

Appendix A: How this guideline was developed

This guideline was developed in accordance with the process and methods set out in [Developing NICE guidelines: the Manual](#) (2014).

The review questions used to develop the guideline were as follows:

1. Which aspects of the experience of using adult social care services are positive or valued by people who use services?
2. For people who use adult social care services, what are the barriers related to improving their experience of care?
3. For people who use adult social care services, what would help improve their experience of care?
4. What methods and approaches for gathering, monitoring and evaluating the experiences of people using adult social care services are effective and cost-effective?

1. Search strategy

The evidence reviews used to develop the guideline recommendations were underpinned by systematic literature searches, following the methods described in the [manual](#). The aim of the systematic searches was to comprehensively identify the published evidence to answer the review questions developed by the Guideline Committee and NICE Collaborating Centre for Social Care (NCCSC).

A single search strategy for the review questions was developed by the NICE Collaborating Centre for Social Care. The research questions were translated into a framework of four concepts:

- (1) views and experiences – including: views, experience, preference, perspective, satisfaction, dissatisfaction feedback, learn, attitudes, expectation, complaint
- (2) Setting (social care services) – including: social care, social provision, social service, community, residential, home, personal budget, direct payment, care plan
- (3) Population (adults) – including: adults, older people, frail, elderly, homeless, disabled, disability

(4) Study type and outcomes – including: quality studies, evaluation studies, measures or outcomes, economic studies

These concepts were translated into search strategies using subject heading and free text terms. The strategies were run across a number of databases.

To help maximise the relevance of the results and to keep the search focused we combined difference terms near each other for 'service user' such as consumer, client, customer, people with terms used to elicit people's views and experiences, such as perspective, satisfaction, feedback, experience.

The search was restricted to human studies in the English language and published from 2000. This was chosen to include those studies that were most likely to be generalizable to the England and Wales policy and legislative context. Two significant policy and legislative documents included The Care Act 2014 and Valuing People 2001 that were intended to change the way people experienced health and social care.

Economic evidence was searched for as part of the single search strategy, and included searching within the economic databases the NHS Economic Evaluation Database (NHS EED) and the Health Economic Evaluations Database (HEED).

Additional searches of websites of relevant organisations were undertaken to capture literature that might not have been found from the database searches.

A call for evidence from stakeholders, providing an opportunity for any groups or organisations to submit relevant evidence was also carried out at the beginning of the review which ran on the NICE website up to the end of March 2016.

Guideline Committee members were also asked to alert the NICE Collaborating Centre for Social Care to any additional evidence, published, unpublished or in press, that met the inclusion criteria throughout the review.

The database and website searches were undertaken in March 2016. Update searching of the bibliographic databases searches took place in January 2017. When the update searches were ran an adjustment was made to the original search strategy to include the term 'disabled' in the population segment of the search.

Additional methods used

To ensure that we were including the views from different groups in this review and to capture the direct user experience it was necessary to look at additional evidence sources and types of evidence for this review.

We searched the Leeds Disability Rights Unit database and the Skills for Care Archive to identify any studies likely to contain the direct views and experiences of people from diverse groups using social care services.

The GC highlighted, from their experience, the compelling nature of video evidence on direct user experience. We additionally searched databases which contained a range of relevant video evidence accompanied by transcripts. This included SCIE Social Care TV and Think Local Act Personal (TLAP) video collection.

2. Sources searched

The following sources were searched.

Bibliographic databases

Social care and social science:

Ageline (Ebsco)

Applied Social Sciences Index & Abstracts (ASSIA) (Proquest)

International Bibliography of the Social Sciences (IBSS) (Proquest)

Social Policy and Practice (SCO, CPA, CLA, IDOX Information) (Ovid)

Social Work Abstracts (SWA) (Ovid)

Social Services Abstracts (SSA) (Ovid)

SocINDEX (Ebsco)

Sociological Abstracts (Proquest)

Health:

Cumulative Index to Nursing and Allied Health Literature (CINAHL) (Ebsco)

Medline (Ovid)

PsycINFO (Ovid)

Other databases:

Campbell Collaboration Library

Centre for Reviews and Dissemination database (includes NHS EED¹ - economic database and DARE)

Social Care Online (SCO)

The Cochrane Library

5. Review questions and objectives

1. Views and experiences of services users

Component	Description
Review No & Question Scope section:	1. Which aspects of the experience of using adult social care services are positive or valued by people who use services?

