

Self-harm: assessment, management and preventing recurrence

[G] Evidence review for risk assessment and formulation

NICE guideline number tbc

Evidence reviews underpinning recommendations 1.5.10-1.5.14 and 1.5.18-1.5.21 in the NICE guideline

January 2022

Draft for consultation

These evidence reviews were developed by the National Guideline Alliance which is a part of the Royal College of Obstetricians and Gynaecologists

Disclaimer

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the [Welsh Government](#), [Scottish Government](#), and [Northern Ireland Executive](#). All NICE guidance is subject to regular review and may be updated or withdrawn.

1 Risk assessment and formulation

2 Review question

3 What are the benefits and harms of a risk assessment and formulation including those
4 models or tools that combine elements of machine learning and artificial intelligence for
5 people who have self-harmed?

6 Introduction

7 Risk assessment is commonly used as part of the management of self-harm to assess the
8 likelihood of repeat self-harm or suicide. It is also sometimes used by both specialist and
9 non-specialist staff in order to determine access to treatment, hospitalisation, or other
10 measures such as observation. Risk formulation describes the process where risk factors are
11 drawn together in order to construct a meaningful narrative that will inform a treatment plan.
12 On the one hand, assessment of risk provides necessary information vital to the recovery of
13 a person who has self-harmed. On the other hand, it has been suggested than an
14 overreliance on risk assessment to decide the management of self-harm can be misleading.
15 The aim of this review is to identify the benefits and harms of a risk assessment and
16 formulation including those models or tools that combine elements of machine learning and
17 artificial intelligence for people who have self-harmed.

18 Summary of the protocol

19 See Table 1 for a summary of the Population, Intervention, Comparison and Outcome
20 (PICO) characteristics of this review.

1 **Table 1: Summary of the protocol (PICO table)**

Population	<p>Inclusion:</p> <ul style="list-style-type: none">• All people who have self-harmed, including those with a mental health problem, neurodevelopmental disorder or a learning disability, who have presented to a non-specialist or specialist setting. <p>Exclusion:</p> <ul style="list-style-type: none">• People displaying repetitive stereotypical self-injurious behaviour, for example head-banging in people with a significant learning disability
Intervention	<ul style="list-style-type: none">• Risk assessment (label people as low/ medium/ high risk; for example, using check lists, structured clinical judgement, risk scoring, computer-aided risk assessment) + risk formulation (take into account all different risks in person when formulating a management plan)• Risk assessment (label people as low/ medium/ high risk; for example, using check lists, structured clinical judgement, risk scoring, computer-aided risk assessment) alone• No risk assessment (or formulation)
Comparator	<ul style="list-style-type: none">• Each other

Outcome	Critical <ul style="list-style-type: none">• Self-harm repetition (for example, self-poisoning or self-cutting)• Service user satisfaction (dignity, compassion and respect)• Suicide Important <ul style="list-style-type: none">• Quality of life• Distress• Service utilisation (voluntary/compulsory)
----------------	---

1 For further details, see the review protocol in appendix A.

2 **Methods and process**

3 A modified version of the GRADE approach to rate the certainty of evidence in systematic
4 reviews was used as part of a pilot project undertaken by NICE. Instead of using predefined
5 clinical decision/minimal important difference (MID) thresholds to assess imprecision in
6 GRADE tables, imprecision was assessed qualitatively during committee discussions. Other
7 than this modification, GRADE was used to assess the quality of evidence for the selected
8 outcomes and this evidence review developed using the methods and process described in
9 [Developing NICE guidelines: the manual](#). Methods specific to this review question are
10 described in the review protocol in appendix A and the methods document (supplementary
11 document 1).

12 Declarations of interest were recorded according to NICE's conflicts of interest policy.

13 **Effectiveness evidence**

14 **Included studies**

15

16 Two studies were included in this review. Both were non-randomised prospective cohort
17 studies (Kapur 2005, Murphy 2011).

18 These included studies are summarised in Table 2.

19 Both studies were conducted in a UK setting and included individuals presenting with an
20 episode of self-harm (Kapur 2005, Murphy 2011).

21 One study compared emergency department staff assessment with mental health staff
22 assessment (Kapur 2005). One study compared mental health nurse assessment with
23 psychiatrist assessment (Murphy 2011).

24 Please note that the included studies do not meet the inclusion criteria, in the sense that
25 there were no studies that compared risk assessment (RA) plus risk formulation with RA
26 alone or no RA, and no studies comparing RA alone with no RA. Instead, the evidence
27 included were from studies comparing RAs conducted by different professionals, which may
28 have resulted in differences in risk formulation. These studies were included because they
29 were the best evidence available.

30 See the literature search strategy in appendix B and study selection flow chart in appendix C.

1 **Excluded studies**

2 Studies not included in this review are listed, and reasons for their exclusion are provided, in
3 appendix J.

4 **Summary of included studies**

5 Summaries of the studies that were included in this review are presented in Table 2.

6 **Table 2: Summary of included studies**

Study	Population	Intervention	Comparison	Outcomes
<p>Kapur 2005</p> <p>Cohort study</p> <p>UK</p>	<p>N=7612 people aged ≥16 years who presented with self-harm in 1997-2001 at one of four hospitals in Manchester and Salford.</p> <ul style="list-style-type: none"> • Emergency department staff assessments: n=4879 <p>No demographic details reported by study group</p> <ul style="list-style-type: none"> • Mental health staff assessments: n=3828 <p>No demographic details reported by study group</p>	<p>Emergency department staff assessments. 	<ul style="list-style-type: none"> • Co-morbidities: Not reported • Mean duration of self-harm (SD): Not reported • Method of self-harm: self-poisoning n=2997; cutting n=322; combined methods of injury and poisoning n=123; other injuries including asphyxiation n=49 • Mental health nurse assessment: N=2626 No demographic details reported by study group • Psychiatrist assessment: N=865 No demographic details reported by study group 			

1 MSHR, Manchester Self-Harm Rule; MSPS, modified SAD PERSONS Scale; NA, not applicable; SD, standard
2 deviation; SPS, SAD PERSONS Scale; UK, United Kingdom

3 See the full evidence tables in appendix D.

4 **Summary of the evidence**

5 One study (Kapur 2015) compared emergency department staff risk assessment with mental
6 health staff risk assessment in people aged ≥ 16 years who presented to an emergency
7 department with self-harm. The study reported repeat self-harm within 12 months. Overall,
8 risk assessment conducted by mental health staff was no more likely to identify repeat self-
9 harm than risk assessment conducted by emergency department staff (low quality). This was
10 also the case for people categorised as high risk (low quality). People categorised as low or
11 moderate risk, respectively, by mental health staff were more likely to repeat self-harm within
12 12 months' follow-up than people categorised as low or moderate risk, respectively, by
13 emergency department staff (low quality).

