

Appendix M Cost-effective treatment of IVF analyses

In chapter 14 an economic model is used to determine the cost-effectiveness of IVF. This is done for a total of 198 scenarios which represent all the following permutations of the following:

Cause (6):	Unknown, Male factor without ICSI, Male factor with ICSI, Tubal, Mild endometriosis, severe endometriosis
Pregnancy history (3):	No previous pregnancy, Previous pregnancy no live birth Previous pregnancy with live birth
Duration of sub-fertility (11):	2-12 years

In this appendix we present the results of all these analyses for a policy of eSET and DET using the model's base case inputs.

In the first part of the appendix, for each scenario we show the treatment decisions that follow from the analysis of incremental costs and effects. This is illustrated with a colour coded 2x2 grid with the woman's age represented on the vertical axis and treatment cycles on the horizontal axis. Where the grid is shaded green it indicates that treatment cycle for a woman of that age is cost-effective using a £20,000 willingness to pay for a QALY threshold and should be funded. Where the grid is shaded yellow, indicates that treatment is cost-effective only if a higher £30,000 willingness to pay for a QALY threshold is used. Conversely, where the grid is shaded red it means that treatment is not cost-effective and should not be funded.

In the cumulative live birth rates we use the following key:

Strategies

IVF1 = One cycle of IVF, followed by EM for the remainder of the woman's reproductive life if one full cycle of IVF was unsuccessful

IVF2 = Up to two cycles of IVF, followed by EM for the remainder of the woman's reproductive life if the two cycles of IVF were unsuccessful

IVF3 = Up to three cycles of IVF, followed by EM for the remainder of the woman's reproductive life if the three cycles of IVF were unsuccessful

At the end of the appendix we show summary lists of cost-effectiveness for the different scenarios. Whilst this presentation makes it easier to appreciate the overall cost-effectiveness of different scenarios it does not indicate the number of cycles that should be provided but rather whether the women in whom some IVF treatment should be offered.
