct answers - simple task condition\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

#### Results\_Divided attention (visual) TAP correct answers - dual task condition\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (visual) TAP correct answers - dual task condition\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (auditory) TAP correct answers - simple task condition\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

#### Results\_Divided attention (auditory) TAP correct answers - simple task condition\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (auditory) TAP correct answers - dual task condition\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Divided attention (auditory) TAP correct answers - dual task condition\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_N-back reaction time\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_N-back reaction time\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_N-back correct answers\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_N-back correct answers\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Stroop Test Color Naming\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Stroop Test Color Naming\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Stroop Test Word Reading\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Stroop Test Word Reading\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Stroop Test Interference\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Stroop Test Interference\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Trail Making Test - A\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Trail Making Test - A\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Trail Making Test - B\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Trail Making Test - B\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Baddeley's Dual Task forward span correct answers\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Baddeley's Dual Task forward span correct answers\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Fluency - semantic\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Fluency - semantic\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Fluency - phonemic\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Fluency - phonemic\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Backward Span\_4 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Backward Span\_8 months

## Study details

**Other publications associated with this study included in review**

- Lincoln, N. B., Bradshaw, L. E., Constantinescu, C. S. et al. (2020) Group cognitive rehabilitation to reduce the psychological impact of multiple sclerosis on quality of life: the CRAMMS RCT. *Health Technology Assessment (Winchester, England)* 24(4): 1-182

<b>Trial name / registration number</b>	CRAMMS study. ISRCTN09697576/14/08/2014.
<b>Study location</b>	UK
<b>Study setting</b>	Outpatient - identified through hospitals, charities and UK MS Register
<b>Study dates</b>	Participants were recruited between 13 March 2015 and 23 March 2017
<b>Sources of funding</b>	Funded by the National Institute for Health Research Health Technology Assessment programme (project number 12/190/05)
<b>Inclusion criteria</b>	Aged 18–69 years; diagnosed with relapsing–remitting or progressive multiple sclerosis; diagnosed at least three months prior to the screening assessment; reported having cognitive problems defined as >27 on the patient version of the Multiple Sclerosis Neuropsychological Screening Questionnaire; impaired on at least one of the Brief Repeatable Battery of Neuropsychological tests (defined as performance >1 SD below the mean of healthy controls, corrected for age and education); able to attend group sessions; able to speak English sufficiently to complete the cognitive assessments; gave written informed consent
<b>Exclusion criteria</b>	Had vision or hearing problems, such that they were unable to complete the cognitive assessments; had concurrent severe medical or psychiatric conditions, which prevented them from engaging in treatment; were involved in other psychological intervention trials
<b>Recruitment / selection of participants</b>	Participants were identified through United Kingdom National Health Service hospitals, charities (e.g., MS Society) and the United Kingdom MS Register. The trial was conducted in five sites in England.
<b>Intervention(s)</b>	Group cognitive programme with main focus on memory + usual care: Cognitive rehabilitation was provided by an Assistant Psychologist to groups of 4-6 with meetings almost weekly for 10 sessions. Content of sessions defined in treatment manual. Included restitution strategies to retrain attention and memory functions and strategies to improve encoding and retrieval. Compensation strategies taught included the use of internal mnemonics (such as chunking) and external devices (such as diaries and mobile phones) and ways of coping with attention and memory problems. Attendance was recorded. If participants missed a session, they could attend early for the following session to catch up on the content they had missed. Homework assignments facilitated individualisation of care and generalization of cognitive strategies to daily life. Usual care involved general advice from multiple sclerosis nurse specialists and occupational therapists on how to manage any

	cognitive difficulties. All participants were notified of information available on the webpages of multiple sclerosis charities, which include suggestions for coping with cognitive problems. All other clinical services, and support from specialist charities, were available as part of usual care.
<b>Population subgroups</b>	Reports data separately for some of the population subgroups in health economic paper (including type of MS)
<b>Comparator</b>	Usual care only: Usual care involved general advice from multiple sclerosis nurse specialists and occupational therapists on how to manage any cognitive difficulties. All participants were notified of information available on the webpages of multiple sclerosis charities, which include suggestions for coping with cognitive problems. All other clinical services, and support from specialist charities, were available as part of usual care.
<b>Number of participants</b>	449 randomised, 404 analysed at 6 months and 387 analysed at 12 months (intervention: n=13 withdrew consent, n=12 lost to follow-up, n=1 returned questionnaire >15 months post-randomisation, n=3 visit completed but questionnaire not done, n=1 MSIS-psychological could not be scored and n=1 unknown; control, n=16 withdrew consent, n=10 lost to follow-up, n=3 returned questionnaire >15 months post-randomisation and n=2 visit completed but questionnaire not done)
<b>Duration of follow-up</b>	Up to 12 months post-randomisation (9-10 months after end of intervention)
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (65% both groups)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (major psychiatric conditions excluded)</li> <li>• Computerised vs clinician led - clinician led</li> <li>• Group vs individual - group</li> </ul> <p>Analysis - modified attention to treat with those with no data excluded</p>

## Study arms

**Group cognitive programme with main focus on memory + usual care (N = 245)**

**Usual care only (N = 204)**

## Characteristics

### Arm-level characteristics

Characteristic	Group cognitive programme with main focus on memory + usual care (N = 245)	Usual care only (N = 204)
<b>% Female</b>	n = 178 ; % = 73	n = 148 ; % = 73
Sample size		
<b>Mean age (SD)</b>	49.9 (9.8)	48.9 (10)
Mean (SD)		
<b>White</b>	n = 237 ; % = 97	n = 195 ; % = 96
Sample size		
<b>Non-white</b>	n = 8 ; % = 3	n = 9 ; % = 4
Sample size		
<b>Comorbidities</b>	NR	NR
Custom value		

<b>Characteristic</b>	<b>Group cognitive programme with main focus on memory + usual care (N = 245)</b>	<b>Usual care only (N = 204)</b>
<b>Years since diagnosis</b>	12.1 (8)	11.1 (8.7)
Mean (SD)		
<b>Relapsing-remitting</b>	n = 159 ; % = 65	n = 132 ; % = 65
Sample size		
<b>Primary progressive</b>	n = 22 ; % = 9	n = 24 ; % = 12
Sample size		
<b>Secondary progressive</b>	n = 64 ; % = 26	n = 48 ; % = 24
Sample size		

## Outcomes

### Study timepoints

- Baseline
- 6 month (6-months - 3-4 months after intervention)
- 12 month (12-months - 9-10 months after intervention)

### Results - difference relative to control group

Outcome	Group cognitive programme with main focus on memory + usual care vs Usual care only, Baseline, N2 = 204, N1 = 245	Group cognitive programme with main focus on memory + usual care vs Usual care only, 6 month, N2 = 187, N1 = 217	Group cognitive programme with main focus on memory + usual care vs Usual care only, 12 month, N2 = 173, N1 = 214
<b>Psychological</b> Mean (SD) baseline values were: 23.3 (5.8) vs. 24.7 (6.0)  Number analysed	NA	217 vs. 187	214 vs. 173
<b>Psychological</b> Mean (SD) baseline values were: 23.3 (5.8) vs. 24.7 (6.0)  Mean (95% CI)	NR (NR to NR)	-0.9 (-1.7 to -0.1)	-0.6 (-1.5 to 0.3)
<b>Physical</b> Mean (SD) baseline values were: 52.0 (13.6) vs. 53.4 (13.1)  Number analysed	NA	215 vs. 187	214 vs. 173
<b>Physical</b> Mean (SD) baseline values were: 52.0 (13.6) vs. 53.4 (13.1)  Mean (95% CI)	NR (NR to NR)	-0.6 (-2.2 to 0.9)	-0.1 (-1.8 to 1.5)

<b>Outcome</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, Baseline, N2 = 204, N1 = 245</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 6 month, N2 = 187, N1 = 217</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 12 month, N2 = 173, N1 = 214</b>
<b>Participant-reported</b> Mean (SD) baseline values were: 45.0 (22.8) vs. 47.1 (23.2)  Number analysed	NA	214 vs. 181	210 vs. 168
<b>Participant-reported</b> Mean (SD) baseline values were: 45.0 (22.8) vs. 47.1 (23.2)  Mean (95% CI)	NR (NR to NR)	-5.3 (-8.7 to -1.9)	-4.4 (-7.8 to -0.9)
<b>Relative-reported</b> Mean (SD) baseline values were: 34.7 (23.4) vs. 38.2 (25.9)  Number analysed	NA	184 vs. 152	164 vs. 142
<b>Relative-reported</b> Mean (SD) baseline values were: 34.7 (23.4) vs. 38.2 (25.9)  Mean (95% CI)	NR (NR to NR)	-5.4 (-9.1 to -1.7)	-5.5 (-9.6 to -1.5)
<b>General Health Questionnaire-30 (GHQ-30)</b> Scale usually 0-90. Assessment of mental wellbeing. Mean (SD)	NA	212 vs. 183	209 vs. 167

<b>Outcome</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, Baseline, N2 = 204, N1 = 245</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 6 month, N2 = 187, N1 = 217</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 12 month, N2 = 173, N1 = 214</b>
baseline values were: 36.5 (14.2) vs. 39.7 (15.8)			
Number analysed			
<b>General Health Questionnaire-30 (GHQ-30)</b> Scale usually 0-90. Assessment of mental wellbeing. Mean (SD) baseline values were: 36.5 (14.2) vs. 39.7 (15.8)	NR (NR to NR)	-3.4 (-5.9 to -0.8)	-3.4 (-6.2 to -0.6)
Mean (95% CI)			
<b>Fatigue Severity Scale</b> Scale used likely 1-7. Mean (SD) baseline values were: 1.4 (1.4) vs. 1.3 (1.3)	NA	214 vs. 185	210 vs. 168
Number analysed			
<b>Fatigue Severity Scale</b> Scale used likely 1-7. Mean (SD) baseline values were: 1.4 (1.4) vs. 1.3 (1.3)	NR (NR to NR)	-0.1 (-0.3 to 0.2)	-0.3 (-0.5 to 0)
Mean (95% CI)			

<b>Outcome</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, Baseline, N2 = 204, N1 = 245</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 6 month, N2 = 187, N1 = 217</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 12 month, N2 = 173, N1 = 214</b>
<b>EQ-5D visual analogue</b> Scale usually 0-100. Mean (SD) baseline values were: 59.9 (21.2) vs. 59.6 (20.3)  Number analysed	NA	224 vs. 187	209 vs. 173
<b>EQ-5D visual analogue</b> Scale usually 0-100. Mean (SD) baseline values were: 59.9 (21.2) vs. 59.6 (20.3)  Mean (95% CI)	NR (NR to NR)	2.6 (-0.9 to 6)	2.6 (-0.9 to 6)
<b>Total</b> Mean (SD) baseline values were: 40.6 (11) vs. 40.2 (10.5)  Number analysed	NA	220 vs. 182	206 vs. 170
<b>Total</b> Mean (SD) baseline values were: 40.6 (11) vs. 40.2 (10.5)  Mean (95% CI)	NR (NR to NR)	1.6 (0.1 to 3)	0.6 (-0.9 to 2.1)

<b>Outcome</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, Baseline, N2 = 204, N1 = 245</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 6 month, N2 = 187, N1 = 217</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 12 month, N2 = 173, N1 = 214</b>
<b>Delay</b> Mean (SD) baseline values were: 5.8 (2.8) vs. 5.7 (2.8)  Number analysed	NA	220 vs. 182	206 vs. 170
<b>Delay</b> Mean (SD) baseline values were: 5.8 (2.8) vs. 5.7 (2.8)  Mean (95% CI)	NR (NR to NR)	0.2 (-0.2 to 0.6)	0.4 (0.1 to 0.8)
<b>Total</b> Mean (SD) baseline values were: 18.1 (4.5) vs. 18.3 (4.9)  Number analysed	NA	217 vs. 182	206 vs. 170
<b>Total</b> Mean (SD) baseline values were: 18.1 (4.5) vs. 18.3 (4.9)  Mean (95% CI)	NR (NR to NR)	-0.6 (-1.5 to 0.3)	-0.1 (-1 to 0.8)
<b>Delay</b> Mean (SD) baseline values were: 6.0 (2.2) vs. 6.3 (2.1)	NA	217 vs. 182	206 vs. 170

<b>Outcome</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, Baseline, N2 = 204, N1 = 245</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 6 month, N2 = 187, N1 = 217</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 12 month, N2 = 173, N1 = 214</b>
Number analysed			
<b>Delay</b> Mean (SD) baseline values were: 6.0 (2.2) vs. 6.3 (2.1)  Mean (95% CI)	NR (NR to NR)	0 (-0.4 to 0.4)	-0.1 (-0.5 to 0.2)
<b>SDMT</b> Symbol Digit Modalities Test. Mean (SD) baseline values were: 36.3 (11.5) vs. 37.8 (12.1)  Number analysed	NA	220 vs. 181	205 vs. 170
<b>SDMT</b> Symbol Digit Modalities Test. Mean (SD) baseline values were: 36.3 (11.5) vs. 37.8 (12.1)  Mean (95% CI)	NR (NR to NR)	1.3 (-0.6 to 3.2)	0.4 (-1.7 to 2.5)
<b>Easy</b> Mean (SD) baseline values were: 31.6 (16.2) vs. 31.3 (16.4)  Number analysed	NA	217 vs. 178	205 vs. 169

<b>Outcome</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, Baseline, N2 = 204, N1 = 245</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 6 month, N2 = 187, N1 = 217</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 12 month, N2 = 173, N1 = 214</b>
<b>Easy</b> Mean (SD) baseline values were: 31.6 (16.2) vs. 31.3 (16.4)  Mean (95% CI)	NR (NR to NR)	0 (-2.4 to 2.5)	-0.6 (-3.1 to 1.9)
<b>Hard</b> Mean (SD) baseline values were: 17.3 (16.5) vs. 15.9 (15.8)  Number analysed	NA	217 vs. 178	205 vs. 169
<b>Hard</b> Mean (SD) baseline values were: 17.3 (16.5) vs. 15.9 (15.8)  Mean (95% CI)	NR (NR to NR)	-0.3 (-2.9 to 2.2)	-1.9 (-4.8 to 1)
<b>Word fluency</b> Mean (SD) baseline values were: 24.8 (8.8) vs. 25.1 (8.9)  Number analysed	NA	219 vs. 182	206 vs. 169
<b>Word fluency</b> Mean (SD) baseline values were: 24.8 (8.8) vs. 25.1 (8.9)	NR (NR to NR)	0 (-1.3 to 1.3)	-0.2 (-1.5 to 1.2)

<b>Outcome</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, Baseline, N2 = 204, N1 = 245</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 6 month, N2 = 187, N1 = 217</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 12 month, N2 = 173, N1 = 214</b>
Mean (95% CI)			
<b>Doors and people (overall age scaled score)</b> Mean (SD) baseline values were: 7.0 (3.7) vs. 7.0 (3.9)	NA	221 vs. 181	206 vs. 168
Number analysed			
<b>Doors and people (overall age scaled score)</b> Mean (SD) baseline values were: 7.0 (3.7) vs. 7.0 (3.9)	NR (NR to NR)	0.4 (-0.1 to 0.9)	0.6 (0 to 1.1)
Mean (95% CI)			
<b>Trail Making Test (B-A)</b> Mean (SD) baseline values were: 71.7 (41.0) vs. 69.6 (41.4)	NA	218 vs 179	205 vs. 165
Number analysed			
<b>Trail Making Test (B-A)</b> Mean (SD) baseline values were: 71.7 (41.0) vs. 69.6 (41.4)	NR (NR to NR)	-0.3 (-6.8 to 6.2)	-3.2 (-10 to 3.6)
Mean (95% CI)			

<b>Outcome</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, Baseline, N2 = 204, N1 = 245</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 6 month, N2 = 187, N1 = 217</b>	<b>Group cognitive programme with main focus on memory + usual care vs Usual care only, 12 month, N2 = 173, N1 = 214</b>
<b>Carer Strain Index</b> Scale unclear - possibly 0-13. Baseline values not reported	NA	173 vs. 154	159 vs. 141
Number analysed			
<b>Carer Strain Index</b> Scale unclear - possibly 0-13. Baseline values not reported	NR (NR to NR)	-0.9 (-2.2 to 0.4)	-0.4 (-1.6 to 0.8)
Mean (95% CI)			
<b>Any employment</b> 82/245 (33%) vs. 69/204 (34%) said to be in employment or education at baseline	NA	224 vs. 187	209 vs. 173
Number analysed			
<b>Any employment</b> 82/245 (33%) vs. 69/204 (34%) said to be in employment or education at baseline	NR (NR to NR)	0.88 (0.55 to 1.39)	0.99 (0.6 to 1.63)
Odds ratio/95% CI			

MSIS-29 - Polarity - Lower values are better

Everyday Memory Questionnaire (EMQ) - Polarity - Lower values are better

General Health Questionnaire-30 (GHQ-30) - Polarity - Lower values are better  
 Fatigue Severity Scale - Polarity - Lower values are better  
 EQ-5D visual analogue - Polarity - Higher values are better  
 Selective reminding test - Polarity - Higher values are better  
 10/36 Spatial Recall Test - Polarity - Higher values are better  
 SDMT - Polarity - Higher values are better  
 Paced Serial Addition Test (PASAT?) - Polarity - Higher values are better  
 Word fluency - Polarity - Higher values are better  
 Doors and people (overall age scaled score) - Polarity - Higher values are better  
 Trail Making Test (B-A) - Polarity - Lower values are better  
 Carer Strain Index - Polarity - Lower values are better  
 Final values for continuous outcomes

Note that number analysed varies depending on the outcome and where it differs to those in the table heading have been indicated separately for each result. Adjusted differences adjusted for site, multiple sclerosis type, gender and baseline score as covariates. Missing baseline scores were imputed for the analysis using the mean score at each site.