<p>Objectives</p>	<p>To identify evidence from 2000 onwards about what people who use adult social care services value as positive aspects of their experience. This should also include what people think works well or contributes to a positive experience. We will use a grounded approach to build a thematic framework that may be used to inform the analysis in subsequent reviews. If possible, themes around negative experiences will also be identified.</p>
<p>Criteria for considering studies for the review</p>	<p>Population: Adults aged 18 or over who use social care services</p> <p>Setting: All UK settings where adult social care services are delivered.</p> <p>Intervention: This is not an intervention review. It focuses on synthesizing evidence from a range of sources about service user views.</p> <p>Outcome: For this question, there is likely to be a considerable amount of evidence from qualitative data, although some types of quantitative or mixed methods studies may also be included. Both service user and service level outcomes may be included as appropriate. Relevant outcomes could include views about:</p> <ol style="list-style-type: none"> 1 Wellbeing and quality of life (related to health, mental health and social wellbeing). 2 Engagement with services and care, including understanding relevant care and management issues where appropriate. 3 Choice and control. 4 Satisfaction of people who use services (including carer, family and advocate perceptions of how satisfied the people who use services are).

	<p>5 Perceived and objectively measured independence.</p> <p>6 Ability to carry out activities of daily living with or without support.</p> <p>7 Continuity of care.</p> <p>8 Participation in social and community activities, including training and education, paid and unpaid employment.</p> <p>9 Resource use.</p> <p>10 Security and personal safety.</p>
<p>Evidence type</p>	<p>Research about the views and experiences of people who use services about the service they receive. This could be: qualitative, quantitative or mixed.</p> <ul style="list-style-type: none"> • Qualitative assessments • Quantitative studies such as surveys where views are gathered. • Mixed methods studies • Systematic reviews - if they address the same research question
<p>Changes made in the course of the review</p>	<p>Study type restricted to studies that are rich in qualitative data, directly reported by people using services themselves in each of the main settings (residential care, own home, hospital and community). Used this framework to identify gaps in the evidence.</p> <p>Used the 'scoping framework' to identify themes. When a theme became saturated, we didn't include more of those studies.</p> <p>Additional search for directly reported views papers (silver standard), and video transcript that address these gaps for three groups: people with learning</p>

	<p>disabilities, including autism; people with sensory impairments, people employing Personal Assistants.</p> <p>Consider people with particular needs and characteristics when reviewing additional evidence:</p> <ul style="list-style-type: none"> ○ Studies of people with learning disabilities (LD), including autism ○ Studies of people hard of hearing, with multiple sensory impairments ○ Studies of Personal Assistants (PAs). ○ LGBTQ ○ BME
--	---

2. Barriers to improving the experience of care

Component	Description
Review No & Question Scope section:	2. For people who use adult social care services, what are the barriers related to improving their experience of care?
Objectives	To identify barriers to improving the experience of adult social care services. The themes identified in Question 1 will be used to help focus this review. Factors that may limit or prevent people's positive experience of care might include barriers to people being engaged in their care planning and delivery; lack of information about what services users value or need; evidence about the characteristics of services where improvements in user experience are either not evaluated, or not improved following negative evaluation.

