

Pancreatic Cancer in adults: diagnosis and management

Appendix L

Health economics evidence tables

31 July 2017

Draft for Consultation

*Developed by the National Guideline Alliance, hosted
by the Royal College of Obstetricians and
Gynaecologist*

Disclaimer

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the Welsh Government, Scottish Government, and Northern Ireland Executive. All NICE guidance is subject to regular review and may be updated or withdrawn.

	<p><u>Source of effectiveness data:</u> Effectiveness data was populated from the ACCORD 11/0402 trial as discussed in detail in the accompanying clinical evidence review. (Gourgou-Bourgade 2013)</p> <p><u>Source of utility data:</u> Utility data was taken from one survey of 267 patients taking part in one randomised phase III trial comparing gemcitabine with placebo to gemcitabine with bevacizumab at multiple sites across the US. Utility values for stable disease and disease progression were collected using the EQ-5D and scored using values derived from the US general population</p> <p><u>Source of cost data:</u> Chemotherapy costs were taken from publicly available healthcare costs specific to the Ontario region of Canada. Resource use for</p>	<p><u>Subgroup analysis:</u> None performed</p>	<p>as second line chemotherapy.</p>	<p><i>FOLFIRINOX vs GEM</i></p> <p>Analysis 1 Analysis 2</p> <p><u>Uncertainty:</u></p> <p>Deterministic Sensitivity Analysis (cost per QALY)</p> <p><u>Discount Rate=0%</u> Analysis 1 Analysis 2</p> <p><u>Discount Rate=3%</u> Analysis 1 Analysis 2</p> <p><u>Relative Dose Intensity FOLFIRINOX=100%</u> Analysis 1 Analysis 2</p> <p><u>Relative Dose Intensity FOLFIRINOX=70%</u> Analysis 1 Analysis 2</p> <p><u>Relative Dose Intensity GEM=90%</u> Analysis 1 Analysis 2</p>	<p>CA\$57,858 CA\$67,626</p> <p>CA\$57,600 CA\$67,289</p> <p>CA\$57,756 CA\$67,493</p> <p>CA\$69,604 CA\$81,666</p> <p>CA\$51,985 CA\$60,606</p> <p>CA\$57,975</p>
