Number of patients	Phage-based tests					

Bibliographic reference	Dinnes J, Deeks J, Kunst H, Gibson A, Cummins E, Waugh N, Drobniewski F and Lalvani A (2007) A systematic review of rapid diagnostic tests for the detection of tuberculosis infection. Health Technology Assessment 11(3)
	<p>5 studies</p> <p>Antituberculosis antibody tests</p> <p>5 studies, 8 evaluations</p> <p>1571 participants</p>
Patient characteristics	<p>Adults or children</p> <p>Studies of adults or children with any form of active TB were eligible for inclusion</p> <p>Patients with any co-morbidity (including HIV infection) were included</p> <p>Studies exclusively conducted in patients with non-tuberculous mycobacterial infection were excluded on the basis that these infections are rare and inclusion of them was outwith the resource constraints of the review</p> <p>Phage-based tests</p> <p>Disease prevalence in sample (mean (range)) = 0.32 (0.14 to 0.52)</p> <p>Sample types: sputum (4), respiratory (1)</p> <p>Antituberculosis antibody tests</p> <p>Disease prevalence in sample (mean (range)) = 0.21 (0.09 to 0.45)</p> <p>Sample types: respiratory (2), serum (14), urine (1)</p>
Index test	<p>For most tests, studies with more than one specimen per patient were included only where accuracy data could be extracted on a per patient as opposed to a per specimen basis or where the difference in the number of specimens compared with the number of patients was less than 10%</p> <p>Studies of specimens 'spiked' with mycobacteria were excluded as they did not use clinical samples</p> <p>Any study that compared a rapid test for detection of active TB with a reference standard was included; 'rapid' tests were defined as those tests for which a result could be obtained in less than the time taken for standard culture (on solid or liquid media)</p> <p>Studies evaluating tests used for strain typing of TB were excluded, as these are more of an epidemiological tool than tests for use in routine clinical practice</p> <p>Studies evaluating drug susceptibility tests were also excluded, as they were beyond the scope of this project</p> <p>Phage-based tests</p> <p>FASTPlaqueTB = 4 evaluations</p> <p>PhageTek MB = 1 evaluation</p>

Reference standard	Reference standards for tests for detecting active tuberculosis can be defined as follows:		

Bibliographic reference	Dinnes J, Deeks J, Kunst H, Gibson A, Cummins E, Waugh N, Drobniewski F and Lalvani A (2007) A systematic review of rapid diagnostic tests for the detection of tuberculosis infection. Health Technology Assessment 11(3)																																																																																								
	<p>A: culture and/or microscopy smear test B: very high clinical suspicion of TB, with or without a response to treatment C: clinical suspicion of TB, but it is not certain one way or the other Studies may use one or more of these reference tests either alone or in combination with each other as a reference strategy Strategy A alone, although previously considered good practice is now recognised as an inadequate reference standard, especially in smear-negative patients; although culture specificity is high, sensitivity is much poorer Clinical diagnosis, although improving sensitivity, has a relatively low specificity for tuberculosis diagnosis</p>																																																																																								
	<p>Phage-based tests Culture alone was used as the reference strategy in 60% (n = 3) of the studies (two FastPlaque and one PhageTek); the remaining two studies combined culture with clinical TB diagnosis, treatment response and X-ray</p>																																																																																								
	<p>Antituberculosis antibody tests Culture alone was used as the reference strategy in five of the 21 evaluations (24%); culture was combined with clinical diagnosis with or without additional tests in eight studies (38%) and clinical diagnosis alone used in three studies</p>																																																																																								
Outcomes measures and effect size	<p>Diagnostic test accuracy – phage-based tests</p> <table border="1"> <thead> <tr> <th>Study</th> <th>Test</th> <th>n</th> <th>TP</th> <th>FN</th> <th>TN</th> <th>FP</th> <th>Sensitivity</th> <th>Specificity</th> </tr> </thead> <tbody> <tr> <td>Albert, 2002</td> <td>FASTPlaqueTB</td> <td>781</td> <td>78</td> <td>33</td> <td>663</td> <td>16</td> <td>70.27</td> <td>97.64</td> </tr> <tr> <td>smear positive</td> <td>FASTPlaqueTB</td> <td>87</td> <td>57</td> <td>11</td> <td>17</td> <td>2</td> <td>83.82</td> <td>89.47</td> </tr> <tr> <td>smear negative</td> <td>FASTPlaqueTB</td> <td>694</td> <td>21</td> <td>22</td> <td>646</td> <td>5</td> <td>48.84</td> <td>99.23</td> </tr> <tr> <td>Albay, 2003</td> <td>FASTPlaqueTB</td> <td>192</td> <td>56</td> <td>8</td> <td>124</td> <td>4</td> <td>87.5</td> <td>96.88</td> </tr> <tr> <td>Alcaide, 2003</td> <td>PhageTek MB</td> <td>1483</td> <td>87</td> <td>47</td> <td>1332</td> <td>17</td> <td>64.93</td> <td>98.74</td> </tr> <tr> <td>Cavusoglu, 2002</td> <td>FASTPlaqueTB</td> <td>63</td> <td>9</td> <td>24</td> <td>29</td> <td>1</td> <td>27.27</td> <td>96.67</td> </tr> <tr> <td>Muzaffar, 2002</td> <td>FASTPlaqueTB</td> <td>514</td> <td>200</td> <td>45</td> <td>263</td> <td>6</td> <td>81.63</td> <td>97.77</td> </tr> <tr> <td>smear positive</td> <td>FASTPlaqueTB</td> <td>192</td> <td>153</td> <td>22</td> <td>15</td> <td>2</td> <td>87.43</td> <td>88.24</td> </tr> </tbody> </table>								Study	Test	n	TP	FN	TN	FP	Sensitivity	Specificity	Albert, 2002	FASTPlaqueTB	781	78	33	663	16	70.27	97.64	smear positive	FASTPlaqueTB	87	57	11	17	2	83.82	89.47	smear negative	FASTPlaqueTB	694	21	22	646	5	48.84	99.23	Albay, 2003	FASTPlaqueTB	192	56	8	124	4	87.5	96.88	Alcaide, 2003	PhageTek MB	1483	87	47	1332	17	64.93	98.74	Cavusoglu, 2002	FASTPlaqueTB	63	9	24	29	1	27.27	96.67	Muzaffar, 2002	FASTPlaqueTB	514	200	45	263	6	81.63	97.77	smear positive	FASTPlaqueTB	192	153	22	15	2	87.43	88.24