<p>Criteria for considering studies for the review</p>	<p>Population: Adults aged 18 or over who use social care services</p> <p>Setting: All UK settings where adult social care services are delivered.</p> <p>Intervention: This is not an intervention review. It seeks to synthesize evidence from a range of sources about the barriers and facilitators to improving the experience of adult social care services</p> <p>Outcomes: For this question, there is likely to be a considerable amount of evidence from qualitative data, although some types of quantitative or mixed methods studies may also be included. Both service user and service level outcomes may be included as appropriate. Relevant outcomes could include measures or information relating to:</p> <ol style="list-style-type: none"> 1 Wellbeing and quality of life (related to health, mental health and social wellbeing). 2 Engagement with services and care, including understanding relevant care and management issues where appropriate. 3 Choice and control. 4 Satisfaction of people who use services (including carer, family and advocate perceptions of how satisfied the people who use services are). 5 Perceived and objectively measured independence. 6 Ability to carry out activities of daily living with or without support.
---	--

	<p>7 Continuity of care.</p> <p>8 Participation in social and community activities, including training and education, paid and unpaid employment.</p> <p>9 Resource use.</p> <p>10 Security and personal safety.</p>
<p>Evidence type</p>	<ul style="list-style-type: none"> • Intervention or evaluation studies where barriers or facilitators are assessed • Qualitative assessments • Quantitative studies such as surveys where views are gathered. • Mixed methods studies • Systematic reviews - if they address the same research question
<p>Changes made in the course of the review</p>	<p>Included settings restricted to residential care, own home, hospital and community. Prioritised residential care studies because residential care considered an area where people's experience may be especially poor, and people may be more excluded from research.</p> <p>Study type restricted to those that are rich in qualitative data, directly reported by people using services themselves in each of the main settings (residential care, own home, hospital and community), except for residential care in which studies reporting views from people other service users were included.</p> <p>Used the 'scoping framework' to identify themes. When a theme became saturated, we didn't include more of those studies.</p>

	<p>Additional search for directly reported views papers (silver standard), and, video transcript that address these gaps, as a way of prioritising</p> <p>Consider people with particular needs and characteristics when reviewing additional evidence:</p> <ul style="list-style-type: none"> ○ Studies of people with learning disabilities (LD), including autism ○ Studies of people hard of hearing, with multiple sensory impairments ○ Studies of Personal Assistants (PAs). ○ LGBTQ <p>BME</p>
--	--

3. Facilitators to improving the experience of care

Component	Description
Review No & Question Scope section:	3. For people who use adult social care services, what would help improve their experience of care?
Objectives	To identify facilitators to improving the experience of adult social care services. The themes identified in Question 1 will be used to focus this review. Factors that help improve people's experience of care might include use of different kinds of information about service users' needs or views to inform development; engagement with formal groups or advocates, and so on. It is likely that there will be considerable overlap between the papers included in review 2 and 3, and some overlap between papers included in reviews 1 and 3.
Criteria for considering studies for the review	Population: Adults aged 18 or over who use social care services

	<p>Setting: All UK settings where adult social care services are delivered.</p> <p>Intervention: This is not an intervention review. It seeks to synthesize evidence from a range of sources about the barriers and facilitators to improving the experience of adult social care services.</p> <p>Outcomes: For this question, there is likely to be a considerable amount of evidence from qualitative data, although some types of quantitative or mixed methods studies may also be included. Both service user and service level outcomes may be included as appropriate. Relevant outcomes could include measures or information relating to:</p> <ol style="list-style-type: none">1 Wellbeing and quality of life (related to health, mental health and social wellbeing).2 Engagement with services and care, including understanding relevant care and management issues where appropriate.3 Choice and control.4 Satisfaction of people who use services (including carer, family and advocate perceptions of how satisfied the people who use services are).5 Perceived and objectively measured independence.6 Ability to carry out activities of daily living with or without support.7 Continuity of care.
--	--

