Patient decision aid

Inhalers for asthma

Information to help people with asthma and their healthcare professionals discuss their options for inhaler devices.

It is suitable for use by people aged 17 years and over.

About this patient decision aid

Asthma affects the airways and can make it difficult to breathe. It may cause symptoms such as chest tightness, wheeziness or coughing.

Inhalers are devices that deliver a medicine into the lungs to help with the symptoms of asthma. There are different types of medicines available. Your healthcare professional will discuss with you which medicine is recommended for you. Once you know which medicine you are using, this patient decision aid will help you and your healthcare professional decide which inhaler you might like to try.

Different types of inhalers are available. Most asthma medicines are available in more than 1 type of inhaler.

The National Institute for Health and Care Excellence (NICE) says everyone should be able to choose the inhaler they find easiest to use. NICE also says that everyone should have the way they use their inhaler checked regularly. If needed, people should be given advice on how to improve their technique.

If you have asthma, you may find it useful to read details about all options. This can help you and your healthcare professional decide which inhaler will suit you best.
## What are the options?

- **Breath-actuated metered dose inhaler (BAI)**
- **Dry powder inhaler (DPI)**
- **Pressurised metered dose inhaler (pMDI)**
- **pMDI plus a spacer** (a spacer is an attachment that can help increase the amount of medicine that reaches the lungs compared to using a pMDI on its own. Some people find they can use a pMDI easier with a spacer.)
- **Soft mist inhaler (SMI)** such as the Spiriva Respimat. At present, only one type of medicine is available in this kind of inhaler. This medicine is recommended only for certain people with asthma, so soft mist inhalers have not been included in the patient decision aid. Your healthcare professional will be able to advise you if it is an option for you. They will explain to you how it works. This type of inhaler does not contain a propellant, so it has a lower carbon footprint than a pMDI.
### Inhalers

**Examples** (other inhalers may be available). Click 🎬 to view a video on how to use the inhaler or use this link [https://bit.ly/inhalervids](https://bit.ly/inhalervids) to find the Asthma UK webpage where all the videos can be found.

Using this patient decision aid

Your healthcare professional will help you use this patient decision aid.

The patient decision aid contains a number of sections:

1. **Options table (page 5):** First, there is a table you can fill in to show how you feel about different aspects of using inhalers. This will help focus the discussion on what is important to you.

2. **Flowchart (page 6):** Then, there is a flowchart that will help you decide which inhaler, or inhalers, you may find the easiest to use. Your healthcare professional will help you with the different breathing techniques. At the end of the flowchart, you will be given a choice of inhalers that you are likely to find the easiest to use. We suggest you and your healthcare professional focus on choosing between these inhalers.

3. **Summary (page 7 to 8):** This is followed by a summary of some different factors related to using inhalers and how they compare with each other. This section is followed by more detailed information on some of the factors. If looking at this page on a screen, you can click on 📅 in the left column to go straight to the detailed information on a particular factor. If you have a printed copy, go to the page number shown for the detailed information.

4. **Detailed information (page 9 to 13):** From page 9 onwards, you can read all the detailed information in full. From the detailed information, you can click on ⬆️ in the left column to return to the summary page.
Inhalers made by different manufacturers may have different instructions. **It is important that you always follow the instructions in the information leaflet that comes with the inhaler.**

You can fill in this table with your healthcare professional to show how you feel about each of the factors included in this patient decision aid. Thinking about this will help you and your healthcare professional focus your discussion on what is important to you. Write down anything else you want to discuss at the bottom of the table.

2: Flowchart – how to use the inhalers

Follow the flowchart to see what options are available to you. Your healthcare professional will be able to help you understand the different techniques.

Each inhaler needs a specific breathing technique. These are described in table 3.

Can you breathe in through your mouth quickly and deeply within 2 to 3 seconds?

- Yes
  - Can you breathe in through your mouth slowly and steadily over 4 to 5 seconds?
    - Yes
      - Can you breathe in and press the inhaler at the same time?
        - Yes
          - You might like to try:
            - DPI
            - pMDI
            - pMDI + spacer
            - BAI
        - No
          - You might like to try:
            - DPI
            - pMDI + spacer
            - BAI
    - No
      - You might like to try:
        - pMDI + spacer

- No
  - Can you breathe in through your mouth slowly and steadily over 4 to 5 seconds?

Some inhalers contain propellants, known as hydrofluorocarbons (HFCs). HFCs do not have an effect on the ozone layer. However, they are powerful greenhouse gases and can contribute to global warming. This is referred to as their carbon footprint, measured in carbon dioxide equivalents (g CO$_2$eq). The bigger the carbon dioxide equivalent, the bigger the impact on global warming.

**Estimated carbon footprint comparison (g CO$_2$eq)**

4. Detailed information

All inhalers can be recycled at some local pharmacies. Used pMDI canisters still contain propellants that are powerful greenhouse gases and can contribute to global warming. All used pMDI canisters should be returned to a pharmacy to dispose of in an environmentally safe way. If there is no recycling scheme they can be placed in the pharmacist’s normal pharmaceutical waste bins.

https://www.recyclenow.com/what-to-do-with/medicines-0

Spacers cannot currently be recycled.

Inhalers made by different manufacturers may have different instructions. It is important that you always follow the instructions in the information leaflet that comes with the inhaler.
How to work out when to replace your inhaler if it does not have a counter or indicator

The packaging that the inhaler comes in will tell you how many doses, or puffs, are in the inhaler. Different inhalers contain a different number of doses. You can calculate how long your inhaler will last by dividing the number of doses in the inhaler by the number of puffs you are taking each day or each week.

For example, if you are taking your inhaler daily and you have been told to take 2 puffs twice a day, you are using 4 puffs each day. If your inhaler contains 200 doses, your inhaler will last you 50 days (200 divided by 4), which is approximately 7 weeks.

If you are only using the inhaler when you need it (‘as required’), you can work out how long it will last you in the same way but you need to monitor how many puffs you are taking each week. For example if you use your inhaler around twice each week and you take 2 puffs each time, you are using 4 puffs each week. If your inhaler contains 200 doses (200 divided by 4), your inhaler will last you around 50 weeks.

If you have used your inhaler more often than usual, it will run out sooner. If you haven’t used your inhaler in a while the instruction leaflet may advise you to test your inhaler by releasing puffs into the air. Count these puffs when working out how long the inhaler will last.

Take note of your inhaler’s expiry or ‘use by’ date. Make sure you replace your inhaler before the expiry or ‘use by’ date, even if there is some medicine left. This is particularly important if you don’t need to use your inhaler very often.

If you are unsure, ask your pharmacist for advice.