Outcomes measures and effect size

Diagnostic test accuracy

Pooled sensitivity of commercial NAATs (95% CI)_a = 85% (84.7% to 86%)

P value for heterogeneity < 0.001

Specificity of commercial NAATs (95% CI)_a = 96.8% (96.7% to 96.9%)

P value for heterogeneity < 0.001

ROC plot:

Positive likelihood ratio (95% CI) = 32.74 (26.01 to 41.22)

Negative likelihood ratio (95% CI) = 0.14 (0.12 to 0.16)

Diagnostic odds ratio (95% CI) = 268.88 (212.07 to 340.90)

Amplicor

Positive likelihood ratio (95% CI) = 26.04 (17.04 to 39.80)

Negative likelihood ratio (95% CI) = 0.15 (0.11 to 0.22)

Diagnostic odds ratio (95% CI) = 174.92 (120.77 to 253.35)

Cobas Amplicor

Positive likelihood ratio (95% CI) = 58.59 (37.77 to 90.86)

Negative likelihood ratio (95% CI) = 0.17 (0.13 to 0.22)

	Item	Authors' judgement	Risk of bias	Applicability concerns
	DOMAIN 1: Patient Selection			
	Was a consecutive or random sample of patients enrolled?	Yes		
	Was a case-control design avoided?	Yes		
	Did the study avoid inappropriate exclusions?	Yes		High
	DOMAIN 2: Index Test All tests			
	Were the index test results interpreted without knowledge of the results of the reference standard?	Yes		
	If a threshold was used, was it pre-specified?	Yes		Low
	DOMAIN 3: Reference Standard			
	Is the reference standards likely to correctly classify the target condition?	Yes		
	Were the reference standard results for TB detection interpreted without knowledge of the results of the index test?	Yes		
	Were the reference standard results for rifampicin resistance detection interpreted without knowledge of the results of the index test?	Yes		Low
	DOMAIN 4: Flow and Timing			
	Was there an appropriate interval between index test and reference standard?	Yes		
	Did all patients receive the same reference standard?	Yes		
	Were all patients included in the analysis?	Yes

			Low
	DOMAIN 3: Reference Standard		
	Is the reference standards likely to correctly classify the target condition?	Yes	
	Were the reference standard results for TB detection interpreted without knowledge of the results of the index test?	Yes	
	Were the reference standard results for rifampicin resistance detection interpreted without knowledge of the results of the index test?	Yes	
			Low
	DOMAIN 4: Flow and Timing		
	Was there an appropriate interval between index test and reference standard?	Yes	
	Did all patients receive the same reference standard?	Yes	
	Were all patients included in the analysis?	Yes