14 One study (Murphy 2011) compared risk assessments by psychiatrists and mental health
15 nurses following an episode of self-harm. The study reported repeat self-harm within 12
16 months. Overall, risk assessment conducted by a psychiatrist was no more likely to identify

1 repeat self-harm than risk assessment conducted by a mental health nurse (moderate
2 quality). This was also the case for people categorised as low or high risk by a psychiatrist or
3 mental health nurse, respectively (moderate quality).

4 None of the included studies reported the following outcomes: service user satisfaction,
5 suicide, quality of life, distress, or service utilisation.

6 See appendix F for full GRADE tables.

7 **Economic evidence**

8 **Included studies**

9 A single economic search was undertaken for all topics included in the scope of this
10 guideline but no economic studies were identified which were applicable to this review
11 question. See the literature search strategy in appendix B and economic study selection flow
12 chart in appendix G.

13 **Excluded studies**

14 Economic studies not included in the guideline economic literature review are listed, and
15 reasons for their exclusion are provided in appendix J.

16 **Economic model**

17 No economic studies were identified which were applicable to this review question.

18 **Evidence statements**

19 **Economic**

20 No economic modelling was undertaken for this review because the committee agreed that
21 other topics were higher priorities for economic evaluation.

22 **The committee's discussion and interpretation of the evidence**

23 **The outcomes that matter most**

24 Self-harm repetition, suicide and service user satisfaction were prioritised as critical
25 outcomes by the committee. Self-harm repetition and suicide were prioritised as critical
26 outcomes because they are direct measures of any differential effectiveness associated with
27 the types of risk assessment and captures both fatal and non-fatal self-harm. Service user
28 satisfaction was chosen as a critical outcome due to the importance of delivering services
29 which are centred on the patients' experiences and because patient satisfaction is likely to
30 influence whether the patient engages with the intervention.

31 Distress, quality of life, and service utilisation (voluntary/compulsory) were considered
32 important outcomes by the committee. Distress was chosen as an important outcome as,
33 given that self-harm is an expression of personal distress, different risk assessment
34 strategies may impact on an individual distress levels in different ways. Quality of life was
35 chosen as an important outcome as it is a multidimensional concept encompassing health-
36 related outcomes beyond those of repeat self-harm or survival. Service utilisation

1 (voluntary/compulsory) was chosen as an important outcome to assess the uptake of
2 services and healthcare resource use during the follow-up period.

3 **The quality of the evidence**

4 When assessed using GRADE methodology the evidence was found to range in quality from
5 low to moderate quality. In all cases, the evidence was downgraded due to risk of bias as per
6 ROBINS-I (for example, due to missing data or lack of blinding or lack of information), and in
7 one study due to indirectness of the population and intervention as well.

8 There was no evidence identified for the following comparisons: risk assessment +
9 formulation; no risk assessment or formulation. Only different types of risk assessment were
10 compared to each other in the available evidence. Additionally, no evidence was identified for
11 the following outcomes: service user satisfaction, suicide, quality of life, distress, or service
12 utilisation.

13 **Imprecision and clinical importance of effects**

14 The committee discussed the available evidence, which mostly found no benefit when risk
15 assessments were carried out by specific staff. Where findings showed people identified as
16 low or moderate risk by mental health staff were more likely to repeat self-harm within 12
17 months' follow-up than those identified by emergency department staff, the committee
18 qualitatively discussed the imprecision of the findings and agreed that the 95% confidence
19 intervals were too wide and too close to the line of no effect to give confidence in the effect
20 estimate. The rest of the evidence was already of low quality even before discussions
21 regarding the imprecision. As a result, the recommendations were drafted based on the
22 evidence where possible, but due to concerns over the quality and paucity of evidence, most
23 of the recommendations were drafted using the committee's own experience and expertise.

24 The committee discussed whether there was a need to develop a research recommendation
25 due to the paucity of the evidence, specifically considering the lack of evidence about
26 machine learning. However, the committee agreed that while new evidence may aid
27 decision-making, it would be unlikely to affect practice, and that the committee's knowledge
28 and experience already allowed recommendations to be made that improved the quality of
29 care. As a result, other review questions were prioritised for research recommendations.

30 **Benefits and harms**

31 The evidence showed there was no significant difference in repeat self-harm regardless of
32 which health professional carried out the risk assessment. Therefore, the committee agreed
33 there was not enough evidence to specify who should complete the risk assessment,
34 especially in settings where risk assessment was usually done as part of a wider
35 psychosocial assessment. The committee therefore used their knowledge and experience to
36 supplement the recommendations on psychosocial assessment with how an assessment of
37 risk should be undertaken as part of the assessment.

38 The recommendation about risk factors to consider during a psychosocial assessment was
39 based on the committee's knowledge and experience that a number of factors were
40 important to assessing risk, such as social characteristics and individual social and
41 healthcare history, which could be triggers for self-harm or be linked to higher risk for self-
42 harm. Qualitative evidence from the review on specialist staff skills (Evidence Report P)
43 confirmed that some people who had self-harmed wanted the impact of cultural, social and
44 demographic factors on self-harm to be considered during their care, although this evidence
45 was of low quality. The committee discussed the fact that suicidal intent, suicidality and the

1 method and frequency of self-harm was often linked to a higher risk of suicide and agreed
2 these factors should be investigated during a risk assessment. Certain risky behaviours or
3 dual diagnoses such as alcohol and drug use were also linked to higher risk of self-harm.
4 The committee also agreed that changes in personal factors such as relationships whether
5 current or upcoming could raise risk, as could exposure to self-harm from peers, which may
6 trigger a desire to self-harm. The committee discussed the fact that social media usage could
7 have both positive and negative effects on risk of self-harm, due to the accessibility of both
8 self-help resources and peer support, as well as potentially distressing content. They agreed
9 that social media was often viewed more negatively by healthcare professionals and so they
10 thought it was important that the recommendations acknowledged the potential positive
11 effect of it on people who have self-harmed as well. The committee also agreed this issue
12 was not just limited to children and young people, due to the widespread adoption of social
13 media and smartphones by people of all ages. The committee agreed that considering these
14 factors would result in a more accurate risk assessment that would allow the person to
15 receive appropriate care based on their experience. The committee agreed based on their
16 knowledge and experience that it was important to assess the individual's mitigating factors
17 as these could help lower risk of repeat self-harm, especially if the person had developed
18 strong coping strategies or had access to personal and/ or professional support, which were
19 linked to higher resilience against repeat self-harm. The committee agreed that the
20 individual's perspective on their ability to manage their own distress was also important to
21 consider, because a lack of hope or belief in their own emotional capacity and abilities could
22 lead to less resistance of repeat self-harm, thus raising risk.