	<p>8 Participation in social and community activities, including training and education, paid and unpaid employment.</p> <p>9 Resource use.</p> <p>10 Security and personal safety.</p>
Evidence type	<ul style="list-style-type: none"> • Intervention or evaluation studies where barriers or facilitators are assessed • Qualitative assessments • Quantitative studies such as surveys where views are gathered. • Mixed methods studies • Systematic reviews - if they address the same research question
Changes made in the course of the review	<p>Study type restricted to studies that are rich in qualitative data, directly reported by people using services themselves in each of the main settings (residential care, own home, hospital and community). Used this framework to identify gaps in the evidence.</p> <p>Used the 'scoping framework' to identify themes. When a theme became saturated, we didn't include more of those studies.</p> <p>Additional search for directly reported views papers (silver standard), and video transcript that address these gaps for three groups: people with learning disabilities, including autism; people with sensory impairments, people employing Personal Assistants.</p> <p>Consider people with particular needs and characteristics when reviewing additional evidence:</p>

	<ul style="list-style-type: none"> ○ Studies of people with learning disabilities (LD), including autism ○ Studies of people hard of hearing, with multiple sensory impairments ○ Studies of Personal Assistants (PAs). ○ LGBTQT ○ BME

4. Effectiveness and cost effectiveness of methods for evaluating experiences

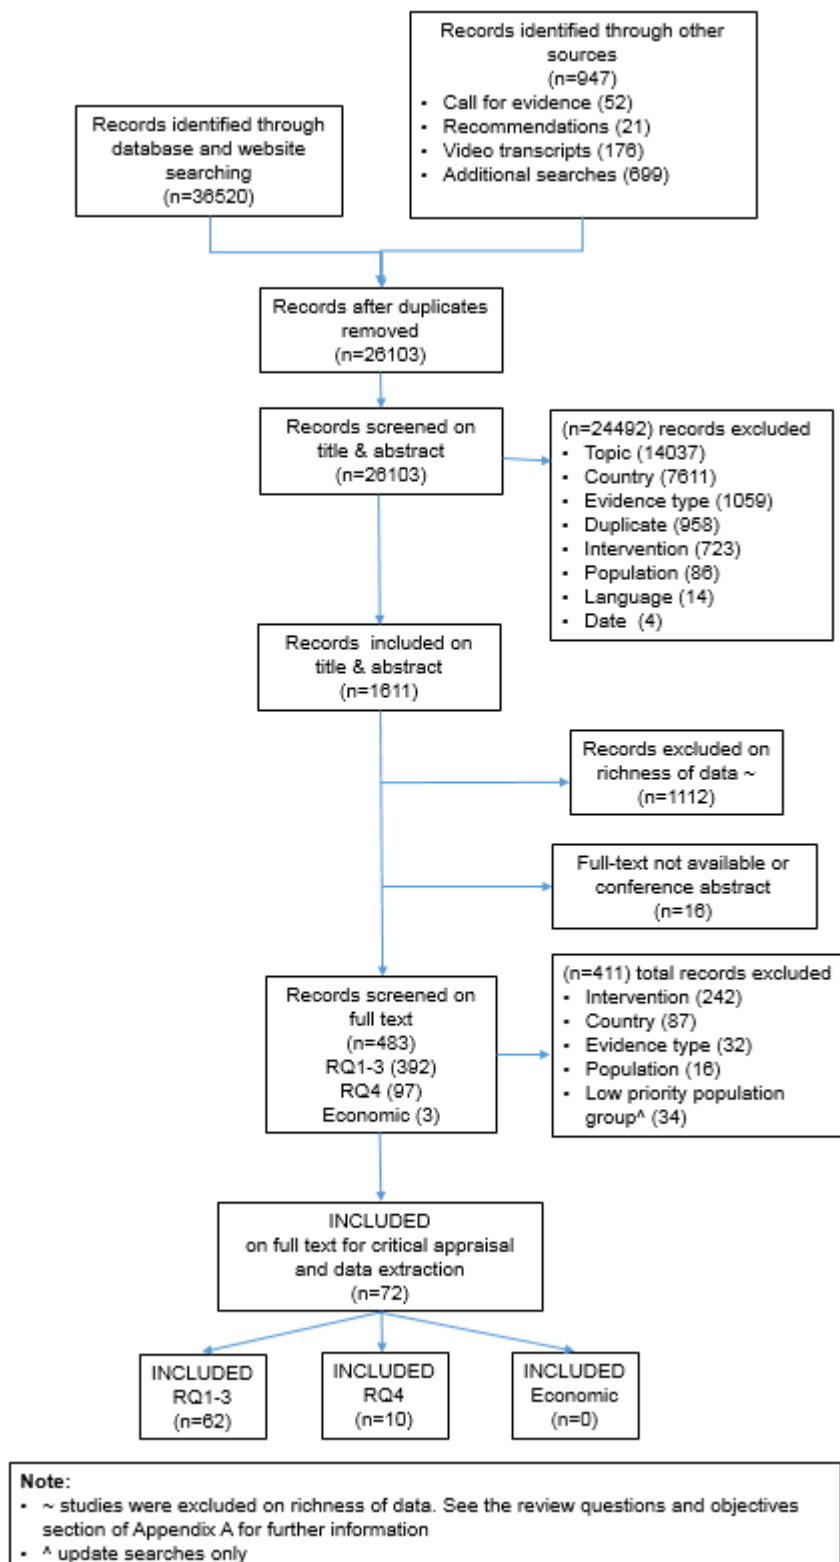

Component	Description
Review No & Question Scope section:	4. What methods and approaches for gathering, monitoring and evaluating the experiences of people using adult social care services are effective and cost-effective?
Objectives	There is some evidence – much of it from research on community engagement - that engagement in service design and delivery can improve both service and individual outcomes. The objective of this review question is to identify evidence from 2000 onwards about what works in terms of the different ways that services collate information about the views and experiences of people who use adult social care services; specifically, the question will focus on and how these activities impact on individual outcomes, including effectiveness and cost effectiveness.
Criteria for considering studies for the review	<p>Population: Adults aged 18 or over who use social care services</p> <p>Setting: All UK settings where adult social care services are delivered.</p> <p>Intervention: This question focuses on different approaches to gathering, synthesizing and using the</p>