Comments			
	<p>a Assumed that studies that did not report age data involved all or mostly adults for the following reasons: the vast majority of specimens evaluated with Xpert MTB/RIF were sputum specimens and children have difficulty producing sputum;</p> <p>b This specimen collection method is used mostly for investigating TB in children</p> <p>c The individual studies are ordered by decreasing sensitivity</p> <p>d Included 22 of the total 27 studies; excluded five studies that enrolled primarily only smear-positive or smear-negative patients</p>		

Bibliographic reference	Steingart KR, Sohn H, Schiller I, Kloda LA, Boehme CC, Pai M and Dendukuri N (2014) Xpert® MTB/RIF assay for pulmonary tuberculosis and rifampicin resistance in adults. The Cochrane Library 1, article no. CD009593
e	Included 21 of the total 27 studies
f	Pooled specificity in the studies in the smear-positive subgroup was not estimated because almost all participants were considered to be true positives
g	Included 21 of the total 27 studies
h	Included 7 of the total 27 studies
i	Included 4 of the total 27 studies

Study characteristics	<p>The search strategy aimed to include all available studies on nucleic acid amplification tests for direct detection of M. tuberculosis in CSF specimens</p> <p>For inclusion, the studies had to report a comparison of an nucleic acid amplification test against a reference standard, provide data necessary for the computation of both sensitivity and specificity, and include at least ten CSF specimens in the study (since very small studies may be vulnerable to selection bias)</p> <p>Although no language restrictions were imposed, only English and Spanish articles were reviewed</p> <p>Conference abstracts were excluded because they universally contained inadequate data to permit evaluation</p>																										
Index test	<p>Commercial nucleic acid amplification tests</p> <table border="1" data-bbox="674 571 1462 1347"> <thead> <tr> <th><i>Study</i></th> <th><i>Index test</i></th> </tr> </thead> <tbody> <tr> <td>Bonington, 1998</td> <td>Amplicor</td> </tr> <tr> <td>Brienze, 2001</td> <td>Amplicor</td> </tr> <tr> <td>D'Amato, 1996</td> <td>Amplicor</td> </tr> <tr> <td>Shah, 1998</td> <td>Amplicor</td> </tr> <tr> <td>Baker, 2002</td> <td>Amplified M. Reference standard	Tuberculous meningitis was defined by the presence of at least 1 of the following diagnostic criteria: (1) M. tuberculosis in cerebrospinal fluid culture; (2) meningitis and presence of acid-fast bacilli on CSF smear; (3) meningitis associated with tuberculosis in another organ; or (4) clinical and/or laboratory evidence of tuberculous meningitis, with improvement after empirical treatment for tuberculosis Patients with other types of infectious meningitis (viral, bacterial or fungal) as well as neoplasms were included as controls	
Outcomes measures and effect size	Diagnostic test accuracy – ADA cut-off 10 U/l Pooled sensitivity of index test (95% CI) = 49.5% (43.6 to 55.4%) Pooled specificity of index test (95% CI) = 90.7% (88.5 to 92.7%)

	<p>The figure consists of two forest plots, both labeled 'C'. The left plot shows Sensitivity on the x-axis (0 to 1) with a vertical line at 0.9. The right plot shows Specificity on the x-axis (0 to 1) with a vertical line at 0.7. Both plots include individual study results as squares with horizontal error bars and a pooled result as a diamond. The legend for the Sensitivity plot includes: Mishra 1996, Blake 1982, Ribera 1987, Schuttle 2001, Zapata 1996, Pettersson 1991, Malan 1984, Baro 1996, Kaur 1992, Choi 2002, Donald 1986, Mann 1982, and Lopez-Cortez 1995. The legend for the Specificity plot includes: Baro 1996, Mishra 1996, Ribera 1987, Blake 1982, Mann 1982, Choi 2002, Pettersson 1991, Zapata 1996, Lopez-Cortez 1995, Kaur 1992, Donald 1986, Malan 1984, and Schuttle 2001.</p>

Reference standard	Cases: <ul style="list-style-type: none"> patients in whom clinical specimens were found to be positive for <i>M. tuberculosis</i> in culture or by the <i>M. tuberculosis</i> polymerase chain reaction (PCR) assay patients who presented a clinical picture of tuberculous peritonitis associated with peritoneal fluid changes consistent with tuberculous peritonitis, histologic biopsy showing caseating granuloma, and a successful response to antituberculosis therapy 																																																																																							

Data are positive patients over total patients (%), unless otherwise indicated. TB, tuberculosis; HIV, human immunodeficiency virus; NA, not applicable; SD, standard deviation.