23 The committee agreed that identifying the risk factors discussed above alone was insufficient
24 to accurately create a comprehensive picture of the person's experience. They agreed that
25 risk formulation should be conducted as part of the psychosocial assessment to ensure that
26 identified risk factors are used to develop a meaningful narrative that would inform the care
27 plan. The committee agreed this would allow co-morbidities to be taken into account and
28 enable specialist staff to provide a higher quality of care.

29 ***Risk assessment tools and scales***

30 There was no evidence on the effectiveness of risk assessment tools and scales, however,
31 the committee discussed benefits and harms based on their extensive experience and
32 knowledge. The committee agreed that the lack of evidence about the efficacy of risk
33 assessment tools as well as the committee's knowledge of the limited validity of tools
34 regarding their ability to accurately predict risk of self-harm meant they should not be used to
35 predict risk of self-harm or suicide. Additionally, the committee discussed the risks of using
36 risk assessment tools, based on their experience that tools and scales may enable the
37 withholding of care based on the level of risk of self-harm identified, even if the tool is not
38 accurate in its assessment. The committee agreed based on their experience that denying
39 care on this basis could lead to repeat self-harm, distress, and lower service user
40 satisfaction, and therefore tools and scales should not be used for this purpose either.
41 Although the committee acknowledged that risk assessment tools could be useful to inform
42 risk formulation, or as an adjunct to clinical assessment, they agreed their potential benefit as
43 a guide for performing assessment was outweighed by the harms associated with using
44 them.

45 The committee discussed the benefits of risk stratification and agreed that using stratification
46 as a clinical communication tool to indicate the individual need of the person allowed for clear
47 and concise communication between professionals. The committee also acknowledged the
48 potential harms of risk stratification, such as implying that risk was static instead of dynamic,
49 which could lead to changes in the person's risk level being missed. They also discussed
50 their experience of some treatments not being offered to people who self-harm unless they
51 were identified as being 'high' risk. This could also lead to people not receiving the most

1 appropriate care so the committee agreed that risk stratification should not be used to
2 determine risk of repeat self-harm, or access to treatment.

3 **Cost effectiveness and resource use**

4 The committee noted that no relevant published economic evaluations had been identified
5 and no additional economic analysis had been undertaken on using risk assessment tools
6 and scales to predict future risk of self-harm repetition. They recommended specific
7 strategies to improve management and risk formulation of people who self-harmed. When
8 drafting the recommendations, they noted how using formal scales to predict future suicide or
9 repetition of self-harm was likely to have a considerable impact on resource use of care
10 services. Moreover, they pointed out that using risk stratification ratings would be likely to
11 result in unnecessary treatment costs for many patients who self-harmed. Thus, the
12 committee agreed that there was unlikely to be a significant resource impact from the
13 recommendations made.

14 **Recommendations supported by this evidence review**

15 This evidence review supports recommendations 1.5.10-1.5.14 and 1.5.18-1.5. Other
16 evidence supporting these recommendations can be found in the evidence reviews on
17 specialist psychosocial assessment (evidence review F).

Review title	Risk assessment and formulation
Review question	What are the benefits and harms of a risk assessment and formulation including those models or tools that combine elements of machine learning and artificial intelligence for people who have self-harmed?
Objective	To identify the benefits and harms of a risk assessment and formulation, including those models or tools that combine elements of machine learning and artificial intelligence for people who have self-harmed.
Searches	<p>The following databases will be searched:</p> <ul style="list-style-type: none">• Cochrane Central Register of Controlled Trials (CENTRAL)• Cochrane Database of Systematic Reviews (CDSR)• Database of Abstracts of Reviews of Effects (DARE)• Embase• Emcare• International Health Technology Assessment (IHTA) database• MEDLINE & MEDLINE In-Process• PsycINFO <p>Searches will be restricted by:</p> <ul style="list-style-type: none">• English language studies• Human studies• Date: 2000 onwards as the current service context is different from pre-2000. <p>Other searches:</p> <ul style="list-style-type: none">• Inclusion lists of systematic reviews• Reference lists of included studies

Field	Content
	The full search strategies will be published in the final review.
Condition or domain being studied	All people who have self-harmed, including those with a mental health problem, neurodevelopmental disorder or a learning disability. 'Self-harm' is defined as intentional self-poisoning or injury irrespective of the apparent purpose of the act. This does not include repetitive stereotypical self-injurious behaviour, for example head-banging in people with a significant learning disability.
Population	Inclusion: All people who have self-harmed, including those with a mental health problem, neurodevelopmental disorder or a learning disability, who have presented to a non-specialist or specialist setting. Exclusion: <ul style="list-style-type: none"> • People displaying repetitive stereotypical self-injurious behaviour, for example head-banging in people with a significant learning disability
Intervention	<ul style="list-style-type: none"> • Risk assessment (label people as low/medium/high risk; e.g., using check lists, structured clinical judgement, risk scoring, computer-aided risk assessment) + risk formulation (take into account all different risks in person when formulating a management plan) • Risk assessment (label people as low/medium/high risk; e.g., using check lists, structured clinical judgement, risk scoring, computer-aided risk assessment) alone • No risk assessment (or formulation)
Comparator/Reference standard/Confounding factors	Each other
Types of study to be included	<ul style="list-style-type: none"> • Systematic review of randomised controlled trials (RCTs) or non-randomised comparative prospective and retrospective cohort studies • RCTs • Non-randomised comparative prospective cohort studies with N≥100 per treatment arm • Non-randomised comparative retrospective cohort studies with N≥100 per treatment arm <p>Conference abstracts will not be included.</p> <p>Non-randomised studies should adjust for the following covariates in their analysis when there are differences between groups at baseline: age, gender, previous self-harm, comorbidities (e.g. alcohol and drug misuse, psychiatric illness, physical illness), and current psychiatric treatment. Studies will be downgraded for risk of bias if important covariates are not adequately adjusted for, but will not be excluded for this reason.</p>
Other exclusion criteria	<p>Studies will not be included for the following reasons:</p> <p>Language:</p> <ul style="list-style-type: none"> • Non-English <p>Publication status:</p> <ul style="list-style-type: none"> • Abstract only <p>Studies published in languages other than English will not be considered due to time and resource constraints with translation.</p>
Context	<p>Settings:</p> <p>Inclusion:</p>