**Results - raw data**

<b>Outcome</b>	<b>Group cognitive programme with main focus on memory + usual care , Baseline, N = 245</b>	<b>Group cognitive programme with main focus on memory + usual care , 6-month, N = 217</b>	<b>Group cognitive programme with main focus on memory + usual care , 12-month, N = 214</b>	<b>Usual care only, Baseline, N = 204</b>	<b>Usual care only, 6-month, N = 187</b>	<b>Usual care only, 12-month, N = 173</b>
<b>Adherence - attended at least 3 sessions</b> Defined as minimum that was considered likely to affect change. Note this	n = 208 ; % = 84.9	n = NA ; % = NA	n = NA ; % = NA	n = NR ; % = NR	n = NA ; % = NA	n = NA ; % = NA

Outcome	Group cognitive programme with main focus on memory + usual care , Baseline, N = 245	Group cognitive programme with main focus on memory + usual care , 6-month, N = 217	Group cognitive programme with main focus on memory + usual care , 12-month, N = 214	Usual care only, Baseline, N = 204	Usual care only, 6-month, N = 187	Usual care only, 12-month, N = 173
was at end of intervention.						
No of events

## Study details

<b>Other publications associated with this study included in review</b>	<ul style="list-style-type: none"> <li>Schirda, B., Duraney, E., Lee, H. K. et al. (2020) Mindfulness training for emotion dysregulation in multiple sclerosis: A pilot randomized controlled trial. <i>Rehabilitation Psychology</i> 65(3): 206-218</li> </ul>
<b>Trial name / registration number</b>	NCT02717429
<b>Study location</b>	USA
<b>Study setting</b>	Outpatient - recruited from community
<b>Study dates</b>	Study recruitment took place from September 2015 through March 2017. Four waves of training began in October 2015, March 2016, September 2016, and March 2017, respectively.
<b>Sources of funding</b>	Supported by the National Multiple Sclerosis Society
<b>Inclusion criteria</b>	Clinical diagnosis of any MS subtype; aged 30 –59 years; absence of relapse in the last 30 days; no other diagnosed neurological disorders (e.g., dementia, Parkinson’s disease, traumatic brain injury); score 23 on the Mini-Mental Status Examination; corrected visual acuity of 20/40 or better; no recent (in the previous year) or long-term experience with mindfulness meditation or cognitive training; and access to a computer and internet at home.
<b>Exclusion criteria</b>	No further criteria reported.
<b>Recruitment / selection of participants</b>	Advertisements were sent via listserv to members of our laboratory’s participant database, the National Multiple Sclerosis Society, and local MS support groups.
<b>Intervention(s)</b>	Adaptive cognitive training covering multiple domains: training in group sessions at Ohio State University for 2 h each week over 4 weeks. Two doctoral students in clinical psychology, supervised by a licensed psychologist, facilitated these group sessions. Sessions included a combination of didactics, group discussion, and practice with the training materials. Participants were asked to supplement the training with 40 min of at-home practice on the remaining 6 days of the week and to log their practice time daily. Designed using component of previous cognitive training programmes with

	<p>demonstrated efficacy, including adaptive difficulty and training in the basic building blocks of cognition, such as processing speed and attention, followed by higher-order cognitive domains, including executive functioning and working memory. Participants trained in these cognitive domains in the following order: processing speed (Week 1); attention (Week 2); executive function, including working memory (Weeks 3 and 4). The first hour of each group session was dedicated to didactics, wherein facilitators presented research findings on known cognitive limitations in PwMS and invited participants to share their personal experiences with this. Following this didactic portion, participants played four computer games lasting approximately 10 min each on the Posit Science BrainHQ website, and in-between games were provided brief instruction from facilitators. An algorithm matched the level of difficulty in each game to participants' current skill level, such that participants were continuously challenged as their performance improved.</p> <p>Mindfulness-based training: training in group sessions at Ohio State University for 2 h each week over 4 weeks. Two doctoral students in clinical psychology, supervised by a licensed psychologist, facilitated these group sessions, with the exception of one group where it was facilitated by a single student. Sessions included a combination of didactics, group discussion, and practice with the training materials. Participants were asked to supplement the training with 40 min of at-home practice on the remaining 6 days of the week and to log their practice time daily. Based on Jon Kabat-Zinn's 8-week programme, 4-week programme used in this study was designed to provide training in the skills and principles of mindfulness in an abbreviated form. First 3 weeks of the programme included breath awareness, body scan, and sitting meditation practices, with a particular emphasis on thoughts, emotions, and sensations, each designed to cultivate sustained attention. In the final week, participants practiced open monitoring of the breath, thoughts, emotions, and bodily sensations, which required concentrative attention. Over time, participants transitioned from focused-attention practices to open-monitoring practices, which required greater self-directed attentional monitoring of the present moment and invited them to bring awareness to unfolding thoughts, emotions, and sensations, moment by moment.</p>
<b>Population subgroups</b>	None
<b>Comparator</b>	Waitlist control: did not engage in any training and invited to complete pre- and post-training assessment sessions.
<b>Number of participants</b>	61 randomised across the three groups, 50 analysed (cognitive training, discontinued due to n=1 relapse, n=1 illness in family, n=1 unclear; mindfulness, discontinued due to n=1 relapse, n=1 lost interested and n=2 were no shows; control,

	discontinued due to n=1 illness in family, n=1 family death, n=1 length of post-training assessment session and n=1 lost interest).
<b>Duration of follow-up</b>	4 weeks - end of intervention period
<b>Indirectness</b>	Outcome - time-point <3 months minimum specified in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (&gt;95% both groups)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (mean scores &lt;6.0 in both groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (may not have been a requirement to have any impairment at baseline)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear</li> <li>• Computerised vs clinician led - mixed - clinician led with some computerised training</li> <li>• Group vs individual - group</li> </ul> <p>Analysis - modified intention to treat (appears to have analysed those with data at follow-up)</p>

### Study arms

**Adaptive cognitive training covering multiple domains (processing speed, attention, executive function and working memory) (N = 20)**

**Waitlist control (N = 21)**

**Mindfulness-based training (N = 20)**

## Characteristics

### Arm-level characteristics

 Results\_SRT-LTS\_4 weeks\_adaptive cognitive training vs. control**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3-month minimum specified in protocol)</i>

### Results\_SRT-CLTR\_4 weeks\_adaptive cognitive training vs. control

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum specified in protocol</i> )

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3-month minimum specified in protocol)</i>

### Results\_Beck Depression Inventory\_4 weeks\_mindfulness vs. adaptive cognitive training

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum specified in protocol</i> )

### Results\_Penn State Worry Questionnaire\_4 weeks\_mindfulness vs. control

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum specified in protocol</i> )

#### Results\_Penn State Worry Questionnaire\_4 weeks\_mindfulness vs. adaptive cognitive training

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3-month minimum specified in protocol)</i>

### Results\_DERS\_4 weeks\_mindfulness vs. control

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum specified in protocol</i> )

### Results\_DERS\_4 weeks\_mindfulness vs. adaptive cognitive training

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month</i> )

Section	Question	Answer
		<i>minimum specified in protocol)</i>

### Results\_quality of life\_4 weeks\_mindfulness vs. control

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3-month minimum specified in protocol)</i>

### Results\_quality of life\_4 weeks\_mindfulness vs. adaptive cognitive training

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3-month minimum specified in protocol)</i>

### Results\_adherence\_4 weeks\_mindfulness vs. control

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_adherence\_4 weeks\_mindfulness vs. adaptive cognitive training

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Study details

<b>Trial name / registration number</b>	IRCT2016090929714N1
<b>Study location</b>	Iran
<b>Study setting</b>	Outpatient - those referred to a Neurology clinic
<b>Study dates</b>	Those referred to clinic between November 2016 and February 2017 invited to participate
<b>Sources of funding</b>	Funded by the Vice Chancellery for Research Affairs at Shiraz University of Medical Sciences, Shiraz, Iran
<b>Inclusion criteria</b>	Relapsing-remitting MS diagnosis; age 20-45 years; normal IQ (>90 on Raven Progressive Matrix Test); at least sixth-grade education; and minimal cognitive impairment based on Addenbrooke's cognitive examination (scores >70 - patients with severe cognitive deficits not included).

<b>Exclusion criteria</b>	MS flare-up within previous 6 months; any chronic illness that may affect neuropsychological system (such as neurologic, rheumatologic, infectious, or endocrine diseases as well as chronic renal/liver failure); significant primary psychiatric disorder; severe ambulation disability; pregnancy; and native language other than Farsi.
<b>Recruitment / selection of participants</b>	Those referred to Emam Reza Neurology Clinic at Shiraz University of Medical Sciences in Shiraz, Iran, between November 2016 and February 2017 were invited to participate in the study
<b>Intervention(s)</b>	Group cognitive rehabilitation: two 2 h sessions of group cognitive rehabilitation per week for 4 weeks. Compensatory, problem-based, and integrated approach based on learning theory and an information processing model to enhance general cognitive function. Total of 8 related sessions with each involving a home training assignment to apply learning to everyday life. Consisted of four main steps: psychoeducation, attention, memory, and executive function enhancement. First session involved being educated about how MS affects cognitive performance and learning about information processing model with everyday examples given for each step (then asked to write an essay about effects of MS on everyday cognitive functioning at home). Second session began with discussion of homework assignment, followed by explaining effects of mood on cognition and relaxation training as a strategy to control stress and anxiety (home assignments involved patients chronicling daily activities in 24 h and 7-day charts. Third session started with discussion of homework assignment followed by compensatory attention rehabilitation section (focused on sustained, shifting and divided attention - verbal and visual examples in training for each type of attention provided). Sessions four to seven focused on memory rehabilitation (memory processing model explained, encoding-enhancement strategies taught for example use of internal aids, and trained to use mnemonics, cueing and chunking to facilitate storage of information, methods of loci and spaced retrieval also explained to improve memory retrieval and taught to use external aids such as calendars and reminders). Eighth session began with description of executive functions and then proceeded to instruction on how previous interventions, such as self-regulation, affected this domain. Patients used their 24-hour charts of daily activities from previous sessions to improve self-regulation. They received feedback from the therapist and from other group members. Patients also learned problem-solving, decision-making, and time management techniques.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - psychoeducation and information-sharing: two 2 h non-therapeutic group sessions per week for 4 weeks. Based on psychoeducation, which was considered a sham intervention compared to the cognition-targeted group intervention received by patients in the intervention group. Control group meetings were designed as dynamic, interpersonal relationship

	training that was integrated with expressions of patients' daily life experiences regarding their disease and the sharing of scientific information about MS. These group meetings had no content related to that assessed on the outcome measures. For 3 months after the last intervention session, patients received phone call follow-ups twice a week encouraging them to use learned techniques in their everyday lives.
<b>Number of participants</b>	34 randomised, 30 analysed (n=2 in control group and n=1 in intervention group failed to complete 3-month study protocol and n=1 in intervention group had incomplete data at follow-up)
<b>Duration of follow-up</b>	Up to 3 months (2 months after the end of the intervention)
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (mild/moderate included as severe was an exclusion criterion)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (possibly excluded as significant primary psychiatric disorder excluded)</li> <li>• Computerised vs clinician led - clinician led</li> <li>• Group vs individual - group</li> </ul> <p>Analysis - per protocol (excluded some that did not adhere to protocol, n=3)</p>

## Study arms

**Group cognitive rehabilitation - psychoeducation, attention, memory and executive function (N = 17)**

## Control - psychoeducation and information-sharing (N = 17)

### Characteristics

#### Arm-level characteristics

Characteristic	Group cognitive rehabilitation - psychoeducation, attention, memory and executive function (N = 17)	Control - psychoeducation and information-sharing (N = 17)
% Female	n = 17 ; % = 100	n = 17 ; % = 100
Sample size		
Mean age (SD)	35.29 (5.22)	35.82 (5.25)
Mean (SD)		
Ethnicity	NR	NR
Custom value		
Comorbidities	NR	NR
Custom value		
Donepezil	n = 9 ; % = 53	n = 8 ; % = 47
Sample size		
Memantin	n = 8 ; % = 47	n = 9 ; % = 53
Sample size		

## Outcomes

### Study timepoints

- Baseline
- 3 month (3-months (2-months after the end of the intervention).)
- 4 week (4-weeks - end of treatment period (for one of attention outcomes as only reported at 4 weeks))

### Results - raw data

Outcome	Group cognitive rehabilitation - psychoeducation, attention, memory and executive function, Baseline, N = 15	Group cognitive rehabilitation - psychoeducation, attention, memory and executive function, 3-month, N = 15	Group cognitive rehabilitation - psychoeducation, attention, memory and executive function, 4-week, N = 15	Control - psychoeducation and information-sharing, Baseline, N = 15	Control - psychoeducation and information-sharing, 3-month, N = 15	Control - psychoeducation and information-sharing, 4-week, N = 15
<b>Addenbrooke's cognitive examination</b> General cognitive function (orientation, attention, memory, verbal fluency, language and visuospatial ability). Scale usually 0-100.	81.41 (7.85)	93.33 (5.03)	NA (NA)	79.91 (8.34)	86.4 (6.49)	NA (NA)

<b>Verbal memory</b>	16.93 (4.78)	19.32 (3.18)	NA (NA)	15.53 (4.24)	14.05 (5.1)	NA (NA)
Mean (SD)						

Addenbrooke's cognitive examination - Polarity - Higher values are better

Wisconsin Card Sorting Test (WCST) - Perseverative errors - Polarity - Lower values are better

Wisconsin Card Sorting Test (WCST) - Category completed - Polarity - Higher values are better

Wisconsin Card Sorting Test (WCST) - Non-perseverative errors - Polarity - Lower values are better

Wisconsin Card Sorting Test (WCST) - Total time taken - Polarity - Lower values are better

BRIEF-A - Global executive function - Polarity - Lower values are better

Memory Functioning Questionnaire (MFQ) - general rating - Polarity - Lower values are better

Weschler Memory Scale-Revised (WMS-R) - Polarity - Higher values are better

Final values for continuous outcomes

Despite n=17 being randomised to each group; analysis was performed on n=15 in each group.

### Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT

#### Results\_Addenbrooke's cognitive examination\_3 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

#### Results\_WCST perseverative errors\_3 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_WCST category completed\_3 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_WCST non-perseverative errors\_3 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_WCST total time taken\_3 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_WCST\_BRIEF-A Global Executive Function\_3 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_memory functioning questionnaire general rating\_3 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_WMS-R visual memory\_3 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_WMS-R verbal memory\_3 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

Martin, K.; Lincoln, N.; das Nair, R.; Group-based memory rehabilitation for people with multiple sclerosis: subgroup analysis of the ReMiND trial; International journal of therapy & rehabilitation; 2014; vol. 21 (no. 12); 590-596

## Study details

<b>Secondary publication of another included study- see primary study for details</b>	
<b>Other publications associated with this study included in review</b>	<ul style="list-style-type: none"> <li>das Nair, R. and Lincoln, N. B. (2012) Evaluation of rehabilitation of memory in neurological disabilities (ReMiND): a randomized controlled trial. Clinical Rehabilitation 26(10): 894-903</li> </ul>

<b>Trial name / registration number</b>	ReMIND study
<b>Study location</b>	UK
<b>Study setting</b>	Outpatient - recruited through community
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Research was supported by grants from The Stroke Association, Remedi (2006/05), Universities UK (Overseas Research Students Award Scheme), and the University of Nottingham.
<b>Inclusion criteria</b>	Over 18 years old; reported memory problems; and diagnosed with stroke, TBI or MS, which was verified by a clinician (note this paper focuses on MS subpopulation)
<b>Exclusion criteria</b>	Did not speak English; did not live within 50 miles of Nottingham or Derby; uncorrected visual or hearing impairments which prevented them from completing the assessments; overall profile score of >1 on the Rivermead Behavioural Memory Test Extended (defined as no impairment)
<b>Recruitment / selection of participants</b>	Advertised through clinicians and charities, such as the Multiple Sclerosis Society.
<b>Intervention(s)</b>	Compensatory memory training (use of external aids): intervention was carried out by research assistants who were trained by a Clinical Psychologist. Each session lasted approximately 1.5 hours with a 10–15-minute break. All sessions began with a summary of the previous session and an outline of the current session, and finished with a review of the session, assignment of homework and a preview of the next session. Each programme contained 10 sessions, one per week for 10 weeks. The purpose of the homework was to give the participants an opportunity to practice strategies learned in the session in daily life. Treatment manuals developed based on existing programmes and in consultation with practitioners. Participants in both of the intervention programmes (restitution and compensation) were taught the use of internal memory aids and errorless learning techniques. Compensation group were also taught how to use external memory aids (e.g., diaries).

	<p>Restitution memory training (training in coding, organisation and retrieval of information - internal aids): intervention was carried out by research assistants who were trained by a Clinical Psychologist. Each session lasted approximately 1.5 hours with a 10–15-minute break. All sessions began with a summary of the previous session and an outline of the current session, and finished with a review of the session, assignment of homework and a preview of the next session. Each programme contained 10 sessions, one per week for 10 weeks. The purpose of the homework was to give the participants an opportunity to practice strategies learned in the session in daily life. Treatment manuals developed based on existing programmes and in consultation with practitioners. Participants in both of the intervention programmes (restitution and compensation) were taught the use of internal memory aids and errorless learning techniques. Those in the restitution group completed exercises to practice encoding and retrieval, and also included attention-retraining exercises, such as letter and number cancellation. Participants in the restitution group were also taught how to encode and retrieve specific information (e.g., remembering people’s names by paying attention not only to the acoustic and orthographic presentation of the name but by creating a visual image of the name).</p>
<b>Population subgroups</b>	None
<b>Comparator</b>	Self-help control group not taught any memory strategies, but were taught relaxation techniques and ways in which they could cope with their condition.
<b>Number of participants</b>	39 randomised,
<b>Duration of follow-up</b>	Up to 7-month follow-up (5- and 7-month time-points - 2-3 and 4-5 months following end of intervention)
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - unclear</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear</li> <li>• Computerised vs clinician led - clinician-led</li> </ul>

- Group vs individual - group

Analysis - intention to treat (appear to be no dropouts and stated intention to treat used)

## Study arms

**Compensatory memory training (use of external aids) (N = 12)**

**Restitution memory training (training in coding, organisation and retrieval of information - internal aids) (N = 17)**

**Self-help control group (N = 10)**

## Characteristics

### Arm-level characteristics

Characteristic	Compensatory memory training (use of external aids) (N = 12)	Restitution memory training (training in coding, organisation and retrieval of information - internal aids) (N = 17)	Self-help control group (N = 10)
% Female	n = 9 ; % = 75	n = 13 ; % = 76	n = 7 ; % = 70
Sample size			
Mean age (SD)	48.3 (10.8)	45.2 (7.5)	47.7 (10.9)
Mean (SD)			

<b>Characteristic</b>	<b>Compensatory memory training (use of external aids) (N = 12)</b>	<b>Restitution memory training (training in coding, organisation and retrieval of information - internal aids) (N = 17)</b>	<b>Self-help control group (N = 10)</b>
<b>Ethnicity</b>	NR	NR	NR
Custom value			
<b>Comorbidities</b>	NR	NR	NR
Custom value			
<b>Time since disease (Months)</b>	131.5 (98.2)	100.8 (93.6)	95.7 (55.1)
Mean (SD)			

## Outcomes

### Study timepoints

- Baseline
- 5 month (5-months - 2-3 months after end of intervention)
- 7 month (7-months - 4-5 months after end of intervention)

## Results - raw data

Outcome	Compensatory memory training (use of external aids), Baseline, N = 12	Compensatory memory training (use of external aids), 5-month, N = 17	Compensatory memory training (use of external aids), 7-month, N = 10	Restitution memory training (training in coding, organisation and retrieval of information - internal aids), Baseline, N = 12	Restitution memory training (training in coding, organisation and retrieval of information - internal aids), 5-month, N = 17	Restitution memory training (training in coding, organisation and retrieval of information - internal aids), 7-month, N = 12	Self-help control group, Baseline, N = 11	Self-help control group, 5-month, N = 17	Self-help control group, 7-month, N = 10
<b>Everyday Memory Questionnaire</b> Scale unclear - usually 0-140. Subjective assessment of memory.  Median (SD)	NR	43.0 (18.7)	39.0 (19.2)	NR	36.0 (25.3)	30.0 (25.2)	NR	38.0 (18.9)	41.0 (20.6)

Number analysed									

Everyday Memory Questionnaire - Polarity - Lower values are better

Rivermead Behavioural Memory Questionnaire - Extended - Polarity - Higher values are better

General Health Questionnaire - Polarity - Lower values are better

Extended Activities of Daily Living - Polarity - Higher values are better

Wimbledon Self-Report Scale - Polarity - Lower values are better

Final values for continuous outcomes

Note number analysed varies depending on outcome and indicated below for each outcome that differs to the numbers given in table heading.

**Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT**  
**Results\_Everyday Memory Questionnaire\_compensatory vs. restitution\_5 months**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

**Results\_Everyday Memory Questionnaire\_compensatory vs. restitution\_7 months**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Some concerns
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

## Study details

<b>Other publications associated with this study included in review</b>	<ul style="list-style-type: none"><li>Mattioli, F., Bellomi, F., Stampatori, C. et al. (2016) Two Years Follow up of Domain Specific Cognitive Training in Relapsing Remitting Multiple Sclerosis: A Randomized Clinical Trial. <i>Frontiers in Behavioral Neuroscience</i> 10: 28</li></ul>
<b>Trial name / registration number</b>	SMICT study. NP:560.
<b>Study location</b>	Italy
<b>Study setting</b>	Unclear - likely outpatient. 10 Italian MS Centres.
<b>Study dates</b>	Patients' enrolment started on June 2010 and ended 31 December 2011.
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	Diagnosed as affected with MS, according to Poser et al. criteria with a relapsing remitting course; have been prescribed interferon beta 1A 44 mcg three times/week no later than 6 months before, in order to have the most homogeneous drug regimen in patients; impaired (age corrected z-score $\leq$ 1.5 SD to norms) in at least one of the following test of the Italian version of the Rao's Brief Repeatable Battery: Paced Auditory Serial Addition Task (PASAT 200, PASAT 300), Symbol Digit

	modality Test (SDMT), Spatial Recall Test (SPART) 10/36, and Delayed Recall (SPART D), Selective Reminding Test Long-Term storage (SRT LTS), Consistent Long-Term Retrieval (SRT CLTR), Delayed Recall (SRT DR) (23), Controlled Oral Words Association (COWA) with the Phoneme (P) and Category (C) modalities (12), and Stroop test;
<b>Exclusion criteria</b>	Dementia (excluded by means of anamnestic reports as well as MMSE >24 in patients), previous or present psychiatric disorders (requiring pharmacological treatment) and clinically evident relapse in the previous 6 months.
<b>Recruitment / selection of participants</b>	Recruited from 10 Italian MS Centres
<b>Intervention(s)</b>	Specific cognitive training - differed depending on the cognitive impairments experienced: scheduled duration was 15 consecutive weeks (2 60 min sessions per week) by an expert neuropsychologist, different from the evaluating one. If missed three sessions, then excluded from study. Administered according to the impaired neuropsychological function: Plan a Day software of the Rehacom was used if a patient resulted impaired in executive function (poor score was in the Stroop test or in the COWA P or COWA/C); Memory software of the same package was used if the patient was impaired in either the SRT or SPART verbal or spatial memory measures, and attention/speeded information processing training if they were impaired in this domain (pathological PASAT 200, PASAT 300, SDMT). If a patient was impaired in more than one domain, all the single domain trainings were balanced in the hourly session each time. Exercises complexity was adapted each time to the severity of each single patient's impairment in the selected domain, with the aim that the exercise had to be challenging in each treatment session. Plan a day trains ability to organise, plan and develop solution strategies using realistic situations. For memory, patients asked to give answers to multiple choice or open questions about tales of increasing length. Information processing training involved increasing velocity previously shown to be effective in people with brain injuries - modified PASAT task with numbers, words and months of the year.
<b>Population subgroups</b>	None
<b>Comparator</b>	Non-specific intervention - psychoeducation with no cognitive skill training: conducted by the psychologist by using conversation about the patient's disease perception, his/her work, family, and hobbies, with the aim not to specifically exercise a cognitive ability, avoiding treating depression or to have any behavioural or psychoanalytic approach. All the psychologists were trained by attending 10 consecutive training meetings with the psychologists of the coordinator centre.
<b>Number of participants</b>	41 randomised, 41 analysed at 1-year follow-up

<b>Duration of follow-up</b>	1-year follow-up (possibly 8-9 months after end of intervention)
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"><li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting</li><li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (median 2.0 in both groups)</li><li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (said to be moderate based on number of tests the population had impairments in)</li><li>• Disease modifying treatment status (currently using and not currently using) - using (all had to be using interferon beta 1A)</li><li>• Mood disorders (presence or absence) - possibly absent (excluded psychiatric disorders where medication was being used for them)</li><li>• Computerised vs clinician led - computerised</li><li>• Group vs individual - individual</li></ul> <p>Analysis - intention to treat (appear to be no dropouts)</p>

### **Study arms**

**Specific cognitive training - differed depending on the cognitive impairments experienced (N = 22)**

**Non-specific intervention - psychoeducation with no cognitive skill training (N = 19)**

## Characteristics

### Arm-level characteristics

Characteristic	Specific cognitive training - differed depending on the cognitive impairments experienced (N = 22)	Non-specific intervention - psychoeducation with no cognitive skill training (N = 19)
% Female	n = 13 ; % = 59.1	n = 11 ; % = 57.9
Sample size		
Mean age (SD)	45 (38 to 50)	43 (34 to 53)
Median (IQR)		
Ethnicity	NR	NR
Custom value		
Comorbidities	NR	NR
Custom value		
Disease duration (Months)	23.5 (12 to 120)	36 (12 to 96)
Median (IQR)		
Relapses during previous year	1 (0 to 2)	1 (1 to 2)
Median (IQR)		
EDSS score	2 (2 to 3)	2 (1 to 3.5)

<b>Characteristic</b>	<b>Specific cognitive training - differed depending on the cognitive impairments experienced (N = 22)</b>	<b>Non-specific intervention - psychoeducation with no cognitive skill training (N = 19)</b>
Median (IQR)		

## Outcomes

### Study timepoints

- Baseline
- 1 year (1-year follow-up - possibly 8-9 months after end of intervention)

### Results - change from baseline

<b>Outcome</b>	<b>Specific cognitive training - differed depending on the cognitive impairments experienced, 1 year vs Baseline, N = 22</b>	<b>Non-specific intervention - psychoeducation with no cognitive skill training, 1 year vs Baseline, N = 19</b>
<b>PASAT 3 seconds</b> Paced Auditory Serial Addition Test. P=0.46 between groups.  Median (IQR)	6 (2 to 10)	4 (0 to 9)
<b>PASAT 2 seconds</b> Paced Auditory Serial Addition Test. P=0.42 between groups.  Median (IQR)	8 (0 to 10)	3 (0 to 8)
<b>SPART 10/36</b> 10/36 Spatial Recall Test for visuo-spatial	4 (1 to 7)	0 (-1 to 5)

Outcome	Specific cognitive training - differed depending on the cognitive impairments experienced, 1 year vs Baseline, N = 22	Non-specific intervention - psychoeducation with no cognitive skill training, 1 year vs Baseline, N = 19
learning – long-term retrieval. P=0.0395 between groups.  Median (IQR)		
<b>SPARTDR</b> Spatial Recall Test for visuo-spatial learning – delayed recall. P=0.36 between groups  Median (IQR)	1 (0 to 4)	0 (-1 to 3)
<b>SRT-LTS</b> Selective Reminding Test – Long-Term storage. P=0.34 between groups  Median (IQR)	10 (4 to 16)	6 (0 to 17)
<b>SRT-CLTR</b> Selective Reminding Test – Consistent Long-Term Retrieval. P=0.22 between groups  Median (IQR)	7.5 (2 to 16)	4 (-4 to 12)
<b>SRT/DR</b> Selective Reminding Test – delayed recall. P=0.0076 between groups	1.5 (1 to 3)	0 (-1 to 1)

Outcome	Specific cognitive training - differed depending on the cognitive impairments experienced, 1 year vs Baseline, N = 22	Non-specific intervention - psychoeducation with no cognitive skill training, 1 year vs Baseline, N = 19
Median (IQR)		
<b>Symbol digit modalities test</b> SDMT. P=0.24 between groups	3 (1 to 7)	1 (0 to 5)
Median (IQR)		
<b>COWA/P</b> Controlled Oral Words Association – Phoneme. P=0.36 between groups	3 (-1 to 8)	1 (-2 to 4)
Median (IQR)		
<b>COWAC</b> Controlled Oral Words Association – Category. P=0.20 between groups	3.5 (2 to 7)	2 (-2 to 6)
Median (IQR)		
<b>Stroop Test</b> P=0.96 between groups	2 (-1 to 7)	2 (-1 to 5)
Median (IQR)		
<b>MS Quality of Life-54</b> Scale usually 0-100. P=0.98 between groups	0 (-12 to 9)	1 (-9 to 7)
Median (IQR)		

Outcome	Specific cognitive training - differed depending on the cognitive impairments experienced, 1 year vs Baseline, N = 22	Non-specific intervention - psychoeducation with no cognitive skill training, 1 year vs Baseline, N = 19
<b>Montgomery–Asberg Depression Rating Scale</b> Scale usually 0-60. P=0.72 between groups  Median (IQR)	-0.5 (-3 to 1)	0 (-4 to 1)
<b>Modified fatigue impact scale</b> Scale usually 0-84 if total score reported. . P=0.52 between groups  Median (IQR)	-2.5 (-8 to 0)	-1 (-9 to 4)

H.; Nasios, G.; Konitsiotis, S.; Ntoskou, A.; Bakirtzis, C.; Grigoriadis, N.; Patrikelis, P.; Panagiotopoulos, E.; Gourzis, P.; Malefaki, S.; Papathanasopoulos, P.; Do Secondary Progressive Multiple Sclerosis patients benefit from Computer- based cognitive neurorehabilitation? A randomized sham-controlled trial; Multiple Sclerosis and Related Disorders; 2020; vol. 39; 101932

### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Greece
<b>Study setting</b>	Outpatient - informed of study by consulting neurologists
<b>Study dates</b>	Recruitment and enrolment performed between January 2018 and February 2019
<b>Sources of funding</b>	Reported not to have received any specific funding
<b>Inclusion criteria</b>	Diagnosis of secondary progressive MS based on McDonald criteria, without any relapses or MRI activity in the last 12 months (none were receiving disease-modifying therapy and no activity was observed throughout the study); patients aged between 25 and 60; educational level of at least 6 years (primary school graduates in Greece); EDSS score no higher than 7; cognitive deficit on at least two domains of the Central Nervous System Vital Sign neuropsychological screening battery

	(performance 1.5 SD below healthy control group data); native Greek speakers; provision of written informed consent to take part in the study; normal or corrected hearing and vision; and IQ score of $\geq 80$ on the Greek-validated Wechsler Abbreviated Scale of Intelligence or normal intelligence as assessed by clinical evaluation.
<b>Exclusion criteria</b>	Ongoing major psychiatric disorders (e.g. psychotic symptoms or disorders, illegal drug use or alcohol abuse); presence of another neurological disorder (e.g., dementia, stroke, epilepsy, and traumatic brain injury resulting in a loss of consciousness for more than 30 minutes); Mini-Mental State Examination score $\geq 24$ ; treated with cognitive rehabilitation in the 12 months prior to enrolment; initiation of psychotropic medications or medications for spasticity, tremor, bladder disturbances, and fatigue (if already taking such medications, doses and schedules had to be held constant during the study period).
<b>Recruitment / selection of participants</b>	Recruitment and enrolment performed between January 2018 and February 2019. Patients attending either the outpatient neurology department at the University Hospital of Patras in Greece or the MS centre at AHEPA University Hospital in Thessaloniki. Recruited by consulting neurologists.
<b>Intervention(s)</b>	Cognitive rehabilitation using RehaCom: 24 individualised domain and task-specific sessions (45 min over an 8-week period - 3 sessions per week) performed at home by the patient on their own or with supervision of a caregiver. RehaCom Cognitive Therapy software was used. As most of those included were impaired in more than one cognitive domain but mostly on episodic memory, information processing speed/attention, and executive functions, the intervention was balanced over the 8-week period in order to train all domains equally. Attention - 'attention and concentration' and 'divided attention' modules. Memory - 'topological memory' and 'verbal memory' modules. Executive function - 'logical reasoning' and 'shopping' modules/tasks. To ensure patients and caregivers understood procedures and instructions, they were trained by psychologists at respective MS clinics. Caregivers present during each session for entire period but told not to provide any assistance regarding their performance. Psychologists visited patient homes and present during first training sessions to solve any problems or difficulty. Phone calls every week to encourage patient adherence/compliance and provide solutions to problems. Conducted on desktop computers with separate screens.
<b>Population subgroups</b>	None
<b>Comparator</b>	Sham cognitive intervention: usual care + sham cognitive intervention. Non-specific computerised activities including solving puzzles, reading and understanding magazines and newspapers, shopping games, brain teasers etc. were used. Patients performed at home in presence of caregiver for 45 min, three times weekly for 8 weeks. Caregivers informed not to provide any assistance relating to performance. Psychologists visited patient homes during first training session to ensure

	PCs functioning and assisted patients in finding activities on the internet. Phone calls every week to encourage patient adherence/compliance and provide solutions to problems. Also continued standard clinical care - taking their prescribed medication and all other related treatments (e.g., physiotherapy, psychotherapy), and all other clinical or referral services were available to them as usual for the entire period.
<b>Number of participants</b>	36 randomised, 36 analysed at end of treatment (8 weeks)
<b>Duration of follow-up</b>	8 weeks - end of intervention period
<b>Indirectness</b>	Outcome - time-point <3 months minimum in protocol

<b>EDSS score</b>	5.5 (4.5 to 7)	6 (5 to 7)
Median (IQR)		

## Outcomes

### Study timepoints

- Baseline
- 8 week (8-weeks - end of intervention period)

### Results - change from baseline

Outcome	Cognitive rehabilitation using RehaCom - executive function, attention, memory and information processing speed training, 8-week vs Baseline, N = 19	Control - usual care + sham computer exercises, 8-week vs Baseline, N = 17
<b>SDMT</b> Symbol Digit Modalities Test. Baseline values were: 34.94 (10.0) vs. 33.23 (9.6)  Mean (SD)	5.47 (3.51)	-1.7 (3.13)
<b>Greek Verbal Learning Test</b> Baseline values were: 50.00 (10.1) vs. 48.29 (8.1)  Mean (SD)	8.1 (5.76)	-0.94 (2.72)
<b>BVMT-RT</b> Brief Visuospatial Memory Test-Revised Total Recall. Baseline values were: 15.10(4.7) vs. 15.58 (4.8)  Mean (SD)	3.78 (1.87)	0.29 (2.25)

Outcome	Cognitive rehabilitation using RehaCom - executive function, attention, memory and information processing speed training, 8-week vs Baseline, N = 19	Control - usual care + sham computer exercises, 8-week vs Baseline, N = 17
<b>EQ-5D Visual Analogue Scale</b> Scale usually 0-100. Baseline values were: 50.74 (16.2) vs. 55.29 (14.6)  Mean (SD)	9.42 (4.79)	-1.17 (7.6)
<b>Modified Fatigue Impact Scale - Cognitive</b> Scale usually 0-40. Baseline values were: 28.10 (3.8) vs. 28.76 (3.1)  Mean (SD)	-5.68 (3.26)	-0.88 (2.26)
<b>Beck Depression Inventory - Fast Screen</b> Scale usually 0-21. Baseline values were: 6.26 (3.1) vs. 6.47 (3.50)  Mean (SD)	-2.57 (2.36)	0.29 (2.82)

SDMT - Polarity - Higher values are better  
 Greek Verbal Learning Test - Polarity - Higher values are better  
 BVMT-RT - Polarity - Higher values are better  
 EQ-5D Visual Analogue Scale - Polarity - Higher values are better  
 Modified Fatigue Impact Scale - Cognitive - Polarity - Lower values are better  
 Beck Depression Inventory - Fast Screen - Polarity - Lower values are better

### Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT

#### Results\_SDMT\_8 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

H.; Zampakis, P.; Malefaki, S.; Ntoskou, K.; Nousia, A.; Bakirtzis, C.; Grigoriadis, N.; Gourzis, P.; Papathanasopoulos, P.; Efficacy of a Computer-Assisted Cognitive Rehabilitation Intervention in Relapsing-Remitting Multiple Sclerosis Patients: A Multicenter Randomized Controlled Trial; Behavioural Neurology; 2017; vol. 2017; 5919841

## Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Greece
<b>Study setting</b>	Outpatient - from outpatient clinic or community
<b>Study dates</b>	Recruitment between March 2014 and December 2015
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	Diagnosis of relapsing-remitting MS based on McDonald criteria; patients aged between 21 and 60; educational level of at least 6 years (primary school graduates in Greece); EDSS score of between 0–5; cognitive deficit on at least one domain of the Central Nervous System Vital Sign neuropsychological screening battery (performance between the 2nd and 8th percentile based on CNSVS demographically corrected normative data); native Greek speakers; provision of written informed consent to take part in the study; normal or corrected hearing and vision; and Q score of $\geq 80$ on the Greek-validated Wechsler Abbreviated Scale of Intelligence.
<b>Exclusion criteria</b>	Ongoing major psychiatric disorders (e.g., psychotic symptoms or disorders, illegal drugs, or alcohol abuse); (presence of another neurological disorder (e.g., dementia, stroke, epilepsy, and traumatic brain injury resulting in a loss of consciousness for more than 30 minutes); Mini-Mental State Examination score $\geq 24$ ; one or more exacerbations in the 3 months prior to enrolment and immunological or immunosuppressant treatment initiated within 4 months prior to enrolment or treated with cognitive rehabilitation in the 12 months prior to enrolment; initiation of psychotropic medications or medications for spasticity, tremor, bladder disturbances, and fatigue (if already taking such medications, doses and schedules had to be held constant during the study period).
<b>Recruitment / selection of participants</b>	Between March of 2014 and December of 2015 patients attending either the outpatient neurology department at the University Hospital of Patras in Greece or the “Society of friends of patients with multiple sclerosis” situated in Ioannina were referred for assessment at outpatient memory and neuropsychological unit
<b>Intervention(s)</b>	Cognitive rehabilitation using RehaCom software: 20 individualised 1 h sessions over a 10-week period (2 sessions per week). The rehabilitation program was conducted by trained clinicians, either speech and language therapists or

	psychologists, and supervised by a clinical neuropsychologist, on a desktop computer with a large screen. RehaCom Cognitive Therapy software was used. As most of those included were impaired in more than one cognitive domain but mostly on episodic memory, information processing speed/attention, and executive functions, the intervention was balanced over the 10-week period in order to train all domains equally. Attention - 'attention and concentration' and 'divided attention' modules. Memory - 'topological memory' and 'verbal memory' modules. Executive function - 'logical reasoning' and 'shopping' modules/tasks.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - usual care: standard clinical care. Continued taking their prescribed medication and all other related treatments (e.g., physiotherapy, psychotherapy), and all other clinical or referral services were available to them as usual for the entire 10 weeks that the intervention group received cognitive training.
<b>Number of participants</b>	58 randomised, 58 randomised at 10 weeks (end of treatment). 6-month time-point reported but only provides data for the intervention group (non-comparative data).
<b>Duration of follow-up</b>	10 weeks - end of treatment period
<b>Indirectness</b>	Outcome - time-point <3-month minimum specified in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (0-5 inclusion criterion)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> <li>• Disease modifying treatment status (currently using and not currently using) - using (majority of &gt;65% in both groups using)</li> <li>• Mood disorders (presence or absence) - unclear (major psychiatric disorders excluded)</li> <li>• Computerised vs clinician led - computerised</li> <li>• Group vs individual - individual</li> </ul>

Analysis - intention to treat (appear to be no dropouts)

## Study arms

**Cognitive rehabilitation using RehaCom - executive function, attention, memory and information processing speed training (N = 32)**

**Control - usual care (N = 26)**

<b>Other publications associated with this study included in review</b>	<ul style="list-style-type: none"><li>Mousavi, S.; Zare, H.; Etemadifar, M. (2020) Evaluating the effectiveness of cognitive rehabilitation on everyday memory in multiple sclerosis patients. <i>Neuropsychological Rehabilitation</i> 30(6): 1013-1023 - provides 'everyday memory' outcome which appears to be a different outcome to 'working memory' described in this 2018 paper</li></ul>
<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Iran
<b>Study setting</b>	Outpatient - recruited from an MS centre

<b>Study dates</b>	Entire study period lasted from August 2015 to December 2016 (selection and screening to end of programme)
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	Age 18– 69 years, the ability to read and write; Multiple sclerosis neuropsychological screening questionnaire $\leq 27$ ; achieving 2 standard deviations lower than the healthy people on the scale of brief repeatable battery of neuropsychological test; EDSS $< 4$ ; General Health Questionnaire score $< 22$ ; and not having medical and severe psychiatric problems at the same time.
<b>Exclusion criteria</b>	No further criteria reported.
<b>Recruitment / selection of participants</b>	Patients were selected from Isfahan's centre for MS
<b>Intervention(s)</b>	Cognitive group memory programme - including various techniques: received the memory rehabilitation program for 8 weeks (1 h per week) in groups of four people. Training in compensatory strategies, explanations on different types of internal and external memory aids, mnemonics, mental reviews and error-free learning. Memory problem adaptation methods offered based on individual difficulties and predetermined objectives. Treatment delivered by MS centre's psychologist that had been trained in rehabilitation. Each group had same person deliver the programme. Also received usual care of offering information regarding cognitive problems.
<b>Population subgroups</b>	None
<b>Comparator</b>	<p>For the purpose of this review, placebo and control groups which were reported as two separate comparators in the paper were combined into a single comparator group to be compared with the memory rehabilitation intervention.</p> <p>Placebo: received body relaxation techniques during weekly sessions. Also received usual care of offering information regarding cognitive problems.</p>

	Control: given ordinary information regarding cognitive problems in MS - usual care with no additional intervention.
<b>Number of participants</b>	60 randomised, 60 analysed at 13 weeks (5 weeks after end of intervention)
<b>Duration of follow-up</b>	Up to 13 weeks (5 weeks after end of 8-week intervention period)
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority (82%) relapsing-remitting</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (score &lt;4.0 inclusion criterion)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - possibly absent (severe psychiatric problems and score &lt;22 on General Health Questionnaire excluded)</li> <li>• Computerised vs clinician led - clinician led</li> <li>• Group vs individual - group</li> </ul> <p>Analysis - intention to treat (appear to be no dropouts)</p>

## Study arms

**Cognitive group memory programme - including various techniques (N = 20)**

**Control - placebo (relaxation techniques) and control (information only with usual care) combined into single control group (N = 40)**

## Characteristics

### Study-level characteristics

Characteristic	Study (N = 60)
<b>% Female</b>	n = 35 ; % = 58
Sample size	
<b>Relapsing-remitting</b>	n = 49 ; % = 82
Sample size	
<b>Secondary progressive</b>	n = 11 ; % = 18
Sample size	

### Arm-level characteristics

Characteristic	Cognitive group memory programme - including various techniques (N = 20)	Control - placebo (relaxation techniques) and control (information only with usual care) combined into single control group (N = 40)
<b>Mean age (SD)</b>	40.55	40.95
Mean

**Bibliographic Reference** Naeeni Davarani, M.; Arian Darestani, A.; Hassani-Abharian, P.; Vaseghi, S.; Zarrindast, M. R.; Nasehi, M.; RehaCom rehabilitation training improves a wide-range of cognitive functions in multiple sclerosis patients; Applied Neuropsychology; 2020; vol. adult; 1-11

### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Iran
<b>Study setting</b>	Outpatient - selected from those had been referred to rehabilitation clinic
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	People with MS referred to specialised rehabilitation clinic (Brain and cognition Clinic); 18-65 years old; and no sensory aphasia, speech comprehension impairment, hemianopia, visual disturbances or mechanical/neuromuscular disorder in the hands.
<b>Exclusion criteria</b>	No further criteria reported.
<b>Recruitment / selection of participants</b>	Recruited from those referred to Brain and Cognition Clinic
<b>Intervention(s)</b>	RehaCom cognitive software - (working memory, attention, processing speed, response control, executive functions and spatial awareness): 5-week intervention period where RehaCom cognitive rehabilitation software was used twice weekly (60 min sessions). Following modules used: 'working memory' training working memory, ability to memorise and manipulate

	information that is presented and then removed; 'responsiveness', which trains attention, response control and processing speed; 'divided attention 2' and 'attention and concentration' which train selective attention, divided attention, visual scanning and response control to visual and acoustic information; 'logical reasoning' which trains executive functions and problem-solving; and 'spatial operations 3D' which trains spatial awareness and spatial attention. These employed for all patients. RehaCom has auto-adaptive ability meaning level of complexity and difficulty of task automatically increased or decreased depending on participant function.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - no intervention: no intervention was received in the control group.
<b>Number of participants</b>	60 randomised, 54 appear to have been analysed (unclear reasons for those missing from analysis)
<b>Duration of follow-up</b>	Up to 10 weeks (5-weeks after the end of the 5-week intervention period)
<b>Indirectness</b>	Outcome - time-point <3-month minimum specified in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - unclear</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - unclear</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (referred to cognition clinic but severity unclear)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (did not exclude those with depression or anxiety)</li> <li>• Computerised vs clinician led - computerised</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - unclear - some missing from analysis and unclear reasons for exclusion</p>

## Study arms

**RehaCom cognitive software - (working memory, attention, processing speed, response control, executive functions and spatial awareness (N = 30)**

**Control - no intervention (N = 30)**

## Characteristics

### Arm-level characteristics

Characteristic	RehaCom cognitive software - (working memory, attention, processing speed, response control, executive functions and spatial awareness (N = 30)	Control - no intervention (N = 30)
% Female	n = 23	n = 21 ; % = 81
Sample size		
Mean age (SD)	39.31 (6.1)	37.55 (8.99)
Mean (SD)		
Ethnicity	NR	NR
Custom value		
Comorbidities	NR	NR
Custom value		

Note that baseline characteristics are given for n=28 and n=26 that appear to have been analysed in the two groups, respectively.

## Outcomes

### Study timepoints

- Baseline
- 10 week (10-weeks - 5-weeks after the end of the 5-week intervention period)

### Results - raw data

<b>Outcome</b>	<b>RehaCom cognitive software - (working memory, attention, processing speed, response control, executive functions and spatial awareness, Baseline, N = 26</b>	<b>RehaCom cognitive software - (working memory, attention, processing speed, response control, executive functions and spatial awareness, 10-week, N = 26</b>	<b>Control - no intervention, Baseline, N = 28</b>	<b>Control - no intervention, 10-week, N = 28</b>

<b>Judgement of Line Orientation</b> Visuospatial and motor skills. Scale 0-30.  Mean (SD)	18.96 (3.57)	20.69 (2.85)	19.65 (4)	18.77 (3.43)
<b>Verbal - DKEFS-D</b>  Mean (SD)	24.22 (10.25)	29.46 (10.59)	25.23 (11.85)	24.85 (10.96)
<b>Non-verbal (DKEFS-T)</b>  Mean (SD)	6.15 (2.54)	7.85 (2.56)	6.54 (2.85)	6.46 (2.77)
<b>SDMT</b> Symbol Digit Modalities Test. Concentration, agility of motor vision, visual scanning and speed of information processing.  Mean (SD)	34.46 (4.19)	38.5 (3.79)	32.96 (5.25)	32.92 (5.1)
<b>PASAT</b> Paced Auditory Serial Addition Test. Capacity and rate of information processing, working	37.25 (9.2)	41.85 (8.86)	36.85 (9.77)	36.54 (9.48)

Outcome	RehaCom cognitive software - (working memory, attention, processing speed, response control, executive functions and spatial awareness, Baseline, N = 26	RehaCom cognitive software - (working memory, attention, processing speed, response control, executive functions and spatial awareness, 10-week, N = 26	Control - no intervention, Baseline, N = 28	Control - no intervention, 10-week, N = 28
memory, and sustained and divided attention.  Mean (SD)				

Integrated Auditory Visual-2 (IVA-2) - Polarity - Higher values are better

Judgement of Line Orientation - Polarity - Higher values are better

Delis-Kaplan Executive Function System (D-KEFS) - card sorting test - Polarity - Higher values are better

SDMT - Polarity - Higher values are better

PASAT - Polarity - Higher values are better

Note that despite n=30 being randomised to each group, n=26 and n=28 appear to have been analysed in the two groups, respectively. Paper suggests results are change scores, but looking at the values and comparing against scale ranges they appear to have given final values for each time-point but used analysis to assess changes across time-points.

K.; Effectiveness of detached mindfulness intervention on cognitive functions in multiple sclerosis patients, results from a randomized controlled study; Pakistan Journal of Medical and Health Sciences; 2020; vol. 14 (no. 4); 2022-2029

## Study details

<b>Other publications associated with this study included in review</b>	<ul style="list-style-type: none"> <li>Nazaribadie, M., Ghaleiha, A., Ahmadpanah, M. et al. (2021) Metacognitive model of mindfulness can improve executive function in multiple sclerosis patients. <i>Pakistan Journal of Medical and Health Sciences</i> 15(1): 590-597</li> </ul>
<b>Trial name / registration number</b>	IRCT2016112728119N5
<b>Study location</b>	Iran
<b>Study setting</b>	Outpatient
<b>Study dates</b>	Conducted between December 2016 and April 2018
<b>Sources of funding</b>	Funded as part of a Ph.D thesis at Hamadan University of Medical Sciences.
<b>Inclusion criteria</b>	outpatients clinically diagnosed with MS (ICD 10: G35); information processing dysfunction (one paper reports this was based on PASAT test but the other states it was based on Wisconsin Card Sorting Test); aged 18-45 years; EDSS score $\leq 4.0$ ; no history of mental (psychosis) and physical disorders; not clinically depressed; diploma or higher education; and attended at least two of the scheduled study sessions.
<b>Exclusion criteria</b>	No further criteria reported.
<b>Recruitment / selection of participants</b>	Conducted at outpatient clinic of Farshchian Hospital and Hamadan MS Association between December 2016 and April 2018.
<b>Intervention(s)</b>	Detached mindfulness: performed in group sessions by psychologists over eight sessions with one session per week (60-70 min per session). Each group included 5-7 participants. Described as metacognitive model of detached mindfulness.

	All participants also received pharmacological treatment consisting of interferon beta-1a (Avonex 30 min, Cinnovex 30 mg or Actovex 30 mg) weekly.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - referred to outpatient clinic for MS once weekly. Received medical treatment and counselling about complications of MS as well as coping with these complications and the socio-therapeutic factors. Social communication with the patient regularly maintained allowing social contact to be maintained. All participants also received pharmacological treatment consisting of interferon beta-1a (Avonex 30 min, Cinnovex 30 mg or Actovex 30 mg) weekly.
<b>Number of participants</b>	60 randomised, 53 analysed (n=3 and n=4 lost in each group, reasons include personal reasons in n=1, unclear in n=4, disliking offered treatment in n=1 and n=1 due to pregnancy)
<b>Duration of follow-up</b>	16 weeks - longest follow-up was 8 weeks after the end of the 8-week intervention period
<b>Indirectness</b>	None
<b>Additional comments</b>	Appears to be modified intention to treat as excluded those lost to follow-up

### Study arms

**Detached mindfulness + interferon treatment (N = 30)**

### Study details

#### Trial name / registration number

Not reported

<b>Study location</b>	Spain - Canary Islands (Tenerife and Lanzarote)
<b>Study setting</b>	Outpatient - MS patients treated at Service of Neurology of two tertiary hospitals recruited
<b>Study dates</b>	The study was conducted between October 2013 and June 2015
<b>Sources of funding</b>	Reported to be no funding sources.
<b>Inclusion criteria</b>	MS diagnosis according to the revised McDonald criteria; being older than 18 years; having an Expanded Disability Status Scale score $\leq 7.0$ to prevent the inclusion of patients who may have difficulty traveling to the centre in the rehabilitation phase; subjective complaints about cognitive problems; and objective cognitive impairment defined as a performance of 1.5 standard deviation lower than the mean in a control group in at least two cognitive tests (determined by the neuropsychological assessment).
<b>Exclusion criteria</b>	Diagnosis of current or past severe psychiatric disorder; relapse or had taken steroids within the 3 months prior to inclusion based on their clinical history; previously participated in any cognitive rehabilitation program; met the criteria for the diagnosis of dementia
<b>Recruitment / selection of participants</b>	An incidental sample obtained from the population of patients with MS treated at the Service of Neurology of two tertiary hospitals was recruited
<b>Intervention(s)</b>	Cognitive rehabilitation: received cognitive training for a total of 12 weekly consecutive sessions, each lasting 60–75 min. Focused on attention, processing speed, memory and executive functions through computerized and paper and pencil tasks designed by the members of the research team (all tasks were different to evaluation procedures to prevent the effect of practice). All sessions were standardised for all patients. Sessions included 10 minutes to evaluate the generalisation of prior training to activities of daily life and control and/or correction of assignment notebooks delivered in the previous session and 50 minutes of working with the patients. The last 10–15 minutes consisted of feedback on the performance and relevance of the work and a review of work done at home during the week. Booklet with tasks to complete at home given after each session - minimum of 10 and maximum of 30 exercises designed to reinforce material covered in sessions and prevent cognitive inactivity between sessions. Compliance $< 80\%$ with home-tasks was an exclusion criterion from analysis. The last booklet contained a set of guidelines and general advice on the influence of habits and lifestyles on cognitive functions, practical exercises for working memory and the ability to concentrate as well as suggestions on planning and physical activity.

<b>Population subgroups</b>	None
<b>Comparator</b>	Waitlist control: received no treatment, only received information about their cognitive status and a booklet containing set of guidelines and general advice on influence of habits and lifestyles on cognitive functions. Group was contacted once a week.
<b>Number of participants</b>	62 randomised, 62 analysed.
<b>Duration of follow-up</b>	3 months - end of intervention period.
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (&gt;90% both groups)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (mean &lt;3.0 in both groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (said to include those with mild-moderate cognitive impairment level)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (severe psychiatric conditions excluded)</li> <li>• Computerised vs clinician led - mixed/unclear (mix of computerised and paper tasks but performed in clinic)</li> <li>• Group vs individual - individual</li> </ul> <p>Analysis - appears to be intention to treat as all randomised were analysed</p>

Overall bias and Directness	Overall Directness	Directly applicable

### Pusswald, 2014

**Bibliographic Reference** Pusswald, G.; Mildner, C.; Zebenholzer, K.; Auff, E.; Lehrner, J.; A neuropsychological rehabilitation program for patients with Multiple Sclerosis based on the model of the ICF; Neurorehabilitation; 2014; vol. 35 (no. 3); 519-27

### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Austria
<b>Study setting</b>	Outpatient - recruited MS outpatients from Department of Neurology at single centre and from the community
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	MS diagnosed by neurologist according to McDonald criteria; no psychiatric disorders; no other neurological disease; no dementia (MMSE >26); no loss of visual acuity; no clinical exacerbations in past 30 days and therefore no corticosteroid therapy in past 30 days.
<b>Exclusion criteria</b>	No further criteria reported

<b>Recruitment / selection of participants</b>	Recruited from MS outpatients at Department of Neurology of Medical University of Vienna and from local MS society
<b>Intervention(s)</b>	Cognitive training - computerised attention training + psychosocial group sessions: cognitive functional training, including specific computer-based home training of divided attention (3 times weekly for 30 min over 5 weeks). Training sessions recorded in individual training diary. Software used was 'Fresh Minder 2', which provides users with feedback and involves the 'Divided Attention' programme consisting of three software packages. This group also received psychosocial group sessions covering other cognitive areas - weekly group sessions for 90 min over 5 weeks. Included several cognitive rehabilitation techniques (e.g., simple behavioural coping strategies such as time management, setting priorities, planning, relaxation techniques, social skills training like conversation-tracking skills, memory retraining including face-name recall, visual imagery or errorless learning and enhancement of emotional health and social function (e.g., stress reduction). Manual used for each session. Trained in these strategies by two neuropsychologists. Therapy book maintained by each participant including information about cognitive functions and advice for training.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - no training: did not undergo any specific training during the trial period.
<b>Number of participants</b>	40 randomised, 40 analysed (said to have all completed study)
<b>Duration of follow-up</b>	5-weeks - end of intervention period (3-month time-point mentioned but no results provided)
<b>Indirectness</b>	Population - does not appear to be an inclusion criterion requiring there to be cognitive deficits at baseline  Outcome - time-point <3 months minimum specified in the protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (83%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (mean &lt;6.0 in both groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (cognitive impairment does not appear to have been an inclusion criterion)</li> </ul>