^a TB peritonitis includes confirmed ($n = 27$) and probable ($n = 3$) TB.

^b These 11 cases include cases of lupus peritonitis ($n = 1$), polyarteritis nodosa ($n = 1$), sclerotic mesenteritis ($n = 1$), candida peritonitis ($n = 1$), rejection after kidney transplantation ($n = 1$), end stage renal disease ($n = 1$), portal hypertension ($n = 3$), and inflammatory bowel disease ($n = 2$).

^c Immunosuppressive condition is defined as presence of underlying diseases, such as HIV infection, malignancy, liver cirrhosis, and chronic renal failure, and/or receipt of immunosuppressive treatment.

Bibliographic reference	Su SB, Qin SY, Guo XY, Luo W and Jiang HX (2013) Assessment by meta-analysis of interferon-gamma for the diagnosis of tuberculous peritonitis. World Journal of Gastroenterology 19(10): 1645-51
Study type	Systematic review
Study quality	Does the review address an appropriate and clearly focused question that is relevant to the review question? yes Does the review collect the type of studies considered relevant to the review question? yes, although only 1 of

Bibliographic reference	Su SB, Qin SY, Guo XY, Luo W and Jiang HX (2013) Assessment by meta-analysis of interferon-gamma for the diagnosis of tuberculous peritonitis. World Journal of Gastroenterology 19(10): 1645-51							
	the most appropriate study design (cross-sectional) was included							
	Is the literature search sufficiently rigorous to identify all the relevant studies? yes							
	Is study quality assessed and reported? yes, using STARD and QUADAS							
	Is an adequate description of methodology included, and the methods used appropriate to the question? yes							
	Additional criteria							
	Is there concern that the included patients do not match the review question? unclear							
	Is there concern that the index test, its conduct, or interpretation differ from the review question? unclear that all are commercially available interferon-gamma release assays; different interferon-gamma release assays with different thresholds for positivity used across the studies							
	Is there concern that the target condition as defined by the reference standard does not match the review question? yes, some cases could be diagnosed on clinical grounds alone (although authors state that ‘diagnosis of peritoneal tuberculosis was confirmed in most of the tuberculous peritonitis patients based on the conventional “gold standard” which was a smear or a positive M. tuberculosis culture which was taken from ascitic fluid and/or histology showing a caseating granuloma’); plus, reference standards vary across studies

Reference standard	<p>Reference standards for tests for detecting active tuberculosis can be defined as follows: A: culture and/or microscopy smear test B: very high clinical suspicion of TB, with or without a response to treatment C: clinical suspicion of TB, but it is not certain one way or the other Studies may use one or more of these reference tests either alone or in combination with each other as a reference strategy Strategy A alone, although previously considered good practice is now recognised as an inadequate reference standard, especially in smear-negative patients; although culture specificity is high, sensitivity is much poorer Clinical diagnosis, although improving sensitivity, has a relatively low specificity for tuberculosis diagnosis</p> <table border="1"> <thead> <tr> <th>Study</th> <th>Reference standard</th> </tr> </thead> <tbody> <tr> <td>Baek, 2000</td> <td>histology plus response to treatment</td> </tr> <tr> <td>Bemer-Melchior, 1998</td> <td>culture alone</td> </tr> <tr> <td>Ehlers, 1996</td> <td>culture alone</td> </tr> <tr> <td>Gamboa, 1997</td> <td>culture alone</td> </tr> <tr> <td>Gamboa, 1998</td> <td>culture plus x-ray</td> </tr> <tr> <td>Rimek, 2002</td> <td>culture alone</td> </tr> <tr> <td>Shah, 1998</td> <td>culture alone</td> </tr> </tbody> </table>				Study	Reference standard	Baek, 2000	histology plus response to treatment	Bemer-Melchior, 1998	culture alone	Ehlers, 1996	culture alone	Gamboa, 1997	culture alone	Gamboa, 1998	culture plus x-ray	Rimek, 2002	culture alone	Shah, 1998	culture alone

Reference standard		In all 63 studies included, the study by Piras ¹⁶ did not mention the diagnosis standard for TPE; in 28 studies, the standard); in the remaining 34 studies, some TPE patients were diagnosed based on “gold standard”, and some patients were diagnosed based on pleural fluid analysis, radiology and the responsiveness to anti-tuberculous chemotherapy		
Outcomes measures and effect size	Diagnostic test accuracy
