Stakeholder	Document	Page No	Line No	Comments	Developer's response
2gether NHS Foundation Trust	Short	7	15	Challenging in practice as significant numbers of people we find initially do not want to receive information relating to diagnosis and stage of their condition. Would welcome greater clarity about the level of information that should be offered about prognosis to patients with early dementia. Suggest that the word 'offer' could be used rather than 'provide'.	Thank you for your comment. The committee noted that, as with all the recommendations in the guideline, people had the right to decline if they wished. However, they noted the evidence was clear that the majority of people diagnosed wanted information on and diagnosis and prognosis early, and therefore agreed the current wording in the guideline was the most appropriate.
2gether NHS Foundation Trust	Short	8	6	Challenging: at diagnosis it is often unknown which healthcare professionals and particularly social care teams will be involved. For healthcare – it would be possible for a 'dementia navigator' role to provide continuity but this would not usually be a healthcare professional – and to use healthcare professionals throughout would be challenging to the capacity of the system. For social care, in these counties, teams are not usually involved until/unless needs increase to a point where social care funding criteria are met, or if there is a crisis – and then there is only short term involvement. So to meet the recommendation would necessitate a marked increase in social care resources, which seems unlikely.	Thank you for your comment. The committee agreed it would not be possible to give full information on all the teams that will be involved in their care, but it should at least be possible to give information on those services that will be involved in providing post-diagnostic support and follow-up.

2gether NHS Foundation Trust	Short	9	17	Wish for clarification: it would be helpful if the document could provide clarity about whether or not dementia diagnosis in non-specialist settings (for example, by General Practitioners) is envisaged (so, for example, should the title read 'initial assessment and diagnosis in non-specialist settings?')	Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft guideline, in that people interpreted it as saying everyone need to attend an appointment at a secondary care service. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and treatment, but this did not mean the person necessarily had to travel to a physical appointment at that service. To ensure this is clear in the final version of the guideline, an explanation has been added to this section of the guideline, giving the following explanation around the term 'refer': "A referral to a diagnostic service does not require that the person be asked to attend a clinic appointment. It can also involve people being seen in community settings (such as their home or a care home), or advice being provided to the referrer without a formal appointment being made. The key issue is to ensure that dementia specialists are involved, both for advice on diagnosis and to ensure appropriate access to post-diagnostic support and treatment."
2gether NHS Foundation Trust	Short	10	25	Wish for clarification: it would be helpful if the document could provide clarity on the usefulness of structural imaging to guide subtyping of dementias using findings such as lobar atrophy or hippocampal atrophy.	Thank you for your comment. No evidence was identified on these imaging findings, and therefore the committee agreed it was not possible to make any recommendations.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
2gether NHS Foundation Trust	Short	11	17	This would necessitate a resource allocation for sampling CSF – perhaps a service level agreement with the local neurology service - and also for the lab testing service.	Thank you for your comment. The committee noted there are issues around access to imaging and CSF examination in certain areas, but agreed the evidence showed these test could be of diagnostic value in some cases, and therefore were appropriate to include in the recommendations.
2gether NHS Foundation Trust	Short	12	6	More frequent use of DAT scans would have resource implications: this is not currently commissioned on a routine basis, just for a limited number of patients. Also, the proportion of DLB cases with normal DAT scans is, I understand, uncertain.	Thank you for your comment. The committee agreed that the diagnostics accuracy of DAT scans for detecting DLB was high, and therefore it was an appropriate diagnostic investigation if a clear diagnosis had not been made by this stage. In order to clarify that such scans should only be undertaken if they are needed to secure a diagnosis, the committee added an additional recommendation for after initial specialist assessment: “Only consider further diagnostic tests if: • it would help to diagnose a dementia subtype and • knowing more about the dementia subtype would change management.”
2gether NHS Foundation Trust	Short	13	17	For the primary care based service to be multidisciplinary would require additional resources.	Thank you for your comment. The committee noted that, wherever reviews are carried out for people living with dementia, it was important they are able to provide the multidisciplinary support the person is likely to need.
2gether NHS Foundation Trust	Short	13	23	See comment number 2	Thank you for your comment. The committee agreed it would not be possible to give full information on all the teams that will be involved in their care, but it should at least be possible to give information on those services that will be involved in providing post-diagnostic support and follow-up.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
2gether NHS Foundation Trust	Short	15	9-14	On a population basis, provision of these measures would require a large injection of resources.	Thank you for your comment. This recommendation has been amended from that in the draft version of the guideline, and now reads: "Offer group cognitive stimulation therapy to people living with mild to moderate dementia. Consider group reminiscence therapy for people living with mild to moderate dementia"
2gether NHS Foundation Trust	Short	20	22	Instead of 'inappropriate care' it might be better to mention physical or psychological needs not being met.	Thank you for your comment. The committee discussed this but decided to keep the original wording as the clearest available.
2gether NHS Foundation Trust	Short	22	11	Challenge in practice: once non-drug measures have been tried, most alternative drug treatments (eg Z drugs) carry well-known adverse effects, while some patients do seem to benefit. Short courses of melatonin may be preferable to either the alternative drugs or to escalating carer stress.	Thank you for your comment. The committee noted this concern, but agreed there was not sufficient evidence on other pharmacological treatments to be able to make recommendations (either positive or negative), and agreed that an absence of alternatives was not a reason to promote the use of a drug (melatonin) where there is evidence of a lack of efficacy.
2gether NHS Foundation Trust	Short	22	13	Challenge in practice: resources are not widely available to implement these.	Thank you for your comment. The committee noted this concern, but agreed that with no robust evidence of any benefits from pharmacological interventions, non-pharmacological management, which did show benefits, was important to recommend.
2gether NHS Foundation Trust	Short	26	15	Challenge in practice: needs for respite care and short breaks are seldom funded locally. To assess carers' needs with no prospect of securing	Thank you for your comment. The committee noted that an assessment for respite care would often form part of a standard Carer's assessment, with the corresponding obligations to provide services deemed to be necessary.

				Hearing loss and dementia both have common symptoms, which can result in hearing loss being misdiagnosed as dementia. ⁴ Unaddressed hearing loss in people with dementia can accelerate cognitive decline. ¹⁹ Since hearing loss and dementia often co-occur, failure to recognise hearing loss in those who have dementia can exacerbate the symptoms of dementia. Hearing loss can also adversely affect performance on cognitive testing and can cause a diagnostic challenge for dementia. The most commonly used test to determine cognitive status, the Mini-Mental State Examination (MMSE), relies on the individual's ability to fully hear the instructions. ⁵ Findings from Jorgensen et al (2016) showed that reduced audibility significantly reduces scores on the MMSE, resulting in greater apparent cognitive deficits as audibility decreased. ⁶ Cohort studies investigating hearing loss have shown that even mild levels of hearing loss can increase the long-term risk of cognitive decline and dementia in

				<p>with all levels of hearing loss, including people who are profoundly deaf.</p> <p>Hearing loss is very common in old age. 55% of people aged over 60 years of age are estimated to be affected by some degree of hearing loss, this increases to 71% for those over 70 years.¹⁸ Considering dementia primarily affects older adults, it is likely that a large proportion of this population will also experience hearing loss. Of this group, many people will not have recognised or addressed their hearing loss, which could further accelerate cognitive decline,¹⁹ and make the symptoms of dementia appear worse. It is therefore imperative that the guideline recommends hearing screening in the initial assessment for the diagnosis of dementia.</p> <p>In England, enhancing the quality of life for people with multiple long-term conditions is a key focus of both the <i>NHS Five Year Forward View</i>²⁰ and the <i>NHS Outcomes Framework 2016/2017</i>.²¹</p>

				<p>Both of these documents emphasise the need for early intervention and diagnosis, a focus on the health and wellbeing of the individual patient, and the need for better integration between services.</p> <p>Improving early diagnosis and management of hearing loss is particularly important in the prevention and management of dementia.²² Hearing loss is a growing public health challenge and is increasingly seen as a national priority. This is demonstrated by the Department of Health and NHS England's Action Plan on Hearing Loss²³ published in March 2015, and NHS England's Commissioning Framework for Adult Hearing Loss Services²⁴ published in April 2016. However, ensuring earlier identification and management of hearing loss in the diagnosis and management of long term conditions such as dementia are not always realised in practice.</p>

				Furthermore, improved rates of early diagnosis and better integrated management of hearing loss alongside dementia would not only improve the quality of life of many people but it would also lead to significant cost savings. For example, it is estimated that at least £28 million per year could be saved in England if hearing loss is managed properly in people with dementia. ²⁵ In addition, further evidence shows that the use of hearing aids and implants for increased amplification leads to lower usage of health and social care. ²⁶ With significant pressures on the health and social care system to reduce costs it is imperative that health and social care professionals, commissioners and providers recognise hearing loss in the assessment, diagnosis and management of dementia.	
Action on Hearing Loss	Full	257-301	General	Section 13 'Non- pharmacological interventions for people living with dementia' should include the use of hearing aids as a non-pharmacological intervention for people living with dementia who have hearing loss.	Thank you for your comment. The committee noted that only very limited RCT evidence was identified on the use of hearing aids specifically in a population of people living with dementia. The committee agreed therefore that, in the absence of evidence, people living with dementia should receive the same

				<p>Question 1: The symptoms of dementia can make the assessment and management of hearing loss challenging This is because firstly, when testing for hearing loss the individual relies on their memory to recognise how their hearing compares with their hearing in the past.³³ They also rely on their memory to tell them how long they have been experiencing hearing loss for.</p> <p>Secondly, diagnosing hearing loss relies on the individual's ability to understand the instructions from the audiologist. This becomes difficult when the individual has symptoms of dementia, and as a result may feel confused. Additionally, there is a risk that hearing loss may be misdiagnosed as dementia,³⁴ since dementia itself can cause communication problems, such as difficulty in finding the right words.</p>	<p>investigated in primary care before referral for diagnosis (recommendation 1.2.6 in the short guideline). Finally, the committee agreed that once hearing loss was identified in a person living with dementia, this should be covered by the recommendation to "ensure that people living with dementia have equivalent access to diagnostics, treatments and care services for comorbidities to people who do not have dementia"</p>

				Furthermore, hearing impairment can adversely affect performance on cognitive testing and can cause a diagnostic challenge resulting in misdiagnosis. The most commonly used test to determine cognitive status, the Mini-Mental State Examination (MMSE), relies on the individual's ability to fully hear the instructions. ³⁵ Findings from Jorgensen et al (2016) showed that reduced audibility significantly reduced scores on the MMSE, resulting in greater apparent cognitive deficits as audibility decreased. ³⁶	
Action on Hearing Loss	Full	354 - 369	General	<p>Section 16 'Staff training' should also acknowledge the difficulties older people living with dementia in care homes may face when seeking help for hearing loss or when using hearing aids.</p> <p>Action on Hearing Loss's 'A World of Silence'³⁷ report shows that older people in care homes are less likely to want to address their hearing loss</p>	<p>Thank you for your comment. The committee agreed that in the absence of any specific evidence around staff training for hearing loss, it was not possible to include this in the recommendations. However, a reference to "adapting communication styles" is included within this section. The committee agreed the most appropriate way to address issues around hearing loss was by adding a cross-reference to the NICE guideline on hearing loss, which makes</p>

				is prevented at mid-life, with 55 years being the youngest mean age in which the presence of hearing loss is shown to increase dementia risk. The study calls for better management and prevention strategies of hearing loss and other risk factors, to tackle the rising number of people with dementia.	
Action on Hearing Loss	Full	407 - 418	General	Section 19 'Palliative care: care towards and at the end of life' should acknowledge the key requirement for good communication for people nearing the end of life. An additional recommendation should be included in the guideline to address the communication needs of people who have dementia and hearing loss undergoing palliative care. Recommendation 114 suggests to involve the person and their family members or carers, however without proper communication support a person with hearing loss may be unable to share their needs and preferences. Promoting good communication can allow patients to feel empowered, and enhance patient autonomy and dignity, helping to improve the quality of their remaining life. ⁴⁴	Thank you for your comment. No evidence was found on hearing loss in palliative care, so the committee agreed it was not possible to make specific recommendations on this topic. However, they agreed this should be covered by the recommendation to "ensure that people living with dementia have equivalent access to diagnostics, treatments and care services for comorbidities to people who do not have dementia." The committee agreed hearing loss would be a key comorbidity to address under that recommendation.

				Question 3: Health and care professionals caring for people undergoing palliative care should be informed on the use and maintenance of hearing aids and should ensure hearing aids are working and being utilised effectively. Similarly, patients and carers should also be informed about assistive listening devices which can help reduce the stress and burden associated with difficulty communicating.	
Action on Hearing Loss	Full	163 - 172	General	Section 8.1 aims to review how people living with dementia may be cared for when admitted to hospital, but fails to identify the additional communication needs that people with dementia may have due to hearing loss. Please refer to comment 2.	Thank you for your comment. The committee noted this as an issue, but agreed that since no evidence was identified on hearing loss in people living with dementia admitted to hospital, it was not possible to make specific recommendations on this issue.
Action on Hearing Loss	Full	402	5-12	The use of hearing aids and incidence of dementia is an important research recommendation which should be prioritised. The significance of this research area is recognised by the James Lind Alliance, Priority Setting Partnership on Mild and Moderate Hearing Loss, which identifies the effect of early	Thank you for your comment. The committee noted this issue was already covered by the NICE guideline on hearing loss, which contains the following research recommendation: "In adults with hearing loss, does the use of hearing aids reduce the incidence of dementia?"

				<p>fitting of hearing aids on the rate of cognitive decline as a key research question.⁴⁵</p> <p>Although currently evidence on the association between hearing aids and cognition is limited, existing evidence suggests a positive association. For example, a prospective study by Amieva et al (2015) showed no difference in the rate of change in MMSE score over the 25 year follow up period in participants with hearing loss using hearing aids compared to the control group (participants without hearing loss). In contrast, participants with hearing loss who did not use hearing aids declined more rapidly on the MMSE than the control group, the findings suggest that hearing aid use decreases cognitive decline.⁴⁶ Findings from Dawes et al (2015) study showed hearing aids to be associated with better cognition, which was independent of social isolation and depression. Suggesting that positive effects of hearing aid use on cognition may be due to improvements in audibility or associated</p>

				<p>diagnosis of Alzheimer's disease, especially in the earliest stages of the disease. Diagnosing dementia is a complex challenge, and doctors have to gather a range of clues to create a picture of what is going on in the brain. Most often, doctors will make a dementia diagnosis by assessing a person's symptoms and ruling out other potential causes of memory and thinking problems, but this approach doesn't always provide conclusive results.</p> <p>Alzheimer's disease is a progressive neurodegenerative disease, and the hallmarks of the disease are present years before any symptoms might occur. Current approaches to diagnosis are focused on the mild, moderate and severe stages and it is important healthcare professionals have a focus on diagnosing in the early stages. According to the Royal College of Psychiatrists' most recent National Audit of Memory Clinics 2014, only 52% patients received an early diagnosis. This is important as when new treatments become available they will be most effective in the earliest stages. In addition to the inclusion of CSF and FDG-PET, the Guideline should reference the importance of the NHS being responsive to developments in technology</p>

Alzheimer's Research UK	Short	10	11	<p>The current phrasing of the guideline implies that all suspected cases of dementia should be referred to a specialist memory assessment service.</p> <p>While we would support this approach, we would question whether there is sufficient current capacity in memory services to ensure all people with suspected dementia can be seen in a timely manner – especially if we are to improve diagnosing in the earliest stages.</p> <p>According to the most recent audit of Memory Clinics, published by the Royal College of Psychiatrists:</p> <ul style="list-style-type: none"> • “Between 2013 and 2014, the number of patients seen by memory clinics increased by 31% on average, although available capacity did not increase significantly.” • “The average waiting time from referral to assessment increased from 5.2 weeks in 2013 to 5.4 weeks in 2014, and waiting time from assessment to diagnosis increased from 8.4 to 8.6 weeks.” <p>While referral to a specialist memory service should be offered to all people with memory</p>	<p>Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft guideline, in that people interpreted it as saying everyone need to attend an appointment at a secondary care service. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and treatment, but this did not mean the person necessarily had to travel to a physical appointment at that service. To ensure this is clear in the final version of the guideline, an explanation has been added to this section of the guideline, giving the following explanation around the term ‘refer’:</p> <p>“A referral to a diagnostic service does not require that the person be asked to attend a clinic appointment. It can also involve people being seen in community settings (such as their home or a care home), or advice being provided to the referrer without a formal appointment being made. The key issue is to ensure that dementia specialists are involved, both for advice on diagnosis and to ensure appropriate access to post-diagnostic support and treatment.”</p>

				establish the subtype diagnosis. Magnetic resonance imaging (MRI) is the preferred modality to assist with early diagnosis and detect subcortical vascular changes, although computed tomography (CT) scanning could be used. Imaging may not always be needed in those presenting with moderate to severe dementia, if the diagnosis is already clear.”	
Alzheimer's Research UK	Short	11	15	<p>We think the Guideline should have greater reference to the different stages and severity of dementia, recognising diseases such as Alzheimer's as progressive neurodegenerative diseases. This includes greater reference to the mild, moderate and severe stages, and that the hallmarks of the disease are present years before any symptoms might occur. For example, recognising the difference between Alzheimer's Dementia and Alzheimer's disease. This will support greater understanding and awareness among healthcare professionals.</p> <p>Understanding severity of dementia is also important for the later guideline section on use of pharmacological interventions, as prescribing decisions are in part made according to the severity of the condition. In addition, given that the mental health care clusters, through which</p>	<p>Thank you for your comment. The committee noted that in many areas the evidence base only covered with particular dementia subtypes and at particular stages of severity. The committee agreed that wherever possible it was appropriate to try and extrapolate this evidence to the more general population of people living with dementia, as otherwise there was a risk of particular groups or dementia subtypes not being covered, solely because studies happened not to have been done in those populations (in particular in people with severe dementia).</p> <p>They agreed this in places led to a lack of specific recommendations for different settings, but believed this was a more acceptable situation than for whole situations not be covered due to a lack of evidence.</p>

Alzheimer's Research UK	Full	P161/2	general	<p>We support the approach that regularity of follow-up should be flexible according to need and preferences. However the guideline should specify a minimum follow-up interval to ensure patients are not lost in the system and are monitored. Including monitoring use of medications and care and support plans, and an individual's ability to cope with their dementia.</p> <p>We also note that there is no guidance about primary care responsibilities should a memory assessment service (or equivalent) discharge a patient.</p>	<p>Thank you for your comment. The committee considered whether it could specify a minimum follow-up interval, but agreed there was currently no evidence to inform that decision. They were also concerned that such a minimum standard would be interpreted as applying to a large section of the population living with dementia, when in fact people with complex needs would need to be seen considerably more often. The committee also noted the guideline already contained a recommendation around the monitoring of care and support plans, and specified that review dates needed to be clearly specified within those.</p> <p>The committee agreed that there was no evidence to make specific recommendation on how to follow-up people discharge from specialist services but noted that a key issue was that areas had a suitable route for people to get back in to specialist services if their needs changed.</p>
Alzheimer's Research UK	Full	98	general	<p>We note that a range of diagnostic assessments are recommended for primary care and that they have similar specificity and sensitivity. We also recognise that many of the tests focus on simple memory recall and therefore can be less helpful in cases where memory loss is not the predominant symptom.</p> <p>We suggest there is a research recommendation made to develop the evidence base in this area.</p>	<p>Thank you for your comment. The committee agreed this was an area of potential future research. However, they noted that, compared to many other areas of the guideline, a reasonable number of studies had been conducted here, and more were known to be ongoing. Therefore, they agreed it was not as high a priority to recommend future research here as in other areas of the guideline.</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Alzheimer's Research UK	Full	170	General	We are concerned that the approach of the committee to potential change to clinical practice is weighted towards pragmatism rather than clinical excellence. To dismiss the TEAM trial model of care because it would be hard to deliver and result in significant acute care reorganisation suggests that the practical challenges of service delivery have more priority than optimising care pathways.	Thank you for your comment. The committee agreed that if the TEAM trial had demonstrate meaningful benefits from the model of care studied, these would justify the potential difficulties in transitioning to such a model of care. However, they noted that the trial had not found a meaningful difference in the outcomes of people living with dementia and their carers, and there was therefore no evidence on which to make a positive recommendation for this approach at this time.
Alzheimer's Research UK	Full	189	Quality of evidence	Given that the committee noted a lack of evidence for the evaluation of interventions for diet, obesity, alcohol and smoking, we would suggest that there should be a research recommendation to address this gap in the evidence base.	Thank you for your comment. The committee discussed this and agreed that currently research around preventing dementia was likely to be of higher priority than research in slowing the progression of established dementia. However the committee were unable to make research recommendations on preventing dementia, as this topic was beyond the scope of the guideline.
Alzheimer's Research UK	Full	208	23-24	We recognise that costs related to informal care can be hard to quantify, however for a condition such as dementia, which relies so significantly on informal carers, to not adequately consider these costs could result in an under-representation of the scale of the problem. We recommend further research to understand how wider cost impacts, including informal care costs, could be measured and the impact this	Thank you for your comment. Although we recognise that costs related to informal care are significant, the NICE reference case does not include informal care costs not borne by the NHS, as set out in the NICE guide to the methods of technology appraisal: https://www.nice.org.uk/process/pmg9/chapter/the-reference-case

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				<p>could have on assessing cost-effectiveness for interventions for dementia.</p> <p>The total cost of dementia is over £26bn. The majority of dementia costs per year are due to informal care at £11.6bn (44.2%), with social care costing £10.3bn (39.0%) and healthcare costs £4.3bn (16.4%).</p>	
Alzheimer's Research UK	Full	376	general	<p>We are concerned that there is a lack of detail regarding the challenge of dementia as a multi-morbidity. While the NICE guidance on multi-morbidities offers an overview, there are specific and unique considerations of how dementia may impact on other conditions - for example someone may forget to take a prescription for diabetes or may not remember to attend a clinical appointment to manage their blood pressure. We would suggest that more detailed guidance should be developed on dementia and co-morbidities.</p> <p>We recommend building on advice included in the 2006 Guideline: "At the time of diagnosis of dementia, and at regular intervals subsequently, assessment should be made for medical comorbidities and key psychiatric features associated with dementia, including depression</p>	<p>Thank you for your comment. The committee agreed that the management of comorbidities in people living with dementia was an important issue, and were disappointed with the lack of evidence available on which to make recommendations. They therefore made a number of research recommendation, in the hope that more evidence will be available for future updates of the guideline.</p> <p>Since the draft version of the guideline, additional recommendations have been added around hearing tests and eye tests for people living with dementia, as these were identified as particularly common comorbidities.</p> <p>The committee agreed that in the absence of evidence on how people living with dementia should have comorbidities managed differently from people without dementia, the key issue was ensuring equivalent access to appropriate services. This was what led to the recommendation to "ensure that people living with dementia have equivalent access to diagnostics, treatments and care services for comorbidities to people who do not have dementia."</p>

				<p>To avoid people being left without information, the guidelines could provide further direction in specifying who should provide this information, or that provision of information should be documented in a single place, accessible to all people that may be providing care (such as in the care plan), so that it is known whether information has been provided.</p>	
Alzheimer's Society	Short	8	3	<p>As highlighted above information provision is vital and we very much welcome its inclusion in the guidance.</p> <p>However there could be some consideration of not overwhelming people with too much information at the point of diagnosis, and the importance of providing a follow up appointment after diagnosis, and to provide more information at this point. This follow up could be with a Dementia Adviser, GP, or memory clinic staff for example. At the time a diagnosis is given many patients are in a state of shock, and in some cases denial, and in need of time to digest the diagnosis. There is recognition of this in the full document which says 'being diagnosed with</p>	<p>Thank you for your comment. The committee agreed with the importance of their being further opportunities for providing information and support, and the guideline includes a recommendation to "direct people and their family members or carers (as appropriate) to relevant services for information and support" after diagnosis.</p> <p>They also agreed providing carer with information was important, and noted the recommendations on information were phrased as "provide people living with dementia and their family members or carers (as appropriate) ..."</p>

Alzheimer's Society	Short	9	14	This statement is indicating that the professional will note down the advance statements and decision, which is a fantastic idea for people as this would make it easier for people to do this. If professionals were involved in this way then it may lead to an increase in people planning ahead in this way. However, for this to happen properly and be of real benefit to people the staff doing this will need to be properly trained , especially as for an advance decision to be valid there are certain legal requirements that need to be met.	Thank you for your comment. The committee agreed that staff involved in advance care planning would need appropriate training to ensure they fulfil the appropriate legal requirements in the documentation.
Alzheimer's Society	Short	9	16	As a whole the section needs to emphasise joint working across specialties and services.	Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft guideline, in that people interpreted it as saying everyone need to attend an appointment at a secondary care service, rather than decisions being made jointly between primary and secondary care. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and treatment, but this did not mean the person necessarily had to travel to a physical appointment at that service. To ensure this is clear in the final version of the guideline, an explanation has

				Checking pulse	
Alzheimer's Society	Short	9	18	Taking a history shouldn't just include cognitive and behavioural symptoms but should also consider a wider range of symptoms, notably psychological (mood changes, apathy, psychoses) and physical changes. This supports a person-centred approach and is in line with the principles asserted at the start (page 6).	Thank you for your comment. The committee agreed with these suggestions, and therefore the history has been expanded to include "cognitive, behavioural and psychological symptoms" and reference has been included to a physical examination.
Alzheimer's Society	Short	9	21	This is a good addition of including someone who knows the person well in taking a history.	Thank you for your comment and your support for this recommendation.
Alzheimer's Society	Short	9	24	We are surprised not to see the inclusion of the GPCOG and would like to see this included. Whilst the full guidelines (page 99, page 101) state that evidence for GPCOG is from a screening study rather than a study in people with suspected dementia, the GPCOG is routinely used in GP practices.	Thank you for your comment. The committee were aware of the use of the GPCOG in practice. However, they noted that the GPCOG has only been tested as a screening test, and no evidence currently exists on the accuracy of the test in a population of people with suspected dementia. The committee noted that studies are likely to find better diagnostic accuracy in an unselected population than one with suspected dementia (as many people in the study will have no cognitive impairment, and therefore will be easily classified by the test), and therefore agreed it was appropriate to

				working. A better recommendation would be for joint working with a neurological service.	and therefore it was not possible to make this part of the recommendation.
Alzheimer's Society	Short	10	19	This should highlight that people with a learning disability, particularly those with Down's syndrome, are at a greater risk of developing dementia at a younger age.	Thank you for your comment. The committee agreed with this point, and made the following comments in their discussion of the diagnostic evidence in the full guideline: "The committee agreed that physicians should be aware of the additional challenges of diagnosing dementia in certain vulnerable groups, such as people with learning difficulties and Down's syndrome, and those people with language and sensory impairment, lower educational levels and a low standard of literacy. Whilst the evidence base did not allow them to make specific recommendations for how the diagnostic pathway should be different for these groups of individuals, they agreed that it was important that people from these more difficult to diagnose groups should be assessed by a clinician with specialist skills in those areas, who would be familiar with the difficulties and able to make appropriate adaptations to the process used."
Alzheimer's Society	Short	10	22	This heading refers to diagnosis in specialist services and the previous heading refers to assessment in non-specialist settings. This would seem to imply that diagnosis shouldn't happen in non-specialist primary care settings, however there are examples of this being done, for example in Salford. In some cases, where primary care staff are appropriately trained, and for cases	Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft guideline, in that some stakeholders interpreted it as saying everyone need to attend an appointment at a secondary care service. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and

Dementia: assessment, management and support for people living with dementia and their carers

**Consultation on draft guideline - Stakeholder comments table
02/01/2018-13/02/2018**

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Alzheimer's Society	Short	12	3	Whilst it is not appropriate to use Apolipoprotein E genotyping or electroencephalography in the diagnosis of Alzheimer's disease, this point may lead people to not use EEG at all. However in people with epilepsy, and people experiencing seizures, an EEG may be appropriate.	Thank you for your comment. The committee agreed that, for clarity, this recommendation should be modified to "do not use electroencephalography to diagnose Alzheimer's disease." In the absence of evidence, the committee agreed it was not possible to make a more positive recommendation about when it might be used.
Alzheimer's Society	Short	12	24	Whilst the full document states that this recommendation is not in conflict with the dementia CQUIN, now part of the standard contract for hospitals, carrying out cognitive assessments on patients over 75 with an unplanned hospital admission, which could be considered a form of case finding, we believe this could appear to be in conflict with the CQUIN, and should be clarified.	Thank you for your comment, and for pointing out this error. This section of the guideline has been rewritten to make clear that this guideline does not affect the interpretation of the CQUIN: "The committee noted that case finding for dementia was introduced in acute hospitals as part of the Commissioning for Quality and Innovation (CQUIN) 2013/14 guidance, and that the committee's recommendations should be interpreted as applying to situations outside this existing guidance."
Alzheimer's Society	Short	13	13	This recommendation lacks clarity. It says to refer a person to a memory service, but they would already be in a memory service for diagnosis. Whilst it is good that the recommendation highlights the importance of a multidisciplinary service, it is unclear what is meant by 'a memory	Thank you for your comment. The committee agreed it was appropriate to reword this recommendation as "ensure they and their family members or carers (as appropriate) have access to a memory service or equivalent hospital- or primary-care-based multidisciplinary dementia service." The committee agreed they would have liked to be able to make more specific recommendations on how these service

				service or equivalent hospital or primary-care-based multidisciplinary dementia service' and what this looks like in practice.	should be organised, but this was not possible based on the evidence available.
Alzheimer's Society	Short	13	16	The wording of 'a choice of flexible access or prescheduled monitoring appointments' is quite vague and unclear.	Thank you for your comment. The committee agreed they would have liked to be able to make more specific recommendations on how these service should be organised, but this was not possible based on the evidence available.
Alzheimer's Society	Short	13	22	The word ' integrated ' should feature in this section a lot more. There are different models of care coordination but integration across settings is key.	Thank you for your comment. The guideline contained a specific review question on the integration of health and social care services, but only a limited amount of evidence was identified and the committee agreed it was not possible to make more directive recommendations than those currently included.
Alzheimer's Society	Short	13	23	Although implied, this could benefit from stating that care coordination should take place as soon as possible .	Thank you for your comment. To address this, a cross-reference has now been added from the recommendation on information to give at the time of diagnosis, to the recommendation on care coordination.
Alzheimer's Society	Short	13	23	We welcome the recommendation for a single person coordinating care. The full document states 'The committee agreed that the positive overall findings from the studies on case management provided robust evidence that there should be a single person responsible for coordinating care' however this does not state	Thank you for your comment. The committee noted this point, and agreed that in practice this role was sometimes carried out by someone who is not a health or social care practitioner. However, they agreed that since the evidence identified all had people from these roles carrying out the care coordination (specifically either nurses, social workers or occupational therapists) it was appropriate to retain this wording in the recommendation.