Field	Content
	<ul style="list-style-type: none"> • Primary, secondary and tertiary healthcare settings (including pre-hospital care, accident and emergency departments, community pharmacies, inpatient care, and transitions between departments and services) • Home, residential and community settings, such as supported accommodation • Supported care settings • Education and childcare settings • Criminal justice system • Immigration removal centres. • Community mental health services • Inpatient mental health services
Primary outcomes (critical outcomes)	<p>Critical:</p> <ul style="list-style-type: none"> • Self-harm repetition (for example, self-poisoning or self-cutting) • Service user satisfaction (dignity, respect, compassion) • Suicide
Secondary outcomes (important outcomes)	<p>Important:</p> <ul style="list-style-type: none"> • Quality of life • Distress • Service utilisation (voluntary/compulsory)
Data extraction (selection and coding)	<p>All references identified by the searches and from other sources will be uploaded into EPPI and de-duplicated.</p> <p>Titles and abstracts of the retrieved citations will be screened to identify studies that potentially meet the inclusion criteria outlined in the review protocol.</p> <p>Dual sifting will be performed on 10% of records; 90% agreement is required. Disagreements will be resolved via discussion between the two reviewers, and consultation with senior staff if necessary.</p> <p>Full versions of the selected studies will be obtained for assessment. Studies that fail to meet the inclusion criteria once the full version has been checked will be excluded at this stage. Each study excluded after checking the full version will be listed, along with the reason for its exclusion.</p> <p>A standardised form will be used to extract data from studies. The following data will be extracted: study details (reference, country where study was carried out, type and dates), participant characteristics, inclusion and exclusion criteria, details of the interventions, setting and follow-up, relevant outcome data, risk of bias and source of funding. One reviewer will extract relevant data into a standardised form, and this will be quality assessed by a senior reviewer.</p>
Risk of bias (quality assessment)	<p>Quality assessment of individual studies will be performed using the following checklists:</p> <ul style="list-style-type: none"> • ROBIS tool for systematic reviews • Cochrane RoB tool v.2 for RCTs and quasi-RCTs • Cochrane ROBINS-I tool for non-randomised (clinical) controlled trials and cohort studies <p>The quality assessment will be performed by one reviewer and this will be quality assessed by a senior reviewer.</p>
Strategy for data synthesis	<p>Quantitative findings will be formally summarised in the review. Where multiple studies report on the same outcome for the same comparison, meta-analyses will be conducted using Cochrane Review Manager software. A fixed effect meta-analysis will be conducted and data will be presented as risk ratios if possible or odds ratios when required (for example if only available in this form in included studies) for dichotomous</p>

Field	Content																					
	<p>outcomes, and mean differences or standardised mean differences for continuous outcomes. Heterogeneity in the effect estimates of the individual studies will be assessed using the I^2 statistic. I^2 values of greater than 50% and 80% will be considered as significant and very significant heterogeneity, respectively. Heterogeneity will be explored as appropriate using sensitivity analyses and subgroup analyses based on identified covariates if they have not been adjusted for. If heterogeneity cannot be explained through subgroup analysis then a random effects model will be used for meta-analysis, or the data will not be pooled if the random effects model does not adequately address heterogeneity.</p> <p>The confidence in the findings across all available evidence will be evaluated for each outcome using an adaptation of the ‘Grading of Recommendations Assessment, Development and Evaluation (GRADE) toolbox’ developed by the international GRADE working group: http://www.gradeworkinggroup.org/</p>																					
Analysis of sub-groups	<p>Evidence (if data allows) will be stratified by:</p> <ul style="list-style-type: none"> • Age group: ≥65 years, 18-64 years, 16-17 years, <16 • Type of risk assessment method used: E.g., check lists, structured clinical judgement, risk scoring, computer-aided risk assessment

Field	Content
Review team members	National Guideline Alliance
Funding sources/sponsor	This systematic review is being completed by the National Guideline Alliance which receives funding from NICE.
Conflicts of interest	All guideline committee members and anyone who has direct input into NICE guidelines (including the evidence review team and expert witnesses) must declare any potential conflicts of interest in line with NICE's code of practice for declaring and dealing with conflicts of interest. Any relevant interests, or changes to interests, will also be declared publicly at the start of each guideline committee meeting. Before each meeting, any potential conflicts of interest will be considered by the guideline committee Chair and a senior member of the development team. Any decisions to exclude a person from all or part of a meeting will be documented. Any changes to a member's declaration of interests will be recorded in the minutes of the meeting. Declarations of interests will be published with the final guideline.
Collaborators	Development of this systematic review will be overseen by an advisory committee who will use the review to inform the development of evidence-based recommendations in line with section 3 of Developing NICE guidelines: the manual. Members of the guideline committee are available on the NICE website: https://www.nice.org.uk/guidance/indevelopment/gid-ng10148 .
Other registration details	None
URL for published protocol	https://www.crd.york.ac.uk/prospero/display_record.php?RecordID=215430
Dissemination plans	NICE may use a range of different methods to raise awareness of the guideline. These include standard approaches such as: <ul style="list-style-type: none"> • notifying registered stakeholders of publication • publicising the guideline through NICE's newsletter and alerts • issuing a press release or briefing as appropriate, posting news articles on the NICE website, using social media channels, and publicising the guideline within NICE.
Keywords	Self-harm, assessment, management, prevention, health care
Details of existing review of same topic by same authors	None
Current review status	Ongoing
Additional information	Not applicable
Details of final publication	www.nice.org.uk

Study details

Country/ies where study was carried out	UK
Study type	Prospective cohort study
Study dates	1997 to 2001
Inclusion criteria	People aged at least 16 who presented with self-harm in 1997-2001 at one of four hospitals providing emergency care in Manchester and Salford
Exclusion criteria	Not reported
Patient characteristics	<p>Emergency department staff assessment</p> <ul style="list-style-type: none"> • n=4879 • Mean age (SD): Not reported • Sex (female/ male): Not reported • Ethnicity: Not reported • Comorbidities: Not reported • Duration of self-harm: Not reported • Method of self-harm: Not reported • Previous self-harm: Not reported <p>Mental health staff assessment</p> <ul style="list-style-type: none"> • n=3828 • Mean age (SD): Not reported • Sex (female/ male): Not reported • Ethnicity: Not reported • Comorbidities: Not reported • Duration of self-harm: Not reported • Method of self-harm: Not reported • Previous self-harm: Not reported
Intervention(s)/control	<ul style="list-style-type: none"> • Emergency department staff assessment (no detail reported) • Mental health staff assessment (no detail reported)
Duration of follow-up	12 months