- Disease modifying treatment status (currently using and not currently using) - unclear
- Mood disorders (presence or absence) - possibly absent (psychiatric disorders excluded)
- Computerised vs clinician led - mixed (mix of computerised tasks and group sessions in clinic)
- Group vs individual - mixed (individual and group components involved)

Analysis - intention to treat (appears to be no missing data)

### Study arms

**Cognitive training - computerised attention training + psychosocial group sessions (coping methods and compensatory techniques, etc.) (N = 20)**

**Control - no training (N = 20)**

### Characteristics

#### Study-level characteristics

Characteristic	Study (N = 40)
<b>Relapsing-remitting</b>	n = 33 ; % = 82.5
Sample size	
<b>Secondary progressive</b>	n = 6 ; % = 15
Sample size	
<b>Primary progressive</b>	n = 1 ; % = 2.5

Characteristic	Study (N = 40)
Sample size	

### Arm-level characteristics

Characteristic	Cognitive training - computerised attention training + psychosocial group sessions (coping methods and compensatory techniques, etc.) (N = 20)	Control - no training (N = 20)
% Female	n = 15 ; % = 75	n = 16 ; % = 80
Sample size		
<b>Mean age (SD)</b>	42.6 (1)	45.3 (7.1)
Mean (SD)		
<b>Ethnicity</b>	NR	NR
Custom value		
<b>Comorbidities</b>	NR	NR
Custom value		
<b>Disease duration (years)</b>	15.1 (10.4)	12.6 (8.8)
Mean (SD)		
<b>EDSS score</b>	3 (1.7)	4 (2.07)
Mean (SD)		

## Outcomes

### Study timepoints

- Baseline
- 5 week (5-weeks - end of intervention period)

### Results - raw data

<b>Outcome</b>	<b>Cognitive training - computerised attention training + psychosocial group sessions (coping methods and compensatory techniques, etc.), Baseline, N = 20</b>	<b>Cognitive training - computerised attention training + psychosocial group sessions (coping methods and compensatory techniques, etc.), 5-week, N = 20</b>	<b>Control - no training, Baseline, N = 20</b>	<b>Control - no training, 5-week, N = 20</b>

### Results\_MUSIC interferences\_5 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3-month minimum in protocol and appears to be no specific cognitive impairment required for inclusion)</i>

### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Iran
<b>Study setting</b>	Unclear - likely outpatient
<b>Study dates</b>	Selected by convenience sampling between July 2016 and March 2017
<b>Sources of funding</b>	Published as part of PhD thesis at Higher Education Centre at Semnan University
<b>Inclusion criteria</b>	Relapsing-remitting MS; aged 18-45 years; Expanded Disability Status Scale score of $\leq 3.5$ ; Mini-Mental State Examination score of 10-20; and at least a moderate literacy level.
<b>Exclusion criteria</b>	Pregnancy during the study or decision to become pregnant at the beginning of the study; the lack of regular medical check-up or follow-up treatment; MS attack in the last month and during the study; psychotic/major psychopathological comorbidities; major medical comorbidities; and hearing or speaking difficulties
<b>Recruitment / selection of participants</b>	Recruited patients with relapsing-remitting MS in Arak City, Iran, from July 2016 to March 2017.
<b>Intervention(s)</b>	<b>Cognitive rehabilitation - for the purpose of this review, computer-based, manual and combined groups were combined into a single intervention to be compared with a control group:</b> all groups were scheduled to have 21 sessions (1 h, once weekly) of cognitive rehabilitation over 5 months. Content of all three groups included memory (immediate or working memory; short-term memory; remote or long-term memory or the type of remembered information,

including verbal; spatial; and motor skills), information processing speed (formulate an appropriate response, processing sentences and making sense of conversations, processing of visual information in a short distance, processing auditory, and the processing of incoming information), attention (selective attention, divided attention, alternating attention, and sustained attention), executive functions (planning and organizing sequencing, e.g. completing complex tasks, flexible thinking, motivation/ drive, self-monitoring, problem-solving, self-correction, diminished abstract reasoning, poor decision making, & distractibility). In addition, these protocols comprised related psychoneurological skills, including linguistic functions and visual perceptual functions. Involved four steps: 1. remediation (retraining impaired functions), 2. substitution (reorganising functions), 3. accommodation (promoting use of preserved functions) and 4. assimilation (learning compensation strategies). Implemented by three MSc in clinical psychology that had been trained and supervised by the researcher in Arak Payam Noor University Counseling Center

**Computer-based group:** Captain's Log Computerised Training System. Developed by Brain Train Company, which involves 2000 different programmes at different levels aiming to improve various cognition functions, including precision, concentration, working memory, instant memory, short-term auditory and visual memory, visual and auditory processing speed, auditory and visual perception, sensorimotor coordination, hand-eye coordination, visual processing, micromotion control, problem-solving skills, executive functions and speed of response.

**Manual-based group:** Pars Cognitive Rehabilitation Package used, including programs for Neurocognitive Joyful Attentive Training Intervention (developed by Nejati 2016) in Cognitive Neuroscience Centre at Shahid Beheshti University. This includes exercises for improving attention and working memory. Also includes pen-paper programme for improving executive functions and consists of hierarchically-organised group of assignments that reinforce different aspects of executive functions. Hierarchical process meaning initial concepts of cognitive domains (e.g., conceptualising, planning and memory) are targeted through frequent exercises and then skills training and higher-level functions are targeted by the intervention. Difficulty of exercises increase based on user's response beyond sessions. Assignments are organised based on various functions of attention, working memory, and inhibition. These assignments can be repeated until the patient reaches the desired level. Therapist present to improve assignment level. Manual programme involved Pars Cognitive

	<p>Rehabilitation Package described as well as being based on cognitive rehabilitation guideline by Kellay and O'Sullivan 2015 and hierarchical model of cognitive rehabilitation by Sohlberg and Mateer.</p> <p><b>Combined group:</b> constructed based on both Captain's Log Computerised Cognitive Training System and the Pars Cognitive Rehabilitation Package described in the computer-based and manual-based groups above, respectively.</p>
<b>Population subgroups</b>	None
<b>Comparator</b>	<p><b>Control - for the purpose of this review two separate control groups reported in the paper (placebo and control) were combined into a single control group to compare against an intervention group.</b></p> <p><b>Placebo:</b> received a physical rehabilitation intervention only. Physical rehabilitation intervention in the placebo group was conducted by a sports and health specialist in Arak City. No further details provided.</p> <p><b>No intervention control:</b> control group that received no intervention.</p>
<b>Number of participants</b>	60 randomised, unclear analysed (assumed 60 as no drop-out mentioned)
<b>Duration of follow-up</b>	5-month (end of intervention period) and 7-month (2 months after end of intervention period) time-points reported
<b>Indirectness</b>	Population - does not appear to be an inclusion criterion relating to cognitive impairment being present
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting MS</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (EDSS up to 3.5 an inclusion criterion)</li> </ul>

- Severity of cognitive impairment (mild/moderate/severe) - unclear (cognitive impairment does not appear to be an inclusion criterion)
- Disease modifying treatment status (currently using and not currently using) - unclear
- Mood disorders (presence or absence) - unclear (psychotic/major psychopathological conditions were excluded)
- Computerised vs clinician led - mixed (combined various groups for purpose of this review - computerised, manual and a mixed group)
- Group vs individual - individual

Analysis - assume intention to treat as no mention of any missing data

### Study arms

**Cognitive rehabilitation (computer-based, manual and combined groups combined into a single intervention) (N = 36)**

**Control (placebo group receiving physical intervention and control with no intervention combined) (N = 24)**

### Characteristics

#### Study-level characteristics

Characteristic	Study (N = 60)
Disease duration (years)	2 to 7
Range	

### Arm-level characteristics

Characteristic	Cognitive rehabilitation (computer-based, manual and combined groups combined into a single intervention) (N = 36)	Control (placebo group receiving physical intervention and control with no intervention combined) (N = 24)
% Female	n = 36 ; % = 100	n = 24 ; % = 100

### Outcomes

#### Study timepoints

- Baseline
- 5 month (5-months - end of intervention period)
- 7 month (7-months - 2 months after the end of the 5-month intervention period)

**Results - raw data**

<b>Outcome</b>	<b>Cognitive rehabilitation (computer-based, manual and combined groups combined into a single intervention,), Baseline, N = 36</b>	<b>Cognitive rehabilitation (computer-based, manual and combined groups combined into a single intervention,), 5-month, N = 36</b>	<b>Cognitive rehabilitation (computer-based, manual and combined groups combined into a single intervention,), 7-month, N = 36</b>	<b>Control (placebo group receiving physical intervention and control with no intervention combined), Baseline, N = 24</b>	<b>Control (placebo group receiving physical intervention and control with no intervention combined), 5-month, N = 24</b>	<b>Control (placebo group receiving physical intervention and control with no intervention combined), 7-month, N = 24</b>
<b>Working memory</b> Likely assessed with PASAT - Paced Auditory Serial Addition Test  Mean (SD)	19.26 (2.7)	22.89 (3.08)	21.89 (3.06)	19.21 (3.07)	19.56 (3.26)	19.46 (3.41)
<b>Selective attention</b> Likely assessed with Stroop Colour and Word Test.  Mean (SD)	12.08 (1.66)	9.13 (1.56)	9.77 (1.54)	12.09 (1.71)	11.96 (1.55)	11.96 (1.33)
<b>Executive function</b>	13.33 (1.65)	10.19 (1.62)	10.91 (1.48)	13.42 (2.08)	13.29 (2.42)	13.33 (2.41)

<b>Outcome</b>	<b>Cognitive rehabilitation (computer-based, manual and combined groups combined into a single intervention,), Baseline, N = 36</b>	<b>Cognitive rehabilitation (computer-based, manual and combined groups combined into a single intervention,), 5-month, N = 36</b>	<b>Cognitive rehabilitation (computer-based, manual and combined groups combined into a single intervention,), 7-month, N = 36</b>	<b>Control (placebo group receiving physical intervention and control with no intervention combined), Baseline, N = 24</b>	<b>Control (placebo group receiving physical intervention and control with no intervention combined), 5-month, N = 24</b>	<b>Control (placebo group receiving physical intervention and control with no intervention combined), 7-month, N = 24</b>
Likely assessed with Wisconsin Card Sorting Test.						
Mean (SD)						
<b>Information processing speed</b> Unclear how this was measured - possibly PASAT or Stroop Colour and Word Test.	1126.8 (73.25)	1041.4 (53.69)	1071.8 (60.06)	1122.7 (62.89)	1122.5 (81.28)	1122.8 (81.26)
Mean (SD)						

Working memory - Polarity - Higher values are better  
Selective attention - Polarity - Lower values are better

Executive function - Polarity - Lower values are better  
 Information processing speed - Polarity - Lower values are better  
 Final values for continuous outcomes

**Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT**  
**Results\_working memory\_5 months**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Canada
<b>Study setting</b>	Outpatient - recruited from MS clinics
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported - part of a thesis
<b>Inclusion criteria</b>	Aged at least 18 years; fluent in English; able to provide informed consent to all procedures; no history of developmental disorder; neither history of nor current substance abuse; diagnosis of MS with no concurrent or previous neurological disorder; no psychiatric disorder (other than mood, personality, or behaviour change following the onset of MS); no other medical condition suspected to influence cognition; no current benzodiazepine or neuroleptic medication use; no relapse

	<p>during the study period or the two months prior; sufficient motor and sensory functioning (e.g., as determined by neurological examination, with an Expanded Disability Severity Scale score <math>\leq 8</math>) – with correction or assistance as required – to complete assessment activities; preliminary indication of functionally significant attention or executive deficits (e.g., from clinical presentation, chart information from the referring institutional clinic and/or patient self-report); objective evidence of functionally significant attention or executive deficits (as determined by the baseline neuropsychological evaluation); ability to complete all study activities, including attendance at 9 weekly training sessions, individual progress meetings and post-training assessments; and sufficient arousal capacity, awareness of deficits and motivation to engage in the interventions. Apart from those listed above, patients were not excluded for undergoing treatment for MS or concurrent mood disorder, but were asked to report any change in treatment status (no changes reported during study period).</p>
<b>Exclusion criteria</b>	No further criteria reported.
<b>Recruitment / selection of participants</b>	All participants were recruited through one of two MS centres.
<b>Intervention(s)</b>	<p>Goal management programme: weekly 2 h sessions over course of 9 weeks. Led by author with support from additional trainer (occupational therapist experienced in working with MS patients or a post-doctoral fellow completing supervised psychological practice hours). Designed to be highly interactive, combining lectures on key topics with discussions relating to participants' experiences with in-class activities and homework. This intervention focused on information and activities to build skills in goal awareness, attentional control and self-regulation, while providing a socially supportive atmosphere to practice and discuss progress with these skills. Comprised 9-modules - engaged in a set of "present-mindedness" exercises aimed at gradually building attentional awareness and control (mindfulness-based strategies) combined with key goal management training strategies (1. accessible education about executive functions, including attention and working memory, 2. building self-awareness of when and why "slips" (errors, forgetfulness) occur, 3. self-regulatory strategies learned in the context of functional tasks and participants' daily life situations, and 4. training in the use of compensatory aids (organizers, mnemonics) within the overall self-regulatory strategy training). Intervention targeted at executive dysfunction tailored to participant needs and real-life situations. Group based programme with groups of 4-5 people. Participants who missed a scheduled group session completed an individual make-up session by the trainer prior to the next scheduled group module. Also provided two private 30-minute appointments with the author (scheduled after the third and sixth training sessions) to discuss their progress and any concerns or questions about program content, activities and assignments.</p>

<b>Population subgroups</b>	None
<b>Comparator</b>	<p>Active control - brain health workshop (psychoeducation): weekly 2 h sessions over course of 9 weeks. Led by author with support from additional trainer (occupational therapist experienced in working with MS patients or a post-doctoral fellow completing supervised psychological practice hours). Designed to be highly interactive, combining lectures on key topics with discussions relating to participants' experiences with in-class activities and homework. This control intervention contained information and activities to increase participants' knowledge of brain function, cognition and MS, while providing social support and lifestyle recommendations (e.g., energy conservation, nutrition and exercise, stress reduction). Psychoeducational programme about the brain, cognition and functional changes associated with MS. Differs from goal management training and other targeted cognitive rehabilitation protocol as though these educational programmes may increase awareness of potential deficits in cognition, they don't provide specific tools to help patients improve these deficits. Combined education about various domains of cognition, their relation to brain functioning and potential effects of MS. To achieve a degree of patient-centred discussion and personal relevance comparable to the intervention group, time was spent on group discussions of participant experiences related to topic material. Homework assignments were also designed to be comparable in terms of length and involvement to those within the intervention group (included readings, brain challenge exercises similar to those in population brain fitness materials, self-assessment scales and log-keeping). Participants who missed a scheduled group session completed an individual make-up session by the trainer prior to the next scheduled group module. Also provided two private 30-minute appointments with the author (scheduled after the third and sixth training sessions) to discuss their progress and any concerns or questions about program content, activities and assignments.</p>
<b>Number of participants</b>	28 randomised, 27 analysed post-test (9 weeks) and 23 analysed at ~8 months (6-month follow-up after the end of the intervention period).
<b>Duration of follow-up</b>	Up to 6 months after the end of the intervention period
<b>Indirectness</b>	Outcome for 9-week time-point - time-point <3-month minimum specified in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (61%)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (median &lt;6.0 in both groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> </ul>

- Disease modifying treatment status (currently using and not currently using) - unclear
- Mood disorders (presence or absence) - unclear
- Computerised vs clinician led - clinician led
- Group vs individual - group

Analysis - those with data (available case analysis) appear to have been reported in paper

<b>Informant-reported</b>	25.9 (18.1)	21.5 (18.8)	15.7 (10.4)	22.7 (16)	22.5 (17.7)	18.4 (13.2)
Mean (SD)						
<b>POMS - Total Mood Disturbance</b> Scale usually 0-200. Measure of mood.	52.9 (39.2)	34.9 (20.1)	36.3 (20.9)	34.3 (23)	23 (21.1)	20.5 (24.1)
Mean (SD)						
<b>PSQI - Global Sleep Disturbance</b> Pittsburgh Sleep Quality Index. Scale usually 0-21.	9.6 (3.5)	7 (4.1)	7.9 (3.3)	9.2 (5.4)	7.2 (5.6)	6.6 (3.8)
Mean (SD)						
<b>Adherence - attendance rate for group sessions</b>	NA	95.2%	NA	NA	94.4%	NA

<b>Outcome</b>	<b>Goal management programme , Baseline, N = 14</b>	<b>Goal management programme , 9-week, N = 13</b>	<b>Goal management programme , 8-month, N = 11</b>	<b>Active control - psychoeducation (Brain Health Workshop), Baseline, N = 14</b>	<b>Active control - psychoeducation (Brain Health Workshop), 9-week, N = 14</b>	<b>Active control - psychoeducation (Brain Health Workshop), 8-month, N = 12</b>
Overall group attendance rate						

Sustained Attention to Response Task (SART) - Commission errors (% no-go trials) - Polarity - Lower values are better

Sustained Attention to Response Task (SART) - Omission errors (% go trials) - Polarity - Lower values are better

Sustained Attention to Response Task (SART) - mean reaction time across go trials - Polarity - Lower values are better

Test of Everyday Attention (TEA) - Polarity - Higher values are better

DKEFS Tower test - achievement score - Polarity - Higher values are better

Hotel Test - Tasks attempted - Polarity - Higher values are better

Hotel Test - deviation from optimal task time - Polarity - Lower values are better

Cognitive Failures Questionnaire (CFQ) - Polarity - Lower values are better

DEX - total score - Polarity - Lower values are better

POMS - Total Mood Disturbance - Polarity - Lower values are better

PSQI - Global Sleep Disturbance - Polarity - Lower values are better

Adherence - attendance rate for group sessions - Polarity - Higher values are better

Final values for continuous outcomes

**Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT**  
**Results\_SART commission errors\_9 weeks**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3 months minimum in protocol)</i>

**Results\_SART commission errors\_9 months**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_SART omission errors\_9 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_SART omission errors\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_SART mean reaction time\_9 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_SART mean reaction time\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_TEA elevator counting with distraction\_9 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_TEA elevator counting with distraction\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_TEA visual elevator\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Hotel Task deviation from optimal time\_9 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_Hotel Task deviation from optimal time\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_achieving or exceeding goals\_9 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_CFQ\_9 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_CFQ\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_DEX self-report\_9 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_DEX self-report\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_DEX informant-reported\_9 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Indirectly applicable <i>(time-point &lt;3 months minimum in protocol)</i>