				comorbidities, which may require more rapid reviews and more frequent follow up'	
Alzheimer's Society	Short	14	12	This could state that as a minimum the care plan should be reviewed annually (as recommended in the NHSE Dementia Good Care Planning guidance).	Thank you for your comment. The committee discussed whether to set a minimum frequency of review, and 1 year was one of the options discussed. However, they were concerned that this would lead towards an assumption that annual reviews were sufficient in general, whilst for many people the reviews may need to occur more frequently. For this reason, the committee agreed it was appropriate not to specify a frequency of review in the recommendation.
Alzheimer's Society	Short	14	14	This section is good, and it is particularly good to see recognition of a wide range of health and care settings mentioned here, but the statements here are very broad and not prescriptive. Whilst the full document (pg 152) recognises a lack of evidence on how information should be transferred and that local areas may adopt different solutions, we still feel more guidance is needed here for it to have any impact in practice.	Thank you for your comment. The committee noted the concerns raised by a number of stakeholders about the lack of specificity in the recommendations, but agreed that at the current time the evidence did not enable them to be more prescriptive. They noted the guideline does contain a number of recommendations for future research in this area, which will hopefully enable more specific recommendation to be mad in future updates of the guideline.
Alzheimer's Society	Short	14	25	This could include a statement on those with learning and /or physical and sensory disabilities.	Thank you for your comment. The committee agreed with this suggestion and these groups have been added to the recommendation.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Alzheimer's Society	Short	15	5	This section should include the importance of healthy lifestyle - exercise, low alcohol intake, not smoking; or 'what is good for your heart is good for your head'. Whilst the full document says 'The committee noted the absence of studies evaluating nonpharmacological or behavioural interventions for modifying risk factors like poor diet, obesity, alcohol consumption and smoking.' (page 189) we still feel this would be a helpful addition.	Thank you for your comment. No specific evidence was identified to make recommendations on these topics, but the committee agreed a number of these issues are covered by the recommendation to "ensure that people living with dementia have equivalent access to diagnostics, treatments and care services for comorbidities to people who do not have dementia."
Alzheimer's Society	Short	15	5	There is a lack of psychosocial intervention content . See BPS, A guide to Psychosocial Interventions in Early Stages of dementia for an example of interventions that may be beneficial, with accompanying evidence. We also note that most of the psychosocial interventions are preceded with 'consider', yet many of the pharmacological interventions are recommended.	Thank you for your comment. The committee agreed it would have been able to provide more detailed targeting of the recommendations for psychosocial interventions, but agreed the evidence was not sufficient for them to be able to do so. They noted a number of recommendations for future research in this area were made, which they hoped would mean these issues can be resolved in future updates of the guideline.
Alzheimer's Society	Short	15	9	The recommendation on CST has softened from the current guidelines, which state 'People with	Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and

				<p>mild-to-moderate dementia of all types should be given the opportunity to participate in a structured group cognitive stimulation programme. This should be commissioned and provided by a range of health and social care staff with appropriate training and supervision, and offered irrespective of any drug prescribed for the treatment of cognitive symptoms of dementia.'</p> <p>This is surprising as the evidence base for CST has increased since the last guidelines.</p> <p>Evidence for CST:</p> <p>For example, a systematic review by Olazaran et al (2010) concluded that Cognitive Stimulation demonstrates the best evidence for improving cognitive functioning amongst all non-pharmacological interventions. Several trials within the Cochrane review compared Cognitive Stimulation with an active, social control group, yet the results were consistently in favour of structured group Cognitive Stimulation over a social control (Woods et al, 2012).</p> <p>There are benefits to CST that are not noted in the full document (pg 296). There are other</p>	<p>come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The committee agreed the evidence base was stronger for CST (as a manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-effectiveness. The committee therefore agreed it was appropriate to split this in to two separate recommendations, a stronger recommendation for CST and a weaker recommendation for reminiscence. Specifically:</p> <p>"Offer group cognitive stimulation therapy to people living with mild to moderate dementia.</p> <p>Consider group reminiscence therapy for people living with mild to moderate dementia."</p> <p>Please find below a response for each of the papers you cited.</p> <p>Spector (2003) reported an improvement in quality of life, but the pooled result of the studies included in the meta-analysis could not differentiate an effect between cognitive stimulation therapy (CST) and the control group.</p> <p>Regarding Yamanaka (2013), the committee agreed that the mood measure used in the study was not appropriate to pool</p>

				<p>benefits found in some of the studies included in the NICE review: quality of life (Spector et al 2003), mood (Yamanaka et al 2013), activities of daily living (Orrell et al 2014). There are also additional studies not included in the NICE review including Niu et al 2010 which showed benefits to depression and apathy, and Paddick et al 2017 that showed benefits to anxiety and behavioural symptoms; and also a Cochrane systematic review (Woods et al 2012) on 15 RCTs of CST that found evidence of improvements in quality of life and communication.</p> <p>The recent Lancet commission on dementia also states that CST is the psychological approach with the strongest evidence for improving cognition.</p> <p>This evidence is also specific to CST, there isn't evidence to suggest that unspecified elements of CST, as recommended in these new guidelines, would have the same effects. CST is also quite different to reminiscence therapy – CST focuses on the generation of new thoughts, ideas and associations and is believed to engage executive functioning skills and enable new semantic connections to be made; whereas reminiscence therapy focuses on the past.</p>	<p>with the other quality of life measures found in other studies, so this data point was not included.</p> <p>Orrell (2014) reported an improvement in QoL-AD but the pooled result of the meta-analysis could not detect clinically meaningful differences in quality of life between people living with mild/moderate dementia offered cognitive stimulation therapy versus usual care.</p> <p>Niu (2010) was excluded from this review question due to it recruiting participants with >5 points in the Neuropsychiatric Inventory, which the committee agreed was a fundamentally different population to the general population of people living with dementia.</p> <p>Olazaran (2010) was included as a systematic review in Appendix O but data was not extracted because Olazaran (2010) did not report details of the individual studies included in their systematic review.</p> <p>Paddick (2017) has now been included as evidence for CST. The inclusion of this study did not make a meaningful difference to any of the results of the analysis.</p> <p>Woods (2012) was included in Appendix O. This systematic review was used as a source for individual RCTs on CST.</p>

				<p>Evidence for cost effectiveness of CST:</p> <p>We would suggest that the assumption that there would be no difference in cost of delivery between providing an intervention with a more varied range of components cannot be made without a cost effectiveness analysis.</p> <p>There is strong evidence for the cost effectiveness of manualised CST, in two key papers (Knapp et al, 2006; D'Amico et al, 2015).</p> <p>There are several errors in Appendix J (p.10) which considers the cost of providing CST: It states that band 4 or 6 staff are required to run sessions, when in reality this is often band 2 staff. It states that groups are for 5 people, when key research trials included between 5-10 people in each group and many trusts offer groups for up to ten people. The total cost per session is calculated as £233.19 in appendix J, however the Knapp (2006) paper calculated the cost per session as £90. Using the Knapp cost per session calculation, even with just 5 people in each group, the total cost per patient</p>

				<p>concern given wider research into the increased likelihood of mortality from isolation (Holt Lunstad et al., 2015).</p> <p>There is evidence on the benefits of peer support here: https://www.housinglin.org.uk/assets/Resources/Dementia/OtherOrganisation/Peer_support_resource_pack_HIN.pdf</p> <p>This should be a separate point to offering CST.</p>	
Alzheimer's Society	Short	15	21	While true, this feels like odd advice and potentially risks putting people off IPT in general.	Thank you for your comment. A definition has been added to the guideline, and the committee were keen to stress this was a recommendation not to use interpersonal therapy to treat the cognitive symptoms of Alzheimer's disease. If people living with dementia had another condition for which interpersonal therapy were indicated, the committee agreed it would be correct to offer them to people living with dementia in the same way as those without.
Alzheimer's Society	Short	16	1	We would recommend the addition of a section on when to review pharmacological interventions, what to review and how to assess benefit . The latter should take into account information from patients and carers and include consideration of: not just improvement in	Thank you for your comment. The guideline did look for evidence on when and how pharmacological interventions for people living with dementia should be reviewed. However, no evidence was identified, and therefore the committee agreed it was most appropriate for this section to cross-refer to the NICE guideline on medicines optimisation.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				cognition, BPSD and / or function but also slowing of decline, stabilisation. In a neurodegenerative condition improvement (especially sustained improvement) is not the usual outcome.	
Alzheimer's Society	Short	16	19	There is inconsistency here in the recommendation to consider memantine for anyone taking AChEIs but not a suggestion of the reverse.	Thank you for your comment. The committee noted this concern, but agreed that since the majority of the evidence was specifically on the addition of memantine to a cholinesterase inhibitor, and cholinesterase inhibitors are the recommended first line treatment for people with mild dementia, the current wording of the recommendation was the most appropriate one. They did, however, note that in practice people were likely to also consider the addition of cholinesterase inhibitors for people who had already started on memantine.
Alzheimer's Society	Short	18	27	Consider making it clearer that these should continue to be offered as clinically indicated for underlying conditions such as diabetes or hypertension.	Thank you for your comment. The committee agreed this point was covered by the part of the recommendation to "not offer the following to slow the progress of Alzheimer's disease." The phrase "specifically to slow the progression of Alzheimer's disease" has now been used to make clear they should still be offered for relevant comorbidities. Treatment of the comorbidity itself would be covered by the alternative recommendation to "ensure that people living with dementia have equivalent access to diagnostics, treatments and care services for comorbidities to people who do not have dementia."

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. Stakeholder	Document	Page No	Line No	Comments	Developer's response
Alzheimer's Society	Short	19	6	We welcome this section, which brings a more pragmatic approach to the limited evidence base around the therapeutically challenging area of dementia with Lewy bodies.	Thank you for your comment, and your support for these recommendations.
Alzheimer's Society	Short	20	20	There is some evidence that simple painkillers such as paracetamol could reduce agitation in people with dementia. (Ballard study - https://www.nursingtimes.net/paracetamol-could-reduce-agitation-in-dementia-patients/5032937.article)	Thank you for your comment. The Ballard study published by Husebo et al. (2011) was found by the searches for this evidence review. However, Husebo et al. (2011) was excluded because the paper did not report on the clinical outcomes listed in our PICO for this review question.
Alzheimer's Society	Short	20	21	Consider expanding this list of 'pain, delirium or inappropriate care' to include 'sensory impairment(s), overly noisy environment'	Thank you for your comment. The committee noted it was not possible to provide an exhaustive list of things that may be associated with agitation, and agreed these would be covered under "clinical or environmental causes".
Alzheimer's Society	Short	20	24	'Offer psychosocial and environmental interventions' is broad and vague, and could include specific interventions to offer. Behavioural and psychological symptoms of dementia such as agitation, aggression, changes in communication and apathy affect up to 90% of people with dementia (Feast, Orrell et al. 2016) and there should be more guidance in this area.	Thank you for your comment. The committee agreed it would have been able to provide more detailed targeting of the recommendations for psychosocial and environmental interventions, but agreed the evidence was not sufficient for them to be able to do so. They noted a number of recommendations for future research in this area were made, which they hoped would mean these issues can be resolved in future updates of the guideline.

					disease. Be aware that interventions may need to be modified for people living with dementia."
Alzheimer's Society	Short	22	7	A 'consider' recommendation of an antidepressant for severe dementia would seem reasonable. Evidence is not strong either way but options in this group are limited.	Thank you for your comment. The committee agreed that in the absence of any evidence, it was not possible to make recommendations on the use of antidepressants in people living with severe dementia.
Alzheimer's Society	Short	22	11	There is reasonable evidence and clinical practice to support use of melatonin for REM sleep behavioural disorder in dementia with Lewy bodies (for example, www.ncbi.nlm.nih.gov/pubmed/20191945/) and a 'consider' recommendation for sleep problems (or RBD) in dementia with Lewy bodies would arguably be justified.	Thank you for your comment. The committee noted this and the fact that the majority of the evidence from the trials was in Alzheimer's disease, and therefore agreed it was appropriate to amend this recommendation to "do not offer melatonin to manage insomnia in people living with Alzheimer's disease." The committee also agreed it was appropriate to add a cross-reference to the Parkinson's disease guideline for the management of non-cognitive symptoms (included RBD) covered there, as no evidence was identified specifically in people with PDD or DLB to allow recommendations to be made in this guideline.
Alzheimer's Society	Short	22	17	There is no mention of sensory impairment . Omitting sensory impairment seems an oversight and useful guidance in this area could support the quality of life and abilities of many people with dementia. Having sight or hearing loss makes things even more difficult for the person with dementia who may already be struggling with	Thank you for your comment. The committee agreed the most appropriate way to address issues around hearing loss was by adding a cross-reference to the NICE guideline on hearing loss, which makes the recommendations you quote on hearing

				<ul style="list-style-type: none"> 13 per cent have diabetes <p>Barnett K, et al (2012) Epidemiology of multimorbidity and implications for healthcare, research, and medical education: A cross-sectional study, <i>Lancet</i>, 380, 37–43.</p>	
Alzheimer's Society	Short	22	24	Whilst this does refer to people who are unable to self-report pain, this should also highlight that people with dementia frequently don't volunteer when they have pain or discomfort.	Thank you for your comment. The committee agreed with your comment and for this reason made the recommendation to use "a structured observational pain assessment tool alongside self-reported pain and standard clinical assessment."
Alzheimer's Society	Short	23	4	This should detail the stepwise treatment protocol or link to one for clarity and consistency.	Thank you for your comment. The committee noted that the stepwise protocols in the studies were the same as those that would be used for people without dementia, and therefore would be familiar to the relevant healthcare professionals.
Alzheimer's Society	Short	23	15	Research has found that older adults with dementia are twice as likely to fall as those without dementia (Allan et al, 2009) . It would be important to acknowledge this. It would also be beneficial to highlight types of dementia that may increase falls risk such as Parkinson's disease dementia and dementia with Lewy bodies.	Thank you for your comment. The committee agreed that people living with dementia are at increased risk of falls, and this was behind their reasoning to highlight the importance of people getting access to the same evidence based falls prevention interventions as would be offered to people without dementia.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Alzheimer's Society	Short	24	9-13	<p>For people with dementia it can be difficult to determine when they are "approaching the end of life." More detail to support practitioners with this would be helpful. As the person may lose capacity, conversations with the individual, their family and carers where appropriate should take place as early as possible (as the person may have lost capacity when they are at the end of life).</p> <p>It would be useful to add 'identifying whether the person has made an advance decision to refuse treatment / Lasting Power of Attorney for health and welfare' as these will be relevant if the person does lack capacity.</p>	<p>Thank you for your comment. The committee agreed that it can be difficult to identify when someone with dementia is approaching the end of life, and the guideline contains a research recommendation on "the most effective interventions to support staff to recognise advanced dementia and develop appropriate escalation/end of life plans to facilitate care to remain at home."</p> <p>They also agreed it was important that information on any advance decision made was available to health and social care staff.</p>
Alzheimer's Society	Short	24	1	<p>The full document (page 170) recognises that 'it was often not appropriate for people living with dementia to be treated on general hospital wards' and 'The committee agreed the correct approach was rather to take elements of best care found in specialist units and apply these to all geriatric units, thereby raising the overall standard of care.' No elements of this 'best care' is reflected in the short guidelines.</p>	<p>Thank you for your comment. The committee noted that the large NIHR TEAM trial (comparing ways of organising hospital care), if it had produced more positive results, could have led to a number of strong recommendations being made around how care in hospitals should be organised for people living with dementia, and agreed it was unfortunate that meaningful benefits for people living with dementia were not identified in this study.</p> <p>The committee agreed that, given the results of this study, it was not possible to include any strong and definitive recommendations in this section.</p>

				<p>The guidelines recognise that admission to hospital should be avoided wherever possible, recognising the evidence that people with dementia who go into hospital are often less physically well and less mentally well when they leave than when they went in. Some hospital admissions are unavoidable though and so it seems an omission not to include guidance on how to improve care for admissions that are unavoidable, to avoid or reduce these negative outcomes. Department of Health figures show that people with dementia in hospital account for around 3.2 million bed days a year, with 25 per cent of hospital beds occupied by people with dementia at any one time. (http://www.parliament.uk/business/publications/written-questions-answers-statements/written-question/Commons/2014-11-05/213473). There is an impact both on the individual and cost of care, if a person's condition deteriorates and they require a longer stay or require discharge to residential care.</p> <p>While screening for delirium at arrival is essential, much more can be done to improve care quality for people with dementia in hospital; specific to meeting the needs of people with dementia, so</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				with dementia at the end of life e.g. in a care home.	possible to include any recommendations on this topic in the guideline.
Alzheimer's Society	Short	24	6	The point of diagnosis may not be appropriate to 'offer' someone palliative care as they may be reluctant to have a conversation, so this should be an ongoing process that responds to the person's needs.	Thank you for your comment. The committee agreed with this point, and noted that the phrase "from diagnosis" was used to capture that this should be a continuous process throughout the person's life.
Alzheimer's Society	Short	24	9	Further information is needed for what constitutes an 'anticipatory healthcare planning process'.	Thank you for your comment. A cross-reference has been added from this recommendation to the section on advance care planning to improve the clarity of this recommendation.
Alzheimer's Society	Short	24	14	As the guidelines signposted to here are not dementia-specific, the section on palliative care in the dementia guidelines needs more detail about the specific needs of people with dementia when it comes to palliative care and how palliative care can support the individual, rather than just signposting to other guidance. Similarly, the mental capacity guidance is not completed yet and more detail is needed for supporting people with dementia approaching the end of life who may lack capacity.	Thank you for your comment. An evidence review was conducted, looking for evidence on specific palliative care interventions for people living with dementia. However, in the absence of any effective interventions being found, the committee agreed it was most appropriate to cross-refer to the general NICE guidance on palliative care. The NICE guideline on decision-making and mental capacity is due to publish in July 2018.

**Consultation on draft guideline - Stakeholder comments table
02/01/2018-13/02/2018**

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Alzheimer's Society	Short	24	23	This statement is quite generic and misses the opportunity to talk directly to the individual about issues which impact them, particularly around comfort feeding. Positive to have this included as previously the notion was if a person was dying then it would be better not to provide drink, but there needs to an element of assessment in this which is not referred to.	Thank you for your comment. The committee noted that a decision-aid is going to be produced to accompany the guideline, covering issues around eating and drinking. The committee agreed this should hopefully address many of the points raised.
Alzheimer's Society	Short	24	25	We still see people with dementia who receive the feed so more information on this point is needed. Alzheimer's Society has a report on end of life which has more information and could be helpful for these purposes.	Thank you for your comment. NICE will be producing a decision-aid on issues relating to feeding that will be published alongside the guideline.
Alzheimer's Society	Short	25	1	It is good to see this point about keeping people with dementia out of hospital. At the same time, this section could be more explicit about which services the hospital should refer to. Suggesting local health and care services that should be considered as an alternative would be beneficial. Stakeholders need the additional guidance on this and the NICE guidelines are an excellent opportunity.	Thank you for your comment. The committee agreed that no evidence was identified on alternative services to refer people living with dementia to if hospital admission is deemed inappropriate, and therefore it was not possible to make recommendations on this topic.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. Stakeholder	Document	Page No	Line No	Comments	Developer's response
Alzheimer's Society	Short	25	1	There doesn't seem to be any discussion of different care settings and the decision seems to be based only on "medical needs". At end of life, people can be admitted to hospital in times of crisis but there is no mention of how to address this early, before the decision to admit someone (or even call an ambulance) arises.	Thank you for your comment. The committee agreed that no evidence was identified on alternative services to refer people living with dementia to if hospital admission is deemed inappropriate, and therefore it was not possible to make recommendations on this topic.
Alzheimer's Society	Short	25	10	<p>It is positive to see above factors being taken into account but is the staff member having a conversation with the relevant stakeholders about Lasting Power of Attorney etc. and the protocols that need to be in place to inform decision making about what to do in any health and care setting.</p> <p>There needs to be a wider discussion with family and carers even if there is no LPA.</p> <p>There should be an in-depth conversation about how to take into account any advance care and support plans and what in particular needs to be taken into account. This should not just be a DRI. In some CCGs, there is strict guidance.</p>	Thank you for your comment. The committee noted that the list of factors given here were only examples, and there were many other factors that would need to be taken in to account in individual cases. The specific examples on the list were chosen by the committee as those they agreed were likely to be the most common problems encountered.
Alzheimer's Society	Short	25	14	Family carers should be provided with information to understand what happens when	Thank you for your comment. The committee agreed that providing accurate and timely information was important for

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				care, including how to understand and respond to changes in behaviour, that is tailored to diverse groups, and tailored along the dementia pathway'	recommendation most accurately reflect the evidence upon which this recommendation was based.
Alzheimer's Society	Short	26	20-28	We understand that there is other NICE guidance on moving to different care settings, however, these do not focus specifically on dementia. People with dementia experience different issues when moving to different care settings, compared to those that do not have dementia, and so this guidance could be expanded to focus on these issues and consider a dementia perspective on moving.	Thank you for your comment. The guideline did look for evidence on how transitions should be managed for people living with dementia. However, the evidence found for this review question was not sufficient to allow any recommendations to be made, and it was for this reason the guideline chose to make cross-references to the existing NICE guidelines on transitions between care settings, rather than different recommendations being made for this guideline.
Alzheimer's Society	Short	26	2-3	The first two bullets of this section should be swapped around.	Thank you for your comment. This has been changed as suggested.
Alzheimer's Society	Short	26	10	This statement is too broad – does this mean cost effective or effective in the form of the intervention, or both? Group sessions should be tailored to meet the needs of the person and culturally appropriate, e.g. reflecting the needs of the LGBT, BME or travelling community.	Thank you for your comment. The committee agreed the evidence available, from both subgroup analyses of the RCT data and the meta-regression model, showed that on average, group sessions were more effective than individual, telephone or online sessions. However, the committee also agreed both that the group sessions would need to be appropriately tailored to the individuals attending them, and that this format would not be

Stakeholder	Document	Page No	Line No	Comments	Developer's response
					the most suitable for all individuals, due to differences in their circumstances and preferences. They therefore agreed it was appropriate for the recommendation for group sessions to be kept at the weaker "be aware" level, and that the guideline should also recommend support for carers is "provided in a format suitable for them (for example individual or group sessions, or online training and support)", to ensure this is not taken as a blanket statement that group sessions are the most appropriate format for all carers.
Alzheimer's Society	Short	26	15	The carers assessment should mention care act advocacy, and support should be provided to carers to do the assessment. The assessment should have a vision of what to do at point of crisis and reference the dementia journey such as palliative care planning. The assessment should enable capturing of data around behaviours that challenge to provide context where additional support is required.	Thank you for your comment. The committee agreed that, in the absence of any evidence being identified, it was not possible to give recommendations on what the content of a Carer's assessment should be, or how they should be conducted.
Alzheimer's Society	Short	26	19	Overall, the guidance in this section is not very clear. It would be quite difficult to use this guidance to ensure stakeholders are following good practice of transition between care settings. If the guidelines were more detailed, they would provide a better guide for developing a good standard of care at a local level.	Thank you for your comment. The guideline did look for evidence on how transitions should be managed for people living with dementia. However, the evidence found for this review question was not sufficient to allow any recommendations to be made, and it was for this reason the guideline chose to make cross-references to the existing NICE guidelines on transitions between care settings, rather than different recommendations being made for this guideline.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				<p>The lack of guidance on care homes means a significant population of people with dementia are being missed.</p> <p>70% of care home residents are people living with dementia (Prince M, Knapp M et al (2014). Dementia UK: Update, Alzheimer's Society). This is around 280,000 people in the UK. The current guidelines provide some recommendations for care homes (1.1.10 in current guidelines) - including the importance that design of built environments for living in meet the needs of people with dementia, and factors that should be paid attention to including size of units, mix of residents, skill mix of staff, a supportive and therapeutic environment. At a minimum this previous guidance should be reinstated. There is also new evidence in relation to care homes that could be considered. Randomised trial evidence (Ballard et al, 2018 https://www.ncbi.nlm.nih.gov/pubmed/29408901) arising from a large NIHR (WHELD) programme grant has underlined the benefit of person-centred approaches in nursing settings. This study aimed to evaluate the efficacy of a person-centred care and psychosocial intervention incorporating an antipsychotic review, WHELD, on</p>	<p>a more acceptable situation than for whole situations not be covered due to a lack of evidence.</p> <p>The committee also noted that many of the recommendations made (such as those around staff training and managing non-cognitive symptoms) were of direct relevance to care homes, and much of the evidence underpinning these recommendations was based on people living in care homes. The committee noted there is considerable ongoing research around dementia care and how this should be organised in different settings, and agreed that the publication of this evidence should make it possible to make more specific recommendations in future updates of the guideline.</p> <p>The specific study you cite (Ballard 2018) was published after the cut-off date for evidence to include within the guideline. However, this reference has been passed to the NICE surveillance team for consideration in planning future updates of the guideline.</p>

				<p>QoL, agitation, and antipsychotic use in people with dementia living in nursing homes, and to determine its cost. These findings suggest that the WHELD intervention confers benefits in terms of QoL, agitation, and neuropsychiatric symptoms, albeit with relatively small effect sizes, as well as cost saving in a model that can readily be implemented in nursing homes.</p> <p>The lack of guidance on home care means a significant part of the dementia journey is being missed.</p> <p>An estimated 60% of people receiving homecare services have some form of dementia (UKHCA, 2013). This is around 400,000 people in England.</p> <p>Care in hospitals is commented on later.</p>	
Alzheimer's Society	Full	General	general	The guideline scope document says that people with a confirmed diagnosis of mild cognitive impairment (MCI) will not be covered by this guideline. However the boundary between dementia and MCI is not always clear cut.	Thank you for your comment. The diagnosis and management of mild cognitive impairment was not within the scope of this guideline, and therefore it was not possible to make recommendations on this topic. A number of stakeholders have raised this as an important issue needing guidance, and this feedback has been based to the commissioning team

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				<p>People who have MCI are also at an increased risk of going on to develop dementia (around 39% of those diagnosed with MCI in specialist settings and 22% in population studies develop dementia over the subsequent 3 to 10 years compared with 3% of the population without MCI at the same age - Lancet commission). We therefore think it is important that people with MCI are considered within this guideline. As per the current version of the guideline, people with MCI should be offered follow-up to monitor cognitive decline and other signs of possible dementia in order to plan care at an early stage (1.3.3.3. in current guidelines). It could also be added that a diagnosis of MCI provides an opportunity for making lifestyle changes to reduce the chances of MCI progressing to dementia. The Lancet commission calculated that 21.7% of dementia progression from mild cognitive impairment is potentially preventable by eliminating poor diet, diabetes, and neuropsychiatric symptoms (assuming these are risk factors for, not symptoms of, or the result of, dementia), whilst recognising that more research is needed in this area.</p> <p>MCI also isn't currently covered by any other NICE guidelines.</p>	<p>within NICE for consideration when the topics of future guidelines are discussed.</p>

Alzheimer's Society	full	General	general	The guidelines have removed mention of review and treatment of vascular and other modifiable risk factors in middle aged and older people (for example, smoking, excessive alcohol consumption, obesity, diabetes, hypertension and raised cholesterol) and there is no mention at all of risk in these new guidelines. With the Lancet commission on dementia reporting that 30% of cases of dementia are potentially avoidable through modifiable lifestyle factors, it is important that risk factors are recognised within these key dementia guidelines.	Thank you for your comment. This guideline did not contain a review question on the prevention of dementia, or risk factors for the development of dementia, and therefore it was not possible to make recommendations on this topic.
Alzheimer's Society	Full	General	general	There is an omission of the importance of the physical environment , which can affect aspects of assessment, management and support in general (i.e. a noisy or poorly lit room during assessment). The environment is only mentioned briefly in managing non-cognitive symptoms (1.7). There is evidence on the environment from the Kings Fund's Enhancing the Healing Environment (EHE) Programme (funded by the Department of Health) and the Association for Dementia Studies at the University of Worcester.	Thank you for your comment. Evidence on modifications of the physical environment was looked for in the section of the guideline on maintaining independence and reducing risk. Only a very limited amount of evidence was identified on this issue, and none that the committee believed was robust enough to be able to use to make recommendations. The particular report you cite was not included as evidence, due to not being published in a peer-reviewed journal. However, the committee did agree this was an important issue, and one that should be considered in future updates of the guideline. The committee also noted that the guideline did make a number of recommendations around staff training, and that

				Through its work with over 250 care organisations, the EHE Programme has created a solid body of evidence to support the design of environments which promote well-being. Projects have demonstrated that relatively inexpensive interventions, such as changes to lighting, floor coverings and improved way-finding, can have a significant impact. Evaluation has shown that environmental improvements can have a positive effect on reducing falls, violent and aggressive behaviours (as well as improving staff recruitment and retention). The EHE schemes have shown that it is possible to improve the quality and outcomes of care for people with dementia as well as improve staff morale and reduce overall costs by making inexpensive changes to the environment of care.	well-trained staff were likely to be able to respond more promptly and appropriately in situations where aspects of the physical environment need to be modified in order to improve the care and support for people living with dementia.
Alzheimer's Society	Full	General	general	There is an omission of assistive technology that can support someone to live well.	Thank you for your comment. Evidence on the effectiveness of assistive technology was specifically looked for as part of the development of the guideline, but no randomised controlled trials were identified. The committee agreed it was therefore not possible to make recommendations on this topic at this time, but did note that there are a number of ongoing trial in this area, such as the ATTILA (Assistive Technology and Telecare to maintain Independent Living At home for people

					with dementia) study. Therefore, it will hopefully become possible to make recommendations on this in the future when these studies have published.
Alzheimer's Society	full	General	general	<p>There is no mention of inherited dementia and referring people for genetic counselling, as included in the current guidelines (1.3.1.3 and 1.3.1.4 in current guidelines).</p> <p>People can experience distress if diagnosed with dementia that is likely to have a genetic cause – worried about children they have, or about future reproductive choices.</p>	Thank you for your comment. Based on the feedback received at consultation, the committee agreed it was appropriate to add two new recommendations to the guideline, raising awareness of the genetic causes of a proportion of both frontotemporal dementia and early-onset Alzheimer's disease. They agreed that the evidence was not sufficient to make specific recommendations on how this should be managed, but that, in line with elsewhere in the guideline, they would expect equivalent advice and support be provided to people diagnosed with dementia as those within and other genetic condition.
Alzheimer's Society	full	General	General	The guidelines don't address the issue of people that have obvious cognitive impairment but don't want a diagnosis . This can have huge consequences for the individual, can be hugely challenging to families and can present ethical issues too. This can be very challenging for GPs and guidance in this area would be welcomed.	Thank you for your comment. The committee agreed that there was no evidence identified within the guideline that would enable them to make recommendations, but agreed this was a relevant issue. As noted within the committee's discussion of the evidence for the diagnostic section; "the committee commented that it was also important to consider situations where a patient may not want a referral for an assessment/diagnosis, and the potential disadvantageous outcomes that might result from this choice (e.g. problems with obtaining support, care and treatment)."