Sources of funding	Manchester Mental Health and Social Care Trust
Sample size	N=7612
Results	Risk of repetition of self-harm within 12 months (repeats/total)
	<p>Emergency department staff assessments</p> <ul style="list-style-type: none"> • Total 646/ 4879 • Low 113/ 1624 • Moderate 326/ 2284 • High 207/ 971 <p>Mental health staff assessments</p> <ul style="list-style-type: none"> • Total 549/ 3828 • Low 165/ 1721 • Moderate 289/ 1738 • High 95/ 369

Critical appraisal

Section	Question	Answer
1. Bias due to confounding	Risk of bias judgement for confounding	Moderate <i>(Potential for confounding and no information provided on analysis method to control for confounding)</i>
2. Bias in selection of participants into the study	Risk of bias judgement for selection of participants into the study	Low <i>(All participants who would have been eligible for the target trial were included in the study and start of follow up and start of intervention coincided)</i>
3. Bias in classification of interventions	Risk of bias judgement for classification of interventions	Moderate <i>(Intervention status is well defined, but unclear whether some aspects of intervention assignment were determined retrospectively)</i>
4. Bias due to deviations from intended interventions	Risk of bias judgement for deviations from intended interventions	Low <i>(Any deviations from usual practice were unlikely to impact on the outcome)</i>
5. Bias due to missing data	Risk of bias judgement for missing data	No information
6. Bias in measurement of outcomes	Risk of bias judgement for measurement of outcomes	Moderate <i>(The outcome measure is only minimally influenced by knowledge of the intervention received by study participants)</i>

Section	Question	Answer
7. Bias in selection of the reported result	Risk of bias judgement for selection of the reported result	Moderate <i>(There is no clear evidence of a pre-registered protocol, but outcomes and analyses are consistent with an a priori plan)</i>
Overall bias	Risk of bias judgement	Moderate <i>(Moderate risk of bias due to confounding, classification of intervention, measurement of outcomes and selection of the report result)</i>
	Risk of bias variation across outcomes	None
	Directness	Directly applicable

Murphy, 2011

Bibliographic Reference Murphy, E.; Kapur, N.; Webb, R.; Cooper, J.; Risk assessment following self-harm: Comparison of mental health nurses and psychiatrists; Journal of Advanced Nursing; 2011; vol. 67; 127-139

Study details

Country/ies where study was carried out	UK
Study type	Prospective cohort study
Study dates	1 September 2002 to 31 August 2006
Inclusion criteria	All episodes of self-harm by individuals aged 16 years and over that met the case definition: "an act of intentional self-injury or poisoning irrespective of the apparent purpose of the act" including attempts regardless of suicidal intent or medical seriousness, and who had received a psychosocial assessment during the 4-year period
Exclusion criteria	Not reported
Patient characteristics	<p>Total sample</p> <ul style="list-style-type: none"> • N=3491 • Median age (IQR): 31 (22-41) years • Sex (female/male): 2060/ 1431 • Ethnicity: Not reported • Co-morbidities: Not reported • Mean duration of self-harm (SD): Not reported • Method of self-harm: self-poisoning n=2997; cutting n=322; combined methods of injury and poisoning n=123; other injuries including asphyxiation n=49 <p>Mental health nurse assessment: n=2626</p> <p>Demographic and clinical characteristics not reported by study group</p>

	Psychiatrist assessment: n=865 Demographic and clinical characteristics not reported by study group
Intervention(s)/control	<ul style="list-style-type: none"> • Mental health nurse assessment: Psychosocial assessment used is a comprehensive assessment carried out following self-harm, of which risk assessment is a key component • Psychiatrist assessment: Psychosocial assessment used is a comprehensive assessment carried out following self-harm, of which risk assessment is a key component
Duration of follow-up	12 months
Sources of funding	Department of Health
Sample size	N=3491
Results	<p>Repeat self-harm within 12 months</p> <p>Psychiatrist Assessment</p> <ul style="list-style-type: none"> • Total cases: 93/ 629 • High risk assessment: 11/ 48 • Lower risk assessment: 82/ 581 <p>Mental Health Nurse Assessment</p> <ul style="list-style-type: none"> • Total cases: 320/ 2087 • High risk assessment: 56/ 227 • Lower risk assessment: 264/ 1860

Critical appraisal

Section	Question	Answer
1. Bias due to confounding	Risk of bias judgement for confounding	Moderate <i>(Confounding expected and all important confounding domains appropriately measured and controlled for)</i>
2. Bias in selection of participants into the study	Risk of bias judgement for selection of participants into the study	Low
3. Bias in classification of interventions	Risk of bias judgement for classification of interventions	Low
4. Bias due to deviations from intended interventions	Risk of bias judgement for deviations from intended interventions	Low
5. Bias due to missing data	Risk of bias judgement for missing data	Low
6. Bias in measurement of	Risk of bias judgement for measurement of	Moderate

Section	Question	Answer
outcomes	outcomes	<i>(Likely that methods of outcome assessment were comparable across groups and measurement of outcome only minimally affected by knowledge of intervention)</i>
7. Bias in selection of the reported result	Risk of bias judgement for selection of the reported result	Moderate <i>(Reported outcomes and analysis are clearly defined within the study and no indication of selection of analysis from multiple analyses or subgroups)</i>
Overall bias	Risk of bias judgement	Moderate <i>(Moderate risk of bias due to possible bias in measurement of outcomes and selection of reported results)</i>
	Risk of bias variation across outcomes	None
	Directness	Directly applicable

Appendix E Forest plots

Forest plots for review question: What are the benefits and harms of a risk assessment and formulation including those models or tools that combine elements of machine learning and artificial intelligence for people who have self-harmed?

There are no forest plots for this review as no meta-analyses were conducted.

Appendix F Modified GRADE tables

Modified GRADE tables for review question: What are the benefits and harms of a risk assessment and formulation including those models or tools that combine elements of machine learning and artificial intelligence for people who have self-harmed?