### Results\_DEX informant-reported\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_POMS total mood disturbance\_9 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low

Section	Question	Answer
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_POMS total mood disturbance\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_PSQI sleep disturbance\_9 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns

Section	Question	Answer
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3 months minimum in protocol</i> )

### Results\_PSQI sleep disturbance\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_adherence - attendance group sessions\_9 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

## Study details

<b>Trial name / registration number</b>	NCT02287454
<b>Study location</b>	Spain
<b>Study setting</b>	Outpatient - recruited through neurologists
<b>Study dates</b>	The recruitment and enrolment were conducted in several periods from January to March 2013, from January to April 2014, and from May to September 2015.
<b>Sources of funding</b>	Supported by the Spanish Ministry of Economy and Competitiveness
<b>Inclusion criteria</b>	Clinically definite MS according to McDonald criteria; patients aged between 20 and 60 years; with relapsing-remitting, secondary progressive or primary progressive MS; and with or without cognitive deficits
<b>Exclusion criteria</b>	Presence of dementia as defined by a Mini Mental State Examination Test score lower than 24; having suffered an exacerbation during the month prior to the cognitive assessment; being treated with corticosteroids during study participation; the presence of another relevant neurological disorder; history of stroke or traumatic brain injury resulting in a loss of consciousness for more than 30 min; and the presence of psychiatric disorders.
<b>Recruitment / selection of participants</b>	The recruitment and enrolment were conducted in several periods from January to March 2013, from January to April 2014, and from May to September 2015. Informed of opportunity to participate in the study by their neurologists from Cruces and Basurto University Hospitals, in Biscay, Spain
<b>Intervention(s)</b>	Manual cognitive rehabilitation using REHACOP: group cognitive rehabilitation for 3 months (3 1 h sessions per week, 39 sessions total) -5 also had private cognitive rehabilitation sessions on top of this during their participation in the study (mean 10 sessions, 45 min each) mainly focusing on short term memory. REHACOP is an integrative cognitive rehabilitation programme based on the principles of restoration, compensation and optimisation. Treatment begins with remediation of basic cognitive processes, gradually advancing to more complex cognitive domains, and finishes with daily living complex tasks that integrate the utilization of several more basic cognitive domains. Allows for individual or group format and is composed of up to 300 paper and pen tasks divided into eight consecutive modules: attention, learning and memory, language, executive functions, social cognition, social skills, activities of daily living, and psycho-education. Processing speed is also trained in the first four modules, because several tasks are timed. Tasks within each module are hierarchically

	<p>arranged by ability subtypes and difficulty levels to ensure an increasing level of cognitive demand. Two neuropsychologists, trained in the administration of the protocol, conducted the cognitive rehabilitation using the same materials and instructions. The neuropsychologists provided instructions of each paper–pencil task to the whole group, and subsequently, patients individually performed the task. Once the correction process was finished, patients could share with the remaining members of the group the difficulties encountered and the strategies employed during the task. Four weeks training in attention, three weeks focused on learning and memory, three weeks focused on language, three weeks focused on executive functioning and one week on training in social cognition. Also performed tasks at home three times a week during the learning and memory module to promote the generalization of the use of learning strategies to daily life activities.</p>
<b>Population subgroups</b>	None
<b>Comparator</b>	Waitlist control group - waitlist control with no intervention.
<b>Number of participants</b>	44 randomised, 42 analysed
<b>Duration of follow-up</b>	3 months - end of intervention period
<b>Indirectness</b>	Population - does not appear to have required participants to have a cognitive impairment at baseline to be included
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (&gt;70% in both groups)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (mean &lt;6.0 in both groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (does not appear to have required cognitive impairment to be included)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (likely absent as psychiatric conditions excluded)</li> <li>• Computerised vs clinician led - clinician led</li> <li>• Group vs individual - group</li> </ul>

Analysis - those with data (available case analysis) appear to have been reported in paper

## Study arms

**Manual cognitive rehabilitation using REHACOP ( focused on attention, processing speed, learning and memory, language, executive functioning, and social cognition) (N = 22)**

**Waitlist control (N = 22)**

## Characteristics

### Arm-level characteristics

Characteristic	Manual cognitive rehabilitation using REHACOP ( focused on attention, processing speed, learning and memory, language, executive functioning, and social cognition) (N = 22)	Waitlist control (N = 22)
% Female	n = 13 ; % = 61.9	n = 14 ; % = 66.67
Sample size		
<b>Mean age (SD)</b>	43.9 (9.51)	43.67 (6.89)
Mean (SD)		
<b>Ethnicity</b>	NR	NR
Custom value		
<b>Comorbidities</b>	NR	NR
Custom value		

<b>Characteristic</b>	<b>Manual cognitive rehabilitation using REHACOP ( focused on attention, processing speed, learning and memory, language, executive functioning, and social cognition) (N = 22)</b>	<b>Waitlist control (N = 22)</b>
<b>Disease duration (years)</b> Mean (SD)	9.95 (7.84)	10.67 (5.79)
<b>Relapsing-remitting</b> Sample size	n = 15 ; % = 71.43	n = 17 ; % = 80.95
<b>Primary progressive</b> Sample size	n = 1 ; % = 4.76	n = 0 ; % = 0
<b>Secondary progressive</b> Sample size	n = 5 ; % = 23.81	n = 4 ; % = 19.05
<b>EDSS score</b> Mean (SD)	3.52 (1.59)	2.5 (1.85)

Baseline characteristics are given for those analysed (n=21 per group) and not those randomised (n=22 per group)

## Outcomes

### Study timepoints

- Baseline

- 3 month (3-months - end of intervention period)

### Results - raw data

Outcome	Manual cognitive rehabilitation using REHACOP ( focused on attention, processing speed, learning and memory, language, executive functioning, and social cognition), Baseline, N = 21	Manual cognitive rehabilitation using REHACOP ( focused on attention, processing speed, learning and memory, language, executive functioning, and social cognition), 3-month, N = 21	Waitlist control, Baseline, N = 21	Waitlist control, 3-month, N = 21

Brief Test of Attention - Polarity - Higher values are better

Backward Digits subtest of the Wechsler Adult Intelligence Scale III; - Polarity - Higher values are better

SDMT - Polarity - Higher values are better

Salthouse Perceptual Comparison Test - Polarity - Higher values are better

Trail-Making Test Part A - Polarity - Lower values are better

Hopkins Verbal Learning Test-Revised - learning - Polarity - Higher values are better

Hopkins Verbal Learning Test-Revised - recall - Polarity - Higher values are better

Calibrated Ideational Fluency Assessment - Polarity - Higher values are better

Stroop Word-Colour Test - Polarity - Higher values are better

Stroop interference - Polarity - Higher values are better

Final values for continuous outcomes

Note despite n=22 being randomised to each group, baseline values for outcomes only given for the n=21 per group that were analysed at end of intervention.

### Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT

#### Results\_Brief Test of Attention\_3 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_backward digits\_3 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	High

### Study details

<b>Trial name / registration number</b>	IRCT2016042227522N1
<b>Study location</b>	Iran
<b>Study setting</b>	Outpatient - those referred to an MS clinic
<b>Study dates</b>	Conducted from August 2016 to April 2017
<b>Sources of funding</b>	Supported by Isfahan University of Medical Sciences
<b>Inclusion criteria</b>	Ability to read and write; Extended Disability Severity Scale of $\leq 5.5$ ; mild to moderate memorial impairment based on Everyday Memory Questionnaire; and mild to moderate depression status based on second version of Beck depression inventory.
<b>Exclusion criteria</b>	Those refusing to have primary psychological and cognitive assessment.
<b>Recruitment / selection of participants</b>	Recruited those referred to Kashani MS Clinic affiliated to Isfahan University of Medical Sciences

<b>Intervention(s)</b>	<p>Tailored cognitive rehabilitation: 10 sessions of group cognitive rehabilitation (2 h per session, sessions every 7-10 days). Duration unclear but ~10-14 weeks based on spacing and number of sessions. General aim of therapist in each class was reinforcement and/or consolidation of previous cognitive abilities which have been impaired and reinforcing remaining abilities to compensate for those where there were impairments. Rehabilitation areas trained included attention, concentration, visual and auditory memory and autobiographical memory. Approaches were performed considering the severity of cognitive impairment and with the aim of optimisation of the residual functions. The mnemonic approach was utilised which includes visual imagery, theological organization, and relational strategies including mnemonics of fiction, the clues about the first word, chain connection, and the technique of Preview, Question, Read, Self-recitation and Test (PQRST). Memory and its disturbances in the daily life were explained for the participants; then, the autobiographical memory, its subtypes, and its disturbances were represented.</p> <p>The technique of recalling positive memories through autobiographical memory was trained, and then, the psychologist presented several samples and requested the participants to recall and then present their positive memories. Of n=33 randomised, n=3 said to have not received the allocated intervention (excluded from analysis).</p>
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - discussion of experiences and coping strategies only: attended similar classes with regard to the number and duration of sessions; however, the content of the sessions was different and was not supporting cognitive rehabilitation. In these sessions, patients were requested to present their experiences of cognitive impairments, and cases with successful coping with new conditions were admired. Duration unclear but ~10-14 weeks based on spacing and number of sessions.
<b>Number of participants</b>	66 randomised, 56 analysed at follow-up (3-months after start of intervention - intervention duration unclear but ~10-14 weeks based on spacing and number of sessions)
<b>Duration of follow-up</b>	3-months after the start of the intervention (intervention duration unclear but ~10-14 weeks based on spacing and number of sessions)
<b>Indirectness</b>	None
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (&gt;65% both groups)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (score up to 5.5 was inclusion criterion)</li> </ul>

- Severity of cognitive impairment (mild/moderate/severe) - unclear (mild-moderate impairments included proportion with each unclear)
- Disease modifying treatment status (currently using and not currently using) - using (all using one)
- Mood disorders (presence or absence) - present (mild-moderate depression on BDI inclusion criterion)
- Computerised vs clinician led - clinician led
- Group vs individual - mixed/unclear (described as group despite saying treatment tailored to each individual)

Analysis - per protocol (some excluded for not receiving intended intervention)

## Study arms

**Tailored cognitive rehabilitation (N = 33)**

**Control - discussion of experiences and coping strategies (N = 33)**

## Characteristics

### Arm-level characteristics

Characteristic	Tailored cognitive rehabilitation (N = 33)	Control - discussion of experiences and coping strategies (N = 33)

Sharifi, A.; Yazdanbakhsh, K.; Momeni, K.; The effectiveness of computer-based cognitive rehabilitation in executive functions in patients with multiple sclerosis; Journal of Kermanshah University of Medical Sciences; 2019; vol. 23 (no. 1)

#### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Iran
<b>Study setting</b>	Outpatient - members of MS society in a single city in Iran
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Funded as part of a thesis - Cognitive Technologies and Sciences Development Headquarter
<b>Inclusion criteria</b>	MS diagnosis; age of 18 - 45 years; reading and writing literacy; and a willingness to participate in the study
<b>Exclusion criteria</b>	Dementia and severe psychiatric disorder recorded in medical or psychiatric files; participation in other rehabilitation programs; and severe motor disabilities interfering with the study process.

<b>Recruitment / selection of participants</b>	Convenience sampling was used to select people with MS that were members of MS Society in city of Kermanshah, Iran. Card sorting test performed on 60 patients and then the n=20 with lowest scores (perseverative error $\leq 20$ ) were selected and randomly divided into two groups.
<b>Intervention(s)</b>	Computerised cognitive rehabilitation focused on executive function: 12 sessions (50 min per session) of computer-based cognitive rehabilitation, being held twice weekly. Captain's Log cognitive rehabilitation software used. Two programs focused on executive functions were selected and administered, which were stimulus reaction/inhibition (red light and green light) and scanning reaction/inhibition (mouse hunt), each comprising 15 different stages. Stages got more difficulty with increasing stage number and entering next stage required completion of the previous task. Therapist carefully reviewed how each assignment was performed and explained it for the experimental group in a simple and straightforward language. The program of each session was different from that of the previous session.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - no training: the control group received no training.
<b>Number of participants</b>	20 randomised, 20 assumed to be analysed as no missing data reported
<b>Duration of follow-up</b>	end of intervention - not explicitly stated but likely 6 weeks based on number of sessions and sessions per week.
<b>Indirectness</b>	Population - unclear if required cognitive impairment to be included  Outcome - time-point <3-month minimum in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - unclear</li> <li>• According to disability (EDSS &lt;6 and EDSS <math>\geq 6</math>) - &lt;6.0 (suggests all had EDSS &lt;3.5)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear (presence of an impairment may not have been an inclusion criterion)</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (severe psychiatric disorder excluded)</li> <li>• Computerised vs clinician led - computerised</li> </ul>

- Group vs individual - individual

Analysis - number analysed unclear but assumed intention to treat as no missing data mentioned

## Study arms

**Computerised cognitive rehabilitation focused on executive function (N = 10)**

**Control - no training (N = 10)**

## Characteristics

### Arm-level characteristics

Characteristic	Computerised cognitive rehabilitation focused on executive function (N = 10)	Control - no training (N = 10)
% Female	n = 6 ; % = 60	n = 5 ; % = 50
Sample size		
Mean age (SD)	38.1 (8.71)	36 (6.35)
Mean (SD)		
Ethnicity	NR	NR
Custom value		
Comorbidities	NR	NR

Characteristic	Computerised cognitive rehabilitation focused on executive function (N = 10)	Control - no training (N = 10)
Custom value		

## Outcomes

### Study timepoints

- Baseline
- 6 week (6-weeks - end of intervention (6 weeks not explicitly stated but assumed based on total number of sessions and sessions per week))

### Results - raw data

Outcome	Computerised cognitive rehabilitation focused on executive function, Baseline, N = 10	Computerised cognitive rehabilitation focused on executive function, 6-week, N = 10	Control - no training, Baseline, N = 10	Control - no training, 6-week, N = 10
<b>Wisconsin Card Sorting Test - Number of categories</b>	2.2 (1.23)	4.8 (1.13)	3.5 (1.18)	3.5 (0.7)
Mean (SD)				
<b>Wisconsin Card Sorting Test - Total errors</b>	30.9 (8.77)	19 (4.39)	27.9 (2.45)	40.7 (2.45)
Mean (SD)				

Wisconsin Card Sorting Test - Number of categories - Polarity - Higher values are better

Wisconsin Card Sorting Test - Total errors - Polarity - Lower values are better

Final values for continuous outcomes

**Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT**

### Stuifbergen, 2018

**Bibliographic Reference** Stuifbergen, A. K.; Becker, H.; Perez, F.; Morrison, J.; Brown, A.; Kullberg, V.; Zhang, W.; Computer-assisted cognitive rehabilitation in persons with multiple sclerosis: Results of a multi-site randomized controlled trial with six-month follow-up; Disability & Health Journal; 2018; vol. 11 (no. 3); 427-434

### Study details

<b>Trial name / registration number</b>	NCT 03200899
<b>Study location</b>	USA
<b>Study setting</b>	Outpatient - recruitment from community
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Supported by the National Institutes of Health, National Institute of Nursing Research 1R01NR014362
<b>Inclusion criteria</b>	18–60 years of age; able to understand and comply with the study protocol; visual acuity with correction sufficient to work on a computer screen; clinically definite MS for at least 6 months and exacerbation free for 90 days); and score at least 10 (indicating some problems in at least 5 areas) on Perceived Deficits Questionnaire.
<b>Exclusion criteria</b>	No further criteria reported

<b>Recruitment / selection of participants</b>	Participants were recruited from three large metropolitan communities in Texas: Houston, San Antonio and Dallas. Recruited via physician referral, targeted mailings to persons with MS on the mailing list of the National MS Society, contact with support groups, and notices in MS newsletters and web sites.
<b>Intervention(s)</b>	Computer-assisted cognitive rehabilitation (MAPSS-MS intervention): aims to help persons with MS acquire the highest level of cognitive functioning and functional independence. The intervention includes group sessions (2 h per week for 8 weeks) focused on building efficacy for use of cognitive strategies and a home-based computer training program (45 min three times per week). Programme's conceptual model proposes accurate knowledge of cognitive problems, lifestyle adjustments (sleep, stress management, physical activity) that support cognitive functioning, and self-efficacy to manage cognitive challenges will support persons with MS in the use of compensatory cognitive strategies and cognitive skills. Group component - first four sessions involved common cognitive problems experienced with MS (attention and processing speed, memory and language, visuospatial and executive functioning) and development of relevant compensatory strategies. The final four sessions focused on lifestyle behaviours to support cognitive functioning, including managing fatigue and stress and increasing physical activity. Computer component - Lumosity program from Lumos Labs used. Facilitator prescribed exercises from a study-specific protocol addressing the most common deficits experienced by persons with MS (attention, memory, flexibility, and problem solving). Arranged so that the most basic cognitive skills (attention) were addressed first. Each participant was asked to complete 3 sessions (45–60 min of training) a day three times a week, (approximately 45 games) and to keep a written log of practice time. To promote consistency in testing and intervention delivery, the researchers trained neuropsychological testers and facilitators at each site in the study procedures.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control - usual care + freely available games: received their usual care and a referral to “MyBrainGames”, available for free at MultipleSclerosis.com. Games challenge processing speed, working memory attention and task switching ability. Asked to keep a log of practice time. Also had weekly check-in calls with research staff during 8-week intervention period.
<b>Number of participants</b>	183 randomised, 183 appear to have been analysed at all time-points despite missing data (n=27 missing 5 months, 3 months after the end of the intervention; n=33 missing at 8 months, 6 months after the end of the intervention)
<b>Duration of follow-up</b>	Up to 6 months after the end of the 8-week intervention period (8 months). Extracted 8-week and
<b>Indirectness</b>	None

<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - majority relapsing-remitting (69% both groups)</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (mean EDSS ~5.0 in both groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear</li> <li>• Computerised vs clinician led - mixed (some computerised and some in-clinic components)</li> <li>• Group vs individual - mixed (some individual and some group components)</li> </ul> <p>Analysis -intention to treat with last observation carried forward imputation.</p>

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_CES-D depression\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	High
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Multifactorial memory questionnaire - strategy\_5 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_Multifactorial memory questionnaire - strategy\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	High
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low

Section	Question	Answer
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_PROMIS applied cognition abilities\_5 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Some concerns
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_PROMIS applied cognition abilities\_8 months

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	High
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

### Results\_adherence computer training\_end of treatment

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Directly applicable

#### Results\_adherence group classes attended\_end of treatment

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Low
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Some concerns
Overall bias and Directness	Risk of bias judgement	High