Alzheimer's Society	full	General	general	We welcome the ' person-centred care ' section preceding the recommendations, but there should be more mention of 'person centred' care throughout the recommendations themselves.	Thank you for your comment. The committee agreed that person-centred care should be a key feature underlying all of the interactions between staff and people living with dementia and their carers. They therefore agreed it was most appropriate to retain this as a standalone section, since including references to this in some recommendations in the guideline could have the incidental effect of making the principles appear less important in those areas where they are not referenced. An exception to this was made for the recommendation on staff training, where the committee agreed that training on person-centred care was sufficiently important that it should be explicitly mentioned.
Alzheimer's Society	Full	98		The full guidelines recognise that 'being diagnosed with dementia can be a stressful and traumatic experience' and ' the importance of guiding people with suspected dementia through the assessment process carefully ' (page 98). This needs to be reflected in a recommendation in the 'Diagnosis' section.	Thank you for your comment. The committee agreed there was not sufficient evidence to make specific recommendations around how the diagnostic process should be organised for people living with dementia. However, they did agree that a key aspect was staff being appropriately trained in how to manage this process. Consequently, they amended one of the recommendations around staff training to make explicit it covered the diagnostic process. Specifically: "Health and social care professionals advising people living with dementia (including those involved in diagnosis) should be trained in starting and holding difficult and emotionally challenging conversations."
Alzheimer's Society	Full	101		The full guidance states that 'physicians should be aware of the additional challenges of diagnosing	Thank you for your comment. The committee agreed with the importance of this issue – hence its inclusion within their

				area where systemic therapists working in older people's services have particular expertise and consideration of this therapeutic avenue might be worth including in the guideline.	
Association for Family Therapy and Systematic Practice in the UK	short	28	11-13	Says: Health and social care professionals advising people living with dementia should be trained in starting and holding difficult and emotionally challenging conversations. This might have considerable training and cost implications.	Thank you for your comment. The committee noted this concern, but agreed the clear evidence that this training was effective in improving the experience of people living with dementia justified its inclusion in the recommendations.
Bangor University	Full	108	30-31	'If Alzheimer's disease is suspected, include a test of verbal episodic memory in the assessment.' This is sound advice, that would be improved by examples of the type of tests that the committee had in mind as being helpful. These might range from the 3 item free recall on the MMSE, the name and address on the ACE-R to sub-tests of the Wechsler Memory Scale. However, we are concerned that readers might gain the impression that a cognitive test in a single domain suffices in a diagnostic assessment. In cases where the diagnosis is not clear cut, a neuropsychological assessment covering the whole range of cognitive functions is needed (to assess global impairment), and in straight-forward cases a wide-ranging scale such as the ACE-R may serve this purpose. Thus	Thank you for your comment. The committee agreed the evidence did not enable them to identify a preferred verbal episodic memory test to recommend. However, to address the concerns about this being undertaken at the expense of more detailed testing, two changes have been made to the recommendations. First, reference has been added to "cognitive testing" as part of the initial specialist assessment, to make clear the verbal episodic memory test should be part of broader cognitive testing. Secondly, a specific recommendation has been added around formal neuropsychological testing for people with an unclear diagnosis: "Consider neuropsychological testing if it is unclear: • whether or not the person has cognitive impairment • whether or not their cognitive impairment is caused by dementia or

				this recommendation – the only one regarding cognitive assessment in a specialist setting – runs the risk of being misleading.	<ul style="list-style-type: none"> • what the correct subtype diagnosis is.”
Bangor University	Full	108	4, 14-16	We were surprised not to find any mention of the GP-Cog (Brodaty et al 2002; JAGS), which has the advantage over other scales of having a brief informant questionnaire built in – easier to administer in primary care than IQCODE. For primary care use, I think this scale should be considered.	<p>Thank you for your comment. The committee were aware of the use of the GPCOG in practice. However, they noted that the GPCOG has only been tested as a screening test, and no evidence currently exists on the accuracy of the test in a population of people with suspected dementia.</p> <p>The committee noted that studies are likely to find better diagnostic accuracy in an unselected population than one with suspected dementia (as many people in the study will have no cognitive impairment, and therefore will be easily classified by the test), and therefore agreed it was appropriate to recommend only those tests shown to have sufficiently good properties in the relevant population.</p>
Bangor University	Full	109	9-24	‘If the diagnosis is uncertain and Alzheimer’s disease is suspected...’ ; in this section new diagnostic procedures are being recommended that appear to us to be beyond the capacity of the memory assessment services with which we have worked over many years. We would welcome clarity as to what is meant by ‘if the diagnosis is uncertain’; does this mean a) that it is uncertain whether or not the person has a dementia or b) the sub-type of dementia is uncertain? If the	<p>Thank you for your comment. The committee noted there are issues around access to imaging and CSF examination in certain areas, but agreed the evidence showed these test could be of diagnostic value in some cases, and therefore were appropriate to include in the recommendations.</p> <p>The committee noted that the ‘consider’ recommendation for CSF examination came at the end of the diagnostic pathway, and would consequently only be of relevance for the small number of people who still did not have a diagnosis after all</p>

				latter, then we wonder what the cost-benefit analysis of sub-type determination is – especially for older age groups, where it is well-established that mixed sub-types are the norm, and where, as the draft guideline states CSF evaluation is less accurate. There needs to be a balance between full investigation and the benefits gained, determined on a case by case basis. In the hard working, accredited memory services we have worked with, one of the factors in extending the period required for a diagnosis to be made has been the waiting time for 'specialist' investigations such as MRI scans. More resources would be needed for timely access to the new investigations recommended here, and we would suggest that these resources might be equally, if not more, valuable used in providing post-diagnostic support for those who are diagnosed.	the prior possible diagnostic steps had been considered. However, they noted that a number of stakeholders had interpreted this recommendation as bringing CSF earlier in the diagnostic pathway, and to counter that conception agreed it was appropriate to add an additional recommendation before all of those on imaging and biomarkers. Specifically: “Only consider further diagnostic tests if: • it would help to diagnose a dementia subtype and • knowing more about the dementia subtype would change management.”
Bangor University	Full	300	4-6	We have looked at the recommendations, and the underlying rationale, in some detail, because we have participated in many of the largest UK trials of approaches including cognitive stimulation, reminiscence and cognitive rehabilitation. We have also led the Cochrane reviews of cognitive stimulation (2012) and of reminiscence therapy, which is due to be	Thank you for your comment. Please find below a response for each of the papers you cited. Thank you for pointing out the error with the Woods data – this has now been corrected wherever it appeared. Regarding Eritz (2015), there was variability between the different non-pharmacological interventions. Therefore,

				<p>published early March 2018. We appreciate the huge volume of work that has gone into the reviews and meta-analyses in the draft guidelines, and the complexity of interpreting the world-wide literature.</p> <p>In relation to reminiscence therapy, the Cochrane review has drawn on a similar pool of studies, although some different decisions have been made regarding studies to include in meta-analyses. We noted that (appendix H, p120) Woods 2012/2016 is included in studies using the ADCS-ADL – this is incorrect. We also noted that (appendix H, p124) Eritz et al are included in the individual reminiscence therapy analysis – our reading of this paper suggests that the study did not include any formal reminiscence work with individual patients. Leaving aside any errors or differences in interpretation, our overall results are similar. We found overall a very small effect on cognition (14 studies SMD 0.11; 95%CI 0.00 to 0.23) and no overall effect on quality of life. The smaller number of studies (nine) using the MMSE showed a mean difference of 1.87 points (95%CI 0.54 to 3.20). However, we found a great deal of inconsistency, and as well as the individual v group v joint reminiscence sub-group analyses</p>	<p>interventions were grouped together into categories if they shared the same characteristics. For example, Eritz (2015) evaluated a life history intervention involving semi structured interviews with people living with dementia and/ or a proxy family carer or relative regarding residents' childhood, friends, personality and life events. This life intervention was categorised as reminiscence therapy which also uses life stories to improve psychological well-being.</p> <p>The overall quality of life SMD at follow-up (0.26, 95%CI 0.03 to 0.49) was downgraded for impression because 95% CI crossed 1 line of a defined MID interval.</p> <p>The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The committee agreed the evidence base was stronger for CST (as a manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-effectiveness. The committee therefore agreed it was appropriate to split this in to two separate recommendations,</p>

				<p>that NICE have undertaken we found that whether the study used a care home population or a community sample made some difference to the results obtained. In care homes, there was an improvement in quality of life (3 studies; SMD 0.46; 95%CI 0.18 to 0.75), but not in community settings.</p> <p>In relation to cognitive stimulation, the effects on cognition are well-established, and there was also – in our view more importantly - an effect on quality of life in our 2012 Cochrane Review. We consider this case has been strengthened by the Orrell et al 2014 maintenance cognitive stimulation study. Examining the meta-analyses of this outcome for cognitive stimulation (appendix H, pp. 102-103), it appears that the mid-point evaluation in this study has been included as 'postintervention' and the final evaluation, at the end of the 6 months of once a week sessions has been included under 'follow up'. We note that the overall quality of life SMD at follow-up is 0.26 (95%CI 0.03 to 0.49), which would appear to be above the pre-determined threshold of 0.2 for a meaningful clinically important difference, and so we would suggest that this provides evidence for the broader effect</p>	<p>a stronger recommendation for CST and a weaker recommendation for reminiscence. Specifically:</p> <p>“Offer group cognitive stimulation therapy to people living with mild to moderate dementia.</p> <p>Consider group reminiscence therapy for people living with mild to moderate dementia.”</p>

				<p>of cognitive stimulation, beyond cognition. We have previously shown, of course, that the changes in cognition mediate the changes in quality of life in cognitive stimulation groups (Woods et al; 2006 Aging & Mental Health, 10, 219-226). We note that the improvement specifically on the QoL-AD is 1.87 points, which falls short of the 3 point difference the committee established as the MID for this scale – this is a tough test, reflecting an SMD of around 0.5.</p> <p>In summary, we are suggesting from our examination of the evidence that:</p> <ul style="list-style-type: none"> a) The committee distinguish between the benefits of interventions for people with mild to moderate dementia living in care homes, compared with those living in the community. b) The committee recognise the effects of cognitive stimulation on quality of life as well as on cognition. <p>It is noteworthy that in the maintenance cognitive stimulation trial (Orrell, 2014), no difference in outcomes between care home and community settings was found, so this is probably an issue largely for reminiscence therapy.</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				<p>We have read with interest the committee's thinking that has led to recommendation 75. We do not consider that the recommendation to include elements of cognitive stimulation and reminiscence therapy in structured group activities is supported by the evidence, and cannot be justified on the basis that cognitive stimulation includes elements of reminiscence. These are distinct groups of approaches, each with a large body of work beyond RCTs developing understanding of concepts and mechanisms of change. Reminiscence in particular comes in many shapes and forms, with individual life story books probably the most promising aspect for the future. Where cognitive stimulation considers aspects of the person's life story, this is brought into the present and changes over the years highlighted.</p> <p>There is one study that does include a mixture of reality orientation (an early form of cognitive stimulation), reminiscence and physical exercise (Tanaka 2017) that has been included in the NICE meta-analyses as a reminiscence study, but the evidence from this small study does not appear to us strong enough to recommend a mixed treatment approach of this type.</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				<p>A mixed treatment needs development and evaluation in its own right; we cannot imagine a similar recommendation being made for psychological therapies in other domains, where generally the evidence suggests that following one model produces the best results (even if the choice of model is less crucial).</p> <p>We note that the committee consider it possible that any effects of these interventions is due to effects not specific to the actual treatment modality e.g. simply meeting as a group. We considered this possibility in our 2012 Cochrane review of cognitive stimulation, and were not able to identify different outcomes for those studies with some form of attentional control.</p> <p>We are also concerned regarding the recommendation being restricted to those not already accessing them (structured group activities). If they are currently being offered, this is typically as a result of the 2006 NICE guideline and resulting MSNAP accreditation criteria. Any recommendation regarding future availability of psychosocial intervention groups does not need this restriction.</p>

				<p>We also note that the committee consider the interventions discussed here as being 'intensive' (p 299). We note that the interventions both in the REMCARE and maintenance cognitive stimulation trial comprised one session a week, and we would suggest this is hardly intensive in the context of dementia. Early studies for example delivered sessions up to 5 days per week.</p> <p>In conclusion, we would re-frame the recommendation as follows:</p> <p>“Offer structured group activities, including cognitive stimulation groups and reminiscence groups, to people living with mild to moderate dementia in care homes and cognitive stimulation groups to people living with mild to moderate dementia in community settings.”</p>	
Betsi Cadwaladr University Health Board	Short	3	5	Fronto temporal dementia should be included here	Thank you for your comment. This has been included as suggested.

Betsi Cadwaladr University Health Board	Short	10	22	Apart from the assessment of verbal episodic memory if a diagnosis of Alzheimer's disease is suspected, there is no mention of the use of cognitive assessment. This is a serious omission. In addition to being an important route to diagnosis and to the identification of subtypes of dementia, cognitive assessment should be able to answer questions that people have about their cognitive abilities and provide them with an account of their strengths and weaknesses (Clinical Psychology in the Early Stage Dementia Care Pathway, The British Psychological Society, 2014).	Thank you for your comment. The committee noted this concern, and agreed the recommendation on initial assessment in specialist settings should be expanded to mention cognitive assessment, specifically: "Diagnose a dementia subtype (if possible) if initial specialist assessment (including a neurological examination and cognitive testing) confirms cognitive decline and reversible causes have been ruled out." They also agreed it was appropriate to add a specific mention around neuropsychological testing for people with an unclear diagnosis to this section: "Consider neuropsychological testing if it is unclear: • whether or not the person has cognitive impairment • whether or not their cognitive impairment is caused by dementia or • what the correct subtype diagnosis is."

					captured the important features of how this information should be tailored.
Biogen	Short	9	18	Would it be useful to suggest some criteria for when to suspect dementia? Eg cognitive complaint, care giver feedback	Thank you for your comment. The guideline did not contain a review question on the signs and symptoms that should make someone suspect dementia, and therefore the committee were not able to make any recommendations on this topic.
Biogen	Short	11	15-26	We would highlight the importance of these biomarkers (and additional ones, such as amyloid PET) earlier in the disease continuum, especially with possible DMTs in the future. We wonder if a statement advocating referral to a clinical trial could be added also?	Thank you for your comment. Whilst the committee did not believe it was appropriate to advocate referral to specific clinical studies, they did agree it was appropriate to add a general recommendation to the guideline to "tell people living with dementia (at all stages of the condition) about research studies they could participate in."
Biogen	Short	16	1	Could a comment be added to acknowledge ongoing research into AD, including possible future DMTs?	Thank you for your comment. The committee agreed that, in the absence of particular DMTs that could be recommended for research at this time, this was not something that could be considered within the guideline.
Biogen	Full and Short	General	general	General comment : whilst we appreciate that these guidelines are focused on (overt) dementia, we feel that it would be useful to broaden to reflect the course of disease in conditions such as Alzheimer's (AD). In the case of Alzheimer's, there is a spectrum of disease which ranges from preclinical AD, to prodromal (pAD) / mild cognitive impairment (MCI) due to AD, to overt, severe Alzheimer's dementia. For patients with cognitive symptoms (pAD/MCI) the issues faced	Thank you for your comment. The diagnosis and management of mild cognitive impairment was not within the scope of this guideline, and therefore it was not possible to make recommendations on this topic. A number of stakeholders have raised this as an important issue needing guidance, and this feedback has been based to the commissioning team within NICE for consideration when the topics of future guidelines are discussed.

British Acupuncture Council	Full	271	13-14	Most of the 18 excluded acupuncture papers (Appendix F) were removed because they were not English language. Given that acupuncture is an integral part of Chinese medicine, that much of the research on it is Chinese, and that all of the RCTs to date on acupuncture and dementia are Chinese this is a major problem if you are aiming to get a good idea of existing research on the subject. None of the other interventions considered is in this situation and it introduces a possible bias to your review.. We appreciate that there would be practical difficulties and expense in including Chinese language papers but this is increasingly the approach taken by Cochrane groups	Thank you for your comment. The exclusion of papers not in English is a consistent approach taken throughout NICE. The committee noted this led to particular problems with the evidence base in certain areas, and hope that greater translation of papers published in other languages to English would enable a greater volume of evidence to be captured in the future.
British Acupuncture Council	Full	295	19-21	For the two included acupuncture trials you calculated a mean difference of 1.88 in favour of acupuncture (vs no acupuncture) for the MMSE outcome (Appendix G). This is above the minimal clinically important difference value used for the guideline (1.4) but it's not statistically significant. Partly this is because of the heterogeneity in the two studies you've chosen and partly because of the small numbers. Both of these problems would have been lessened if Chinese language studies had also been included. In Zhao et al's (2015)	Thank you for your comment. The exclusion of papers not in English was a consistent approach taken throughout the guideline. The committee noted this led to particular problems with the evidence base in certain areas, and hope that greater translation of papers published in other languages to English would enable a greater volume of evidence to be captured in the future.

				research recommendation: there is a complete shortage of clinical trial data for a UK, or UK comparable setting.	
British Association for Psychopharmacology	Short		1.13	It might be helpful to refer to the core competencies for dementia care enshrined in the Health Education England documentation. https://www.hee.nhs.uk/sites/default/files/documents/Care%20Navigation%20Competency%20Framework_FINAL.pdf	Thank you for your comment. The committee noted the existence of this (and other) HEE framework documents that could be useful in dementia, but agreed it would not be appropriate to pick out 1 or 2 of these to refer to over and above other advice on training and competencies.
British Association for Psychopharmacology	Short		1.1.1 1	It is open to debate as to when is the right time to offer advice on advance care planning and guidance. I think perhaps the word "timely" rather than "early" would be better as most practitioners would agree that it can sometimes be too early to provide information on advance care planning e.g. at the first clinic appointment.	Thank you for your comment. The committee discussed this issue and agreed there was an important balance between early opportunities to discuss topics such as advanced care planning, and not introducing at an inappropriate stage. The committee stressed that early did not necessarily mean at the first opportunity or first appointment. However, they did also note the evidence showed staff were often reluctant to initiate these discussions, and people often wanted to have these conversation before they are currently offered them. They therefore agreed "early" was the appropriate word to use, and noted that since the recommendation was phrased as "offer", there would be nothing to stop an individual deciding it was earlier than they wanted to start these conversations, and that it would then be appropriate to offer additional opportunities to discuss at a later date.

British Association for Psychopharmacology	Short		1.1.2	I think the use of the term “simplify” text is somewhat patronising in that it suggests that people with dementia need things produced in a simple way – in many ways this is the antithesis to person centred care and I am sure the committee will find, if they are minded, a better and less patronising word for this.	Thank you for your comment. The committee discussed this wording and agreed that the current wording is clear and unambiguous, and should therefore be retained. They were in agreement that the use of clear and simple text was not patronising, but a basic part of good information provision that could and should often be applied more widely across the healthcare system.
British Association for Psychopharmacology	Short		1.2.1 1	I would have thought reference to the generally approved diagnostic criteria such as the International Classification of Diseases (ICD) might be more useful for clinicians rather than going into the very specialist diagnostic criteria, which are often used for research.	Thank you for your comment. The committee noted that the current ICD classifications are somewhat out of date, and therefore it was appropriate to refer to more modern criteria. However, they agreed it may well be appropriate to refer to the ICD10 classification, once that is finalised.
British Association for Psychopharmacology	Short		1.2.1 2	Going straight to detailed Cerebrospinal Fluid (CSF) examination or a PET scan seems clinically very inappropriate and the remarkable statement that “if one does not work try the other one” will, in untutored hands, cause a great deal of unnecessary upset for patients and their families. Someone reading this might think that a person in their mid-eighties who has mild loss of memory and in whom the diagnosis of Alzheimer’s disease or mild cognitive impairment is uncertain should have a CSF examination and, if this does not give a diagnosis should then have a PET scan, I would	Thank you for your comment. The committee noted that the ‘consider’ recommendations for CSF examination and imaging came at the end of the diagnostic pathway, and would consequently only be of relevance for the small number of people who still did not have a diagnosis after all the prior possible diagnostic steps had been considered. However, they noted that a number of stakeholders had interpreted this recommendation as bringing CSF and imaging earlier in the diagnostic pathway, and to counter that conception agreed it

					The committee noted that although there were differences between the six tests recommended (whether or not they were initially designed as screening tests, self-administered versus clinician-administered) they all showed sufficiently good diagnostic accuracy to be useful tools in guiding referral decisions in primary care.
British Association for Psychopharmacology	Short		1.4	It is very helpful to have clear guidance on the things not to give - reference to aromatherapy would be helpful.	Thank you for your comment. The committee agreed it was appropriate to make "do not offer" recommendations in areas where there was no evidence of benefit from interventions. For aromatherapy, whilst the evidence base was limited, there was some evidence of potential benefits on agitation in people with severe dementia. The committee agreed this evidence was not sufficient to make a positive recommendation, but also that it was not appropriate to make a negative recommendation when there is some evidence there may be potential benefits.
British Association for Psychopharmacology	Short		1.2.2 3	It is important to note that national initiatives for raising awareness of dementia care	Thank you for your comment. The committee noted that this recommendation focused solely on case finding in a population with no clinical suspicion of dementia, and agreed that generally raising awareness of dementia among health and social care professionals was a fundamentally different and important issue. The committee were also aware of specific policy initiatives (such as the dementia CQUIN) and it has been made clear within the guideline that this recommendation is not meant to affect the interpretation of that pre-existing policy.

British Association for Psychopharmacology	Short		1.2.2 7	Using some less traditional language of “refer” “and multidisciplinary” phrases feels outdated and taking advice from dementia advisors who can be based at primary care seems to be appropriate. Reference should be made to the current review of the Mental Health Act and the implications that will have in terms of capacity would be important.	<p>Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft guideline, in that people interpreted it as saying everyone need to attend an appointment at a secondary care service. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and treatment, but this did not mean the person necessarily had to travel to a physical appointment at that service. To ensure this is clear in the final version of the guideline, an explanation has been added to this section of the guideline, giving the following explanation around the term ‘refer’:</p> <p>“A referral to a diagnostic service does not require that the person be asked to attend a clinic appointment. It can also involve people being seen in community settings (such as their home or a care home), or advice being provided to the referrer without a formal appointment being made. The key issue is to ensure that dementia specialists are involved, both for advice on diagnosis and to ensure appropriate access to post-diagnostic support and treatment.”</p> <p>A cross-reference has now also been added to the NICE guideline on decision-making and mental capacity (which is due to be published in July 2018), which the committee agreed was the appropriate place for issues around the Mental Health Act to be considered.</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
British Association for Psychopharmacology	Short		1.2.6	I think it is an important point to make that not everybody with suspected dementia needs to be referred to a specialist dementia diagnostic service. There are very good examples where the diagnosis can be made in primary care by a GP who knows the person well. For example, an elderly person who has been a long-time resident of a care home who has developed some cognitive impairment in whom the GP has done all the various tests is a situation where it would be clinically inappropriate for that person to be removed and taken to a memory service and subjected to an MRI scan. I have sent examples of this to Harry Allen some time ago. This would be counter to good clinical practice. Many colleagues in Primary Care are able to make a diagnosis and can use the advice of support of specialist memory services without a formal referral being made – perhaps it is the word “refer” that could be amended to reflect the breaking down of barriers between primary and secondary care which is to the benefit of people with dementia and their families.	Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft guideline, in that people interpreted it as saying everyone need to attend an appointment at a secondary care service. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and treatment, but this did not mean the person necessarily had to travel to a physical appointment at that service. To ensure this is clear in the final version of the guideline, an explanation has been added to this section of the guideline, giving the following explanation around the term ‘refer’: “A referral to a diagnostic service does not require that the person be asked to attend a clinic appointment. It can also involve people being seen in community settings (such as their home or a care home), or advice being provided to the referrer without a formal appointment being made. The key issue is to ensure that dementia specialists are involved, both for advice on diagnosis and to ensure appropriate access to post-diagnostic support and treatment.”
British Association for Psychopharmacology	Short		1.3.6	I would have thought some reference for marginalised group would be appropriate.	Thank you for your comment. The committee agreed there were particular issues around a number of marginalised groups, both in terms of the general difficulties these groups

					add a definition of this to the guideline to ensure there was no misunderstanding of what was meant.
British Association for Psychopharmacology	Short		1.2.9	In previous NICE guidance it has been suggested that a brain scan is not necessarily in established disease and reflecting this here would be useful.	Thank you for your comment. The committee agreed with this suggestion and an additional note has been added to the recommendation to "be aware that structural imaging is not always needed, if dementia is well established and the subtype diagnosis is clear."
British Association for Psychopharmacology	Short		1.4.7	A definition of interpersonal therapies would be useful as there is some evidence that psychotherapy can help people with early Alzheimer's disease.	Thank you for your comment. A definition has been added to the guideline, and the committee were keen to stress this was a recommendation not to use interpersonal therapy to treat the cognitive symptoms of Alzheimer's disease. If people living with dementia had another condition for which interpersonal therapy were indicated, the committee agreed it would be correct to offer them to people living with dementia in the same way as those without.
British Association for Psychopharmacology	Short	General	General	I would like to congratulate NICE and the committee for all their hard work into producing such an excellent guideline.	Thank you for your comment and your support for the guideline.
British Association for Psychopharmacology	Short	3-5		In the background it might be worth mentioning the numbers of people diagnosed with dementia and it seems a shame to simply infer this from a publication now 6 years old that dealt primarily with antipsychotic prescribing. The last figures from NHS Digital is that in December 2017 there were 456,739 people on GP registers as having a formal diagnosis of dementia, of whom 441,782	Thank you for your comment. Some additional information has been added to this section around the increase in diagnosis rates in recent years. Specifically: "Finally, in December 2017, there were 456,739 people on GP registers with a formal diagnosis on dementia, up from approximately 290,000 people in 2009/10, with the majority of this difference accounted for by an increase in diagnosis rates."

Dementia: assessment, management and support for people living with dementia and their carers

**Consultation on draft guideline - Stakeholder comments table
02/01/2018-13/02/2018**

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				Also, NICE Guidelines are used nationally and internationally, but there other guidelines used in the devolved nations that might be appropriate to make reference to this.	
British Association for Psychopharmacology	Short	6		The section on person centred care is very welcome and extremely important. As the committee knows the Alzheimer's Society / Dementia Action Alliance have produced a set of "We" statements which are an update of the original "I" statements and reference to these might be useful. The majority of practitioners are aware of these and they simply articulate good practice and recognise the rights and responsibilities of individuals.	Thank you for your comment, and for this information.
British Association for Psychopharmacology	Short	10	12	There should be some indication that infections should be examined for as a potential cause of cognitive decline that is independent to delirium. i.e. just excluding infections that are associated with delirium ignores the important finding that infections can contribute to cause cognitive decline without causing a delirium. Likewise they also contribute to behavioural and psychological symptoms. We are concerned that infections will only seem of importance in dementis in situations where it is causing delirium but would otherwise be ignored as non contributory.	Thank you for your comment. The committee noted this point, but agreed it was not possible to include an exhaustive list of all dementia mimics in the guideline, and this was not as significant an issue as the ones (such as delirium and depression) that are specifically mentioned in the recommendations.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. Dementia: assessment, management and support for people living with dementia and their carers

**Consultation on draft guideline - Stakeholder comments table
02/01/2018-13/02/2018**

Stakeholder	Document	Page No	Line No	Comments	Developer's response
British Association for Psychopharmacology	Short	10	16	The term rapidly progressive dementia should be clearly defined. i.e. what time frame is considered rapid. We are concerned that rapid might be misconstrued to mean only dementias that develop over less than a week.	Thank you for your comment. The committee discussed this issue and agreed the presentation of rapidly progressive dementia was sufficiently clear it would be highly unlikely to cause confusion for GPs.
British Association for Psychopharmacology	Short	10	25	The advice for the use of structural imaging would benefit from a more structured approach and the use of structural scan considered when a rapidly progressive dementia is present should be changed to mandatory unless there are clinical contraindications. It should be also mandatory in patients at high risk of treatable pathology e.g. under the age of 65 years or where there are doubts about the diagnosis. We are concerned that the current guidance is opening the door to poor clinical practice.	Thank you for your comment. The committee agreed this recommendation could have been phrased more clearly, and has now been changed to "offer structural imaging to rule out reversible causes of cognitive decline and to assist with subtype diagnosis. Be aware that structural imaging is not always needed, if dementia is well established and the subtype diagnosis is clear." This is more in line with the recommendation from the previous version of the guideline, which many stakeholders raised as being appropriate to retain.
British Association for Psychopharmacology	Short	11	15-7	The emphasis on the use of PET scans and cerebrospinal fluid access over MRI scans seems to be divorced from clinical reality. It should be emphasised that these specialist investigations should only follow an MRI scan. I am concerned that clinicians seeing this list of idealistic preferences over what is currently available (i.e..CT or MRI scans) in the NHS will undermine any confidence in these guidelines overall.	Thank you for your comment. The committee noted that the 'consider' recommendations for CSF examination and imaging came at the end of the diagnostic pathway, and would consequently only be of relevance for the small number of people who still did not have a diagnosis after all the prior possible diagnostic steps had been considered. However, they noted that a number of stakeholders had interpreted this recommendation as bringing CSF and imaging earlier in the diagnostic pathway, and to counter that conception agreed it

					<p>was appropriate to add an additional recommendation before all of those on imaging and biomarkers. Specifically: "Only consider further diagnostic tests if:</p> <ul style="list-style-type: none"> • it would help to diagnose a dementia subtype and • knowing more about the dementia subtype would change management." <p>The committee agreed this should address any concerns about the guideline advocating a sudden expansion in the use of complex diagnostic tests, or their use in determining if someone has dementia at all, rather than to support subtyping.</p>
British Association for Psychopharmacology	Short	11	28	The use of CSF over the age of 80 is almost certainly of no value. In anything other than a research setting.	Thank you for your comment. The committee agreed that the utility of CSF testing was lower in older people, and this was what led them to make a recommendation to "be aware that the older a person is, the more false positives will be found with cerebrospinal fluid examination."
British Association for Psychopharmacology	Short	12	20	CT head scans should also be used where MRI scans are contraindicated.	Thank you for your comment. This recommendation has been amended to follow this suggestion.
British Association for Psychopharmacology	Short	17	3	I think it would be appropriate to specifically mention old age psychiatrists as they are probably the commonest prescribers.	Thank you for your comment. The committee agreed that old age psychiatrists are likely to be the most common prescribers, but agreed it was appropriate to be more general in the recommendation to avoid giving the impression that other subtypes of psychiatry (such as learning disabilities psychiatrists) were not appropriate prescribers.

British Association for Psychopharmacology	Full		1.10	I welcome the section on palliative care.	Thank you for your comment and your support for these recommendations.
British Association for Psychopharmacology	Full		1.1.1 1	Advanced care planning discussions do involve a lot of time if done properly. This would have some implications in terms of time at clinics. This will also have implications if there is a need for this at regular care review.	Thank you for your comment. This element of the guideline formalises what the committee believes is current practice, and therefore should not consume significant additional resources.
British Association for Psychopharmacology	Full		1.2.4	In non specialist settings the concept of functional assessment is very important but I doubt whether in primary care it would be possible or even necessary to use IQCODE or FAQ. This would add time to the average GP consultation – which would not be welcome. The AD8 is a very useful validated questionnaire which can help decide on the need for onward referral to expert opinion. It has been well validated	Thank you for your comment. The committee disagreed with this point, and noted that because neither of these instruments need the GP present to complete, there should be no additional time needed for them to be included. As documented in the evidence to recommendation section for this question, “the committee commented that the IQCODE (Informant Questionnaire on Cognitive Decline in the Elderly) and FAQ had the advantage of being self-administered tests. It could therefore be completed in the waiting room by the informant. This could free up time in the appointment for the GP to listen to the patient and informant, potentially reducing the number of appointments needed to reach an initial diagnosis and saving money for the NHS.” The committee also noted that although the AD8 has been validated as a screening test for dementia, only one study was identified in a population of people with suspected dementia, and this did not find the AD8 to have as high a diagnostic accuracy as the instruments recommended in the guideline.