Table 5: Evidence profile for comparison between risk assessment by emergency department staff and risk assessment by mental health staff

Quality assessment						No of patients		Effect		Quality	Importance
Number of studies	Design	Risk of bias	Inconsistency	Indirectness	Other considerations	Emergency Department Staff Assessment	Mental Health Staff Assessment	Relative (95% CI)	Absolute		
Repeat self-harm (follow-up: 12 months)											
1 (Kapur 2005)	observational study	serious ¹	no serious inconsistency	serious indirectness ²	none	646/4879 (13.2%)	549/3828 (14.3%)	0.92 (0.83, 1.03)	11 fewer per 1,000 (from 24 fewer to 4 more)	LOW	CRITICAL
Repeat self-harm (low³ risk assessment) (follow-up: 12 months)											
1 (Kapur 2005)	observational study	serious ¹	no serious inconsistency	serious indirectness ²	none	113/1624 (7.0%)	165/1721 (9.6%)	0.73 (0.58, 0.91)	26 fewer per 1,000 (from 40 fewer to 9 fewer)	LOW	CRITICAL
Repeat self-harm (moderate³ risk assessment) (follow-up: 12 months)											
1 (Kapur 2005)	observational study	serious ¹	no serious inconsistency	serious indirectness ²	none	326/2284 (14.3%)	289/1738 (16.6%)	0.86 (0.74, 0.99)	23 fewer per 1,000 (from 43 fewer to 2 fewer)	LOW	CRITICAL
Repeat self-harm (high risk³ assessment) (follow-up: 12 months)											
1 (Kapur 2005)	observational study	serious ¹	no serious inconsistency	serious indirectness ²	none	207/971	95/369	0.83 (0.67, 1.03)	44 fewer per 1,000 (from 58 fewer to 10 fewer)	LOW	CRITICAL

Quality assessment						No of patients		Effect		Quality	Importance
Number of studies	Design	Risk of bias	Inconsistency	Indirectness	Other considerations	Emergency Department Staff Assessment	Mental Health Staff Assessment	Relative (95% CI)	Absolute		
2005)	study		inconsistency	indirectness ²		(21.3%)	(25.7%)	1.02)	1,000 (from 85 fewer to 5 more)		

CI = confidence interval; ROBINS-I = Risk Of Bias In Non-randomised Studies - of Interventions; RR = Risk Ratio

1 Serious risk of bias in the evidence contributing to the outcomes

2 Population and intervention is indirect due to dates of recruitment/treatment/presentation (1997-2001).

3 Risk of repeat self-harm within 12 months of index presentation assessed as low, moderate or high risk as assessed by emergency department staff or mental health staff.

Table 6: Evidence profile for comparison between risk assessment by psychiatrist and risk assessment by mental health nurse

Quality assessment						No of patients		Effect		Quality	Importance
Number of studies	Design	Risk of bias	Inconsistency	Indirectness	Other consideration	Psychiatrist Assessment	Mental Health Nurse Assessment	Relative (95% CI)	Absolute		
Repeat self-harm (follow-up: 12 months)											
1 (Murphy 2011)	observational study	serious ¹	no serious inconsistency	no serious indirectness	none	93/629	320/2087	0.96 (0.78, 1.19)	6 fewer per 1,000 (from 34 fewer to 29 more)	MODERATE	CRITICAL
Repeat self-harm (high risk assessment) (follow-up: 12 months)											
1 (Murphy 2011)	observational study	serious ¹	no serious inconsistency	no serious indirectness	none	11/48	56/227	0.93 (0.53, 1.64)	17 fewer per 1,000 (from 116 fewer to 158 more)	MODERATE	CRITICAL

Quality assessment						No of patients		Effect		Quality	Importance
Number of studies	Design	Risk of bias	Inconsistency	Indirectness	Other consideration	Psychiatrist Assessment	Mental Health Nurse Assessment	Relative (95% CI)	Absolute		
1 (Murphy 2011)	observational study	serious ¹	no serious inconsistency	no serious indirectness	none	52/581	264/1860	0.99 (0.79, 1.25)	1 fewer per 1,000 (from 30 fewer to 35 more)	MODERATE	CRITICAL

CI = confidence interval; ROBINS-I = Risk Of Bias In Non-randomised Studies - of Interventions; RR = risk ratio

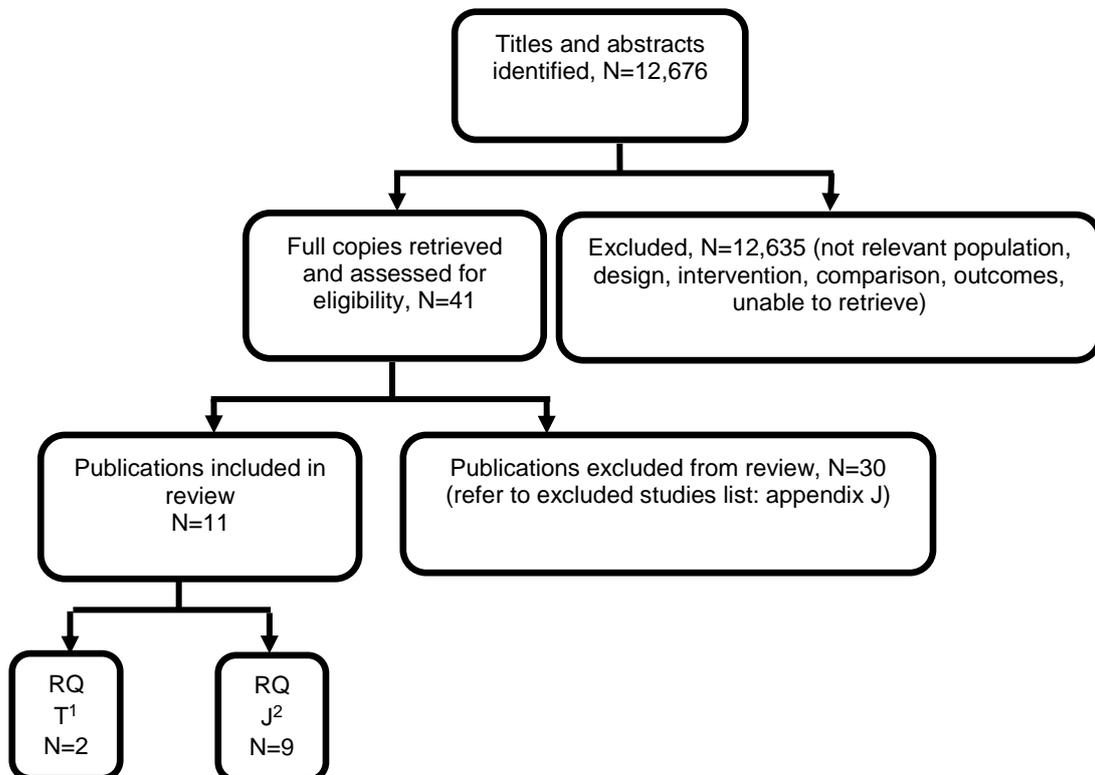

¹ Serious risk of bias in the evidence contributing to the outcomes

Appendix G Economic evidence study selection

Study selection for review question: What are the benefits and harms of a risk assessment and formulation including those models or tools that combine elements of machine learning and artificial intelligence for people who have self-harmed?