Section	Question	Answer
Overall bias and Directness	Overall Directness	Directly applicable

### Vilou, 2020

**Bibliographic Reference** Vilou, I.; Bakirtzis, C.; Artemiadis, A.; Ioannidis, P.; Papadimitriou, M.; Konstantinopoulou, E.; Aretouli, E.; Messinis, L.; Nasios, G.; Dardiotis, E.; Kosmidis, M.; Grigoriadis, N.; Computerized cognitive rehabilitation for treatment of cognitive impairment in multiple sclerosis: an explorative study; *Journal of Integrative Neuroscience*; 2020; vol. 19 (no. 2); 341-347

### Study details

<b>Trial name / registration number</b>	Not reported
<b>Study location</b>	Greece
<b>Study setting</b>	Outpatient - recruited from outpatient department
<b>Study dates</b>	Not reported
<b>Sources of funding</b>	Not reported
<b>Inclusion criteria</b>	Adults diagnosed with relapsing-remitting MS; clinically and radiologically stable for at least 3 months before the inclusion; performed 1.5 Standard Deviation units below average on at least one of the neuropsychological measures administered; and were not diagnosed with a psychiatric condition
<b>Exclusion criteria</b>	No further criteria reported

<b>Recruitment / selection of participants</b>	Participants were recruited from outpatient clinic
<b>Intervention(s)</b>	Computerised cognitive rehabilitation (BrainHQ) - focus on memory, attention and processing speed: 6-week (twice weekly sessions for ~40 min) cognitive rehabilitation intervention using the web based BrainHQ platform (BrainHQ, Posit Sciences). Enables clinicians to design a custom-made rehabilitation programme using a variety of training modules. Following modules were used in this study: episodic memory (Memory Grid, Rhythm Recall, and To-Do List Training modules), attention (Divided Attention, Double Decision, Mixed Signals, and Freeze Frame modules) and processing speed (Eye for Detail, Hawk-Eye, Visual Sweeps and Sound Sweeps modules). Home-based programme and performed in native language. Trained individually for the use of the platform by a neuropsychologist. The activities were set in advance and were given to patients in printed form. Each session involved training on two scheduled activities (20 min per activity). Weekly contact with trained neuropsychologist and assistance available when needed. Scheduled visits were performed every 2 weeks, to review and optimize the levels of difficulty in each activity, according to patients' performance.
<b>Population subgroups</b>	None
<b>Comparator</b>	Control: no definition provided, assume received no additional intervention.
<b>Number of participants</b>	47 randomised, 47 appear to have been analysed at end of treatment (6 weeks)
<b>Duration of follow-up</b>	6-weeks - end of intervention period
<b>Indirectness</b>	Outcome - time-point <3 months minimum in protocol
<b>Additional comments</b>	<ul style="list-style-type: none"> <li>• According to type (relapsing remitting MS, secondary progressive MS, and primary progressive MS) - all relapsing-remitting</li> <li>• According to disability (EDSS &lt;6 and EDSS ≥6) - &lt;6.0 (mean &lt;6.0 in both groups)</li> <li>• Severity of cognitive impairment (mild/moderate/severe) - unclear</li> <li>• Disease modifying treatment status (currently using and not currently using) - unclear</li> <li>• Mood disorders (presence or absence) - unclear (diagnosis of psychiatric condition excluded so possibly absent)</li> <li>• Computerised vs clinician led - computerised</li> </ul>

- Group vs individual - individual

Analysis - presume intention to treat as no missing data mentioned

## Study arms

**Computerised cognitive rehabilitation (BrainHQ) - focus on memory, attention and processing speed (N = 23)**

**Control - no intervention? (N = 24)**

## Characteristics

### Arm-level characteristics

Characteristic	Computerised cognitive rehabilitation (BrainHQ) - focus on memory, attention and processing speed (N = 23)	Control - no intervention? (N = 24)
% Female	n = 20 ; % = 87	n = 20 ; % = 83.3
Sample size		
Mean age (SD)	33.5 (16)	37.8 (19)
Mean (SD)		
Ethnicity	NR	NR
Custom value		

<b>Characteristic</b>	<b>Computerised cognitive rehabilitation (BrainHQ) - focus on memory, attention and processing speed (N = 23)</b>	<b>Control - no intervention? (N = 24)</b>
<b>Comorbidities</b>	NR	NR
Custom value		
<b>Duration since diagnosis (years)</b>	8.3 (10.3)	10 (8.5)
Mean (SD)		
<b>Duration since onset (years)</b>	9.9 (10.5)	12.5 (6.8)
Mean (SD)		
<b>EDSS score</b>	2.9 (1.5)	3.5 (2.5)
Mean (SD)		

## Outcomes

### Study timepoints

- Baseline
- 6 week (6-weeks - end of treatment)

## Results - raw data

Outcome	Computerised cognitive rehabilitation (BrainHQ) - focus on memory, attention and processing speed, Baseline, N = 23	Computerised cognitive rehabilitation (BrainHQ) - focus on memory, attention and processing speed, 6-week, N = 23	Control - no intervention?, Baseline, N = 24	Control - no intervention?, 6-week, N = 24
<b>SDMT</b> Symbol Digit Modalities Test. Measures information processing speed  Mean (SD)	49.1 (19)	50 (12)	46.1 (13)	44.5 (13)
<b>Greek Verbal Learning Test</b> Measures verbal learning  Mean (SD)	54.2 (26)	63.7 (17)	56.5 (14)	54.4 (14)
<b>BVMT-R</b> Brief Visuospatial Memory Test-Revised. Measures visuospatial memory  Mean (SD)	22.6 (14)	27.5 (10)	22.8 (11)	22.5 (9)

<b>Outcome</b>	<b>Computerised cognitive rehabilitation (BrainHQ) - focus on memory, attention and processing speed, Baseline, N = 23</b>	<b>Computerised cognitive rehabilitation (BrainHQ) - focus on memory, attention and processing speed, 6-week, N = 23</b>	<b>Control - no intervention?, Baseline, N = 24</b>	<b>Control - no intervention?, 6-week, N = 24</b>
<b>Part A</b> Measures visual attention  Mean (SD)	51.5 (23)	38.2 (20)	46.5 (22)	43.4 (21)
<b>Part B</b> Measures task switching  Mean (SD)	105.9 (62)	73.4 (27)	100.8 (54)	82.5 (24)
<b>Colour</b>  Mean (SD)	58.7 (27)	65.2 (18)	56.9 (19)	57.5 (23)
<b>Colour-Word</b>  Mean (SD)	38 (13)	44 (16)	36.7 (8)	38.8 (9)
<b>Compliance with protocol</b> Definition of compliance unclear  No of events	n = NA ; % = NA	n = 12 ; % = 52.1	n = NA ; % = NA	n = NR ; % = NR

SDMT - Polarity - Higher values are better

Greek Verbal Learning Test - Polarity - Higher values are better

BVMT-R - Polarity - Higher values are better  
 Trail Making Test - Polarity - Lower values are better  
 Stroop Test - Polarity - Higher values are better  
 Final values for continuous outcomes

**Critical appraisal - Cochrane Risk of Bias tool (RoB 2.0) Normal RCT**  
**Results\_SDMT\_6 weeks**

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_Greek Verbal Learning Test\_6 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_BVMT-R\_6 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_Trail Making Test Part A\_6 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low

Section	Question	Answer
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_Trail Making Test Part B\_6 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low

Section	Question	Answer
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_Stroop Test Colour\_6 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_Stroop Test Colour-Word\_6 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Some concerns
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	High
Overall bias and Directness	Overall Directness	Indirectly applicable ( <i>time-point &lt;3-month minimum in protocol</i> )

### Results\_compliance with protocol\_6 weeks

Section	Question	Answer
Domain 1: Bias arising from the randomisation process	Risk of bias judgement for the randomisation process	Some concerns

Section	Question	Answer
Domain 2a: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)	Risk of bias for deviations from the intended interventions (effect of assignment to intervention)	Low
Domain 3. Bias due to missing outcome data	Risk-of-bias judgement for missing outcome data	Low
Domain 4. Bias in measurement of the outcome	Risk-of-bias judgement for measurement of the outcome	Low
Domain 5. Bias in selection of the reported result	Risk-of-bias judgement for selection of the reported result	Low
Overall bias and Directness	Risk of bias judgement	Some concerns
Overall bias and Directness	Overall Directness	Directly applicable

## D.2 Studies extracted in previous review version – bold text indicates outcomes relevant to the new protocol that have been added in the updated review

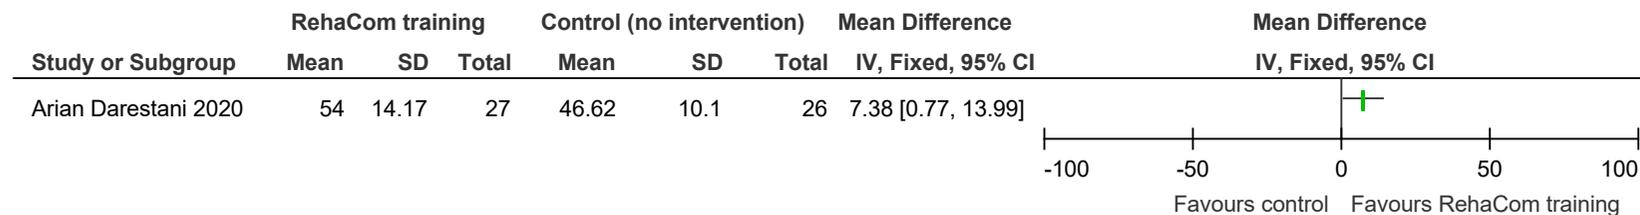

**Figure 538: Pittsburgh Sleep Quality Index – Global Sleep Disturbance (scale usually 0-21; lower better)**

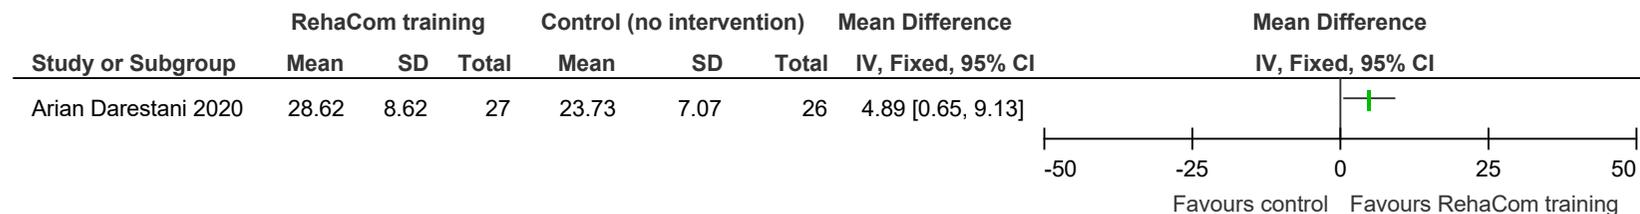

## E.41 Improving language: RehaCom verbal fluency training vs. control (no intervention), 5-10 weeks

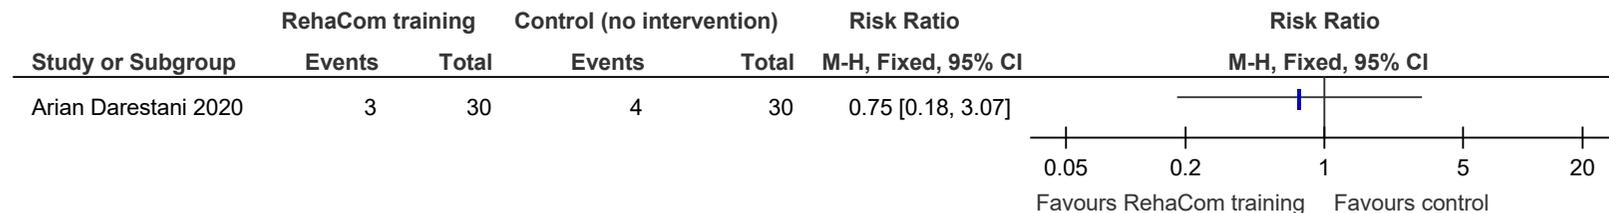

**Figure 539: California Verbal Learning Test-II (higher better)**

**Figure 540: COWAT (higher better)**

**Figure 541: Adherence (optional dropout of treatment)**

## Appendix F – GRADE tables

**Table 3: Clinical evidence profile: General cognitive rehabilitation (multi-component and multi-domain) vs. control, 1-6 months**

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	General cog. rehab - multi-component	control, 1-6 months	Relative (95% CI)	Absolute (95% CI)		
<b>Selective Reminding Test - Long-term storage (follow up: 1-6 months)</b>												
2	randomised trials	not serious <sup>a</sup>	serious <sup>b</sup>	not serious	serious <sup>c</sup>	none	75	57	-	MD 2.19 higher (2.48 lower to 6.86 higher)	⊕⊕○○ LOW	CRITICAL
<b>Selective Reminding Test - Long-term storage - 1-6 months - Consistent long-term retrieval (follow up: 1-6 months)</b>												
2	randomised trials	serious <sup>a</sup>	serious <sup>b</sup>	not serious	serious <sup>d,e</sup>	none	75	57	-	MD 3.06 higher (2.91 lower to 9.02 higher)	⊕○○○ VERY LOW	CRITICAL
<b>Selective Reminding Test - Long-term storage - 1-6 months - Delayed recall (follow up: 1-6 months)</b>												
3	randomised trials	serious <sup>a</sup>	not serious	not serious	not serious <sup>f</sup>	none	127	106	-	MD 0.4 higher (0.23 lower to 1.03 higher)	⊕⊕⊕○ MODERATE	CRITICAL
<b>Selective Reminding Test - 1-6 months - Mean free recall (follow up: 6 months)</b>												
1	randomised trials	serious <sup>a</sup>	not serious	not serious	not serious <sup>g</sup>	none	52	49	-	MD 0 (0.74 lower to 0.74 higher)	⊕⊕⊕○ MODERATE	CRITICAL
<b>Selective Reminding Test - 1-6 months - Learning index (follow up: 6 months)</b>												

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	General cog. rehab - multi-component	control, 1-6 months	Relative (95% CI)	Absolute (95% CI)		
1	randomised trials	serious <sup>a</sup>	not serious	not serious	serious <sup>dh</sup>	none	52	49	-	MD 6.7 higher (1.91 lower to 15.31 higher)	⊕⊕○○ LOW	CRITICAL

10/36 Spatial Recall Test - 1-6 months - Total score (follow up: 1-6 months)

3	randomised trials	serious <sup>a</sup>	serious <sup>i</sup>	not serious	serious <sup>dj</sup>	none	127	106	-	MD 1.15 higher (1.3 lower to 3.59 higher)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	----------------------	----------------------	-------------	-----------------------	------	-----	-----	---	---	------------------	----------

10/36 Spatial Recall Test - 1-6 months - Delayed recall (follow up: 1-6 months)

3	randomised trials	serious <sup>a</sup>	serious <sup>i</sup>	not serious	very serious <sup>dk</sup>	none	127	106	-	MD 0.06 higher (1.21 lower to 1.32 higher)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	----------------------	----------------------	-------------	----------------------------	------	-----	-----	---	--	------------------	----------

SDMT - 1-6 months - Similar at baseline (follow up: 1-6 months)

4	randomised trials	very serious <sup>a</sup>	not serious	not serious	not serious <sup>l</sup>	none	202	174	-	MD 1.65 higher (0.77 lower to 4.06 higher)	⊕⊕○○ LOW	CRITICAL
---	-------------------	---------------------------	-------------	-------------	--------------------------	------	-----	-----	---	--	-------------	----------

SDMT - 1-6 months - Larger difference at baseline (lower in intervention) (follow up: 3 months)

1	randomised trials	very serious <sup>a</sup>	not serious	serious <sup>m</sup>	serious <sup>dn</sup>	none	21	21	-	MD 4.9 lower (12.6 lower to 2.8 higher)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	----------------------	-----------------------	------	----	----	---	---	------------------	----------

PASAT (2 seconds) - 1-6 months (follow up: 1-6 months)

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	General cog. rehab - multi-component	control, 1-6 months	Relative (95% CI)	Absolute (95% CI)		
4	randomised trials	very serious <sup>a</sup>	very serious <sup>o</sup>	not serious	serious <sup>d,p</sup>	none	202	174	-	MD 1.96 higher (4.31 lower to 8.23 higher)	⊕○○○ VERY LOW	CRITICAL

PASAT (3 seconds) - 1-6 months (follow up: 1-6 months)

5	randomised trials	very serious <sup>a</sup>	not serious	serious <sup>m</sup>	not serious <sup>o</sup>	none	238	198	-	MD 2.69 higher (1.37 higher to 4.01 higher)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	----------------------	--------------------------	------	-----	-----	---	--	------------------	----------

COWAT - 5-6 months (follow up: 5-6 months)

3	randomised trials	very serious <sup>a</sup>	not serious	not serious	not serious <sup>r</sup>	none	185	157	-	MD 1.37 higher (0.77 lower to 3.52 higher)	⊕⊕○○ LOW	CRITICAL
---	-------------------	---------------------------	-------------	-------------	--------------------------	------	-----	-----	---	---	-------------	----------

Stroop test time - 5-6 months - Colour naming time (follow up: 6 months)

1	randomised trials	serious <sup>a</sup>	not serious	not serious	not serious <sup>s</sup>	none	58	40	-	MD 3.3 lower (10.45 lower to 3.85 higher)	⊕⊕⊕○ MODERATE	CRITICAL
---	-------------------	----------------------	-------------	-------------	--------------------------	------	----	----	---	--	------------------	----------

Stroop test time - 5-6 months - Colour/word interference time (follow up: 6 months)

1	randomised trials	serious <sup>a</sup>	not serious	not serious	not serious <sup>t</sup>	none	58	40	-	MD 0.2 higher (13.03 lower to 13.43 higher)	⊕⊕⊕○ MODERATE	CRITICAL
---	-------------------	----------------------	-------------	-------------	--------------------------	------	----	----	---	--	------------------	----------

Stroop test time - 5-6 months - General 'Stroop test' (follow up: 5)

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	General cog. rehab - multi-component	control, 1-6 months	Relative (95% CI)	Absolute (95% CI)		
1	randomised trials	very serious <sup>a</sup>	not serious	serious <sup>m</sup>	not serious <sup>u</sup>	none	36	24	-	MD 2.83 lower (3.63 lower to 2.03 lower)	⊕○○○ VERY LOW	CRITICAL

**Stroop test - 3 months - Word-color test (follow up: 3 months)**

1	randomised trials	very serious <sup>a</sup>	not serious	serious <sup>m</sup>	very serious <sup>d,v</sup>	none	21	21	-	MD 1.05 lower (7.99 lower to 5.89 higher)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	----------------------	-----------------------------	------	----	----	---	---	------------------	----------