British Association for Psychopharmacology	Full		1.2.6	Good to mention anticholinergic burden	Thank you for your comment and your support for this recommendation.
British Association for Psychopharmacology	Full		1.5.3	These comments concerning memantine addition are very welcome	Thank you for your comment and your support for this recommendation.
British Association for Psychopharmacology	Full		1.5.4	“For people with an established diagnosis of Alzheimer’s disease who are already taking an AChE inhibitor, primary care prescribers may start treatment with memantine without taking advice from a specialist clinician”. These comments are particularly welcome	Thank you for your comment and your support for this recommendation.
British Association for Psychopharmacology	Full		1.2.9	“Consider structural imaging to rule out reversible causes of cognitive decline”. I feel that this is not strong enough. For a brain disorder structural imaging of the brain is very important. Perhaps “it is good practice or normal practice to perform structural brain imaging. Patients and carers expect a scan and in some centres the only way to be able to get a FDG-PET scan is to have a structural scan first.	Thank you for your comment. The committee made 2 changes to address this issue. First, the recommendation on structural imaging has been changed from a ‘consider’ to an ‘offer’. Secondly and additional caveat, based on that from the last guideline, has been added that “structural imaging is not always be needed, if dementia is well established and the subtype diagnosis is clear.”
British Association for Psychopharmacology	Full		1.8.8	The reference to use of mirabegron is welcome. In clinical practice there is a lot of urinary frequency induced by cholinesterase inhibitors. This can lead to a lot of anti muscarinic prescription. Many clinicians are unaware of this	Thank you for your comment. The committee agreed with the importance of raising awareness of mirabegron as a treatment option in this population. However, since this recommendation comes from a NICE technology appraisal, it is not possible to do more than add a cross-reference to that appraisal within the

				side effect. This side effect could be emphasised more in the guideline as it is so common and it would help with patient management.	guideline, as the wording of the recommendations themselves cannot be changed. The committee also noted that there were side-effects associated with cholinesterase inhibitors, but agreed that concerns around anti-muscarinic prescription were covered by the recommendation to "consider minimising the use of medicines associated with increased anticholinergic burden, and if possible look for alternatives".
British Association for Psychopharmacology	Full		1.7.10 and 1.7.11	This is a very difficult area. It is often very hard to judge depression in even mild moderate dementia. These statements reflect the evidence although it is absolutely clear that psychological treatments help mild to moderate depression and anxiety in people with mild to moderate dementia? In clinical practice specially with moderate dementia this does not seem to be easy to deliver.	Thank you for your comment. The committee agreed with all of these points, and that future research was necessary to try and address these issues. They therefore made the following research recommendation: "What are the most effective psychological treatments for managing depression or anxiety in people living with dementia at each stage of the condition?"
British Association for Psychopharmacology	Full		1.10.8 and 1.10.9	This section is very welcome. I do feel that better promotion of this type of information would lead to less inappropriate hospital admission and extreme intervention for patients with advanced dementia who are dying	Thank you for your comment and your support for these recommendations.
British Association for Psychopharmacology	Full	General	general	Might the committee consider saying that signing up to initiatives such as "Join Dementia Research" (https://www.joindementiaresearch.nihr.ac.uk/)	Thank you for your comment. The committee agreed with the value of making people living with dementia aware of opportunities to be involved in research, and therefore added a recommendation to "tell people living with dementia (at all

				would be a good way to encourage people into reseach.	stages of the condition) about research studies they could participate in.”
British Association for Psychopharmacology	Full	General	General	In summary the new guidelines, in my opinion, are helpful and improve upon the previous guidelines and the committee are to be commended on their hard work in bringing this together.	Thank you for your comment and your support for the guideline.
British Association for Psychopharmacology	Full	General	General	Crucial to any dementia work-up and subtyping is the physical and neurological examination – this is not mentioned in the guidelines. This is particularly important in individuals with early onset, suspected vascular aetiologies, parkinsonism and atypical presentations.	Thank you for your comment. The committee noted this concern and agreed it was appropriate to add in references to a physical examination as part of the initial assessment in primary care (recommendation 1.2.1), and a neurological examination as part of the initial assessment in specialist diagnostic services (recommendation 1.2.9).
British Association for Psychopharmacology	Full	General	General	Sleep apnoea – symptoms of which can masquerade as dementia or indeed can be associated with dementia is not mentioned.	Thank you for your comment. The committee agreed that sleep apnoea can be a dementia mimic. However, they agreed it was not possible to include an exhaustive list of all dementia mimics in the guideline, and this was not as significant an issue as the ones (such as delirium and depression) that are specifically mentioned in the recommendations.
British Association for Psychopharmacology	Full	General	General	Can it be made more explicit the reasons why amyloid PET imaging should not be considered as part of the diagnostic work-up?	Thank you for your comment. The committee agreed that the evidence base for amyloid PET imaging was not yet sufficient to make specific recommendations on its use within the guideline. However, the committee agreed it was an important area for future study, and therefore made a research

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				research and clinical trials. Given the huge political impetus to deliver improved dementia research in the UK, it would be important that this is recognised in the document. In particular accessing research studies/clinical trials remains a major challenge in dementia. Connecting people with dementia with well established networks (DeNDRoN) and case registers (e.g. Join Dementia Research) could be mentioned.	recommendation to “tell people living with dementia (at all stages of the condition) about research studies they could participate in.”
British Association for Psychopharmacology	Full	General	General	Atypical, familial or young onset cases should always be referred onto specialist services for further assessment.	Thank you for your comment. The committee agreed that no evidence was identified that enabled them to make specific recommendations around these issues, but did agree that the more unusual the presentation, the greater the importance of involving specialist services early.
British Association for Psychopharmacology	Full	General	general	The guidelines at the moment are quite Alzheimer's centric. I appreciate this is important given that AD epidemiologically is the dominant neurodegenerative dementia in the UK. However, this approach is perhaps to the detriment of the coverage of other dementias (e.g. DLB, FTD, vascular etc.) in the guidelines.	Thank you for your comment. The evidence searches conducted for the guideline looked for evidence on all subtypes of dementia, but more evidence was found on Alzheimer's disease than other subtypes for a number of the questions. In some situations the committee agreed that it was appropriate to extrapolate the evidence found for dementia subtypes including Alzheimer's disease to make recommendations for all people living with dementia, rather than just those with the specific subtypes in the research studies included in the evidence review however this was not always possible.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. Stakeholder	Document	Page No	Line No	Comments	Developer's response
British Association for Psychopharmacology	Full	General	General	Despite detailed analysis of the utility of core diagnostic symptoms of DLB (as derived from the consensus criteria as presented in Section 5.1.4.16 for example) the diagnostic utility of 2 or more of visual hallucinations, parkinsonism and REM sleep behaviour disorder in the diagnosis of Lewy body related dementias is not mentioned in the recommendations section (4.1). In addition, REM sleep behaviour symptoms can antedate the occurrence of Lewy body diseases (e.g. Parkinson's disease, DLB) by many years; the occurrence of this symptom in the presence of mild cognitive impairment significantly raises the probability that these individuals will convert to DLB.	Thank you for your comment. Whilst the guideline recommendations do not explicitly refer to these diagnostic symptoms, the recommendations do contain a reference to the International consensus criteria for dementia with Lewy bodies, which these symptoms form a part of. The committee agreed it was more appropriate to reference these validated criteria than to make recommendations around specific individual symptoms.
British Association for Psychopharmacology	Full	General	General	It can be particularly challenging to differentiate DLB from delirium given attentional difficulties, fluctuations, arousal problems and hallucinations occur in both conditions. This may need to be mentioned. See, for example, http://www.jamda.com/article/S1525-8610(16)30292-4/abstract for a further discussion on this topic.	Thank you for your comment. The guideline contained a specific review question on effective tools to differentiate dementia from delirium, and dementia with Lewy bodies was included within that recommendation. The committee made recommendations for specific tests that may be useful to differentiate dementia from delirium.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
British Association for Psychopharmacology	Full	Research recommendations		One major issue is related to development of agitation which is very common. These patients are usually on donepezil. One of the most common side effects of donepezil is agitation. The question in practice is whether the donepezil is contributing to the agitation and whether donepezil should be reduced or stopped or whether memantine should be added. The DOMINO study provided some information on more advanced dementia in relation to whether to stop donepezil or combine with memantine or add memantine. However it did not answer the question: for people taking donepezil who have agitation what are the best options eg reduce donepezil, stop donepezil, change to memantine or add memantine or other options???	Thank you for your comment. The committee agreed this was an issue. However, they also agreed that it would be difficult to conduct high quality research in this area due to problems recruiting a sufficiently large population with levels of agitation that would enable randomisation to answer this question. The committee therefore agreed that this was not a high priority for future research.
British Association for Psychopharmacology	Full	10		The only definition in the guideline is very poor/incorrect! If this intended as just a lay 'definition', then a proper definition should be given later which it isn't. I recommend NIA/AA	Thank you for your comment. The committee noted the guideline contains links to diagnostics criteria for specific subtypes of dementia, and that the included was a suitable 'lay' definition for the introduction to the guideline. Some edits have been made to this definition to improve the accuracy and clarity
British Association for Psychopharmacology	Full	29		Summary of Recommendations – This is the only bit most people will read so needs to be written with this in mind! My comments primarily refer to summary with links to body review. The sub-	Thank you for your comment. This is an issue that should only occur with the consultation version of the guideline. When the guideline is published it will appear on the website with all the headings included with the recommendations.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				headings need to be included in the summary, in addition to the body text of the review or it becomes a bit confusing with just the numbered points.	
British Association for Psychopharmacology	Full	29	10-17 and 35-36	Section 4.1.2 advises on the use of variety of brief cognitive instruments. These certainly are suitable for primary care / non-specialist setting. It would be important, however, to make this explicit to avoid confusion over what tests might be advocated for use in specialist dementia diagnostic services. For example is the verbal episodic memory assessment (4.1.8, line 35-36) something which is conducted at the latter? The details of which tests are applied in what settings are evident elsewhere in the document but I think the majority of readers will look only at the summary of recommendations section.	Thank you for your comment. The final version of the guideline draws a clear distinction between tests to be used in the initial assessment in primary care, and tests that may be useful in specialist services. In particular, a reference to formal neuropsychological testing has been added to the specialist service setting: "Consider neuropsychological testing if it is unclear: <ul style="list-style-type: none"> • whether or not the person has cognitive impairment • whether or not their cognitive impairment is caused by dementia or • what the correct subtype diagnosis is" Additionally, a definition of verbal episodic memory has been added to the short version of the guideline.
British Association for Psychopharmacology	Full	29	10-17	Choice of tests is fine, but should it say something about limitations? All of these will have validity issues if patient doesn't have good English. This is mentioned superficially in page 102 of the diagnostics section, which very few will read. This is a major problem in cities like Birmingham.	Thank you for your comment. The committee agreed there were a range of issues that could affect interpretations of test scores, including language, education, learning disabilities or age. It was for this reason the committee agreed it was not appropriate to set cut-offs to use for the particular tests, but they should instead be considered alongside a broader assessment including a history (including cognitive, behavioural and psychological symptoms), a physical examination and

Stakeholder	Document	Page No	Line No	Comments	Developer's response
					appropriate blood and urine tests to exclude reversible causes of cognitive decline.
British Association for Psychopharmacology	Full	29	24-28	Section 4.1.5 advises that reversible causes of cognitive decline have been investigated. This may be suitable for delirium or medication derived problems, but often reversible causes can only be determined after specialist assessment and investigation (e.g. normal pressure hydrocephalus, space occupying lesions, vasculitis).	Thank you for your comment. The committee agree with this point, and this is the reason for the difference in language between the primary care section (where reversible causes of cognitive decline only need to be investigated before someone is referred) and the secondary care section (where reversible causes need to be ruled out before a subtype diagnosis is made).
British Association for Psychopharmacology	Full	29	20-23	Perhaps suggest these may be preferred to a cognitive test if English is not good	Thank you for your comment. The committee noted there was no evidence to enable them to make specific recommendations around people without good English proficiency, but noted that for these people, consideration should be given both to appropriate test to use, and how the results of those tests should be interpreted.
British Association for Psychopharmacology	Full	29	29-31	GP won't have a clue about rapidly progressive dementia – need for more detail	Thank you for your comment. The committee discussed this issue and agreed the presentation of rapidly progressive dementia was sufficiently clear it would be highly unlikely to cause confusion for GPs.
British Association for Psychopharmacology	Full	29	41-43	Add 'best contemporary'	Thank you for your comment. The committee noted that these criteria listed were likely to become out of date as time progresses, and therefore noted the recommendation only phrased them as examples of criteria that could be used, rather than recommending them as preferred criteria.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. British Association for Psychopharmacology	Full	29	35-36	Bit vague – ‘test of learning and recall’ would be better	Thank you for your comment. The committee agreed it was appropriate to keep the phrase “verbal episodic memory” as the most specific and accurate term available. However, they did agree it was appropriate to add a definition of this to the guideline to ensure there was no misunderstanding of what was meant.
British Association for Psychopharmacology	Full	29	37-38	This is interesting. Whilst I am no fan of scan all, this is too vague in my view.	Thank you for your comment. The committee made 2 changes to address this issue. First, the recommendation on structural imaging has been changed from a ‘consider’ to an ‘offer’. Secondly and additional caveat, based on that from the last guideline, has been added that “structural imaging is not always be needed, if dementia is well established and the subtype diagnosis is clear.”
British Association for Psychopharmacology	Full	29	35-36	It is be important to bear in mind that many DLB patients are misdiagnosed as AD initially. Some of this stems from the fact that patients are not assessed adequately from the physical perspective (see earlier comment) and thus, for example, subtle signs of parkinsonism are not detected. There may also be a failure to ask about sleep symptoms (e.g. REM sleep behaviour symptoms as noted above) or a lack of explicit enquiry about visual hallucinations or cognitive fluctuations (core symptoms of DLB). Furthermore in section 5.1.6 – quite rightly the guidelines indicate that “If Alzheimer’s disease is	Thank you for your comment. The committee agreed that it had made recommendations for all tests for identifying dementia subtypes on which there was robust evidence available. However, they did note the specific concern raised about signs of parkinsonism not being detected, and agreed it was appropriate to add reference to “an appropriate neurological examination” as part of the initial assessment in specialist services.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. Stakeholder	Document	Page No	Line No	Comments	Developer's response
				suspected, include a test of verbal episodic memory in the assessment." However whilst many DLB patients experience memory deficits they may have problems in other domains – for example, often having disproportionate deficits in visuo-spatial and visuo-perceptual function. These aspects are not addressed specifically in the guidelines.	
British Association for Psychopharmacology	Full	29	24	Should this link to delirium guideline?	Thank you for your comment. The guideline does include a cross-reference to the delirium guideline for both the prevention and treatment of delirium.
British Association for Psychopharmacology	Full	30	13-25	Having left any sort of structural imaging optional in 9, this perhaps needs expanding/clarifying. Lab ranges may be an issue. How many UK labs have established reliable ranges?	Thank you for your comment. The committee agreed these were important issues, but no evidence was identified that allowed them to make recommendations.
British Association for Psychopharmacology	Full	30	13-23	It is laudable that for diagnosing uncertain cases of AD there is a recommendation that we should examine the CSF or use FDG-PET. However pragmatically how available will CSF sampling be given that typical memory clinic services are in mental health trusts (and thus lack appropriate infrastructure to do testing) and led by health professionals not skilled in lumbar puncture? There would need to be a significant shift in mind-	Thank you for your comment. The committee noted there are issues around access to imaging and CSF examination in certain areas, but agreed the evidence showed these tests could be of diagnostic value in some cases, and therefore were appropriate to include in the recommendations. The committee noted that the 'consider' recommendation for CSF examination came at the end of the diagnostic pathway, and would consequently only be of relevance for the small number of people who still did not have a diagnosis after all

				set and investment needed to deliver this and/or FDG-PET (the latter which is also not widely available). In addition amyloid PET imaging (which is licensed) for example may be more accessible in certain services than getting CSF. The default back to SPECT HMPAO/perfusion imaging with its suboptimal sensitivity/specificity in AD seems is somewhat unsatisfactory (given higher sens/spec for other the imaging modalities).	<p>the prior possible diagnostic steps had been considered. However, they noted that a number of stakeholders had interpreted this recommendation as bringing CSF earlier in the diagnostic pathway, and to counter that conception agreed it was appropriate to add an additional recommendation before all of those on imaging and biomarkers. Specifically:</p> <p>“Only consider further diagnostic tests if:</p> <ul style="list-style-type: none"> • it would help to diagnose a dementia subtype and • knowing more about the dementia subtype would change management.” <p>The committee agreed that the evidence base for amyloid PET imaging was not yet sufficient to make specific recommendations on its use within the guideline. However, the committee agreed it was an important area for future study, and therefore made a research recommendation on the diagnostic accuracy on amyloid PET imaging. Specifically: “Does amyloid PET imaging provide additional diagnostic value, and is it cost effective, for the diagnosis of Alzheimer’s disease and other dementias when compared with standard diagnostic procedures?”</p>
British Association for Psychopharmacology	Full	30	34-35	Fine, but if local nuclear med can't do DAT then MIBG this will be unreliable. What about polysomnography – not obviously mentioned and it's in revised criteria?	Thank you for your comment. The committee agreed that DAT scans and scintigraphy were the two tests with clear evidence of high diagnostic accuracy, and therefore these were the two it was appropriate to refer to in the recommendations.

02/01/2018-13/02/2018**

Stakeholder	Document	Page No	Line No	Comments	Developer's response
British Association for Psychopharmacology	Full	30	42-43	Not sure I agree with this as stated. Sure, a normal MRI (Kipps 0/1) wouldn't put me off but if the functional imaging was also within normal limits then the FTD diagnosis is certainly in question (possible not probable at best). This is particularly important as normal MRI and normal functioning imaging may indicate a treatable phenocopy	Thank you for your comment. The committee noted that a combination of multiple negative test results would certainly lead to questioning a working diagnosis, but noted that this recommendation was focused on not over interpreting the results of individual imaging tests.
British Association for Psychopharmacology	Full	30	44-45	Bit vague	Thank you for your comment. The committee agreed this recommendation was as specific as it was possible to be given the evidence available.
British Association for Psychopharmacology	Full	30	30-31	4.1.15 – recommends that EEG should not be used for the diagnosis AD. However as worded some may take this implicitly that EEG should not be used at all for dementia when actually it may have a place for atypical presentations (e.g. seizures / encephalopathy).	Thank you for your comment. The committee agreed that, for clarity, this recommendation should be modified to “do not use electroencephalography to diagnose Alzheimer’s disease.”
British Association for Psychopharmacology	Full	31	3-6	Link to delirium guideline	Thank you for your comment. The guideline does include a cross-reference to the delirium guideline for both the prevention and treatment of delirium.
British Association for Psychopharmacology	Full	31	13-14	Recommendation 4.1.26 “Only conduct case finding for suspected dementia as part of a clinical trial 13 that also provides an intervention to people diagnosed with dementia.” I think some	Thank you for your comment. The committee agreed with this suggestion and a definition of case finding has been added to the guideline.

				description early on is needed by what is meant by case-finding.	
British Association for Psychopharmacology	Full	34	18-37	Interesting. Not much relevant evidence here. Aupperle with CDR improving at 2 years sound very dodgy! Letting anybody prescribe will likely result in people staying on drugs with no individual evidence of efficacy. Agree longer term people in non-specialist care will stop earlier. This will have interesting implications for service structures if widely implemented. Considers dementia treatment generally but really DLB prescribing and monitoring should be restricted to specialists in my view. Why recommend changes if evidenced base for them is poor?	Thank you for your comment. The general feedback from stakeholders around allowing the prescription of cholinesterase inhibitors and memantine and primary care has been positive. However, the committee agrees that evidence does not yet exist as to whether it is safe for treatment to be initiated in primary care for other subtypes of dementia, and therefore the committee did not extend these recommendations to other dementia types, such as DLB.
British Association for Psychopharmacology	Full	34	38-44	In my view it should be with best tolerated oral drug – fortunately currently coincides with price	Thank you for your comment. These recommendations come from a part of NICE technology appraisal 217 that was not updated as part of this guideline, and therefore it was not possible to make changes to the recommendation.
British Association for Psychopharmacology	Full	34	8-11	Statement needs to include evidence after last technology assessment. Having old recommendation preserved in tablet of stone in a new guideline is very silly. Should include severe AD	Thank you for your comment. These recommendations come from a part of NICE technology appraisal 217 that was not updated as part of this guideline, and therefore it was not possible to make changes to the recommendation. The guideline does however include a recommendation to “offer memantine in addition to a cholinesterase inhibitor if

					they have severe disease", which the committee noted should cover the area of concern.
British Association for Psychopharmacology	Full	34	45-48	Severity is now a non-issue – so irrelevant. Does raise highlight ethnicity issue though for the first time	Thank you for your comment. These recommendations come from a part of NICE technology appraisal 217 that was not updated as part of this guideline, and therefore it was not possible to make changes to the recommendation.
British Association for Psychopharmacology	Full	35	4-21	This is still fine	Thank you for your comment.
British Association for Psychopharmacology	Full	35	30-32	See comment 16	Thank you for your comment. The general feedback from stakeholders around allowing the prescription of cholinesterase inhibitors and memantine in primary care has been positive. However, the committee agrees that evidence does not yet exist as to whether it is safe for treatment to be initiated in primary care for other subtypes of dementia, and therefore the committee did not extend these recommendations to other dementia types, such as DLB.
British Association for Psychopharmacology	Full	35	41-43	More generally whilst readers are directed to the NICE Parkinson's guideline (NG71) with regard to the pharmacological management of Parkinson's disease with dementia, there is no elaboration in the guidelines on the management of non-cognitive symptoms in DLB. Whilst there are symptom overlaps with Alzheimer's disease, a number of symptoms are specific and troubling to people with DLB such as, for example, REM sleep	Thank you for your comment. The guideline did look for evidence on management of non-cognitive symptoms in DLB, but only limited evidence was identified, so the committee did not feel able to make recommendations. They therefore agreed it was appropriate to add an additional reference to the Parkinson's disease guideline to cover the management of non-cognitive symptoms, with a caveat around the need to potentially modify interventions for people with PDD and DLB.

				behaviour disorder (as noted above), autonomic symptoms, drooling and parkinsonism and management of these are not specifically covered for DLB in the NICE Parkinson's guideline.	
British Association for Psychopharmacology	Full	35	22-23	Agree – a bit inconsistent with technology appraisal stuff above though	Thank you for your comment. This recommendation was an update of the recommendation from TA217 on when treatment should be stopped, and therefore there is no inconsistency, as the appraisal recommendation will be stood down upon publication of this guideline.
British Association for Psychopharmacology	Full	35	33-34	Agree. Should we be giving any advice on stopping ACHEI in LB patients? In my experience there is a significant risk of rebound, i.e. they get worse than they would likely have been if drug is withdrawn	Thank you for your comment. This guideline did not contain a question on stopping rules for cholinesterase inhibitors in people with DLB, and therefore it was not possible to make any recommendations on this topic.
British Association for Psychopharmacology	Full	35	35-36	Galantamine has worse tolerability than the other 2 in AD at effective doses??	Thank you for your comment. The evidence base for galantamine in DLB and PDD is considerably less than for donepezil or rivastigmine, and it was for this reason the committee agreed it should be the third choice cholinesterase inhibitor in this group.
British Association for Psychopharmacology	Full	35	39-40	Interesting advice – not sure of logic	Thank you for your comment. The committee noted the point estimates for the effectiveness of memantine were similar to those for cholinesterase inhibitors, although there was considerably more uncertainty, and therefore agreed it was appropriate to make a weak recommendation for its use in cases where cholinesterase inhibitors cannot be used.

British Association for Psychopharmacology	Full	36	38-41	I think there needs to be a distinction between AD and other forms of dementia where drug risk issues are higher (e.g. DLB). No real distinction drawn either between different types of psychopathology or typical v atypical antipsychotics. All atypicals are not alike – no reliable evidence that quetiapine effective based on several trials. In fact whole section below on pharmacological BPSD management is very limited – needs more detail. In my view an evidence based statement could be made for SSRIs and possibly for ACHEIs and memantine	Thank you for your comment. The committee noted the majority of the evidence available for these drugs was from Alzheimer's disease, and therefore it was not possible to make specific recommendation for other subtypes. The committee also agreed that the evidence came from a sufficient number of different drugs that it was reasonable to make an overarching recommendation around antipsychotics. The committee agreed that there was a lack of detail in some of the recommendations made, but noted that this was a result of the limited evidence base in the area, including around SSRIs, cholinesterase inhibitors and memantine for the management of non-cognitive symptoms. The committee did note the specific concerns around the risks of antipsychotics in people with dementia associated with Parkinson's disease, and therefore agreed to add an extra bullet point to recommendation 1.7.3, stating that "for people with dementia with Lewy bodies or Parkinson's disease dementia, be aware these medicines can worsen the motor features of the condition, and in some cases can causes severe antipsychotic sensitivity reactions. For more guidance, see the advice on managing delusions and hallucinations in NICE guideline on Parkinson's disease. Be aware that interventions may need to be modified for people living with dementia."
British Association for Psychopharmacology	Full	36	3-4	True but not exactly helpful. Next item (71, lines 5-6) is fine on its own	Thank you for your comment. The committee noted that there are a number of commonly prescribed medicines that clinicians are often unaware are associated with increased

					anticholinergic burden, and therefore felt this was a useful awareness making recommendation to make.
British Association for Psychopharmacology	Full	36	25-26	Agree – no mention yet of Souvenaid. We don't prescribe them, but should we have a position on recommending or not?	Thank you for your comment. The committee agreed that at the current time there was no evidence of clinically meaningful benefits from souvenaid, and therefore it was appropriate that no positive recommendations be made for its use.
British Association for Psychopharmacology	Full	36	40-41	Neuroleptic sensitivity in DLB is not mentioned despite significant risks associated with the prescription of these medications in Lewy body dementias. In particular the current advice in the guidelines suggest antipsychotics can be offered to dementia patients (4.1.84) who experience hallucinations and agitation; this advice may be detrimental if that individual has underlying DLB.	Thank you for your comment. The committee noted the specific concerns around the risks of antipsychotics in people with dementia associated with Parkinson's disease, and therefore agreed to add an extra recommendation to this section, stating to "be aware that for people with dementia with Lewy bodies or Parkinson's disease dementia, antipsychotics can worsen the motor features of the condition, and in some cases cause severe antipsychotic sensitivity reactions. For more guidance, see the advice on managing delusions and hallucinations in NICE guideline on Parkinson's disease. Be aware that interventions may need to be modified for people living with dementia."
British Association for Psychopharmacology	Full	37	11-12	What is meant by mood stabilizer? No RCTs of lithium, CMZ unproven, but a clear evidence that valproate is harmful. Needs more detail, particularly in headline statement.	Thank you for your comment. The committee agreed it was appropriate to be more specific in the recommendation, and therefore it has been restricted to valproate rather than all mood stabilisers. Specifically, "do not offer valproate to manage agitation or aggression in people living with dementia, unless it is indicated for another condition."

British Association for Psychopharmacology	Full	37	21-22	The guidance advises against the use of melatonin in dementia. Whilst I appreciate there is a lack of trials for melatonin in DLB and PDD (evidence base in idiopathic REM sleep behaviour disorder), this agent is frequently used, with good effect, in these populations for treatment of REM sleep behaviour symptoms.	<p>Thank you for your comment. The committee noted this and the fact that the majority of the evidence from the trials was in Alzheimer's disease, and therefore agreed it was appropriate to amend this recommendation to "do not offer melatonin to manage insomnia in people living with Alzheimer's disease."</p> <p>The committee also agreed it was appropriate to add a cross-reference to the Parkinson's disease guideline for the management of non-cognitive symptoms (included RBD) covered there, as no evidence was identified specifically in people with PDD or DLB to allow recommendations to be made in this guideline.</p>
British Geriatrics Society	Short and Full	22	n/a	Specific reference on management of REM sleep behaviour disorder in DLB/PDD would be beneficial or reference to an alternative guideline.	Thank you for your comment. The committee noted that only very limited evidence was found on managing non-cognitive symptoms in people with Parkinson's disease dementia or dementia with Lewy bodies, and therefore agreed it was appropriate to cross-refer to the advice in the NICE Parkinson's disease guideline. However, the committee noted these interventions may need to be modified to be appropriate for a population of people living with dementia, and agreed it was important to highlight this within the recommendation.
British Geriatrics Society	Short and Full	102 in Full		Consider carefully what is in the short guide versus the longer guide eg advice on carrying out investigative diagnostic tests sequentially rather than in parallel would be helpful in the short	Thank you for your comment. The committee discussed this and agreed the way the recommendations were presented in the guideline represented a clear sequential pathway.