A global health economics search was undertaken for all areas covered in the guideline. Figure 2 shows the flow diagram of the selection process for economic evaluations of interventions and strategies associated with the care of people who have self-harmed.

Figure 2: Flow diagram of economic article selection for global health economic search

Abbreviations: RQ: Research question

Notes:

1 What are the most effective models of care for people who have self-harmed?

2 What psychological and psychosocial interventions (including safety plans and electronic health-based interventions) are effective for people who have self-harmed?

Appendix H Economic evidence tables

Economic evidence tables for review question: What are the benefits and harms of a risk assessment and formulation including those models or tools that combine elements of machine learning and artificial intelligence for people who have self-harmed?

No evidence was identified which was applicable to this review question.

Appendix I Economic model

Economic model for review question: What are the benefits and harms of a risk assessment and formulation including those models or tools that combine elements of machine learning and artificial intelligence for people who have self-harmed?

No economic analysis was conducted for this review question.

Appendix J Excluded studies

Excluded studies for review question: What are the benefits and harms of a risk assessment and formulation including those models or tools that combine elements of machine learning and artificial intelligence for people who have self-harmed?

Excluded effectiveness studies

Table 7: Excluded studies and reasons for their exclusion

Excluded economic studies

Table 8: Excluded studies from the guideline economic review

Study	Reason for Exclusion
Adrian, M., Lyon, A. R., Nicodimos, S., Pullmann, M. D., McCauley, E., Enhanced "Train and Hope" for Scalable, Cost-Effective Professional Development in Youth Suicide Prevention, <i>Crisis</i> , 39, 235-246, 2018	Not relevant to any of the review questions in the guideline - this study examined the impact of an educational training ongoing intervention, and the effect of the post-training reminder system, on mental health practitioners' knowledge, attitudes, and behaviour surrounding suicide assessment and intervention. As well, this study was not a full health economic evaluation
Borschmann R, Barrett B, Hellier JM, et al. Joint crisis plans for people with borderline personality disorder: feasibility and outcomes in a randomised controlled trial. <i>Br J Psychiatry</i> . 2013;202(5):357-364.	Not relevant to any of the review questions in the guideline - this study examined the feasibility of recruiting and retaining adults with borderline personality disorder to a pilot randomised controlled trial investigating the potential efficacy and cost-effectiveness of using a joint crisis plan
Bustamante Madsen, L., Eddleston, M., Schultz Hansen, K., Konradsen, F., Quality Assessment of Economic Evaluations of Suicide and Self-Harm Interventions, <i>Crisis</i> , 39, 82-95, 2018	Study design - this review of health economics studies has been excluded for this guideline, but its references have been hand-searched for any relevant health economic study
Byford, S., Barrett, B., Aglan, A., Harrington, V., Burroughs, H., Kerfoot, M., Harrington, R. C., Lifetime and current costs of supporting young adults who deliberately poisoned themselves in childhood and adolescence, <i>Journal of Mental Health</i> , 18, 297-306, 2009	Study design – no comparative cost analysis
Byford, S., Leese, M., Knapp, M., Seivewright, H., Cameron, S., Jones, V., Davidson, K., Tyrer, P., Comparison of alternative methods of collection of service use data for the economic evaluation health care interventions, <i>Health Economics</i> , 16, 531-536, 2007	Study design – no comparative cost analysis
Byford, Sarah, Barber, Julie A., Harrington, Richard, Barber, Baruch Beautrais Blough Brent Brodie Byford Carlson Chernoff Collett Fergusson Garland Goldberg Harman Harrington Hawton Huber Kazdin Kerfoot Knapp Lindsey McCullagh Miller Netten Reynolds Sadowski Shaffer Simms Wu, Factors that influence the cost of deliberate self-poisoning in children and adolescents, <i>Journal of Mental Health Policy and Economics</i> , 4, 113-121, 2001	Study design – no comparative cost analysis
Denchev, P., Pearson, J. L., Allen, M. H., Claassen, C. A., Currier, G. W., Zatzick, D. F., Schoenbaum, M., Modeling the cost-effectiveness of interventions to reduce suicide risk among hospital emergency department patients, <i>Psychiatric Services</i> , 69, 23-31, 2018	Not relevant to any of the review questions in the guideline - this study estimated the cost-effectiveness of outpatient interventions (Postcards, Telephone outreach, Cognitive Behaviour Therapy) to reduce suicide risk among patients presenting to general hospital emergency departments
Dunlap, L. J., Orme, S., Zarkin, G. A., Arias, S. A., Miller, I. W., Camargo, C. A., Sullivan, A. F., Allen, M. H., Goldstein, A. B., Manton, A. P., Clark, R., Boudreaux, E. D., Screening and Intervention for Suicide Prevention: A Cost-	Not relevant to any of the review questions in the guideline - this study estimated the cost-effectiveness of suicide screening followed by an intervention to identify suicidal individuals and prevent recurring self-harm

Flood, C., Bowers, L., Parkin, D., Estimating the costs of conflict and containment on adult acute inpatient psychiatric wards, Nursing economic\$, 26, 325-330, 324, 2008	Study design – no comparative cost analysis
Fortune, Z., Barrett, B., Armstrong, D., Coid, J., Crawford, M., Mudd, D., Rose, D., Slade, M., Spence, R., Tyrer, P., Moran, P., Clinical and economic outcomes from the UK pilot psychiatric services for personality-disordered offenders, International Review of Psychiatry, 23, 61-9, 2011	Not relevant to any of the review questions in the guideline
George, S., Javed, M., Hemington-Gorse, S., Wilson-Jones, N., Epidemiology and financial implications of self-inflicted burns, Burns, 42, 196-201, 2016	Study design – no comparative cost analysis
Gunnell, D., Shepherd, M., Evans, M., Are recent increases in deliberate self-harm associated with changes in socio-economic conditions? An ecological analysis of patterns of deliberate self-harm in Bristol 1972-3 and 1995-6, Psychological medicine, 30, 1197-1203, 2000	Study design - cost-of-illness study
Kapur, N., House, A., Dodgson, K., Chris, M., Marshall, S., Tomenson, B., Creed, F., Management and costs of deliberate self-poisoning in the general hospital: A multi-centre study, Journal of Mental Health, 11, 223-230, 2002	Study design – no comparative cost analysis
Kapur, N., House, A., May, C., Creed, F., Service provision and outcome for deliberate self-poisoning in adults - Results from a six centre descriptive study, Social Psychiatry and Psychiatric Epidemiology, 38, 390-395, 2003	Study design – no comparative cost analysis
Kinchin, I., Russell, A. M. T., Byrnes, J., McCalman, J., Doran, C. M., Hunter, E., The cost of hospitalisation for youth self-harm: differences across age groups, sex, Indigenous and non-Indigenous populations, Social Psychiatry and Psychiatric Epidemiology, 55, 425-434, 2020	Study design – no comparative cost analysis
O'Leary, F. M., Lo, M. C. I., Schreuder, F. B., "Cuts are costly": A review of deliberate self-harm admissions to a district general hospital plastic surgery department over a 12-month period, Journal of Plastic, Reconstructive and Aesthetic Surgery, 67, e109-e110, 2014	Study design – no comparative cost analysis