	<p>views of adults who use services in service development and improvement.</p> <p>Outcomes: For this question, there is likely to be a range of interventions such as different models of consultation or service management, support services, such as advocacy and peer support, devices and technologies. Studies with a comparative design, including before / after designs, controlled trials, randomised controlled trial, cost effectiveness studies and other evaluation designs where a comparison group is used will be included, where individual outcomes are reported. Relevant outcomes could include measures or information relating to:</p> <ol style="list-style-type: none">1 Wellbeing and quality of life (related to health, mental health and social wellbeing).2 Engagement with services and care, including understanding relevant care and management issues where appropriate.3 Choice and control.4 Satisfaction of people who use services (including carer, family and advocate perceptions of how satisfied the people who use services are).5 Perceived and objectively measured independence.6 Ability to carry out activities of daily living with or without support.7 Continuity of care.
--	---

	<p>8 Participation in social and community activities, including training and education, paid and unpaid employment.</p> <p>9 Resource use 10 Security and personal safety.</p>
<p>Evidence type</p>	<ul style="list-style-type: none"> • Before / after or other controlled design, which measure and report on relevant individual outcome measures. • Controlled trials or RCTs • Studies of cost effectiveness • Evaluation studies where a control or comparison group is used • Systematic reviews of effectiveness studies
<p>Changes made in the course of the review</p>	<p>Using our original review protocol criteria we identified only two studies. We therefore explored options for identifying additional literature. We considered: amending our UK-only inclusion criteria to include studies with a control group from other countries; or, amending our criteria in relation to study design. On closer review, the latter option seemed more appropriate and useful for answering our question.</p> <p>It was suggested by the GC7 that we include studies evaluating the ASCOT toolkit as evidence for RQ4. We ran a specific search of studies of our EPPI database of studies (including the updated search studies) evaluating ASCOT. To be in scope and in keeping with processes developed for evidence presented to previous GC meetings, we set the criteria that these studies not only had to be evaluating the effectiveness of ASCOT but had to</p>

	ideally also include direct user views in the evaluation.