British Geriatrics Society	Short	14	14	The section on care transitions could usefully consider the role of unified DNACPR forms	Thank you for your comment. The committee agreed that, in the absence of any evidence being identified, it was not possible to include these issues within the recommendations made.
British Geriatrics Society	Short	14	18	Care co-ordination- a specific mention that the plan should be shared would be vital.	Thank you for your comment. The committee agreed with this point, and the importance of care and support plans being appropriately shared. The committee noted the guideline contains a recommendation to "Ensure that relevant information is shared and recorded in the person's care and support plan."
British Geriatrics Society	Short	18	27	The section on modifiable risk factors for AD. The effect only on cognition was considered. However these risk factors may have other benefits in terms of preventing physical disability which may be more difficult to manage for a person in dementia. The remit seems a little limited. It certainly merits mention in the short guide that treatment of diabetes etc is helpful for management of co-morbidity	Thank you for your comment. The committee agreed this point was covered by the part of the recommendation to "not offer the following to slow the progress of Alzheimer's disease." The phrase "specifically to slow the progression of Alzheimer's disease" has now been used to make clear they should still be offered for relevant comorbidities. Treatment of the comorbidity itself would be covered by the alternative recommendation to "ensure that people living with dementia have equivalent access to diagnostics, treatments and care services for comorbidities to people who do not have dementia."
British Geriatrics Society	Short	22	10	The section on BPSD/sleep-I think in the summary recommendation it would be helpful to recommend that at present trazodone is not recommended, this is a medication seen used a	Thank you for your comment. The committee noted there was positive evidence on trazadone from the only small trial currently published, and therefore agreed there was neither sufficiently strong evidence for it to be recommended, not

					committee agreed that in this complex situation it was unsurprising that a longer instrument was needed than in the case of screening. The wording of the recommendation has now been amended to try and clarify the meaning.
British Geriatrics Society	Full	105		The committee base the consideration for further invasive diagnostic tests to subgroup dementia diagnosis on a young population. It is noted that this is 10 years younger than the average age of those attending memory clinic. The committee do not consider that large percentage of people presenting with dementia (often in association with frailty) via the general hospital acute services, geriatric medicine day hospital or hospital at home services (age range approx 80-100). This population rarely features in research studies and therefore it is difficult to draw conclusions, but a pragmatic recommendation about the use of imaging (probably structural imaging to rule out treatable cause) and biomarker analysis (suggest only in those who will benefit from the greater diagnostic accuracy afforded by this investigation) would be useful.	Thank you for your comment. The committee agreed that there are always issue in extrapolating research evidence beyond the very tightly defined populations usually recruited to studies, and attempted to draw more general conclusions from this evidence wherever possible. The committee agreed the appropriate way to cover the population of people in whom additional more invasive testing may not be justified was to add an additional recommendation ahead of the section on subtype diagnosis. Specifically: ““Only consider further diagnostic tests if: • it would help to diagnose a dementia subtype and • knowing more about the dementia subtype would change management.”
British Geriatrics Society	Full	108		Recommendation on the cognitive tests to use for diagnosis and also around follow-up would be	Thank you for your comment. The committee agreed that the recommendations included in the guideline were as specific as was possible to make from the evidence available,

British Psychological Society	SH	8	18	The Society is concerned that this guidance implies that these questions do not need to be asked or documented at the start of the assessment process. A person's right to be involved in discussions and decision making is specified in <i>Recommendations</i> and it should therefore be made clear that this applies also to information about a dementia assessment and the need to obtain informed consent for this process, (as a small minority of people choose not to proceed or don't want a diagnosis). This is clearly stated in the standards assessed by the MSNAP memory services accreditation process.	<p>Thank you for your comment. The committee's discussion of the evidence around diagnosis gives their thoughts on this issue:</p> <p>"Being diagnosed with dementia can be a stressful and traumatic experience. The committee recognised this and noted the importance of guiding people with suspected dementia through the assessment process carefully. In particular, it is essential that information is provided throughout the diagnostic process and continued informed consent is obtained for investigations that may be particularly stressful (e.g. imaging and lumbar puncture for cerebrospinal fluid (CSF) biomarker tests).</p> <p>The committee commented that it was also important to consider situations where a patient may not want a referral for an assessment/diagnosis, and the potential disadvantageous outcomes that might result from this choice (e.g. problems with obtaining support, care and treatment)."</p> <p>The committee agreed it was not appropriate to include this in the recommendations, as issues around information and informed consent apply in any interaction between staff and patients/carers, and therefore to mention in one specific situation risked giving the impression these issues were less important at other points in the pathway.</p>

				<p>when a diagnosis is mild or questionable but it appears that this has been removed from the current guideline. Cognitive testing in the current guideline refers only to brief cognitive screens and a test of verbal episodic memory in suspected Alzheimer's disease. These measures of cognition are not sufficient for a diagnosis. No recommendations are given regarding the utility of a full neuropsychological assessment to acquire a baseline level of function, assess change or clarify a dementia subtype. The 2006 guidelines noted that Hentschel and colleagues (2005) provide evidence that a neuropsychological assessment adds to the basic neuropsychiatric evaluation, with the initial diagnosis being changed in a significant number of cases. This occurs mainly at the borderline between 'no dementia' and 'dementia'. Without access to comprehensive neuropsychological assessment there is the risk that rates of misdiagnosis will increase. This is highly distressing for patients and their family members and may deny access to treatment and support options.</p> <p>The Society is concerned about the lack of reference to neuropsychological assessment recommendations throughout the current</p>	<p>the diagnostic process in specialist settings. Therefore, the following recommendation was added to the guideline: "Consider neuropsychological testing if it is unclear:</p> <ul style="list-style-type: none"> • whether or not the person has cognitive impairment • whether or not their cognitive impairment is caused by dementia or • what the correct subtype diagnosis is." <p>The committee also noted that there was no evidence that would enable it to make recommendations on which specific tests should be used as part of this process, and that this would often be different between different neuropsychologists.</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				<p>Given the range of applications for a neuropsychological assessment we are very concerned that this is not acknowledged in the current recommendations.</p> <p>NB no mention is given to the key role of neuropsychological assessment in potential cases of Young Onset Dementia, in which most cases could be deemed not clinically obvious and are often complex. This is despite the full guidance (page 370, Section 17, Line 6) noting that young onset dementia will often be of a less typical syndrome, consequently it is much more likely to require a neuropsychological assessment.</p>	
British Psychological Society	SH	9	24	<p>The cognitive screening measures noted in the current guideline are very brief and only appropriate for use as initial screens in primary care. The ACE-III and other comprehensive cognitive screening tools such as CAMCOG, ADAS-cog, MEAMS and the RBANS are not included. The 2006 NICE guideline noted the utility of these more comprehensive cognitive screening tools to be used to determine a baseline, to assess change, to assist in differential diagnosis and to inform management of cases. The 2006 guideline</p>	<p>Thank you for your comment. The committee noted that the cognitive tests mentioned were only recommended for use as part of the initial assessment in non-specialist settings. The committee noted the evidence did not enable them to identify the most appropriate tests to use as part of assessment in specialist services, but agree it was appropriate to include a reference to cognitive testing as part of the initial specialist assessment, as well as an additional recommendation on neuropsychological testing:</p> <p>“Consider neuropsychological testing if it is unclear:</p> <ul style="list-style-type: none"> • whether or not the person has cognitive impairment

				<p>also recognised their utility as an initial part of a full neuropsychological assessment, usually conducted by a clinical psychologist.</p> <p>The ACE-III is routinely used across secondary mental health settings and neurology. Use of a more comprehensive cognitive screen forms part of a stepped care model of assessment for the presentation of cognitive symptoms. Primary care typically administers a brief screen with secondary care using a more comprehensive tool such as ACE-III as one part of the process, which may lead on to a full neuropsychological assessment if required. Various members of multidisciplinary teams including nursing, psychiatry and neurology are able to access an online training programme regarding ACE-III administration as well as supervision by a Clinical Psychologist regarding interpretation as required.</p> <p>To remove these comprehensive cognitive screens from the NICE guideline undermines their clinical validity. It also has the potential to increase assessors' reliance on the briefer measures which yield less clinical information and are not sufficient to lead to a diagnosis in many cases. No information is provided in the current</p>	<ul style="list-style-type: none"> • whether or not their cognitive impairment is caused by dementia or • what the correct subtype diagnosis is.”

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				guideline to indicate why the more comprehensive cognitive screens have been omitted.	
British Psychological Society	SH	10	11	The recommendations note that a referral to a specialist dementia diagnostic service should be made following a clinical history and brief cognitive screen. Most young people presenting with a suspected dementia will not go on to actually receive that diagnosis. This population are more likely to be experiencing cognitive symptoms due to mental or physical health problems, medication, head injury, alcohol or substance use for example. Consequently comprehensive assessment for this population should include neuropsychological assessment when appropriate, scans, bloods and full clinical interview with the patient and a significant other, prior to consideration of referral to a specialist dementia service or older people's CMHT.	Thank you for your comment. The committee agreed with the need to rule out other possible presentations before referring to a specialist dementia diagnostic service, and therefore the recommendations on initial assessment in non-specialist settings have been expanded to include "conduct a physical examination, undertake appropriate blood and urine tests to exclude reversible causes of cognitive decline, and use cognitive testing."
British Psychological Society	SH	10	14	The total cost per session is calculated as £233.19. The Knapp (2006) paper calculated the cost per session as £90. The Knapp (2009) paper may be an overestimate, if, as noted above, lower staff salary and travel costs are taken into account. Using the Knapp cost per session calculation, even with just 5 people in each group,	Thank you for your comment. Economic models produced by NICE are based on the best available evidence along with the committee's judgement about the quality and applicability of that evidence to current practice across the whole of the NHS. Our analysis uses up to date costing for staff, and unlike the Knapp (2006) analysis, assumed that the researchers were not

				the total cost per patient per CST course (14 sessions) is £252, compared to NICE's estimate of £652.94.	skilled in delivering CST and therefore incurred training costs. Furthermore, our analysis assumed that there were external venue costs, and costs associated with the transportation of patients to receive CST. These assumptions were ratified by the guideline committee for use in our economic analysis.
British Psychological Society	SH	10	10,11	The Society would advise that further consideration is given to the assumptions in the cost analysis. Please note groups are generally led by Band 4's (rather than Band 6's); many groups will have a maximum of 8 participants; they are often run from base so there is no staff travel time; participants are generally expected to fund their own travel costs.	Thank you for your comment. We recognise that there is variation between different trusts and organisation, and therefore the guideline committee was consulted with regards to the number and seniority of staff that would be required to run a CST session.
British Psychological Society	SH	10	23	The Society is concerned that a test of verbal episodic memory is the only cognitive assessment recommended as needed in diagnosing possible Alzheimer's disease, as this seems to imply that this is the only cognitive domain that may be affected. The diagnostic criteria for Alzheimer's specify impairment in two or more domains. Also, detailed neuropsychological assessment may be required to differentiate an Alzheimer's presentation from other clinical presentations.	Thank you for your comment. The committee made 2 modifications to address these concerns. First, a reference to "cognitive testing" was added to the recommendation on initial assessment in specialist settings. Secondly, an additional recommendation was added around referral for neuropsychological testing; specifically: "Consider neuropsychological testing if it is unclear: <ul style="list-style-type: none"> • whether or not the person has cognitive impairment • whether or not their cognitive impairment is caused by dementia or • what the correct subtype diagnosis is."

Stakeholder	Document	Page No	Line No	Comments	Developer's response
British Psychological Society	SH	10	27	The guidance on diagnosis of different subtypes implies that this is possible without detailed cognitive assessment. It is extremely difficult to reliably diagnose a dementia subtype and rule out causes such as depression, which in some instances requires detailed neuropsychological assessment.	Thank you for your comment. The committee agreed it was appropriate to make 2 modifications to the recommendations to address this concern. First, a reference to cognitive testing has been added as part of the initial assessment in specialist services. Secondly, an additional recommendation has been added around the use of neuropsychological testing; specifically: "Consider neuropsychological testing if it is unclear: <ul style="list-style-type: none"> • whether or not the person has cognitive impairment • whether or not their cognitive impairment is caused by dementia or • what the correct subtype diagnosis is."
British Psychological Society	SH	13	11	Question 4: We note that guidance is given on telling the difference between delirium and dementia. However, guidance on telling the difference between depression and dementia or MCI and dementia is not included. A significant proportion of referrals for dementia assessment will be of people who have memory difficulties associated with depression, anxiety or stress as well as people with MCI.	Thank you for your comment. Evidence on people with a prior diagnosis of either depression or MCI was looked for in the section of the guideline on diagnosing dementia, but no evidence was identified which enabled the committee to make recommendations on this topic.
British Psychological Society	SH	13	13	Question 3: Consistent with person-centred literature on dementia and studies of the diagnostic process (Aminzadeh et al, 2007), service users emphasise the importance of	Thank you for your comment. The committee agreed with these concerns, and the importance of staff conducting these conversations appropriately. To address this, the committee agreed it was appropriate to amend one of the

				psychosocial factors, including how the diagnosis is shared and the support that is needed afterwards. Doing this insensitively can cause distress. We are concerned that the lack of reference to considering psychosocial factors in how a diagnosis is shared or in relation to review implies that this is not relevant. A person-centred approach would place these factors at the centre of the process. There seems to be an inconsistency here in emphasising a person-centred approach but providing guidance only on diagnostic tools in relation to assessment and diagnosis.	recommendations around staff training to clarify the importance of this issue. Specifically: "Health and social care professionals advising people living with dementia (including those involved in diagnosis) should be trained in starting and holding difficult and emotionally challenging conversations"
British Psychological Society	SH	15	5	The Society is concerned that recommendations on interventions to promote cognition, independence and wellbeing seem to imply that only cognitive stimulation, cognitive rehabilitation and activities are worth considering. The Society's 2014 guidance on psychosocial interventions in dementia outlines the evidence base for a wide range of possible interventions, including specialist psychological therapies (BPS, 2014). While acknowledging that the evidence base is limited, and may not meet NICE criteria, it should be recognised that there is a growing evidence base for psychological therapies and	Thank you for your comment. The committee noted a wide range of potential interventions were considered within the guideline, but that robust evidence of benefit was only found for CST, reminiscence therapy, cognitive rehabilitation and occupational therapy, so these were the only interventions the committee felt able to make recommendations on. They agreed that further research on other potential interventions would be valuable, and agreed it was appropriate to add a research recommendation on the most effective psychological interventions to support cognition, functional ability and wellbeing in people living with dementia.

				these should be considered, as laid out in e.g. Matrics Cymru (2017), which provides guidance on evidence based psychological therapies and dementia. In our memory assessment and young onset dementia services we offer specialist psychological therapies to people living with dementia and their care partners where needed in recognition of the fact that they frequently struggle to access generic mental health services, which struggle to adapt to their particular needs.	
British Psychological Society	SH	15	9,10, 11	The Society believes that this recommendation shows a significant shift in language from the previous NICE guidelines, despite further evidence since 2006 for the effectiveness of Cognitive Stimulation Therapy (CST). Also, there is no evidence to suggest that "elements" of cognitive stimulation and reminiscence therapy are effective. The vast majority of positive evidence is for structured CST, following a manualised approach. The wording in the draft guidelines seems to be based on a misunderstanding and misinterpretation of the evidence base for CST.	Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The committee agreed the evidence base was stronger for CST (as a manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-effectiveness. The committee therefore agreed it was appropriate to split this into two separate recommendations, a stronger

				to be developed, which can then guide appropriate psychosocial interventions. We believe that the importance of guiding interventions by an integrated perspective (often termed a formulation) needs to be included in this chapter due to the introduction in recent years of formulation-led interventions. (Holle, D. et al, 2015).	people living with dementia, conduct a structured assessment to: <ul style="list-style-type: none"> • explore possible reasons for the person's distress and • check for and address clinical or environmental causes (for example pain, delirium or inappropriate care)."
British Psychological Society	SH	277	37	This section considers the economic analysis of CST, but uses a base case model, rather than published health economic studies. There have been 2 key papers published considering the cost effectiveness of manualised CST (Knapp et al, 2006 which considered CST; D'Amico et al, 2015 which considered maintenance CST). Both are listed in the references in Appendix J, but only D'Amico et al (2015) has been considered in the evidence. These papers show strong evidence for the cost effectiveness of manualised CST and it is important for the Knapp paper to be used, rather than a base case model. These papers look at the cost of the delivery, as well as the changes in use of health and social care services for those in receipt of the intervention.	Thank you for your comment. The Knapp (2006) paper was not a cost-utility study and therefore did not consistent with the reference case. As a result, it is inaccurate to state that this analysis showed that CST is cost effective, as no threshold value has been established for the effectiveness instruments used against which gains could be assessed. The D'Amico (2015) paper however, was a cost-utility study and was eligible for inclusion as part of the economic review. Please note that the effectiveness evidence used in Knapp (2006) was based on Spector (2003), and has been considered by this guideline by the way of inclusion in our quantitative synthesis of parameters for the model developed by NICE.

				<p>The current wording risks creating ambiguity and it is likely to be interpreted that any type of structured group is sufficient, leading to a lack of clinical governance, and a lack of adherence to any sort of standardisation. The conclusion in the report that "this was likely to lead to better outcomes for a range of people than one narrowly focused on a very specific intervention model" appears to be based on no evidence and also a misunderstanding of CST, which is not "narrowly focused on a specific intervention model". Instead, CST has a variety of interventions depending on the interests and abilities of the group, and is delivered according to important key principles which fit with the underlying theoretical models. We would encourage NICE to argue for more adherence to protocol and evidence base, rather than less.</p>	<p>recommendation for CST and a weaker recommendation for reminiscence. Specifically:</p> <p>"Offer group cognitive stimulation therapy to people living with mild to moderate dementia.</p> <p>Consider group reminiscence therapy for people living with mild to moderate dementia."</p>
British Psychological Society	SH	300	4	<p>The Society has concerns regarding the following statement, "Consider providing structured group activities (including elements of cognitive stimulation and reminiscence therapy) to people living with mild to moderate dementia who are not already accessing them". 				will be offered only medication, and it will be even harder for people to access non-pharmacological interventions.	
Care and Repair England	Summary	General	General	Whilst the title includes management and support for people with dementia and their carers the recommendations seem to be much more focused more on diagnosis, assessment and conditions management and does not give enough focus to long term post diagnosis support. We would have liked to see a greater focus on support for daily living for the person with dementia and their carers including opportunities for a review of this support. Given that there are also quality standards in existence in relation to this it might be helpful to make further reference to this in the text. At present the dementia guidance, quality standards and links between these are a bit unclear.	Thank you for your comment. The committee noted that evidence on diagnosis, assessment and support were all looked for as part of the guideline, and the recommendations made reflected those areas where robust evidence on effectiveness and cost-effectiveness was available. The committee also noted that that quality standard on dementia may be updated after the publication of this guideline.
Care and Repair England	Summary	Page 1	Box	The guideline covers - this should also include housing professionals who also support people with dementia	Thank you for your comment. This has been added as suggested.
Care and Repair England	Summary	Page 3	Line 27	While the introduction talks about the importance of coordinating care between different services (a key feature to support people with dementia and their carers) there is little in	Thank you for your comment. The committee noted the guideline contained a specific review question on how health and social care should be integrated, but the absence of robust evidence made it difficult for them to make strong

				the guideline that addresses this aspect though there is much more on the training aspects and support for carers. We note that the named person is the opportunity to facilitate this coordination, but we would like to see this section expanded a little even if it might be by reference to other NICE guidelines on the coordination of care and support.	recommendations. They agreed the key recommendation in the guideline in this regard was for a single named person coordinating care, and implementation of this should lead to better coordination between services.
Care and Repair England	Summary	Page 4	Line 4 - 5	It is important that people with dementia can get the housing as well as the care and support needed	Thank you for your comment. Additional text has been added to the section on who the guideline is relevant for, to include "housing associations, private and voluntary organisations contracted by the NHS or social services to provide care for people living with dementia."
Care and Repair England	Summary	Page 8	Line 6 to 7	Should add housing professionals and add a section to this list which refers to the suitability of their housing since this should be a part of the assessment. We suggest the following – an assessment of their housing suitability and any plans to make the home more suitable.	Thank you for your comment. The committee noted this concern, but agreed that in the absence of evidence it was not possible to include this reference in the recommendations.
Care and Repair England	Summary	Page 9	Line 11	We are pleased to see a reference to considering a person's preference for their 'place of care' and 'place of death'. We feel it would be better to talk about where people live so perhaps say a preference for where they want to live and die – rather than their place of care and death. After	Thank you for your comment. The committee noted this suggestion, but agreed that the included terms had a technical meaning that was well understood, and were therefore appropriate to retain within the guideline.

				all, in many cases this will be the person's own home. Who calls their own home a place for care?	
Care and Repair England	Summary	Page 27	Line 4 and 13	We would like to add housing support staff as well as care staff many of whom support people with dementia and would also benefit from training. Indeed, in this section where it talks of health and care staff we would like to add housing staff at every reference point.	Thank you for your comment. The committee noted the evidence identified focused on care and support staff, so agreed it was appropriate to retain this wording in the recommendation. However, the committee agreed this training would also be relevant to other groups involved in providing support or services for people living with dementia.
Central and North West London NHS Trust	Full	General	General	A specialist in dementia treatment at CNWL has reviewed the guidelines. The main feedback is an observation that cognitive stimulation therapy appears to have been downgraded in the guidance as an important part of treatment.	Thank you for your comment. Having reconsidered the evidence around CST, the committee agreed it was appropriate to make a stronger recommendation for CST and the recommendation has therefore been amended to an 'offer'. Specifically, "offer group cognitive stimulation therapy to people living with mild to moderate dementia".
Cochrane Dementia and Cognitive Improvement Group	Full and short	General	general	As worded, the recommendations concerning memantine (1.5.2 and 1.5.3) use are unnecessarily complicated and confusing for clinical practice. We agree that the evidence now supports coadministration of memantine and cholinesterase inhibitors. However, memantine monotherapy also has high quality evidence of a small effect. If a patient with moderate AD is neither already taking a ChEI, nor	Thank you for your comment. The committee appreciated this concern, but noted the guideline was not updating these recommendations on treatment from NICE technology appraisal 217, and therefore it was not possible to make changes to these recommendations. They noted the guideline now contained a clear treatment pathway. Cholinesterase inhibitors for people with mild dementia, consideration of co-prescription in moderate dementia, and offering co-prescription in severe dementia.

				prescribing in advanced stages of dementia and link with the medicine optimisation policy.	However, the committee did agree it was appropriate to add a cross-reference to the NICE guideline on “managing medicines for adults receiving social care in the community”, which does include recommendations around covert administration of medicines.
College of Mental Health Pharmacy, endorsed by The Royal Pharmaceutical Society	Short	16	19-24	The statement is not clear whether memantine should be considered in all ACHEI users or only where there is a lack of response to ACHEI. It would help to have criteria to guide when the memantine should be added in. We are concerned that prescribers in primary care may not have the experience to know when to add it in and needs more guidance. I think this will be challenging to implement because it is assuming that people are seen when they progress from mild to moderate or moderate to severe stages. This may not always be the case.	Thank you for your comment. The committee noted the guideline contains recommendations from both NICE technology appraisal 217 and new recommendations from the guideline. They agreed though that the guideline did contain a clear pathway, with people with mild dementia being offered a cholinesterase inhibitor, consideration if co-prescription in people with moderate dementia, and finally offering co-prescription in people with severe dementia.
College of Mental Health Pharmacy, endorsed by The Royal Pharmaceutical Society	Short	20	9-13	Strengthen the recommendation to minimise – ie remove ‘consider’. Also previous guidance suggested that a full medication review should be carried out prior to referral for cognitive assessment. This need to be clearer to ensure that people with medication related cognitive decline are managed as quickly as possible.	Thank you for your comment. The committee discussed this but agreed that since currently the evidence on actively reducing anticholinergic burden as an intervention was minimal, it was appropriate to maintain this as a ‘consider’ recommendation. The committee noted that a research recommendation was also included within the guideline on this issue, and that future research in this area would hopefully enable future updates of the guideline to make stronger recommendations.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. College of Mental Health Pharmacy, endorsed by The Royal Pharmaceutical Society	Short	20	14	The AEC anticholinergic effect on cognition is another validated tool which is in the All Wales guidance for classification of anticholinergic medication which has looked specifically at effect on cognition and possibly more relevant to use in people with suspected dementia. There is also an online tool www.medicheck.com which we think could be mentioned.	Thank you for your comment. The committee noted the existence of this new and potentially improved tool, but were not aware that it had yet been validated in the same way as the other tools included in the review. As a result, the committee agreed it was best to retain the reference to the ABS, but that this was presented solely as an example, and that the use of more modern validated scales would be appropriate when they are available.
College of Mental Health Pharmacy, endorsed by The Royal Pharmaceutical Society	Short	21	8	Need clarity on whose responsibility it is to review the antipsychotic. Need to strengthen the need to document a clear plan and monitoring. National guidance on this area is very poor. The way that this guideline refers the reader to NICE medicines optimisation is not that helpful on this specific topic.	Thank you for your comment. The committee agreed that it was for local areas to implement their own policies around antipsychotic prescribing and monitoring. They noted the key things to emerge from the evidence these recommendations were based on was the need for frequent review, and for treatment to be discontinued if there is not a clear and ongoing benefit from it.
College of Mental Health Pharmacy, endorsed by The Royal Pharmaceutical Society	Short	22	11	Sleep disorders- melatonin mentioned but no advice on zopiclone and other hypnotics. Need to state to avoid all use of sedative and if absolutely necessary to have a time limited prescription.	Thank you for your comment. The committee noted this concern, but agreed there was not sufficient evidence on other pharmacological treatments to be able to make recommendations (either positive or negative), and agreed that an absence of alternatives was not a reason to promote the use of a drug (melatonin) where there is evidence of a lack of efficacy.
College of Mental Health Pharmacy, endorsed by The	Short	23	24	Surely need to mention non drug treatment – whether incontinence a result of AChE and needs review. Also consider that many patients may not comply with assessment and symptomatic	Thank you for your comment. The committee also noted that there were side-effects associated with cholinesterase inhibitors, but agreed that concerns around anti-muscarinic prescription were covered by the recommendation to

Compassion in Dying	Short	9	6	<p>We welcome the recommendations on advance care planning and the acknowledgment that it is important for people with dementia to be involved in decisions about their care. .</p> <p>We recommend that the <i>specific</i> benefits of planning ahead for those with dementia and their carers are outlined in this section. The issue of fluctuating capacity should be addressed clearly; dementia will cause a person's capacity to fluctuate and some may lose all capacity to make decisions about their treatment and care, leaving it up to healthcare professionals and carers to make decisions on their behalf. Planning ahead is therefore particularly important for people with dementia to ensure their carers and healthcare team know their wishes for care if they can no longer communicate them. This should be explained to the person with dementia, so that not participating in advance care planning is just as informed a choice as participating in advance care planning.</p>	Thank you for your comment and your support for this recommendation. The committee agreed that all of these points were relevant as part of an advance care planning discussion, but they represented too much detail to be included within the guideline recommendations themselves.
Compassion in Dying	Short	9	11	There is scope in the guidelines to add a bullet point or sentence encouraging healthcare professionals to make referrals to other	Thank you for your comment. The committee agreed that these discussions could involve reference to external sources of information or support, if appropriate, but that the evidence

Dementia Industry Group	Short	General	General	It is estimated that between 5 and 20 per cent of people aged over 65 have MCI. It is not a type of dementia, but a person with MCI is more likely to go on to develop dementia. A lot of research has focused on trying to identify which people with MCI will go on to develop dementia. If this could be predicted, it would mean people could be offered a range of support and treatment earlier in the development of dementia. DIG would recommend that due attention is paid to the detection, care and research into Mild Cognitive Impairment within these guidelines.	Thank you for your comment. The diagnosis and management of mild cognitive impairment was not within the scope of this guideline, and therefore it was not possible to make recommendations on this topic. A number of stakeholders have raised this as an important issue needing guidance, and this feedback has been passed to the commissioning team within NICE for consideration when the topics of future guidelines are discussed.
Dementia Industry Group	Short	General	General	Behavioural and functional symptoms: the full guideline sets out clearly the challenges of diagnosing and treating these symptoms, recognising the qualitative and quantitative burden on individuals, families and health and social care systems. We note that this information and guidance is not incorporated into the short guideline to an extent that would be helpful for professionals. We feel the short guideline does not provide adequate information on definitions, support for detection, diagnosis and care for behavioural and functional symptoms.	Thank you for your comment. The committee agreed that the recommendations included in the short guideline were as specific as possible given the evidence available, and noted that a number of recommendations for future research had been made in areas with a lack of evidence. The committee noted that a number of different terminologies were used to describe non-cognitive symptoms for people living with dementia, but agreed the current wording in the guideline should be clear and familiar to most people working in the area.

				Recommendation: In reference to symptoms we would recommend the use the terms cognitive, behavioural and functional .	
Dementia Industry Group	Short	4	7	DIG welcomes the recognition that new methods for diagnosing and assessing dementia have been developed. Both amyloid imaging techniques and cerebrospinal fluid examination represent reliable methods for diagnosing dementia and Alzheimer's disease. New developments in diagnosing Alzheimer's disease continue to be made, some of these maybe blood tests others could be sensitive digital cognitive tests. For example, researchers presenting findings at the Alzheimer's Association International Conference 2017 demonstrated that a blood test could indicate the presence of amyloid in the brain indicative of Alzheimer's pathology. These developments, along with ongoing innovations in clinical practice and technology, mean that the National Health Service must ensure that it takes opportunities to combine new methods for diagnosing and assessing dementia and Alzheimer's disease with existing clinical practice to enhance the reliability of diagnostic criteria.	Thank you for your comment. The committee agrees with the importance of evaluating the accuracy and effectiveness of newer diagnostic tests, and notes that future updates of the guideline should take account of any new evidence published in these areas.

				Recent years have seen progress in supporting people to access dementia research. Between 2012 and 2015, Government funding for dementia research doubled, to over £60m a year. Launched in 2014, Join Dementia Research (JDR) has played an important role in encouraging more people diagnosed with dementia to take part in research. To enhance recruitment to clinical trials in the UK it is vital that GPs, community pharmacies and memory clinics both ask people diagnosed with dementia and those at risk of developing dementia if they would like to participate in research and provide information on opportunities to do so.	
Dementia Industry Group	Short	9	4	DIG welcomes advance care planning to offer early and ongoing opportunities for people living with dementia and people involved in their care to discuss the benefits of planning ahead and their values regarding their future care. As noted above, we contend that people living with and at risk of developing dementia should discuss their interest in participating in dementia research.	Thank you for your comment. The committee agreed with the value of making people living with dementia aware of chances to be involved in research, and therefore added a recommendation to “tell people living with dementia (at all stages of the condition) about research studies they could participate in.”
Dementia Industry Group	Short	9	24	DIG welcomes the recommendation to use a validated cognitive instrument when using	Thank you for your comment. The committee noted that the MOCA did not show any evidence of superior accuracy to the

				diagnosing Alzheimer's dementia and Alzheimer's disease.	
Dementia Industry Group	Short	11	28	Although analysis of Alzheimer's Disease Neuroimaging Initiative (ADNI) data showed that the diagnostic accuracy of the tau/Aβ42 ratio was higher in the younger (<75 years) than in the older (>75 years) age group due to reduced specificity in older people, DIG notes that using a combination of biomarkers, may still show satisfactory sensitivity and specificity in older people. We therefore recommend that a combination of biomarkers maybe useful tests at all ages.	Thank you for your comment. The committee agreed there was no clear age threshold above which biomarkers should not be used. However, they noted the evidence did show that the utility of CSF testing was lower in older people, and this was what led them to make a recommendation to "be aware that the older a person is, the more false positives will be found with cerebrospinal fluid examination".
Dementia Industry Group	Short	12	24	DIG notes that the guideline states that case finding for suspected dementia should only be undertaken as part of a clinical trial that provides an intervention to people diagnosed with dementia. While case finding for suspected dementia will not always be appropriate, DIG believes that people with dementia should be able to access diagnostic services. There are over 850,000 people currently living with dementia in the UK, many of whom who have not had a formal diagnosis of their condition. Alzheimer's	Thank you for your comment. The committee agreed about the importance of access to an accurate and early diagnosis, but agreed this was different from implementing a system of active case finding, which would need to have clear evidence of benefits to justify the costs of such an approach, which could otherwise be used to provide care for people with diagnosed dementia.

				furrowed brows, which seems to me to exaggerate the facts, almost to excuse failings in what is essentially a simple paradigm: people need help – the help required should be tailored to the individual, be flexible and change over time as needs change. Help will be needed throughout the remainder of life, and family and other carers may require support and therapy even beyond death of the individual”.	
Dementia Pathways Community Interest Company	Short	4	3	Page four emphasises the financial implication of individual cases, but most particularly the costs arising within health and social care services. The impression is that the burden of these costs weighs more heavily than the impact on the lived experiences of individuals and their families. From this, a transition to information about new, complex and expensive techniques which require examination of cerebrospinal fluid, fits uneasily. These techniques have been demonstrated but to hint that they can reasonably add to good clinical practice seems less than wise.	Thank you for your comment. NICE's remit is to consider the balance between costs and effects of the interventions it considers. As such, the recommendations made were ones the committee were confident would be an effective and cost-effective use of resources.
Dementia Pathways Community Interest Company	Short	5 6	15 – 29	Reference is made to key relevant legislation since the 2006 NICE Guidance on Dementia. However, there is no mention of the Law	Thank you for your comment. The committee agreed the most appropriate way to address these issues was to cross-refer to the NICE guideline on decision-making and mental capacity

Dementia Pathways Community Interest Company	Short	31	9 - 20	Regarding "case management" and the question of its cost effectiveness - already Admiral Nurses, Community Support Co-ordinators and numerous other case manager models are proving their worth and we need to learn from these innovations.	Thank you for your comment. The committee agreed with this point, and that this current knowledge would need to be borne in mind when designing future research.
Dementia UK	Short	General	General	Overall we welcome the inclusion of family members and carers in assessment, diagnosis, decision- making and on-going care/ support. There should however be some consideration of how 'carers' are defined and who is involved in decisions especially where there are conflicting views and the person with dementia is unable to make decisions due to lack of capacity	Thank you for your comment. The committee agreed these issues were best addressed by the cross-reference in the guideline to the Mental Capacity Act and its accompanying Code of Practice, as well as a cross-reference to the NICE guideline on Decision-making and mental capacity (which is due to be published in July 2018).
Dementia UK	Short	General	General	Whilst there is recognition of the incidence of depression in family members/ carers and the risk of delirium in dementia; there is little reference to the risk of depression and anxiety for people with dementia. We recommend inclusion of how depression and anxiety can impact on assessment, diagnosis and treatment. Consideration of recommended tools for screening and use of psychological treatments including Cognitive Behavioural Therapy and psychotherapy is also suggested.	Thank you for your comment. The committee noted there was only limited evidence on assessing and managing depression in people living with dementia, and the identified trials covered a wide range of different interventions. The committee therefore agreed it was not possible to be more specific than the current recommendation in the guideline: "For people living with mild to moderate dementia who have mild to moderate depression and/or anxiety, consider psychological treatments."