**Stroop test - 3 months - Interference (follow up: 3 months)**

1	randomised trials	very serious <sup>a</sup>	not serious	serious <sup>m</sup>	serious <sup>d,w</sup>	none	21	21	-	MD 2.55 higher (1.78 lower to 6.88 higher)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	----------------------	------------------------	------	----	----	---	--	------------------	----------

**Trail Making Test time - 6 months - Part A (follow up: 3-6 months)**

2	randomised trials	serious <sup>a</sup>	not serious	not serious	not serious <sup>y</sup>	none	79	61	-	MD 1.62 higher (2.34 lower to 5.59 higher)	⊕⊕⊕○ MODERATE	CRITICAL
---	-------------------	----------------------	-------------	-------------	--------------------------	------	----	----	---	--	------------------	----------

**Trail Making Test time - 6 months - Part B (follow up: 6 months)**

1	randomised trials	serious <sup>a</sup>	not serious	not serious	not serious <sup>y</sup>	none	58	40	-	MD 3.7 higher (10.77 lower to 18.17 higher)	⊕⊕⊕○ MODERATE	CRITICAL
---	-------------------	----------------------	-------------	-------------	--------------------------	------	----	----	---	---	------------------	----------

**California Verbal Learning Test (CVLT) - 5 months - Total (follow up: 5 months)**

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	General cog. rehab - multi-component	control, 1-6 months	Relative (95% CI)	Absolute (95% CI)		
2	randomised trials	very serious <sup>a</sup>	not serious	not serious	serious <sup>d,z</sup>	none	127	117	-	MD <b>2.93 higher</b> (0.26 lower to 6.11 higher)	⊕○○○ VERY LOW	CRITICAL

California Verbal Learning Test (CVLT) - 5 months - Delayed (follow up: 5 months)

2	randomised trials	very serious <sup>a</sup>	not serious	not serious	not serious <sup>aa</sup>	none	127	117	-	MD <b>0.4 higher</b> (0.53 lower to 1.33 higher)	⊕⊕○○ LOW	CRITICAL
---	-------------------	---------------------------	-------------	-------------	---------------------------	------	-----	-----	---	---	-------------	----------

Hopkins Verbal Learning Test - Revised - 3 months - Learning (follow up: 3 months)

1	randomised trials	very serious <sup>a</sup>	not serious	serious <sup>m</sup>	very serious <sup>ab,d</sup>	none	21	21	-	MD <b>0.33 lower</b> (3.07 lower to 2.41 higher)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	----------------------	------------------------------	------	----	----	---	---	------------------	----------

Hopkins Verbal Learning Test - Revised - 3 months - Recall (follow up: 3 months)

1	randomised trials	very serious <sup>a</sup>	not serious	serious <sup>m</sup>	serious <sup>ac,d</sup>	none	21	21	-	MD <b>0.77 lower</b> (2.15 lower to 0.61 higher)	⊕○○○ VERY LOW	CRITICAL

Study details	Population & interventions	Costs	Health outcomes	Cost effectiveness
<p><b>Economic analysis:</b> CUA (health outcome: QALYs)</p> <p><b>Study design:</b> Within-RCT analysis (CRAMMS RCT, same paper)</p> <p><b>Approach to analysis:</b> Analysis of individual level data for EQ5D and resource use using regression to account for baseline differences. Multiple imputation for missing inputs. Unit costs applied. Incremental cost per improvement in MSIS-Psy score (primary trial outcome) at 12 months also presented.</p> <p><b>Perspective:</b> UK NHS</p> <p><b>Follow-up:</b> 12 months</p>	<p><b>Population:</b> Adults with MS who have cognitive problems</p> <p><b>Cohort settings:</b> Start age: 1. 48.9 (n=204) 2. 49.9 (n=245) Male: 27%</p> <p><b>Intervention 1:</b> Usual care</p> <p><b>Intervention 2:</b> Cognitive rehabilitation for attention and memory problems (10-week intervention, once weekly 1.5-hour group session) and usual care.</p>	<p><b>Total costs (mean per patient):</b> Intervention 1: NR Intervention 2: NR Incremental (2–1): saves £575 (95% CI: saves £1,879 to £729; p=0.39)</p> <p><b>Currency &amp; cost year:</b> 2017 UK pounds</p> <p><b>Cost components incorporated:</b> CRAMMS intervention (including training, implementation and delivery costs) (£209) and healthcare and personal social service resource use, and medication.</p>	<p><b>QALYs (mean per patient):</b> Intervention 1: NR Intervention 2: NR Incremental (2–1): 0.00 (95% CI:-0.02 to 0.02; p=0.91)</p>	<p><b>ICER (Intervention 2 versus Intervention 1):</b> Intervention 2 dominant</p> <p>Probability Intervention 2 cost effective (£20/£30K threshold): 84.8%/85.7%</p> <p><b>Alternative analyses:</b> Cost per QALY using MSIS-8D to derive QALYs. Incremental QALYs at 12 months were 0.01 (95% CI: -0.01 to 0.03; p=0.19). Intervention 2 remains dominant.</p> <p>Cost per improvement in MSIS-Psy score presented as a sensitivity analysis. Incremental effect -0.5 (95%CI: -1.5 to 0.5). Intervention 2 remains dominant.</p> <p>Across all scenarios, the CIs for both incremental costs and incremental effects span zero, and for the costs, CIs are wide. Given this, caution should be applied in interpreting these results.</p>

<p><b>Treatment effect duration:</b><sup>(a)</sup> NA  <b>Discounting:</b> Costs: NA; Outcomes: NA</p>				<p><b>Analysis of uncertainty:</b>          Deterministic one-way sensitivity analyses conducted as well as a threshold analysis and bootstrapping undertaken.</p> <p>In the one-way sensitivity analyses they found that at 12 months, using the lower bound for cost and the upper bound for effect, intervention 2 dominance is observed to be consistent with the base-case analysis, whereas when using the upper bound for cost and the lower bound for effects, intervention 1 is dominant. Using the upper bound for both incremental costs and incremental effects produces an ICER of £31,055 per QALY gained for intervention 2 compared to intervention 1, whereas using the lower bound for both incremental costs and incremental effects produces an ICER of £89,306 per QALY gained for intervention 1 compared to intervention 2. These analysis highlight uncertainty in base-case analysis.</p> <p>Including cognitive assessment in the cost of intervention 2, intervention 2 was no longer cost effective, with an ICER of £39,826 per QALY gained.</p> <p>An available-case analysis was conducted on both outcomes and costs</p>
--	--	--	--	--

as part of a sensitivity analysis. The results of this were similar to the base case and conclusions did not change.

Extrapolation beyond 1 year considered but authors deemed that the data inputs would yield an extrapolation of the within-trial results and not produce plausible, reliable, or informative estimates of the longer-term costs and consequences of cognitive rehabilitation.

**Data sources**

**Health outcomes:** QALYs calculated using the area under the curve approach (assuming linear interpolation). Other health outcomes measure included Multiple Sclerosis Impact Scale (MSIS-29) to derive the MSIS-8D and MSIS-Psy, the former was used to estimate QALYs as an alternative QoL outcome measure and the latter health outcomes was presented in a cost-consequence analysis in the paper. No mortality or serious adverse events reported and therefore not included in health economic analysis. **Quality-of-life weights:** EQ5D-5L measured at baseline, 6 and 12 months. EQ5D-5L mapped to EQ5D-3L in base case. Mapping function not reported. **Cost sources:** Intervention resource use from interviews and direct communication with clinical staff involved in trial and trial staff. Some resource use based on assumption (duration of additional catch-up sessions), but these were explored in sensitivity analyses. Healthcare and personal social service resource use from a health and social service questionnaire (UHSSQ) at baseline, 6 and 12 months, completed by participants. Medication resource use based on patient recall. Published unit costs used (PSSRU, NHS reference costs and BNF).

**Comments**

**Source of funding:** NIHR. **Limitations:** EQ5D-5L mapped to EQ5D-3L but mapping function used was not reported. Does not include all comparators in the review protocol. Based on a single RCT and so may not reflect full body of clinical evidence. RCT and HE analysis based on follow up of only 12 months and many not capture long term costs. **Other:** For the base-case analysis, the costs of the cognitive assessment to determine eligibility for the CRAMMS trial were excluded as these were assumed to be part of usual care. The impact of including the cognitive assessment as part of the CRAMMS trial intervention was tested in a sensitivity analysis.

**Overall applicability: Partially applicable<sup>(b)</sup> Overall quality: Minor limitations<sup>(c)</sup>**

*Abbreviations: 95% CI= 95% confidence interval; CRAMMS = Cognitive Rehabilitation for Attention and Memory in people with Multiple Sclerosis; CUA= cost-utility analysis; EQ-5D= Euroqol 5 dimensions (scale: 0.0 [death] to 1.0 [full health], negative values mean worse than death); ICER= incremental cost-effectiveness ratio; MSIS 8D= Multiple Sclerosis Impact Scale 8 dimensions; MSIS Psy= Multiple Sclerosis Impact Scale – psychological subscale; NR= not reported; pa= probabilistic analysis; QALYs= quality-adjusted life years.*

*(a) For studies where the time horizon is longer than the treatment duration, an assumption needs to be made about the continuation of the study effect. For example, does a difference in utility between groups during treatment continue beyond the end of treatment and if so for how long.*

*(b) Directly applicable / Partially applicable / Not applicable*  
*(c) Minor limitations / Potentially serious limitations / Very serious limitations*

## **Appendix I – Health economic model**

No original economic modelling was undertaken.

## Appendix J – Excluded studies

### Clinical studies

**Table 44: Studies excluded from the clinical review**

Study	Code [Reason]
(2019) Impact of an adaptive program for cognitive and emotional deficits (ADACOG program) in multiple sclerosis patients with cognitive impairments. <i>Revue neurologique</i>	- Study design not relevant to this review protocol. <i>Nonrandomised study</i> .
Abdolghaderi, M., Narimani, M., Atadokht, A. et al. (2019) Comparing the effect of positive psychotherapy and dialectical behavior therapy on memory and attention in multiple sclerosis patients. <i>NeuroQuantology</i> 17(12): 1-8	- Study design not relevant to this review protocol

## Health Economic studies

Published health economic studies that met the inclusion criteria (relevant population, comparators, economic study design, published 2005 or later and not from non-OECD country or USA) but that were excluded following appraisal of applicability and methodological quality are listed below. See the health economic protocol for more details.

**Table 45: Studies excluded from the health economic review**

Reference	Reason for exclusion
None	

## Appendix K – Research recommendations – full details

### K.1 Research recommendation

For adults with MS, including people receiving palliative care, what is the clinical and cost effectiveness of non-pharmacological interventions for memory and cognitive problems?

This might include individual or group interventions for people with MS and also in person, holistic or computerised rehabilitation programmes.

Research should aim to include outcome measures looking at:

- Direct measures of cognitive function
- Experience, engagement and acceptability of cognitive rehabilitation
- Functional outcomes including engagement in meaningful activities

Long-term follow up to consider the longer-term benefits and maintenance of change to support evidence of cost effectiveness of intervention.

#### K.1.1 Why this is important

Cognitive impairment affects 43–70% of people with MS often affecting speed of information processing, working memory and memory and executive function. Cognitive impairment can affect ability to carry out everyday activities and engage in social and vocational activities, employment and carrying out routine household tasks. Cognition can also impact on someone's ability to independently manage medication regimes and make complex decisions about their MS related care.

Cognitive impairment has a complex interplay with other symptoms of MS such as fatigue and psychological distress, low mood and anxiety. Furthermore, cognitive impairment can also impact on family and social roles including parenting and can affect these relationships with others. Caring for a person with MS is also likely to be more difficult if they have cognitive impairment and outcomes from research should include effect on caregivers.

#### K.1.2 Rationale for research recommendation

Importance to 'patients' or the population	If non-pharmacological Interventions are shown to offer clinically important benefits to the management of memory and cognition for people with MS, at a reasonable cost threshold, then it may be an important modality to improve current practice and enhance clinical outcomes in this patient group. If specific interventions are identified to be effective, this can support people with MS to choose effective interventions while an increased understanding of optimal strategies can help standardise care and improve patient outcomes.
Relevance to NICE guidance	This research can reduce the existing uncertainty regarding the clinical and cost-effectiveness of non-pharmacological interventions for memory and cognition and support decision making in the development of future recommendations.

Relevance to the NHS	A clear recommendation for the non-pharmacological interventions for memory and cognition will offer clinicians clearer guidance on best care for people with MS. Increased knowledge of non-pharmacological interventions would improve and standardise care.
National priorities	The national service framework for long term conditions supports the early management of symptoms
Current evidence base	The current research base is limited. Limitations in the evidence included most outcomes within each comparison being based on one or two very small studies, as there was limited opportunity for pooling, there was uncertainty in the direction and/or size of the effect for most outcomes reported.
Equality considerations	Trials are unlikely to impact on equality issues.

### K.1.3 Modified PICO table

Population	<p><u>Inclusion:</u></p> <p>Adults (≥18 years) with MS, including people receiving palliative care.</p> <p><u>Exclusion:</u></p> <p>Children and young people (≤18 years).</p>
Intervention	<p><b>Multi-domain cognitive/neuropsychological rehabilitation, for example (list not exhaustive),</b></p> <ul style="list-style-type: none"> <li>• Individualised neuropsychological rehabilitation, for example, external compensatory training</li> <li>• Brain Training Apps such as luminosity</li> <li>• Neuropsychological intervention for example neuropsychological</li> <li>• Computer aided 'Cognifit Personal Coach' for cognition</li> <li>• MS-Rehab computerised tool</li> <li>• Insight and awareness (typically termed as 'metacognitive training or metacognitive strategies')</li> </ul> <p><b>Speed of information processing</b></p> <ul style="list-style-type: none"> <li>• Individualised neuropsychological rehabilitation, for example, external compensatory training Time Pressure Management Training (TPM)</li> </ul> <p><b>Attention and Working Memory</b></p> <ul style="list-style-type: none"> <li>• Individualised neuropsychological rehabilitation, for example, external compensatory training</li> <li>• CogMed Working Memory Training</li> <li>• Attention Process Training (APT)</li> </ul>

<p>Comparator</p>	<ul style="list-style-type: none"> <li>• Interventions will be compared to each other, placebo/sham, or usual care.</li> <li>• Waiting list control</li> <li>• Supportive therapy (dedicated time with a supportive clinician)</li> </ul>

Outcome	<p>All outcomes are considered equally important for decision making and therefore have all been rated as critical.</p> <ul style="list-style-type: none"><li>• Objective Measures<ul style="list-style-type: none"><li>○ Cognitive functions, such as memory, attention, executive functions, processing speed, for example, symbol digit modality test (SMDT)</li></ul></li><li>• Subjective Measures<ul style="list-style-type: none"><li>○ Health-related Quality of Life, for example EQ-5D, SF-36, Leeds MS quality of life scale, MS Impact Scale.</li><li>○ Patient-reported outcomes, for example symptoms, (for example Canadian Occupational Performance measure, Cognitive failure questionnaire, perceived deficits questionnaire</li><li>○ Self-efficacy/self-management (MS self-efficacy scale</li></ul></li><li>• Functional Measures<ul style="list-style-type: none"><li>○ Medication management/ adherence to medication</li><li>○ Mood</li><li>○ Fatigue (MS fatigue scale includes cognition)</li><li>○ Activities of daily living (ADL).</li></ul></li><li>• Vocational Measures<ul style="list-style-type: none"><li>○ Employment</li><li>○ Training</li><li>○ Social engagement</li><li>○ Relationship satisfaction</li><li>○ Impact on carers.</li></ul></li><li>• Engagement Measures<ul style="list-style-type: none"><li>○ Completion/adherence rates</li><li>○ Acceptability</li><li>○ Satisfaction</li></ul></li></ul> <p>Validated measures should be used where possible</p> <p><b>Follow up:</b></p> <p>Looking at long-term follow up is helpful to establish long-term cost-effectiveness</p>
---------	---

	<ul style="list-style-type: none"> <li>• 3-6 months</li> <li>• &gt;6 months – 1 year</li> </ul>
Study design	RCT or cohort study adjusted for key confounders
Timeframe	Long term
Additional information	The studies should be adequately powered for the main outcomes

## K.2 Research recommendation

The development of a set of core outcomes measures for trials assessing memory and cognition in people with multiple sclerosis

### K.2.1 Why this is important

There are a large number of outcomes measures used to assess memory and cognition in people with multiple sclerosis. Inconsistency in outcomes used and concerns over the validity of some outcomes measures make it difficult to combine and compare results from different trials, limiting the ability to draw overall conclusions on the clinical and cost effectiveness of interventions. The development of a core outcome set will allow direct comparisons of interventions for multiple sclerosis and symptoms management. A standard dataset should include outcome measure in both objective, subjective and functional tools. This should be considered as a minimum dataset and research studies may want to add specific measures to the intervention they are investigating.

### K.2.2 Rationale for research recommendation

Importance to 'patients' or the population	At present there is no agreed core outcome set for MS for use in trials in the clinical effectiveness of treatments for memory and cognition. With a standardised set of validated outcome measures trials can be combined in meta-analysis and treatments can be directly compared to allow clinicians to evaluate their effectiveness.
Relevance to NICE guidance	High quality research in this area will reduce the heterogeneity of the evidence base and will inform the evidence base to support decision making for NICE recommendations in the area of the management of memory and cognition in people with MS
Relevance to the NHS	Stronger recommendations for interventions for memory and cognition will offer clinicians clearer guidance in providing care for people with MS.
National priorities	None
Current evidence base	Throughout the development of the guideline the heterogeneity of the outcomes in the evidence base was noted.

Equality considerations	The recommendation is unlikely to impact on equality issues.
-------------------------	--

### K.2.3 Modified PICO table

Population	Specialist MS healthcare professionals and researchers People with multiple sclerosis
Intervention	For use in all trials of interventions to treat or manage memory and cognition in people with MS
Study design	Phase 1: Systematic search to identify existing or ongoing studies on developing a core outcome set using COMENT online database and studies reporting on Patient Reported Outcome Measures (PROMS). Phase 2: Systematic review to evaluate current outcome measures used in trials, identifying the frequency of use of each outcome and validation data. In line with the four-step process for developing core outcome sets outlined in the COMET handbook, this is to initially identify and agree on potential outcomes, to define and determine how they will be measured. These should include family reported outcome measures as well as patient reported outcome measures Phase 3: To reach consensus on which outcomes should be included in the core outcome set, their definition and measurement, a Delphi consensus technique of multiple rounds, involving specialists, research experts and people with lived experience of ME/CFS in the UK will be used.
Timeframe	Medium