Study	Reason for Exclusion
Olfson, M., Gameraoff, M. J., Marcus, S. C., Greenberg, T., Shaffer, D., National trends in hospitalization of youth with intentional self-inflicted injuries, <i>American Journal of Psychiatry</i> , 162, 1328-1335, 2005	Study design – no comparative cost analysis
Ostertag, L., Golay, P., Dorogi, Y., Brovelli, S., Cromec, I., Edan, A., Barbe, R., Saillant, S., Michaud, L., Self-harm in French-speaking Switzerland: A socio-economic analysis (7316), <i>Swiss Archives of Neurology, Psychiatry and Psychotherapy</i> , 70 (Supplement 8), 48S, 2019	Conference abstract
Ougrin, D., Corrigan, R., Poole, J., Zundel, T., Sarhane, M., Slater, V., Stahl, D., Reavey, P., Byford, S., Heslin, M., Ivens, J., Crommelin, M., Abdulla, Z., Hayes, D., Middleton, K., Nnadi, B., Taylor, E., Comparison of effectiveness and cost-effectiveness of an intensive community supported discharge service versus treatment as usual for adolescents with psychiatric emergencies: a randomised controlled trial, <i>The Lancet Psychiatry</i> , 5, 477-485, 2018	Not self-harm. In addition, the interventions evaluated in this economic analysis (a supported discharge service provided by an intensive community treatment team compared to usual care) were not relevant to any review questions
Palmer, S., Davidson, K., Tyrer, P., Gumley, A., Tata, P., Norrie, J., Murray, H., Seivewright, H., The cost-effectiveness of cognitive behavior therapy for borderline personality disorder: results from the BOScot trial, <i>Journal of Personality Disorders</i> , 20, 466-481, 2006	Not self-harm
Quinlivan L, Steeg S, Elvidge J, et al. Risk assessment scales to predict risk of hospital treated repeat self-harm: A cost-effectiveness modelling analysis. <i>J Affect Disord</i> . 2019;249:208-215.	Not relevant to any of the review questions in the guideline - this study estimated the cost-effectiveness of risk assessment scales versus clinical assessment for adults attending an emergency department following self-harm
Richardson JS, Mark TL, McKeon R. The return on investment of postdischarge follow-up calls for suicidal ideation or deliberate self-harm. <i>Psychiatr Serv</i> . 2014;65(8):1012-1019.	Not enough data reporting on cost-effectiveness findings

M., Lucas, Z., Verheul, R., Luyten, P., Day hospital versus intensive out-patient mentalisation-based treatment for borderline personality disorder: Multicentre randomised clinical trial, <i>British Journal of Psychiatry</i> , 216, 79-84, 2020	Not self-harm
Tsiachristas, A., Geulayov, G., Casey, D., Ness, J., Waters, K., Clements, C., Kapur, N., McDaid, D., Brand, F., Hawton, K., Incidence and general hospital costs of self-harm across England: estimates based on the multicentre study of self-harm, <i>Epidemiology & Psychiatric Science</i> , 29, e108, 2020	Study design – no comparative cost analysis
Tsiachristas, A., McDaid, D., Casey, D., Brand, F., Leal, J., Park, A. L., Geulayov, G., Hawton, K., General hospital costs in England of medical and psychiatric care for patients who self-harm:	Study design – no comparative cost analysis

Study	Reason for Exclusion
a retrospective analysis, <i>The Lancet Psychiatry</i> , 4, 759-767, 2017	
Tubeuf, S., Saloniki, E. C., Cottrell, D., Parental Health Spillover in Cost-Effectiveness Analysis: Evidence from Self-Harming Adolescents in England, <i>PharmacoEconomics</i> , 37, 513-530, 2019	This study is not a separate study from one already included in the guideline for topic 5.2 (Cottrel 2018). This secondary analysis presents alternative parental health spillover quantification methods in the context of a randomised controlled trial comparing family therapy with treatment as usual as an intervention for self-harming adolescents of (Cottrel 2018), and discusses the practical limitations of those methods
Tyrer, P., Thompson, S., Schmidt, U., Jones, V., Knapp, M., Davidson, K., Catalan, J., Airlie, J., Baxter, S., Byford, S., Byrne, G., Cameron, S., Caplan, R., Cooper, S., Ferguson, B., Freeman, C., Frost, S., Godley, J., Greenshields, J., Henderson, J., Holden, N., Keech, P., Kim, L., Logan, K., Manley, C., MacLeod, A., Murphy, R., Patience, L., Ramsay, L., De Munroz, S., Scott, J., Seivewright, H., Sivakumar, K., Tata, P., Thornton, S., Ukoumunne, O. C., Wessely, S., Randomized controlled trial of brief cognitive behaviour therapy versus treatment as usual in recurrent deliberate self-harm: The POPMACT study, <i>Psychological medicine</i> , 33, 969-976, 2003	Study design - no economic evaluation
Van Roijen, L. H., Sinnaeve, R., Bouwmans, C., Van Den Bosch, L., Cost-effectiveness and Cost-utility of Shortterm Inpatient Dialectical Behavior Therapy for Chronically Parasuicidal BPD (Young) Adults, <i>Journal of Mental Health Policy and Economics</i> , 18, S19-S20, 2015	Conference abstract
van Spijker, B. A., Majo, M. C., Smit, F., van Straten, A., Kerkhof, A. J., Reducing suicidal ideation: cost-effectiveness analysis of a randomized controlled trial of unguided web-based self-help, <i>Journal of medical Internet research</i> , 14, e141, 2012	Not self-harm

Appendix K Research recommendations – full details

Research recommendations for review question: What are the benefits and harms of a risk assessment and formulation including those models or tools that combine elements of machine learning and artificial intelligence for people who have self-harmed?

No research recommendations were made for this review question.