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Dementia UK	Short	General	General	We are concerned that the guidelines offer little instruction for those who have not received a formal diagnosis for varied reasons. The presence of dementia may be clear to significant others but often leads to complex situations or crisis occurs before support is provided. Family/carers require education and coping strategies in these situations.	Thank you for your comment. The committee agreed that there was no evidence identified within the guideline that would enable them to make recommendations, but agreed this was a relevant issue. As noted within the committee's discussion of the evidence for the diagnostic section; "the committee commented that it was also important to consider situations where a patient may not want a referral for an assessment/diagnosis, and the potential disadvantageous outcomes that might result from this choice (e.g. problems with obtaining support, care and treatment)."
Dementia UK	Short	9	18/19	Capacity assessment and best interests should be considered by GP/practice nurse in non – specialist settings during assessment	Thank you for your comment. The committee agreed these were relevant issues to consider, if there were concerns about the person's capacity at the time of this initial assessment.
Dementia UK	Short	13	General	Telling the difference between delirium and dementia This highlights detecting delirium in the hospital setting but if applied in the community setting, unplanned admission to hospital may be avoided. However, no reference is made to obtaining history and presentation/ information from family/carer's who often notice changes but are not always listened to.	Thank you for your comment. The committee noted the evidence identified for this review question came from hospital settings, and therefore agreed it was appropriate to restrict their recommendations to that setting. They also noted that the question asked was not about what should prompt concern about whether a person has cognitive impairment/delirium, but how dementia and delirium should be distinguished once suspected.
Dementia UK	Short	13	12	In cases where diagnosis is uncertain suggest a follow-up appointment should be arranged to review any further deterioration in cognition	Thank you for your comment. The committee noted this suggestion, but agreed there was no evidence identified which would enable it to be included in the recommendations.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. 02/01/2018-13/02/2018**

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Dementia UK	Short	13	22	We welcome the recommendation for a dedicated coordinator for intensive case management throughout the trajectory of dementia. We recommend from our clinical experience that this role requires a professional with specialist knowledge in dementia with knowledge and skills to support both person with dementia and carers. We believe Admiral Nurses can play a key role in intensive case management particularly for those with complex needs, requiring significant input from a variety of professionals; offering both face-to-face and telephone support for both the person with dementia and their family carers.	Thank you for your comment. The committee agreed with your points as to the skills such a person would need, but that in the evidence base considered, a number of different roles were responsible for care coordination (social workers, nurses, occupational therapists), and it was not possible to make recommendations on which of these was the most appropriate. They did agree that Admiral Nurses were one very obvious group of professionals to play a role in implementing this recommendation.
Dementia UK	Short	22	4	Consider appropriate observational skills and assessment tools to diagnose depression and anxiety in people with moderate to severe dementia or where person unable to articulate there mood/emotions	Thank you for your comment. The committee noted this suggestion but agreed that, in the absence of evidence meeting the inclusion criteria for the guideline, this was not something they were able to include in the recommendations.
Dementia UK	Short	24	General	Palliative care and advanced healthcare plans- we consider further education is required for out of hours staff, ambulance service and on call doctors who will often follow rigid procedures or easiest option without considering the needs/wishes of the person with dementia or carer. Access to	Thank you for your comment. The committee discussed these issues but agreed that, in the absence of any evidence being identified, it was not possible to make recommendations on this topic.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. Stakeholder	Document	Page No	Line No	Comments	Developer's response
				advanced decision documents or best interest decisions also needs to be considered.	
Dementia UK	Short	24	6	The offer of flexible referral to palliative care is a sensitive subject and consideration should be given to appropriate timing. This requires skilled support by a specialist nurse/professional who can provide information, the time and skilled support to ensure a seamless progression into End of Life care. Admiral nurses are concerned this may be carried out as a tick box exercise and not followed up.	Thank you for your comment. The committee agreed with this point, and this was behind the decision to recommend that the offer of palliative care should be both "flexible" and "needs-based."
Dementia UK	Short	25	General	Supporting carers - we note the need to consider anticipatory grief and follow-up bereavement support. Loss of significant others and the role of carer can also increase the risk of loneliness, isolation and depression.	Thank you for your comment. The committee discussed this, but agreed that due to the potential high cost impact of widely delivered carer training, it was important to focus the recommendations on areas with robust evidence of effectiveness and cost effectiveness, and few of the studies included specifically included carer training in these issues.
Dementia UK	Short	26	10/11	Although group sessions are considered the most effective for carers; there is little guidance offered on the type of group intervention i.e. psycho-education, peer support, psychotherapeutic, etc. Clinical experience from Admiral Nurses indicates that groups are not always possible (due to availability of respite) or appropriate, as they do not always address the complexities and dynamics of families/carers.	Thank you for your comment. The committee noted that there were examples of the types of carer interventions recommended (such as the START intervention referenced in the full guideline) that could be implemented in a fully structured way. The committee agreed that although the evidence showed that groups were, on average, the most effective way to deliver these interventions, the support should be "provided in a format suitable for them (for example individual or group sessions, or online training and support)."

				Time to provide individual coping strategies and building resilience is also often neglected. We would recommend a tailored approach, which offers flexibility and allows for individual choice.	
Department of Health and Social Care	Full	General	general	I wish to confirm that the Department of Health and Social Care has no substantive comments to make, regarding this consultation.	Thank you for your comment.
Down's Syndrome Association	Short	General	General	We know that individuals with a learning disability (and people with Down's syndrome, in particular) have been identified as a priority group of individuals who are more at risk of developing dementia and are more likely to be excluded from mainstream dementia services. Adults with a learning disability have been identified as a <i>seldom heard</i> group by the Dementia Action Alliance (The Down's Syndrome Association is a member of this network). In 2017 the Alliance produced a briefing paper on dementia and learning disability, outlining some of the agreed challenges. www.dementiaaction.org.uk/joint_work/dementia_and_seldom_heard_groups/people_with_learning_disabilities	Thank you for your comment. The committee agreed that there were particular issues around both diagnosis and management of dementia for people with learning disabilities (including Down's syndrome). Evidence on these issues was looked for throughout the guideline, but no evidence was identified which the committee felt enabled them to make specific recommendations for this population. The committee agreed that further research in this areas would be valuable, both generally around how LD services should be organised, and specifically around the interaction between LD and dementia services. The committee agreed that, as a response to a number of issues raised during the consultation around dementia in people with learning disabilities, it was appropriate to add a specific mention to learning disabilities in the recommendation on groups of people to whom service should be designed to be accessible.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				<p>We know that people with Down's Syndrome (DS) have a much higher risk of developing early onset dementia and also, therefore, premature mortality. It is estimated that the prevalence of DS is 0.66 per 1000 population such that there are over 40,000 people with DS in the UK. Since it has been estimated that the cumulative prevalence of dementia in this population is 95% by the age of 60, the public health imperatives concerning health and social care for people with DS are self-explanatory. (McCallion et al, 2017).</p> <p>However, people with DS are also at risk of diagnostic overshadowing i.e. the changes due to the onset of dementia being attributed to their underlying learning disability or certain health conditions associated with their condition (e.g. thyroid disorder, visual and hearing impairments). People with DS often present later for diagnosis or are the subject of misdiagnosis, due to ill-informed professionals misinterpreting symptoms as being dementia, when in fact they are due to another underlying, treatable, condition.</p> <p>From an end of life care perspective, evidence suggests that people with DS are a unique population within the wider population of people</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				<p>with LD. Their mortality profile is unique given that dementia will be the cause, or associated cause, of death for many adults with DS. The prevalence of dementia in this population has been reported to rise from 9% for adults with DS aged between 40-49 years to 32% for adults aged 50-59 years (Coppus et al, 2006). Sinai et al (2018) report that the average survival time following a diagnosis of dementia in this population is less than 4 years.</p> <p>The established link between DS and dementia implies also that people with DS are more likely than other people with LD to experience a death that will have been anticipated for some month or years (Todd, et al, in prep). Given the progressive nature of dementia and the imperative of actively involving the individual and carers in planning end of life care, early diagnosis has been linked with improved end of life care outcomes (Goodman et al, 2015). The situation of people with DS and dementia has, as yet not featured in the small but growing body of evidence concerning end of life care for people with LD (Stancliffe et al, 2017)</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				<p>There is evidence to suggest that people with LD are at risk of transitioning out of LD services in the last years of life. (Patti et al, 2010). End of life care should be identified at the time of diagnosis and this should be reviewed as the illness advances, and more so when the individual is recognised to be nearing the dying phase. These include: awareness of when the terminal phase of dementia has begun; appropriate referral to specialist palliative care services; advance care planning and person and carer involvement in this; ethical decisions in relation to medication and nutrition; under-treatment of pain relief; and over and burdensome treatment interventions (Sampson et al, 2009; Lillyman and Bruce, 2016).</p> <p>McCallion et al (2017) suggest that recognizing when an individual with LD and dementia is entering the dying phase of the illness is perhaps more difficult for people with DS since most tools (e.g. FAST) over-emphasize decline in everyday functioning. They suggest that attention to acute clinical events such as multiple hospitalisations, recurrent infections, aspiration pneumonia, pressure sores, weight loss and/or refusal to eat maybe more useful in this population.</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Down's Syndrome Association	Short	5	7	We would support the call for improved research and in relation to the research priority of staff training , we would add that this should include training on condition specific risk factors that predispose some people with LD to develop dementia (and at an early age of onset). In relation to research relating to care and support planning we would highlight that people with DS are less likely to be married and unlikely to have children, therefore they are less likely to have the support of a partner or family-carers who are at an age where they have the capacity to provide direct care. Often people with DS have primary family-carers who are their parents, naturally they are likely to be older themselves and may not be a position to provide direct care to their loved one. People with DS who develop dementia in middle age may also be providing informal care for their parents and often the mutuality of this caring relationship is not fully recognised.	Thank you for your comment, and your support for these research recommendations. The committee agreed that future research should target the whole range of people who develop dementia, rather than being focused only on more common presentations. They also noted the guideline did contain a specific research recommendation on "the most effective methods of care planning for people who do not have regular contact with an informal carer."
Down's Syndrome Association	Short	7	10	We welcome approaches that will increase the accessibility of information provided to individuals with LD who develop dementia, however, we would stress that accessible written resources are only one small part of this. People need to have well-trained, supportive, staff, who	Thank you for your comment. The committee agreed with all the points expressed, and that time and appropriate follow-up appointments are necessary to ensure people receive the support they require.

				have the skills and sufficient time to help explain complex information related to their dementia condition in an accessible and non-threatening way.	
Down's Syndrome Association	Short	8	3	In a recent trawl across the public health and third sectors, we failed to identify much in the way of accessible information about dementia for people with LD. We identified a particular gap in literature that could help to explain to someone with LD about a relative's dementia (if a parent was developing dementia, for example). We would like to see the commissioning of new materials to address this shortfall and would be pleased to be involved in this process and share our experiences of working with adults with DS.	Thank you for your comment. The committee agreed there were gaps around information sources for many more unusual dementia presentations, including rarer dementia subtypes and people with comorbidities such as learning disabilities. They agreed it was important that accessible information is available that is tailored to an individual's particular circumstances, as mentioned in recommendation 1.1.4
Down's Syndrome Association	Short	8	12	We would draw attention to recently developed guidance from Public Health England on reasonable adjustments relating to dementia for people with LD. Making Reasonable Adjustments to Dementia Services for People with Learning Disabilities. September 2013. Learning Disabilities Public Health Observatory. https://www.gov.uk/government/publications/reasonable-adjustments-for-people-with-learning-disabilities	Thank you for your comment and for bringing this information to our notice.

**Consultation on draft guideline - Stakeholder comments table
02/01/2018-13/02/2018**

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Down's Syndrome Association	Short	9	3	Advance Care Planning for adults with LD is an area which has been significantly overlooked. We would support a call for further research and development of protocols in this area and highlight the work undertaken by Dr Stuart Todd at The University of South Wales, UK.	Thank you for your comment. The committee agreed that for many areas throughout the guideline (including advance care planning) there was a lack of research with people with learning disabilities, and would welcome further research being conducted on these topics.
Down's Syndrome Association	Short	9	24	We would highlight that for people with DS there is a need to use adapted assessment tools to assess whether an individual is developing dementia (for example CAMDEX or DSQUID). Non LD accessible assessments will be of little use. We would also highlight the advantages of monitoring protocols that obtain baseline data relating to an individual's cognitive functioning (in order to quickly identify any decline). Some localities are establishing monitoring protocols for their population of adults with DS aged 30+ (e.g. Aneurin Bevan Health Board Learning Disability Directorate, Monmouthshire, UK) The signs of onset of dementia should be picked up through an Annual Healthcheck via the individual's GP, although we are aware that many people with a learning disability do not access this.	Thank you for your comment. The committee agreed it was important to appropriately tailor assessments, and the tools used, for people with learning disabilities. For this reason, the committee agreed it was appropriate to add a cross-reference to the NICE guideline on "mental health problems in people with learning disabilities", which includes specific recommendations on assessment tools to use in people with learning disabilities and suspected dementia.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. Stakeholder	Document	Page No	Line No	Comments	Developer's response
Down's Syndrome Association	Short	10	11	We would highlight the importance of suitably trained professionals carrying out a differential diagnosis when assessing someone with DS who maybe developing dementia, paying particular attention to associated health conditions such as thyroid disorder, visual and hearing impairments, which could mimic some symptoms of dementia.	Thank you for your comment. The committee agreed with this point, and made the following comments in their discussion of the diagnostic evidence in the full guideline: "The committee agreed that physicians should be aware of the additional challenges of diagnosing dementia in certain vulnerable groups, such as people with learning difficulties and Down's syndrome, and those people with language and sensory impairment, lower educational levels and a low standard of literacy. Whilst the evidence base did not allow them to make specific recommendations for how the diagnostic pathway should be different for these groups of individuals, they agreed that it was important that people from these more difficult to diagnose groups should be assessed by a clinician with specialist skills in those areas, who would be familiar with the difficulties and able to make appropriate adaptations to the process used."
Down's Syndrome Association	Short	10	20	Many within the dementia community object to be dementia being referred to as a <i>mental health condition</i> . Consideration should be given to the appropriateness of this term and it's continued use.	Thank you for your comment. The committee agreed with this point, and noted that at no point in the guideline dementia is referred to as a mental health condition. The only mention of this is in a cross-reference to the title of another piece of NICE guidance.
Down's Syndrome Association	Short	12	20	Although the most prevalent cause of dementia amongst people with DS is Alzheimer's disease, it should be noted that vascular dementia can also be present and that some individuals may experience the combined effect of both causes.	Thank you for your comment and for this information.

02/01/2018-13/02/2018**

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Down's Syndrome Association	Short	13	13	We would stress the benefits of adults with DS who develop dementia remaining within the LD service provision, who should have expertise in meeting their specific needs (and will likely know the individual over a period of time). Dementia services are often not accessible to people with a LD and adults with LD who develop dementia are at risk of feeling excluded or experiencing barriers to accessing specialist dementia services, unless specific staff training and reasonable adjustments have been put in place.	Thank you for your comment. The committee agreed with this point, as given in the following point from their discussion of the evidence: "It was agreed that for the majority of people with learning disabilities who are subsequently diagnosed with dementia, their diagnosis and management of dementia would primarily sit within the learning disability pathway rather than the dementia one, and therefore recommendations on how those services should be organised fit better within a learning disabilities guideline."
Down's Syndrome Association	Short	13	22	We very much welcome better care coordination for those who need to access support around dementia. A keyworker approach would be helpful, however, this rarely happens in practice.	Thank you for your comment. The committee agreed this would represent a considerable change in practice in some areas, and hoped the guideline could act as a stimulus to promote these positive changes.
Down's Syndrome Association	Short	15	10	We recognise the benefits of therapies such as reminiscence, however we would highlight that, for adults with DS who develop dementia at a younger age, their reference points and life experiences might be very different from others who do not have a learning disability. This make accessing mainstream group activities more problematic and calls for a more tailored solution.	Thank you for your comment. The committee agreed with this point, and agreed it was appropriate to add people with learning disabilities as a specific group in the recommendation on groups to whom services should be made accessible.
Down's Syndrome Association	Short	16	3	Many pharmacological interventions for the treatment of Alzheimer's disease have a window of efficacy, meaning that early diagnosis is of	Thank you for your comment. The committee agreed with this point, and agreed it was appropriate to add people with

				paramount importance. We again highlight that often adults with DS present late for diagnosis, as early signs of dementia are missed. We would also advocate for equality of access to appropriate drug treatments and that an individual's learning disability should be no barrier to these being prescribed.	learning disabilities as a specific group in the recommendation on groups to whom services should be made accessible.
Down's Syndrome Association	Short	20	24	The need to continue with a differential diagnosis approach to recognising changes in an individual's functioning continues beyond the point at which a diagnosis of dementia is made. Treatable conditions such as thyroid, visual and hearing impairments will still present and can be ameliorated with the correct interventions.	Thank you for your comment. The committee agreed with the point around the importance of appropriate management of comorbidities, and noted this was captured within the recommendation to "ensure that people living with dementia have equivalent access to diagnostics, treatments and care services for comorbidities to people who do not have dementia."
Down's Syndrome Association	Short	22	1	We welcome approaches that promote personalised activities that suit an individual's needs. We would highlight that for this to take place, settings need to use regular staff who are appropriately trained and know the individual they are supporting.	Thank you for your comment and your support for this recommendation. The committee agreed with the importance of using regular staff, and that this would have advantages for the care and support provided in a range of situations.
Down's Syndrome Association	Short	22	13	We would add that people with DS are more likely to experience sleep apnoea and this should be taken into consideration when assessing needs. There is a 50-100% incidence of obstructive sleep apnoea in individuals with Down Syndrome, with almost 60% of children with	Thank you for your comment. The committee agreed that in the absence of any evidence on how sleep apnoea should be managed being identified, it was not possible to include recommendations on this topic in the guideline.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. Stakeholder	Document	Page No	Line No	Comments	Developer's response
				Down syndrome having abnormal sleep studies by age 3.5 – 4 years. The overall incidence of obstructive sleep apnoea increases as individuals grow older.	
Down's Syndrome Association	Short	22	17	We again highlight the need to be aware of diagnostic overshadowing – not assuming that changes in an individual are due to dementia, but also looking at other possible causes like thyroid and sensory impairments, which would have their own interventions.	Thank you for your comment. The committee agreed it was appropriate to add sensory impairment to the list of possible dementia mimics that should be investigated before a diagnosis is made.
Down's Syndrome Association	Short	24	2	We would question what joint work has been undertaken between Learning Disability Champions, appointed to coordinate better care of people with LD whilst in hospital. Our experience is that the understanding of the needs of people with LD in acute settings is variable and often lacking. Family carers often report that there is an expectation that they will remain with their relative for the entirety of the hospital stay as staff seem unable to communicate with of meet the basic care needs of some people with LD. This is an unreasonable expectation and demonstrates a lack of capacity (and thus a resource and training need) within some hospital settings.	Thank you for your comment. The committee noted these concerns, but agree that in the absence of any evidence being identified on this topic, it was not possible to make any recommendations about the organisation of hospital services for people with learning disabilities and dementia.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Down's Syndrome Association	Short	25	1	We would be very supportive of strategies that help keep an individual at home, in familiar surroundings, as we know this does much to mitigate the effects of dementia. However, we would report that frequently individuals with LD and dementia do move, often to inappropriate nursing care provision due to lack of support provided to maintain them in their usual living situation. Often the funding of waking night staff in support staff is a stumbling block and the unwillingness of commissioners to provide funding for this means an individual is moved, purely on the basis of cost of a care package.	Thank you for your comment. The committee agreed that there were many advantages of people being kept in a familiar environment, and that it was appropriate for these advantages to be spelled out in the guideline, to hopefully motivate policies to be put in place to ensure this happens whenever possible.
Down's Syndrome Association	Short	25	15	We have recently identified a lack of accessible information explaining what dementia is to a person with LD who has a relative (often a parent) who is developing dementia. Often the person with LD is an informal carer for their loved one. We would like to see this commissioned.	Thank you for your comment. The committee agreed there were gaps around information sources for many more unusual dementia presentations, including rarer dementia subtypes and people with comorbidities such as learning disabilities. They agreed it was important that accessible information is available that is tailored to an individual's particular circumstances.
Down's Syndrome Association	Short	27	13	We would support the need to improve training for all relevant health and social care staff and would add to the list the need for condition specific training, targeted to learning disability social care staff, so that they have improved skills and knowledge to support an aging population of	Thank you for your comment. The committee discussed this, but agreed that due to the potential high cost impact of widely delivered staff training, it was important to focus the recommendations on areas with robust evidence of effectiveness and cost effectiveness. On this basis they agreed

				people with LD, who are increasingly likely to present as experiencing dementia.	it was not possible to include more detailed recommendations in this section of the guideline than those currently included.
East of England Mental Health Clinical Network	Short	10	25	The use of scans / structural imaging is mentioned but should there not be more information and guidance provided to 'guide' the 'considerations' around deciding about a scan? There are numerous Scanning Guidance docs which go into considerable detail around this subject. Perhaps this doc should include some greater detail to reflect the 'complex' nature of deciding about when to scan and when not to scan?	Thank you for your comment. The committee agreed this recommendation could have been phrased more clearly, and has now been changed to "offer structural imaging to rule out reversible causes of cognitive decline and to assist with subtype diagnosis. Be aware that structural imaging is not always needed, if dementia is well established and the subtype diagnosis is clear." This is more in line with the recommendation from the previous version of the guideline, which many stakeholders raised as being appropriate to retain.
East of England Mental Health Clinical Network	Short	13	13	Concern at the Guidance indicating that diagnoses of dementia have to be confirmed by a specialist memory assessment service. We are encouraging GPs to do more diagnosing, especially of people living in Care Homes, in order to make the diagnosis process simpler and where appropriate to avoid on ward referral to an MAS. Please clarify	Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft guideline, in that people interpreted it as saying everyone need to attend an appointment at a secondary care service. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and treatment, but this did not mean the person necessarily had to travel to a physical appointment at that service. To ensure this is clear in the final version of the guideline, an explanation has been

					added to this section of the guideline, giving the following explanation around the term 'refer': "A referral to a diagnostic service does not require that the person be asked to attend a clinic appointment. It can also involve people being seen in community settings (such as their home or a care home), or advice being provided to the referrer without a formal appointment being made. The key issue is to ensure that dementia specialists are involved, both for advice on diagnosis and to ensure appropriate access to post-diagnostic support and treatment."
East Sussex County Council	Short	General	General	Unpaid care This document starts by setting out the costs arising from dementia illnesses in 2013. Given the extent of the unpaid care contribution to supporting people with dementia, it is felt that the document as a whole needs to place a much greater emphasis on the role of unpaid carers in meeting the needs of people with dementia. This will be especially important as the number of people with dementia increases across the country and budgets for professional health and social care support come under increasing pressure.	Thank you for your comment. The committee noted that the guideline contained a specific section on the needs of unpaid carers, including recommendations for training and support interventions that should be rolled out to all carers of people living with dementia.
East Sussex County Council	Short	General	General	Role of communities	Thank you for your comment. The committee noted the current interest around dementia friendly communities, and

				Greater management and support of people with dementia needs to be at a society level through dementia friendly communities that prevent, delay and manage the impact of dementia for as long as possible without the intervention of specialist health and social care services. This needs to be recognised in the guidance and would help provide balance to what currently reads as a medicalised approach to assessment, management and support for people with dementia and their carers.	other ways of modifying the environment to improve the experience of people living with dementia and their carers. However, they noted that in the absence of specific evidence of benefit from such approaches, it was not possible for them to make recommendations on this topic in the current iteration of the guideline.
East Sussex County Council	Short	General	General	<p>Partnership working</p> <p>For achieving the benefits the recommendations are seeking, there also needs to be greater emphasis on very close working and communication between all agencies involved. The closer that services work together then the greater the opportunity for providing a coherent message to people with dementia and their carers and for achieving better outcomes. Integrated health and social care services can help here but can bring challenges associated with pooling budgets and maintaining a balance between medical and social models of intervention. Initiatives such as the Dementia</p>	Thank you for your comment. The committee agreed that close integration between health and social care services was a key to delivering effective care. The committee noted that no evidence was identified that enabled recommendations to be made on specific interventions to achieve that integration, but this was an area where considerable innovation was currently going on at local levels, which would hopefully lead to more evidence in the future on how best this should be achieved.

The committee agreed the current wording, on "helping professionals to involve people living with dementia and their carers in decision-making" is an appropriate reflection of this particular aim of the guideline.
East Sussex County Council	Short	12	24	This recommendation would benefit from some clarity as to what constitutes case finding in this context.	Thank you for your comment. A definition of case finding has now been added to the guideline to provide this clarity.
East Sussex County Council	Short	13	23	We question whether it is feasible or desirable for every person with dementia to have a care co-ordinator from health or social care. If we are moving towards dementia friendly communities then the role of supporting people with dementia is in, and through, the community. Where a person's dementia has progressed to the point of needing active involvement of health and social care professionals then for a period of time professional care co-ordinators may be necessary but the aim should be to return the person to the care of the community wherever possible and not	Thank you for your comment. The committee agreed the evidence was clear that having a single named care coordinator was an effective intervention that improved the care and support for people living with dementia, and were therefore confident that it should be retained in the recommendations.

				often stepped, as is the case with vascular dementia.	
Innovations in Dementia	Short	8	5	<p>Q1. For a greater impact, it is also important to recognise that cognitive decline is not necessarily equated with decline of quality of life. Kate Swaffer has spoken eloquently about 'prescribed disengagement', whereby she was told at diagnosis effectively to go home and get her affairs in order. (Kateswaffer.com) Her experience is not an isolated case, and we have heard over the years from many, many people with dementia who formed the impression at the point of diagnosis that their 'life was over'.</p> <p>Q3. Some have indeed discovered that their lives are better than they were previously! The resources here are growing resources of evidence of the experience of people living with dementia (http://dementiavoices.org.uk/ and https://dementiadiaries.org/)</p>	Thank you for your comment. The committee agreed there was not a linear relationship between cognition and quality of life, and throughout the guideline evidence was looked for on changes in quality of life directly, independently of the way interventions may affect cognition.
Innovations in Dementia	Short	8	12	Q1 We are encouraged by the referral to the Equality Act. However, duties under the Equality	Thank you for your comment. The committee agreed there was a wider range of issues relevant to people living with dementia

				Dementia, Our Rights” (http://dementivoices.org.uk/deep-groups-news/our-dementia-our-rights/)	
Innovations in Dementia	Short	13	27	<p>This refers to initial assessments being carried out by named ‘care coordinators’ face to face ‘if possible’. We find the vague nature of this approach quite puzzling, considering the rigour of other parts of the guidance.</p> <p>Q3 As we have already mentioned above, we feel the recommendation for initial assessments by named care coordinators should come much earlier - during the diagnostic process for an obvious cognitive impairment - thus allowing the build-up of trusting relationships. This could well be over two years too late, thus nullifying the potential impact of a named care coordinator</p>	<p>Thank you for your comment. The committee noted that there were situations where it may not be possible or practical to conduct this initial assessment face to face, and therefore it was important to include this caveat in the recommendation. A reference to the section on care coordination has now been added to the section on directing people to appropriate services after diagnosis.</p>
Innovations in Dementia	Short	13	27	<p>We are very concerned and are baffled by the idea that any assessment NOT be carried out face to face. What sort of person-centred assessment could be carried out without face to face</p>	<p>Thank you for your comment. The committee noted that in some areas, for people with mild dementia, an initial assessment was carried out by telephone, with face to face assessments only used if needed. Whilst the committee were keen to promote face to face assessment as much as possible, they agreed there was not sufficient evidence for them to be able to mandate this in all cases.</p>

Innovations in Dementia	Short	25	15	<p>Q3. Traditionally services have focused on the unique set of difficulties of either the carer or the person with dementia in isolation of each other. The failure to recognise the interdependent nature of relationships can only hamper any self-management approaches that the full guidance refers to. Once again a key feature of the Innovations in Dementia 'Getting Along' programme is to work with care partners together and equip them to live well and better with the presence of dementia where they spend most of their time - which is NOT in dementia care services. This gap in addressing the interdependence of relationships has been very clearly identified in the recent work of Bielsten and Hellstrom (2017) whose review recommended that</p> <p><i>"people with dementia should be included in the assessment of the relationship in order to gain an overall picture of relationship dynamics and to</i></p>	<p>Thank you for your comment. The committee noted the points raised, and agreed they were relevant considerations in the design of interventions, which will hopefully be tested in future research. However, they agreed that for the current guidance, they could only make recommendations on interventions for which there was robust evidence of effectiveness and cost-effectiveness.</p>

				policy and practice). Their work aims to support bridging the gap between academic research and care services to support the flow of knowledge from research into practice and vice-versa .	
Innovations in Dementia	Full	General	General	We feel that the relatively vague nature of recommendations around care excellence compared with detailed recommendations for clinicians - reveals a need for further research recommendations and also for more diverse methods of gathering evidence.	Thank you for your comment. The committee agreed with the need for more research to be conducted in the area of social care. The high quality research identified in areas such as social worker led case management and training of social care staff demonstrate that it is feasible for research to be conducted that leads to the ability to make strong recommendation on these topics. The committee would welcome more research in these and other areas of care, which could be made use of in future updates of this guideline, and have made a number of recommendations for future research on these topics.
Innovations in Dementia	Full	General	General	Despite consultation with 'some people with dementia', health and care professionals and family and informal carers, the content of the guidance seems to focus predominantly on only two corners of that triad.	Thank you for your comment. In common with all NICE guidance, this guideline was produced by a group of people including health and social care professionals, people living with dementia and carers of people living with dementia. The guideline also contains specific sections on support for staff (section 1.1.13), support for carers (section 1.11) and support for people living with dementia (the majority of the rest of the guideline).

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Innovations in Dementia	Full	General	General	We feel there has been a missed opportunity in limiting 'care' recommendations to the post diagnostic phase, when families may have been struggling for a couple of years without any support to live with the presence of a dementia in their midst.	Thank you for your comment. The scope of this guideline was only to make recommendations from the point where someone enters the dementia diagnostic pathway, and therefore it was not possible to make recommendations before this time.
Innovations in Dementia	Full	General	General	Below we list a summary of recommendations we recommend be included, either as guidelines for practice or as research suggestions: <ul style="list-style-type: none"> • Research on a relationship-centred approach in and around the time of diagnosis - with a particular focus on the 'Getting Along' programme that is designed specifically for delivery during this period. https://www.youtube.com/watch?time_continue=130&v=gEe9NbCq2Pg • A more explicit recommendation for research on - or sharing of evidence into - the benefits of peer-led groups, such as those that form the growing DEEP network of dementia 	Thank you for your comment. The committee agreed with the importance of a wide range of research in dementia, and added an additional recommendation in the final version of the guideline to tell people living with dementia about research studies they could participate in. The committee noted that it was only possible for them to make research recommendations in areas where evidence had been looked for as part of developing the guideline, and therefore decided not to considerably expand their list of research recommendations from the consultation version of the guideline.

Innovations in Dementia	Full	265		<p>Q3. We noted that no recommendations could be made around non-pharmacological interventions due to the lack of robust evidence.</p> <p>We were struck by mention of a particular variable being the fact that some people may have received some beneficial support pre-diagnosis. This would skew attempts to evaluate some post diagnostic support. Our view is that the efficacy of support much earlier (as we have mentioned already in this response) is surely an area for further recommended research. We would therefore like to see a recommendation for research in this area of the efficacy of pre and peri-diagnostic support.</p>	<p>Thank you for your comment. The committee discussed this issue and agreed about the complexity of the interactions between pre and post-diagnostic support. The committee ultimately decided against recommending further research in this area at this time, as they agreed there were not yet clear hypotheses that could be tested, and trials undertaken without such ran the risk of replicating the findings of the post-diagnostic support trials, where very intensive interventions are found not to be better than moderately intensive ones, but the more fundamental questions about the important elements of support are not answered. However, they agreed this was an important question to revisit in the future, for the purposes both of making recommendations and research recommendations.</p>
Innovations in Dementia	Full	301	8	<p>Q3. We welcome the specific calls for research into unstructured group activities and into the effectiveness of self-management training. The Innovations in Dementia Getting Along programme is specifically aimed at equipping couples to live well and better with the presence of dementia and for couples to come up with their own strategies to use where they spend most of their time together - NOT in dementia</p>	<p>Thank you for your comment and your support for this recommendation.</p>

Institute of Mental Health, University of Nottingham	summary	15	9-11	<p><i>1.4.2 Consider providing structured group activities (including elements of cognitive stimulation and reminiscence therapy) to people living with mild to moderate dementia who are not already accessing them.</i></p> <p>'Consider' There is robust evidence from systematic reviews and trials for the benefits of Cognitive Stimulation Therapy for dementia. It has been recommended in the NICE guidance in 2006, also by Alzheimers Disease International in their World Alzheimers Report 2011 'The strongest evidence by far for efficacy relates to interventions applying principles of cognitive stimulation'. For group CST (eg Spector et al 2003, Knapp et al 2006) there are clear benefits to cognition, quality of life and it is cost effective.</p> <p><i>'including elements of cognitive stimulation and reminiscence'</i> This wording here wrongly seeks to bundle up group CST and reminiscence as if they were much</p>	<p>Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The committee agreed the evidence base was stronger for CST (as a manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-effectiveness. The committee therefore agreed it was appropriate to split this into two separate recommendations, a stronger recommendation for CST and a weaker recommendation for reminiscence. Specifically:</p> <p>"Offer group cognitive stimulation therapy to people living with mild to moderate dementia.</p> <p>Consider group reminiscence therapy for people living with mild to moderate dementia."</p>

				<p>the same thing when in fact they have different psychological mechanisms of action, different key principles, different formats (CST without family carers; and reminiscence often including family carers), different durations and very different evidence in terms of outcomes from trials, different systematic reviews (Cochrane - Cognitive Stimulation 2012, Reminiscence 2018), and economic results. I am concerned that this approach suggesting two different interventions be combined in 'elements' trivialises over 20 years of painstaking high quality research and in doing so will expose NICE to potential reputational damage. NICE would not for example apply the same approach to antidepressants or antidementia drugs and there are no reasons why psychological interventions should be devalued in this way especially with all the evidence available.</p> <p>Furthermore in the full guidance CST and reminiscence are described separately highlighting the inconsistency and artificiality in combining them in the recommendations.</p> <p>Brief group CST for dementia has been highlighted as one of the top 100 impact case study successes of the first 10 years of the impact</p>

Institute of Mental Health, University of Nottingham	short	6	general	There needs to be a recognition that person-centred care may not be the only viable model of dementia care and that this is likely to be context specific. As such, other models of care, such as those derived from Occupational Therapy, may be of more relevance in a setting. Residential homes may find it difficult to deliver person-centred care and the model might not always be the ideal fit for this context.	Thank you for your comment. The committee agreed that other models of care may be appropriate in specific circumstances, but agreed it was appropriate that person-centred care be given prominence within the guideline.
Institute of Mental Health, University of Nottingham	short	7	1.1	To review on a regular basis, especially following transitions in care or a change in progression of dementia	Thank you for your comment. The committee agreed it was important to encourage people living with dementia to give their views and opinions at all stages of care and support, as is given in the first recommendation in the guideline.
Institute of Mental Health, University of Nottingham	short	26	1.11.2	Available regardless of a clinical diagnosis of dementia. This acknowledges that there are many reasons why a formal diagnosis of dementia may be unachievable	Thank you for your comment. The committee discussed this suggestion, and noted that the decision as to the type of support a carer required should be based on their own circumstances and needs, and those of the person they are caring for. They agreed this principle is already enshrined within the Care Act.
Institute of Mental Health, University of Nottingham	short	26	1.11.3	It cannot be assumed that group are universally supportive; they have to be managed by trained/experienced facilitators who can deal with dominant voices.	Thank you for your comment. The committee agreed the evidence available, from both subgroup analyses of the RCT data and the meta-regression model, showed that on average,

					<p>group sessions were more effective than individual, telephone or online sessions.</p> <p>However, the committee also agreed both that the group sessions would need to be well run/moderated, and that this format would not be the most suitable for all individuals, due to differences in their circumstances and preferences. They therefore agreed it was appropriate for the recommendation for group sessions to be kept at the weaker "be aware" level, and that the guideline should also recommend support for carers is "provided in a format suitable for them (for example individual or group sessions, or online training and support)", to ensure this is not taken as a blanket statement that group sessions are the most appropriate format for all carers.</p>
Institute of Mental Health, University of Nottingham	short	27	1.13	All programmes of training, regardless of level and context, need to include compulsory dementia training. Professional qualification courses at degree and post graduate levels provided by universities need to include a mandatory minimum level of dementia training to include communication skills. Carers in the private and statutory sector also need to have mandatory training, which is monitored as part of the CQC inspections to ensure all staff are adequately trained within the probationary period of employment.	Thank you for your comment. The committee agreed that high quality training was a key issue in ensuring effective dementia care, but noted that the specific issues raised are outside of the remit of NICE guidance.

Institute of Mental Health, University of Nottingham	Full	273-274	10-29	The NICE guidance has chosen to omit the definitive health economic paper by Knapp et al (2006) showing that group CST was cost effective for cognition and quality of life. Instead only the paper by D'Amico on long term CST is reported. This approach gives an incomplete picture of the evidence and is therefore misleading.	Thank you for your comment. The effectiveness measures used in cost-effectiveness portion of Knapp (2006) were the QoL-AD and MMSE, and therefore were not consistent with the NICE reference case, which uses QALYs. As a result, it is inaccurate to state that this analysis showed that CST is cost effective, as no threshold value has been established for these instruments against which gains could be assessed. The effectiveness evidence underpinning the Knapp (2006) paper was based on Spector (2003), and was included in our quantitative synthesis of parameters for the model.
Institute of Mental Health, University of Nottingham	Full	296		<i>The committee agreed itit was unclear whether it was the specific content of the interventions that was valuable, or simply the result of being part of a group and undertaking any mentally stimulating activity.</i> See point 1 above. This approach trivialises the evidence and generally undermines the psychological therapies for mental health problems including dementia. The committee seems to believe that any activity groups for people with dementia will offer worthwhile cognitive, quality of life and economic benefits which is not at all in line with the evidence. In the Cochrane review several trials compare Cognitive Stimulation with an active, social control group, and the findings were consistently in favour of	Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The committee agreed the evidence base was stronger for CST (as a manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-effectiveness. The committee therefore agreed it was appropriate to split this into two separate recommendations, a stronger

				<p><i>11. What is the effectiveness and cost-effectiveness of self-management training for people living with dementia and their carers?</i></p> <p>This is an interesting question but there are a number of major studies taking place and it would be prudent to see the results of these before recommending more research.</p>	
Institute of Mental Health, University of Nottingham	Full	369		<p>The panel “noted that the review was not focused on identifying interventions that improve the experience of staff and, therefore, trials that only reported on outcomes for staff would not be relevant to include within the review.”</p> <p>To limit the staff angle to focus on skills, education & training is missing an opportunity. Many other aspects of staff’s experience impact on their engagement, job satisfaction, turnover, turnover intention, performance and their health and wellbeing, but also indirectly on the quality of care for patients/residents and their families - eg. the way the staff’s work is designed, organised and managed (including the quality of senior and line management), the physical work environment, career opportunities, etc.</p>	<p>Thank you for your comment. The committee agreed these were all important issues, but in a guideline focused on improving the care and support for people living with dementia and their carers, it was important that interventions were judged based on the difference made to those groups. The committee noted that staff training was an area that was both highly important for outcomes, and one in which there was sufficient evidence to be able to make strong recommendations.</p>

Institute of Mental Health, University of Nottingham	Appendix L	10		<p><i>What is the effectiveness of unstructured community activities on wellbeing for people living with dementia? Similar effect sizes were found for a range of group, activity based interventions for people living with dementia. One possible interpretation is that the benefits of many of these interventions were driven less by the specific content of the interventions, and more by the benefits from support groups more generally.</i></p> <p>See note 6 above. There is clear evidence unstructured 'social' groups are of no tangible benefit to outcomes although of course they should be designed to be popular and enjoyable.</p> <p><i>If this is true, these groups could potentially be delivered more cheaply than structured interventions, therefore a larger number of people could have access to them.</i></p> <p>This is highly speculative especially since the vast majority of the cost of running groups is staff time which would be needed for structured or unstructured approaches. It is frivolous wasting taxpayers' money on vague research ideas where there is already sufficient evidence of no benefit.</p>	<p>Thank you for your comment. Having reconsidered the evidence on cognitive situation therapy and reminiscence therapy, the committee agreed it was appropriate to remove the recommendation for structured group activities, and replace it with two separate recommendations focusing specifically on CST and reminiscence. Specifically:</p> <p>"Offer group cognitive stimulation therapy to people living with mild to moderate dementia."</p> <p>"Consider group reminiscence therapy for people living with mild to moderate dementia."</p> <p>The committee remained of the opinion, however, that there was only very limited evidence on unstructured activities for people living with dementia, and therefore agreed to maintain the research recommendation for unstructured group activities.</p>

					<p>unsurprising that a longer instrument was needed than in the case of screening.</p> <p>The wording of the recommendation has now been amended to try and clarify the meaning.</p>
Institute of Public Health, University of Cambridge	Full	109	10-24	<p><u>Diagnosing Alzheimer's disease</u></p> <p>We believe clinical guidelines have to reflect ambiguity about the knowledge base currently available. The recommendations incorporate suggestions which are not yet proven to be of value in the context of current diagnostic processes, particularly given the known complexity of dementia neuropathologically, and represent premature translation. If the evidence is not sufficiently robust there is a significant risk of unnecessarily subjecting people with dementia to tests which do not have evidenced diagnostic value. The introduction of invasive and expensive biomarkers should be limited to those situations in which it is likely to make a meaningful difference to patient care. Given the porosity of the boundary between dementia and MCI, there needs to be attention to the potential for "diagnostic creep".</p>	<p>Thank you for your comment. The committee noted that the 'consider' recommendation for CSF examination came at the end of the diagnostic pathway, and would consequently only be of relevance for the small number of people who still did not have a diagnosis after all the prior possible diagnostic steps had been considered. However, they noted that a number of stakeholders had interpreted this recommendation as bringing CSF earlier in the diagnostic pathway, and to counter that conception agreed it was appropriate to add an additional recommendation before all of those on imaging and biomarkers. Specifically:</p> <p>"Only consider further diagnostic tests if:</p> <ul style="list-style-type: none"> • it would help to diagnose a dementia subtype and • knowing more about the dementia subtype would change management."

				<ul style="list-style-type: none"> Procedures for acquiring FDG PET images have been standardised, but procedures for assessing typical AD pattern (temporoparietal and posterocingulate metabolism) have not (Frisoni 2017a). Automated or semi-automated metrics can usefully complement traditional visual read (Perani 2014), but supporting evidence on its incremental added values is still preliminary (Caroli 2012; Frisoni 2013). There is insufficient evidence on the effect of covariates (Age, APOE genotype, disease duration) on hypometabolism (FDG PET) in patients with Alzheimer's disease pathology (Frisoni 2017; Garibotto 2017). Despite all these very obvious evidence gaps, ambiguity and uncertainty in the scientific evidence and without a consistent framework to assess clinical validity and utility of AD biomarkers, many memory clinics have incorporated them into routine clinical practice on the assumption they inform assessment and management of patients; therefore, their use has been heterogeneous and resulted in 'informative' values of biomarkers which certainly cannot be used with full reliability in clinical practice (Frisoni 2017). This creep of insufficiently validated

				the draft NICE Clinical Guideline (CG) 'Dementia: assessment, management and support for people living with dementia and their carers'. Overall Janssen is supportive of the new recommendations and the clinical guideline. Janssen particularly welcomes the new recommendations regarding the methods of diagnosing and assessing dementia and Alzheimer's disease. This supports the innovation in diagnostic methods and also helps to support future technologies which are currently being develop for the treatment of Alzheimer's disease, which rely on early and accurate diagnosis.	
Janssen UK	Short	General	General	Janssen fully supports the principle of patient education and patient empowerment. As the science is evolving to understand Alzheimer's disease very early in the disease process, there needs to be consideration on how to educate individuals regarding potential Alzheimer's disease risk status - family history, APOE4 status, comorbid risks, amyloid status, etc. When appropriately informed of potential risk factors, this could allow for proper planning for individuals and their families. Understanding the risk factors will also empower individuals to engage with a conversation with GPs regarding	Thank you for your comment and your support for these recommendations. The committee agreed that, if there are significant changes in the future around diagnosis or management of particular dementia subtypes, these would need to be reflected in the type and timing of information offered to people living with dementia and their carers.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. Stakeholder	Document	Page No	Line No	Comments	Developer's response
				Alzheimer's disease. As the therapies that are currently being developed are for the earliest stage of the disease, the patient/GP conversation will need to take place well before the current conversation regarding dementia.	
Janssen UK	Short	4	7	Janssen welcomes the recognition that new methods for diagnosing and assessing dementia have been developed. Both amyloid imaging techniques and cerebrospinal fluid examination represent reliable methods for diagnosing dementia and Alzheimer's disease. New developments in diagnosing Alzheimer's disease continue to be made, some of these maybe blood tests others could be sensitive digital cognitive tests. For example, researchers presenting findings at the Alzheimer's Association International Conference 2017 demonstrated that a blood test could indicate the presence of amyloid in the brain indicative of Alzheimer's pathology. These developments, along with ongoing innovations in clinical practice and technology, mean that the National Health Service must ensure that it takes opportunities to combine new methods for diagnosing and assessing dementia and Alzheimer's disease with	Thank you for your comment. The committee agrees with the importance of evaluating the accuracy and effectiveness of newer diagnostic tests, and notes that future updates of the guideline should take account of any new evidence published in these areas.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				existing clinical practice to enhance the reliability of diagnostic criteria.	
Janssen UK	Short	7	14	Janssen supports providing people with dementia, their family members or carers (as appropriate) with oral and written information on topics such as their legal rights and responsibilities, their right to reasonable adjustments (in line with the Equality Act 2010) and how to access local support groups and advocacy services. However, we recommend that, at the point of diagnosis and during the course of the illness, people should be asked if they are interested in taking part in research and healthcare professionals should share information on research activities with people diagnosed with dementia, their family members and carers. We would also recommend that people at risk of developing dementia are asked if they are interested in taking part in research.	Thank you for your comment. The committee agreed with the value of making people living with dementia aware of chances to be involved in research, and therefore added a recommendation to "tell people living with dementia (at all stages of the condition) about research studies they could participate in."
Janssen UK	Short	9	4	The recommendations regarding advance care planning for people living with dementia and people involved in their care is welcomed. These recommendations ensure that these people are offered an opportunity and chance to review and change any advance statements and decisions they have made regarding their care. Both the	Thank you for your comment and your support for these recommendations.

				Group (IWG-2) offer the potential to combine cognitive assessment with biomarkers. These approaches have the advantage not only of introducing biomarkers but also provide criteria for the diagnosis of prodromal Alzheimer's disease on the basis of symptoms and biomarkers or even on the basis of biomarkers alone. While these tests are not yet used in clinical practice, Janssen supports efforts focused on developing new methods to diagnose dementia at an earlier stage of the disease. This is vital because future treatments are likely to deliver the greatest benefit to patients when initiated at the early stages of the disease and a diagnosis provides people with dementia with an opportunity to plan for their future care needs.	
Janssen UK	Short	11	15	<p>Janssen notes and welcomes changes to the recommendations regarding the diagnosis of Alzheimer's and dementia in the new CG. Specifically, recommendation 1.2.12:</p> <p>If the diagnosis is uncertain and Alzheimer's disease is suspected, consider either:</p> <ul style="list-style-type: none"> • examining cerebrospinal fluid for: <ul style="list-style-type: none"> ○ phosphorylated-tau 181 and 	Thank you for your comment and your support for these recommendations. The committee fully agreed that all the information available on an individual should be considered when making a diagnosis, and that individual test results should never be considered in isolation.

				In addition, Janssen suggest that these methods should be used in combination with cognitive assessment rather than solely on their own if the diagnosis of dementia is uncertain. We suggest that NICE updates the CG to reflect this and to ensure the appropriate diagnosis of Alzheimer's disease. The use of biomarkers obtained from cerebrospinal fluid or FDG-PET, alongside cognitive tests to support the diagnosis of dementia during the earlier stages of the disease will insure that future treatments in development are able to positively modify disease outcomes.	
Kent and Medway NHS Partnership Trust	short	general	general	Overall the guideline was very medical in its orientation with very little mention of the important and wide-ranging role that psychologists can play in the assessment, diagnosis, treatment and support for people with dementia and their families from pre-diagnosis to end of life	Thank you for your comment. The committee noted they were only able to make recommendations in areas where evidence was available, but agreed that psychologists could play an important role in implementing many of the recommendations included in the guideline.
Kent and Medway NHS Partnership Trust	short	6	8	It might be useful to include a reference to MSNAP standards here	Thank you for your comment. The committee agreed that there were many relevant documents that could be linked to, and it was not possible to include all of the links in this section.
Kent and Medway NHS Partnership Trust	short	10	5	Could also add 'do not assume dementia solely because a person scores below the suggested cut-off – consider several streams of information	Thank you for your comment. The committee agreed that this was a relevant point, but agreed the purpose of this section was to decide which individuals should be referred on for full

				before coming to a diagnostic decision and consider whether the person may have performed poorly on testing due to other factors such as visual impairment, hearing impairment, anxiety, low mood, long standing learning disability etc.'	diagnostic assessment, and therefore the issue should not arise of people being inappropriately diagnosed solely on the basis of cognitive scores. They also noted the evidence showed these tests had, on average, lower sensitivity than specificity, and therefore at an individual level false negative results were more likely than false positive ones.
Kent and Medway NHS Partnership Trust	short	15	21-22	Not clear what the message is here – talking therapies could be useful in helping people to adjust to the diagnosis of dementia and to think about how to cope with the related changes they are experiencing	Thank you for your comment. The committee noted this recommendation is solely that interpersonal therapy not be offered to treat “the cognitive symptoms of Alzheimer’s disease.” If people living with dementia had another condition or problem for which interpersonal therapy were indicated, the committee agreed it would be correct to offer them to people living with dementia in the same way as those without.
Kent and Medway NHS Partnership Trust	short	20	19 onwards	Should also include recommendation to refer to a specialist team for the assessment and management of BPSD, including the use of formulation and the Newcastle Model	Thank you for your comment. This recommendation has been rewritten to make clear a structured assessment should be the first stage of the process, in order to: <ul style="list-style-type: none"> • explore possible reasons for the person’s distress and • check for and address clinical or environmental causes (for example pain, delirium or inappropriate care).” The committee agreed no evidence was identify to enable recommendations on who should conduct that assessment, and what specifically it should contain.
Kent and Medway NHS Partnership Trust	short	22	5	Ideally psychological interventions would be provided by psychology clinicians within specialist older people’s services, not in primary care	Thank you for your comment. The committee agreed that no evidence was identified that enabled them to recommend who these interventions should be delivered by, or in what setting.

02/01/2018-13/02/2018**

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Kent and Medway NHS Partnership Trust	short	25	14 onwards	There should also be specific mention of Admiral Nursing service	Thank you for your comment. The committee agreed it was not appropriate to list all groups that could be involved in delivering services, but did agree that Admiral Nurses were one obvious group that could be involved in implementing a number of the recommendations included in the guideline.
Kent and Medway NHS Partnership Trust	short	27	28	The document generally needs more guidance re the specific needs of younger people with dementia and those of their carers – should be an additional section to address these	Thank you for your comment. The committee agreed at this time it was appropriate to include recommendations for younger people living with dementia as subsets within the broader recommendations, as the amount of evidence specifically on younger people living with dementia is still small. However, this is currently an area where a considerable amount of research is ongoing, and the committee hope it will be possible to make more specific recommendations on this in future updates of the guideline.
Kent and Medway NHS Partnership Trust	short	28	1	Should also include people with dementia in staff training, not just their carers	Thank you for your comment. The committee discussed this issue but agreed that, in the absence of any evidence, it was not possible to include this within the recommendations.
Kent and Medway NHS Partnership Trust	short	31	6 onwards	Some topics for research were not very clearly worded (e.g. high intensity case management) – no obvious references to research into psychology-specific topics such as neuropsychological assessment or talking therapy	Thank you for your comment. The committee noted that only their five highest priority research recommendations were included in the short guideline, and there are a considerable number of extra research recommendations in the full version of the guideline.
Leeds and York Partnership NHS Foundation Trust	Short	7	17	We are concerned that the statement “stage of their condition” is vague and subjective. Needs to be written using plain, clear language. Felt there	Thank you for your comment. The committee noted the concerns around the lack of specificity in the language “stage of their condition”. However, they agreed that because of the considerable heterogeneity in individual people’s trajectories,

				may be a risk that assumptions may then be made about how information is shared.	it was not possible to be more specific than this in the recommendation.
Leeds and York Partnership NHS Foundation Trust	Short	8	4	This should read oral information then written information.	Thank you for your comment. The committee agreed the current wording was clear that both oral and written information should be provided at this time.
Leeds and York Partnership NHS Foundation Trust	Short	8	27	We are concerned that this may be challenging to implement due to the differing provider pathways.	Thank you for your comment. The committee noted this concern, but agreed this was important to minimise the chance of people being lost to the health and social care system at a time when they may need support.
Leeds and York Partnership NHS Foundation Trust	Short	9	11	May be challenging for these conversations to occur if training and support is not available.	Thank you for your comment. The committee agreed with this, and this formed part of the thinking behind the recommendation that "health and social care professionals advising people living with dementia (including those involved in diagnosis) should be trained in starting and holding difficult and emotionally challenging conversations."
Leeds and York Partnership NHS Foundation Trust	Short	9	14	May be challenging in practice if it is not made explicit whose role this would be	Thank you for your comment. The committee agreed that offering this opportunity would be the responsibility of whoever is running the care review.
Leeds and York Partnership NHS Foundation Trust	Short	9	26,27	May be challenging in practice if the assessor does not make it clear as to which cognitive test is used	Thank you for your comment. The committee agreed the evidence showed these tests were all approximately equally accurate, and therefore any of them would be appropriate to use in a primary care setting.
Leeds and York Partnership NHS Foundation Trust	Short	10	1,2,3,4	May be challenging in practice if the assessor is not clear as to which cognitive test is used	Thank you for your comment. The committee agreed the evidence showed these tests were all approximately equally accurate, and therefore any of them would be appropriate to use in a primary care setting.

Leeds and York Partnership NHS Foundation Trust	Short	13	18	We are concerned that this recommendation is not making it clear as to who is responsible for 'monitoring'.	Thank you for your comment. The committee agreed they would have liked to be able to make more specific recommendations on how these service should be organised, but this was not possible based on the evidence available.
Leeds and York Partnership NHS Foundation Trust	Short	13	23	We are concerned that it has not been made clear as to who would be the single named health and social care professional – does this sit with the GP?	Thank you for your comment. The committee agreed that in the evidence base considered, a number of different roles were responsible for care coordination (social workers, nurses, occupational therapists), and it was not possible to make recommendations on which of these was the most appropriate.
Leeds and York Partnership NHS Foundation Trust	Short	14	15,16,17,18,19,20,21,22,23,24	Overall, this section related to transferring information between services and care settings is challenging in itself. Would be useful to see the role of service user held information such as the 'All About Me" document.	Thank you for your comment. The committee agreed with was a challenging area, but that the current evidence base did not enable them to make more specific recommendations than those currently included in the guideline.
Leeds and York Partnership NHS Foundation Trust	Short	21	11	May be challenging to complete depending on where the person was (i.e. care home)	Thank you for your comment. The committee agreed that in review of the well-established and serious risks of antipsychotics in people living with dementia, frequent monitoring was essential to ensure use was for the shortest possible time.
Leeds and York Partnership NHS Foundation Trust	Short	22	19	We are concerned that this may be challenging to achieve – depending on pathways and resources	Thank you for your comment. The committee noted this concern but agreed that for interventions for comorbidities that have been shown to be effective and cost-effective for people without dementia, it would not be appropriate to deny

					these interventions to people with dementia, unless there was specific evidence the interventions were less effective in this group.
Leeds and York Partnership NHS Foundation Trust	Short	22	25,26	May be useful to have a hyperlink for these pain assessment tools which are cited within the guidance when published. (*we appreciate this is available in the long form)	Thank you for your comment. The committee agreed there was no evidence to recommend a particular pain assessment tool over any other, and therefore this was not something that could be included in the recommendations.
Leeds and York Partnership NHS Foundation Trust	Short	23	1,2	May be useful to have a hyperlink for the structured observational tool within the guidance when published (*we appreciate this is available in the long form)	Thank you for your comment. The committee agreed there was not sufficient evidence to recommend a particular pain assessment tool over any other, and therefore this was not something that could be included in the recommendations.
Leeds and York Partnership NHS Foundation Trust	Short	23	18	We are concerned about the subjective language of 'advanced' dementia and why the multi-factorial risk assessment may not be suitable.	Thank you for your comment. The committee's rationale behind this recommendation is explained in the relevant section of the full guideline. Specifically: "The committee noted that there was a specific area where the evidence on falls management in people living with dementia did not align with that of people without dementia, which was the effectiveness of multi-factorial interventions. These interventions are recommended in the falls guideline (CG61) but the evidence presented did not show a significant effect in a population of people living with dementia. The committee noted that the population in this RCT contained a significant proportion of people identified as having severe dementia and this raised concerns that the interventions may be less effective in this group, and that this may be attributable to the intensity of the interventions and the large number of tests

					involved, which may cause additional distress to someone living with dementia and in particular severe dementia. These negative factors would outweigh any benefits of the intervention. The committee discussed the evidence noting that it was strong enough to recommend that such interventions should not be used in people with severe dementia without consideration, on a case-by-case basis, to ensure that the benefits of the intervention were expected to be greater than the possible harms."
Leeds and York Partnership NHS Foundation Trust	Short	25	1	Maybe useful to be more explicit about who would be responsible for the assessment – is this a specialist role or a role within primary care?	Thank you for your comment. The committee agreed there were a range of issues that could affect interpretations of test scores, including language, education, learning disabilities or age. It was for this reason the committee agreed it was not appropriate to set cut-offs to use for the particular tests, but they should instead be considered alongside a broader assessment including a history (including cognitive, behavioural and psychological symptoms), a physical examination and appropriate blood and urine tests to exclude reversible causes of cognitive decline.
Leeds Beckett University	Short	8	5	In this section can it be specified that people who have received a diagnosis of MCI should be advised about disease progression and how to re-access services, on the basis of recommendations to re-assess after 6 months, to ensure that people are offered appropriate information to this effect	Thank you for your comment. The diagnosis and management of mild cognitive impairment was not within the scope of this guideline, and therefore it was not possible to make recommendations on this topic. A number of stakeholders have raised this as an important issue needing guidance, and this feedback has been based to the commissioning team

					within NICE for consideration when the topics of future guidelines are discussed.
Leeds Beckett University	Short	10	22	It would be useful to define specialist diagnostic services as diagnosis may be delivered in Primary care not suggested by the terminology "specialist" see (Wells & Smith, 2016)	Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft guideline, in that people interpreted it as saying everyone need to attend an appointment at a secondary care service. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and treatment, but this did not mean the person necessarily had to travel to a physical appointment at that service. To ensure this is clear in the final version of the guideline, an explanation has been added to this section of the guideline, giving the following explanation around the term 'refer': "A referral to a diagnostic service does not require that the person be asked to attend a clinic appointment. It can also involve people being seen in community settings (such as their home or a care home), or advice being provided to the referrer without a formal appointment being made. The key issue is to ensure that dementia specialists are involved, both for advice on diagnosis and to ensure appropriate access to post-diagnostic support and treatment."
Leeds Beckett University	Short	15	9	We query the terminology "consider" and why these recommendations are not stronger given the evidence that CST has a meaningful effects for	Thank you for your comment. Having reconsidered the evidence around CST, the committee agreed it was appropriate to make a stronger recommendation for CST than was in the

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Leeds Beckett University	Short	28	1-2	This point is unclear – is this for the carers to attend and learn alongside staff or for carers to be part of the delivery team? The outcomes of the What Works? study suggest that involving people with dementia or family carers in the training facilitation team can be very powerful and help staff to develop empathy and understanding. However, we would not recommend including family members in staff training as learners as their learning needs are very different and this may impact on how well training can meet the needs of both staff and carers.	Thank you for your comment. The committee noted these points but agreed that in the absence of robust evidence, they were not able to be more specific about the roles carers or people living with dementia should play in staff training.
Leeds Beckett University	Short	28	13	The What Works? study has also identified the importance of the organisation culture and leadership in supporting attendance at and then subsequent implementation of training in practice. Supportive leadership and management is key to staff being able to put their learning into practice and thus for training to be able to effect change. We wonder if consideration of the organisational context and support for staff to put learning into practice should be highlighted within the guidelines.	Thank you for your comment. The committee agreed that in the absence of any evidence meeting the inclusion criteria for the guideline, it was not possible to make recommendations on this topic. However, they did note that the recommendations on staff training included training in “the organisation’s model of dementia care and how it provides care.”
Leeds Beckett University	Full	33	47	Perhaps the above should say “...before and after every transition.”	Thank you for your comment. The committee considered this suggestion but agreed that, on the basis of the evidence

Stakeholder	Document	Page No	Line No	Comments	Developer's response
					available, it was not possible to be more specific than the current recommendation for review after transition. In particular they noted there may be little value in some occasions on assessing before a transition, if the person then transfers to a very different setting where those needs and wishes may be considerably different.
Leeds Beckett University	Full	39	6	Perhaps the above recommendation should also include people living with dementia who are in a situation where pain is more likely, such as people living with dementia who are in hospital or are seriously/terminally ill? The same point is also relevant to 107, line 12, on the same page.	Thank you for your comment. The committee noted that the evidence available to support these recommendations was limited, and therefore agreed it was not appropriate to extrapolate beyond the population where evidence had been identified. The committee noted that most of the people mentioned here would be captured by the recommendation for those with "moderate to severe dementia."
Leeds Beckett University	Full	40	11	Why limited to people with severe dementia, detrimental effects of hospital admissions are documented for people with various degrees of dementia, albeit most significantly for people with more advanced dementia. For example, whilst in-hospital mortality rates are four times higher for people with more advanced dementia, in-hospital mortality rates for people with any stage of dementia are still twice as high as their cognitively well counterparts (Sampson et al, 2009).	Thank you for your comment. The committee noted this, but also agreed that for people with milder dementia, there may be issues around people being inappropriately denied treatment for comorbidities if too strong a position was taken on not admitting them to hospital. The committee therefore agreed it was appropriate to restrict this recommendation to severe dementia, where the evidence on harms was strongest.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Leeds Beckett University	Full	40	24	Is this in relation to hospitalised people with dementia (the immediately preceding section), or all people with dementia? It isn't clear from the text.	Thank you for your comment. This recommendation applies to all people living with dementia. This confusion should be addressed in the published version of the guideline, where there will be clear headings separating the recommendations.
Leeds Beckett University	Full	133	32	It is important to stress the specific need to ensure opportunities for people living with dementia and their supporters/family to have opportunities to discuss current and future care plans at key transition points, such as during hospital admissions, when many important decisions about future care are made, and when people with dementia may be particularly vulnerable, due to ill health and unfamiliar environments and people, to having their needs and wishes overlooked. In hospital settings, for example, meetings to discuss future care often take place either amongst professionals only, or amongst professionals and carers - it is common for people living with dementia and their families to feel that they are only involved late in the day, in a very limited fashion, or without access to information to support decision making that is available to professionals.	Thank you for your comment. The committee agreed with the importance of people living with dementia being offered multiple opportunities to discuss these issues as their condition progresses. The committee noted that although there was no specific evidence on when these discussions took place, they agreed the principle was covered by the statements to "offer early and ongoing opportunities for people living with dementia and people involved in their care" to discuss these issues.
Leeds Beckett University	Full	171	Other	Given the extremely limited quantitative data (5 studies) from which the section on caring for people with dementia who are admitted to	Thank you for your comment. The decisions about which reviews should contain qualitative data were made by the committee at the start of the systematic reviewing process,

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				By excluding the wider literature, the section on hospital care for people with dementia appears to rely overly on data from a small number of RCTs which have demonstrated limited effects, and completely excludes literature where people with dementia, families and staff set out their difficulties and suggested improvements to hospital care. Might it be valuable to include, at the very least, reference to the kinds of care improvements that are discussed in the non-trial/quantitative literature, even if these are unable, at present, to be supported or refuted by more compelling evidence.	
London Dementia Clinical Network	Short	8	3-17	Written information on progression of disease. It is very difficult to predict accurately the progression of dementia in an individual, there is also very little published information for people with dementia on this. It might be better to say "provide people with a chance to discuss the changes they might expect as the condition progresses, especially issues of particular concern to individuals and carers" This in our view requires a sensitive and individualised approach. Evidence shows that delivery of diagnosis is often quite poor, let alone discussion on prognosis, so it	Thank you for your comment. The committee agreed with the point around the difficulty of predicting progression, and therefore this recommendation has been rephrased as "the changes they might expect as the condition progresses." The committee noted that recommendation 1.1.6 does include reference to written information, as the committee agreed people often struggle to take in all the necessary information orally. The committee also agreed with the concerns around how diagnosis is delivered, and amended one of their recommendations around staff training to clarify that it did cover this particular situation: "Health and social care

London Dementia Clinical Network	Short	9	14	Advance Care planning Important that care plans are reviewed at transitions of care – recommend incorporating this into the recommendation	Thank you for your comment. The committee agreed with this point, and recommendation 1.12.2 states that advance care and support plans should be reviewed after every transition between care settings.
London Dementia Clinical Network	Short	9	21	Initial assessment 'If possible, from someone who knows the person well' – this needs to be emphasised as extremely important for diagnosis	Thank you for your comment. The committee agreed with the importance of this recommendation as part of an accurate assessment.
London Dementia Clinical Network	Short	9	18,23	Initial assessment We are concerned that GPs may not promptly refer for specialist assessment as they have not had time to complete cognitive testing. Specialist settings currently do not require GPs to complete cognitive tests to encourage referrals. Suggest rewording to 'consider using cognitive testing'	Thank you for your comment. The committee agreed that because all the instruments recommended are brief cognitive instruments, there should be no impact on time to referral from their use.
London Dementia Clinical Network	Short	9	17 – 27	This section lacks recommendation as to when the diagnosis of dementia can be made in a non-specialist setting e.g. advanced dementia in care homes - https://www.england.nhs.uk/wp-content/uploads/2015/01/dementia-diag-mng-ab-pt.pdf	Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft guideline, in that people interpreted it as saying everyone need to attend an appointment at a secondary care service. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and treatment, but this did not mean the person necessarily had to travel to a physical appointment at that service. To ensure this is clear in

London Dementia Clinical Network	Short	13	23	Care navigators – who provide most of the standard post-diagnostic support to navigate the system are often from the voluntary sector – therefore recommend changing 'health or social care professional' to include "or appropriately trained voluntary sector care coordinator" We suggest that you may want to recommend a research question to review the most effective care coordinator model (e.g. voluntary sectors vs primary care nursing / use of risk stratification)	Thank you for your comment. The committee noted that the research evidence included used either social workers, nurses or occupational therapists as care coordinators/navigators, and therefore agreed it was appropriate to retain "health or social care professional" in the recommendation. However, they agreed there was considerable value in future research about how best care coordination should be conducted, and noted a number of research recommendations had been made on this topic.
London Dementia Clinical Network	Short	15	5	Appears errorless learning was not considered as part of the review questions – review of literature here: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3775624/	Thank you for your comment. Errorless learning was not one of the interventions prioritised by the committee for this reviews question (see appendix O for details), and therefore evidence on this was not specifically searched for. The committee did note that While there is evidence for benefits of errorless over trial-and-error learning in some groups, the situation is much less clear with regard to people with dementia. The literature suggests that people with dementia differ in regard to which learning or relearning strategies are most helpful (see, for example, the detailed review by Clare & Jones, 2007). Therefore it is important to establish for each individual which strategies are beneficial. The recent REDALI-DEM trial (Voigt-Radloff et al., 2017) compared errorless and trial-and-error learning as instructional methods for training activities of daily living and found no difference between the two approaches. Errorless learning is

London Dementia Clinical Network	Short	19	17	There is no information on SSRIs for FTD; this appears not to have been discussed by NICE. Although the evidence may be limited, these drugs are frequently used in clinical practice. Could NICE consider reviewing the evidence? http://www.theaftd.org/understandingftd/health-care-professionals/treatment	Thank you for your comment. The questions on pharmacological treatment of non-cognitive symptoms of dementia in the guideline (did look for evidence on the use of SSRIs for FTD. However, no relevant evidence was identified, and therefore it was not possible for the committee to make recommendations on other medicines.
London Dementia Clinical Network	Short	20	14	Example given is the anticholinergic burden scale – this scale is reliable but now slightly out of date. Please consider also mentioning the AEC scale which was designed as an update to other scales and is freely available in a simple useable form on line (medichec.com) (reference- Bishara D et al Anticholinergic effect on cognition (AEC) of drugs commonly used in older people (Int J Ger Psych 2016).	Thank you for your comment. The committee noted the existence of this new and potentially improved tool, but were not aware that it had yet been validated in the same way as the other tools included in the review. As a result, the committee agreed it was best to retain the reference to the ABS, but that this was presented solely as an example, and that the use of more modern validated scales would be appropriate when they are available.
London Dementia Clinical Network	Short	20	19	It is important for the guidance to state that antipsychotic medication can be appropriately prescribed for the treatment of psychosis in dementia. This includes both the treatment of long standing psychotic disorders and the treatment of psychotic symptoms in the context of dementia.	Thank you for your comment. The committee agreed with this point and noted the guideline allowed the use of antipsychotics for people with “hallucinations or delusions that are causing them severe distress.”

London Dementia Clinical Network	Full	General	General	Prevention appears to be out of scope – it would be useful to guide clinicians to other appropriate guidelines.	Thank you for your comment. You are correct that prevention of dementia was not in the scope of this guideline, and therefore it was not possible to make recommendations or links to other guidance in this area.
London Dementia Clinical Network	Full	General	General	There appears to be a lack of any cultural considerations in the recommendations	Thank you for your comment. Cultural issues were considered by the committee at each stage of the process, but it was agreed that there was currently not sufficient evidence to make clear recommendations on this issue, other than the many references through the guideline to care being tailored to an individual's needs, preferences and circumstances.
London Dementia Clinical Network	Full	General	General	Several other reports have endorsed CST since the 2006 guidelines. For example, the World Alzheimer Report (Alzheimer's Disease International), in 2012 and subsequently; have stated that CST should routinely be given to people with early stage dementia.	Thank you for your comment. Having reconsidered the evidence around CST, the committee agreed it was appropriate to make a stronger recommendation for CST and the recommendation has therefore been amended to an 'offer'. Specifically, "offer group cognitive stimulation therapy to people living with mild to moderate dementia".
London Dementia Clinical Network	Full	General	General	I am concerned that the wording for non-pharmacological and psychological interventions is "consider", and the wording for pharmacological interventions is "recommend" or "offer". (E.g. short guidelines 1.5.1 recommend AChE, but section 1.4.2 states "consider elements of cognitive stimulation", despite both CST and AChE having similar benefits). Similarly, the	Thank you for your comment. Having reconsidered the evidence around CST, the committee agreed it was appropriate to make a stronger recommendation for CST and the recommendation has therefore been amended to an 'offer'. Specifically, "offer group cognitive stimulation therapy to people living with mild to moderate dementia". For the recommendation on treating anxiety and depression, the committee agreed this should remain a 'consider'

				wording for psychological treatments for anxiety and depression (short guidelines 1.7.9) is consider, despite the evidence being strong for this intervention.	recommendation for two reasons. First, because the evidence covered a range of different interventions and it was not possible to identify which ones were effective, and secondly because there are people with dementia who will have been diagnosed with mild depression and for whom alternatives such as "active monitoring" (recommended in the NICE depression guideline) would be more appropriate than a psychological intervention.
London Dementia Clinical Network	Full	277	37	This section considers the economic analysis of CST, but uses a base case model, rather than published health economic studies. There have been 2 key papers published considering the cost effectiveness of manualised CST (Knapp et al, 2006 which considered CST; D'Amico et al, 2015 which considered maintenance CST). Both are listed in the references in Appendix J, but only D'Amico et al (2015) has been considered in the evidence. These papers show evidence for the cost effectiveness of manualised CST. The NHS Institute of Innovations and Improvements invested in an 'economic analysis of the alternatives of anti-psychotics for individuals living with dementia', conducted by Matrix Evidence in 2011: https://www.acss.org.uk/wp-content/uploads/2016/03/NHS-Institute-for-	Thank you for your comment. The Knapp (2006) paper was not a cost-utility study and therefore did not consistent with the reference case. As a result, it is inaccurate to state that this analysis showed that CST is cost effective, as no threshold value has been established for the effectiveness instruments used against which gains could be assessed. The D'Amico (2015) paper however, was a cost-utility study and was eligible for inclusion as part of the economic review. Please note that the effectiveness evidence used in Knapp (2006) was based on Spector (2003), and has been considered by this guideline by the way of inclusion in our quantitative synthesis of parameters for the model developed by NICE.

				<p>strong evidence for the cost effectiveness of manualised CST, with two key papers published since the 2006 guidelines (Knapp et al, 2006; D'Amico et al, 2015). Appendix J (p.10) considers the cost of providing CST. There are several errors in this table. Firstly, it states that band 4 or 6 staff are required to run sessions, when in reality it is often band 2 staff. Secondly, it states that groups are for 5 people, when in fact the key research trials included between 5-10 people in each group and many trusts offer groups for up to ten people. The total cost per session is calculated as £233.19. The Knapp (2006) paper calculated the cost per session as £90. Using the Knapp cost per session calculation, even with just 5 people in each group, the total cost per patient per CST course (14 sessions) is £252, compared to NICE's estimate of £652.94.</p> <p>Additionally, the NHS Institute of Innovations and Improvements invested in an 'economic analysis of the alternatives of anti-psychotics for individuals living with dementia', conducted by Matrix Evidence in 2011: https://www.acss.org.uk/wp-content/uploads/2016/03/NHS-Institute-for-Innovation-and-Improvement-antipsychotic-drug-evaluation-2011.pdf. Marie Curie	Short	8	23-24	It is unclear what services the guideline is referencing (GPs, social care or DVLA, for example), and this should be made explicit.	Thank you for your comment. The committee noted that the list of relevant services would be different for different individuals, depending on their individual needs, including any comorbidities. Due to these complexities the committee agreed that it was not appropriate to construct a specific list of services.
Marie Curie	Short	9	3	We are concerned that the guidance's language is not strong enough in the section on advance care planning (ACP). ACP only works for the individual when their plans are frequently updated, and the importance of advance care plans being a 'living document' should be highlighted more strongly in this section. The guidance should be more prescriptive in stating that health professionals must offer opportunities to update these plans at care reviews and as circumstances change.	Thank you for your comment. The committee agreed with the importance of ensuring these documents are up to date, and noted the guideline already contained a recommendation to "at each care review, offer people the chance to review and change any advance statements and decisions they have made."
Marie Curie	Short	9	3	The guidance on ACP would be greatly enhanced if it included a recommendation on the practicalities of ACP. Basic information such as who needs to be collaborating in the planning process (for example carers, the individual, their GP and other health and social care professionals who are involved) and what information is needed would help to make the guidance more practically applicable. ACP is a process that needs to involve a range of people involved in the	Thank you for your comment. The committee noted that only limited evidence was identified on how advance care planning should best be undertaken, and therefore agreed it was not possible to be any more prescriptive in the recommendations made.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				individual's care, and this guidance should make that clear.	
Marie Curie	Short	13	22	We are concerned that the guidance is vague about who should be a care co-ordinator. As it will be unclear who should take on responsibility for this role, it could potentially lead to no one being appointed and people continuing to miss out on care co-ordination.	<p>Thank you for your comment. The committee agreed that in the evidence base considered, a number of different roles were responsible for care coordination (social workers, nurses, occupational therapists), and it was not possible to make recommendations on which of these was the most appropriate.</p> <p>They did also note that local areas would need to have clear policies on who is responsible for this in their service, to avoid the risk you mention from occurring.</p>
Marie Curie	Short	14	22	<p>The guidance recommendation that care should maximise continuity and consistency needs to be clearer on who that involves and how it could be achieved. 'Staff delivering care' should be expanded to explicitly include social care professionals and even legal staff and solicitors, who may have access to information that needs to be shared between care settings.</p> <p>The guidance should be more explicit about the need to provide information to the person with dementia and to their family and carers where relevant.</p>	<p>Thank you for your comment. The guideline contained a specific review question on the integration of health and social care services, including how to maximise consistency and continuity, but only a limited amount of evidence was identified and the committee agreed it was not possible to make more directive recommendations than those currently included.</p> <p>The committee noted the guideline already contained specific recommendations both on providing information, and on their being a single named person coordinating care for people living with dementia.</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				The guidance should also highlight the value of named coordinators in these situations, as a single point of contact through which information can be shared to ensure continuity between settings. NICE's previous research has shown these roles to be effective, such as the 2016 guidance <i>Social care for older people with multiple long-term conditions</i> . The absence of the coordinator function in this section is unfortunate, given how relevant it is to the specific needs of people living with dementia.	
Marie Curie	Short	15	5	Despite describing the terms used, it is still unclear how cognitive training and cognitive stimulation are substantially different. This is particularly important when one is recommended for use and the other is recommended not to be used.	Thank you for your comment. The committee noted these interventions are very different both in theory and practice. In particular, they noted that cognitive stimulation therapy is a structured and manualised intervention, and therefore one it is easy for practitioners to implement consistently.
Marie Curie	Short	20	20	When the guidance discusses agitation, aggression and distress, it should also consider the wellbeing of the family, carer or those close to the person. Any changes in these people or different people being used for care may indirectly affect the person living with dementia.	Thank you for your comment. The committee agreed that the wellbeing of carers should be considered throughout the treatment and care pathway for people living with dementia, but there was no evidence on which to make specific recommendations about this in this section.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. 02/01/2018-13/02/2018**

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Marie Curie	Short	20	21	Arthritis can often be a cause of agitation and is commonly missed. It would be valuable for the guidance to highlight this alongside pain.	Thank you for your comment. The committee noted it was not possible to provide an exhaustive list of things that may be associated with agitation, and agreed arthritis would be covered under "clinical causes".
Marie Curie	Short	22	4	This section is too limited in the information provided. Depression has many overlapping symptoms with dementia and therefore requires a different approach in dementia to identify, diagnose and treat, yet there is no information about possible strategies for diagnosis such as using the Cornell Scale for Depression in Dementia. Details on 'psychological' treatments are also very vague and would likely differ to depression in non-cognitively impaired individuals.	Thank you for your comment. The committee agreed they would have liked to be able to make more specific recommendations in this section, but agreed that because of the very limited evidence available, it was not possible to be more specific. A research recommendation was made on the topic of "the most effective psychological treatments for managing depression or anxiety in people living with dementia at each stage of the condition," and the committee hope further research will enable more specific recommendations to be made in future updates of the guidance.
Marie Curie	Short	22	10	We were surprised that the guidance does not consider the effect of environment in sleep management, such as how dark the room is, the level of noise, or disruptions by staff. These would be particularly relevant in care home and hospital settings.	Thank you for your comment. Evidence on these points was looked for as part of the review on the management of sleep problems in people living with dementia, but no evidence was identified for the committee to use to make recommendations.
Marie Curie	Short	24	6	We are concerned that this section being labelled 'Palliative care' is not clear enough in recommending that a palliative approach needs to be adopted at the start of the dementia trajectory, to ensure discussions and future	Thank you for your comment. The committee agreed this was clear in the recommendation to:

				person lacks capacity and if family carers or advocates and the multidisciplinary team are involved in the decision making. Stating that feeding should not occur when there is risk may increase the use of inappropriate feeding tubes.	
Marie Curie	Short	25	1	<p>We are concerned that the guidance does not take a strong enough stance on the admittance of dying people with dementia to hospital. While this section highlights a range of potential negative outcomes of a hospital admission, it fails to be appropriately prescriptive in saying that these people should not be admitted to hospital unless absolutely necessary. The impact of an unfamiliar environment on these individuals frequently outweighs the benefits of the care they can receive in hospital, particularly as appropriate care is often available in community settings via district nurses and specialist services. The wording of the guidance is too neutral on the issue to adequately convey the negative impact of a hospital admission.</p> <p>In addition, the guidance does not reference the impact of hospital admissions on carers and loved ones. These hospital admissions can be</p>	Thank you for your comment. The committee noted this, but also agreed that for people with milder dementia, there may be issues around people being inappropriately denied treatment for comorbidities if too strong a position was taken on not admitting them to hospital. The committee therefore agreed it was appropriate to restrict this recommendation to severe dementia, where the evidence on harms was strongest.

				disruptive, and may introduce distress and complication to the circumstances of the individual and their loved ones unnecessarily.	
Marie Curie	Short	25	15	Paragraph 1.11.1 of 'Supporting carers' lists a range of support that carers should be offered, however this list does not note that it is likely that some will not be available in different geographical areas. For example, training in providing care and responding to changes in behaviour (lines 19 and 21) may not be available to staff in care homes or acute settings, let alone to family members and carers. Similarly, the availability of psychological therapies for carers (line 27) is not universal, and in many areas such services will not exist. While we recognise that in describing best practice the guidance should highlight these services, we believe that it should also note that these services are subject to availability, so as to reflect the realities that many professionals will be facing.	Thank you for your comment. The committee noted there was robust evidence that the carer interventions included in the guideline were both effective and cost-effective, and therefore agreed it was appropriate to recommend they be offered to all people living with dementia. They noted this may involve an expansion of the carer support services available, but agreed the evidence showed this would be a worthwhile use of resources.
Marie Curie	Short	25	27	This point should expand on exactly what 'relevant services' consist of to offer professionals practical direction when searching for available	Thank you for your comment. The committee noted that the range of services available would differ between areas, and

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				services. For example, specifying that support services can be local charity groups, support lines run on a national basis or online communities would help professionals to find services appropriate for carers in their remit.	therefore it was not possible to be specific about which services people should be informed about.
Marie Curie	Short	26	6	The guidance should be clear that support for carers should also be available at a time they can access as well, for example outside of normal working hours.	Thank you for your comment. The committee agreed with this point, and that this was covered by the recommendations in the guideline around ensuring the support provided to carers is accessible.
Marie Curie	Short	26	10	We are concerned that the evidence was not clear enough across all interventions to make the case that group sessions are more likely to be effective than individual sessions with family carers.	<p>Thank you for your comment. The committee agreed the evidence available, from both subgroup analyses of the RCT data and the meta-regression model, showed that on average, group sessions were more effective than individual, telephone or online sessions.</p> <p>However, the committee also agreed both that the group sessions would need to be well run/moderated, and that this format would not be the most suitable for all individuals, due to differences in their circumstances and preferences. They therefore agreed it was appropriate for the recommendation for group sessions to be kept at the weaker "be aware" level, and that the guideline should also recommend support for carers is "provided in a format suitable for them (for example individual or group sessions, or online training and support)",</p>

				dementia. We recommend adding 'managing behaviours that challenge in people living with dementia' as a further element of training required. Behaviours that challenge are a key issue in caring for people living with dementia, and the guidance should encourage greater training in its management.	delivered staff training, it was important to focus the recommendations on areas with robust evidence of effectiveness and cost effectiveness. On this basis they agreed it was not possible to include more detailed recommendations in this section of the guideline than those currently included.
Marie Curie	Full	General	General	We are concerned that the guidance makes no mention that dementia is a life-shortening condition, or that a palliative approach offers a focus on comfort and planning ahead through the different stages of dementia.	Thank you for your comment. The committee agreed with the importance of adopting a palliative care approach from an early stage, and therefore made a recommendation that people living with dementia be offered "flexible, needs-based palliative care that takes into account how unpredictable dementia progression can be" from the time of diagnosis.
Marie Curie	Full	General	General	The wording of 'family members or carers' throughout the document should be reshaped into 'family, carer or those close to the person with dementia'. Not all will classify themselves as carers and not all will have family members, but rather friends who act as their proxy or closest person.	Thank you for your comment. The phrase "family members or carers" is a standard one used throughout NICE guidance, and the committee agreed it was therefore appropriate to retain this wording for consistency.
Marie Curie	Full	General	General	We believe that the guidance does not give adequate attention to access to assessment for people living with dementia. Many people living with dementia are not known to social care or	Thank you for your comment. The guideline did not contain a review question on what factors should trigger an assessment

				health professionals and this is not reflected in the guidance, which throughout assumes that people will have proper access to assessment. The guidance should be explicit regarding when assessments are required, with whom and in what setting to ensure that health professionals are clear on when they need to instigate assessments for dementia.	for dementia, and therefore it was not possible to include recommendations on this topic. The committee noted there were particular issues around people living with dementia being lost from the system, and hoped this would be addressed by the recommendations to "provide people living with dementia with a single named health or social care professional who is responsible for coordinating their care" and to "ensure that people living with dementia and their carers know how to get more information and who from if their needs change."
Mencap	Short	General	General	There are several groups for whom the risk of dementia is high, one of which is people with learning disabilities – especially those with Down's Syndrome. However, awareness of this tends to be low. Therefore, we would like to see the issues related to dementia for people with learning disabilities reflected in the guidance. More awareness is needed among carers, medical professionals and social care staff of the increased risk and the signs that someone could be developing dementia – which can be different from the general population. This could be achieved by additions to the sections which address prevalence, diagnosis and training.	Thank you for your comment. The committee noted that evidence on people with learning disabilities and dementia was looked for throughout the guideline, but little evidence was identified from which to make recommendations. However, the committee agreed it was appropriate to add a specific reference to learning disabilities in the section of the guideline on making services accessible to specific groups.
Mencap	Short	General	General	The following passage is directly quoted from CIPOLD, (2013): "Dementia is a significant and	Thank you for your comment. The committee noted that evidence on people with learning disabilities and dementia was

				common health condition in people with Down's syndrome, often with a more rapid and consistent progression than in other people. Dementia care pathways should identify issues that are likely to arise, such as potential swallowing difficulties, incontinence and reduced mobility, and allow them to be addressed proactively. However, a considerable amount of planning appeared to be responsive to problems that arose, rather than being anticipatory of problems arising in the future. This made people more vulnerable, for example, making them more susceptible to aspiration pneumonia which was a significant cause of death." Whilst of course it is vital that services are able to react quickly to changing needs, the draft guidance does not, in our opinion, pay sufficient attention to the importance of proactive planning, which is vital for people with dementia and particularly for those with complex needs, such as having a learning disability.	looked for throughout the guideline, but little evidence was identified from which to make recommendations. However, the committee agreed it was appropriate to add a specific reference to learning disabilities in the section of the guideline on making services accessible to specific groups.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Mencap	Short	14	25	The section, making services accessible, also needs to include people with a learning disability.	Thank you for your comment. The committee agreed with this suggestion and it has been added to the recommendation.
Mencap	Short	15	7	It is important that activities are also adapted to accommodate the needs of people with a learning disability, including the different needs a younger adult may have to an older adult – in addition to being tailored to suit personal preferences and tastes.	Thank you for your comment. The committee agreed with this point, and agreed it was appropriate to add people with learning disabilities as a specific group in the recommendation on groups to whom services should be made accessible.
Mencap	Short	20	19	Due to the risks of people with learning disabilities being over medicated – it is estimated that every day about 35,000 people with learning disabilities or autism are prescribed psychotropic medicines without an appropriate clinical indication - this section should refer to the STOMP initiative being led by NHS England.	Thank you for your comment. The committee noted the existence and relevance of this initiative, but agreed it was not an appropriate thing to refer to within the recommendations of a NICE guideline, as no evidence no it was identified as part of the literature searches undertaken for the guideline.
Mencap	Short	26	19	This section focuses on moving to different care settings, however there must also be a section on changing needs and how to support someone for as long as possible in an existing care setting, which may be considered by someone as their home. The guide from the British Psychological Society sets out the three options for people with learning disabilities living with dementia as – staying and dying in their existing housing, moving to a specialist learning disability setting or being referred out of learning disability and into a	Thank you for your comment. The guideline did not include a specific recommendation on keeping people within their existing care setting for as long as possible. The committee noted, however, that implementation of many of the recommendations in the guideline (for example, those on promoting cognition and independence, carer support and staff training) would be highly likely to have this effect in practice.

				<p>an intervention to people diagnosed with dementia. While case finding for suspected dementia will not always be appropriate, MSD believes that people with dementia should be able to access diagnostic services. There are over 850,000 people currently living with dementia in the UK, many of whom who have not had a formal diagnosis of their condition.^{vi} Alzheimer's Research UK estimate that the dementia diagnosis rate in the UK was 69% in 2015/16, with significant variation across the UK, which means that many people are unable to access post-diagnostic support and care to better support people living with dementia and help them learn to live well with dementia.^{vii}</p> <p>Healthcare professionals should be supported to diagnose suspected dementia and identify the early signs and symptoms of the condition to ensure that people can access care and support. There may also be opportunities to align NHS Health Checks with new methods of diagnosis to ensure that those at a high risk of developing dementia are closely monitored for the very early signs of the condition.</p>	<p>case finding, which would need to have clear evidence of benefits to justify the costs of such an approach, which could otherwise be used to provide care for people with diagnosed dementia.</p>

Merck Sharp and Dohme	Short	27	3	<p>Recent years have seen remarkable progress in increasing awareness and understanding of dementia amongst the public and healthcare professionals. Nevertheless, it is essential that healthcare professionals have an understanding of the pathology of dementia and Alzheimer's disease.</p> <p>The findings from a 2016/17 pilot project on dementia risk reduction, run in partnership between Public Health England (PHE), the Alzheimer's Society and Alzheimer's Research UK, have shown varying levels of knowledge among healthcare professionals.^{viii} Some were knowledgeable, having worked with the elderly, while others had specialist experience of dementia or have previously undertaken training on the topic. However, others had limited knowledge on the topic and, similar to the general public, were surprised that lifestyle factors and changes to behaviours could reduce the risks of developing dementia.</p> <p>To enhance understanding of Alzheimer's disease and support the earlier diagnosis of the condition, MSD recommends that care and support providers should train healthcare professionals in</p>	<p>Thank you for your comment. The committee discussed this, but agreed that due to the potential high cost impact of widely delivered staff training, it was important to focus the recommendations on areas with robust evidence of effectiveness and cost effectiveness. On this basis they agreed it was not possible to include more detailed recommendations in this section of the guideline than those currently included.</p>

				<p>Hearing loss in adults: assessment and management guideline.</p> <p>We acknowledge that this draft guideline on dementia does make a weak reference to sensory support – for example. encouraging healthcare professionals to take sensory impairments into account when assessing the severity of dementia, and for them to receive training in giving multi-sensory stimulation for people with dementia and communication difficulties. They should be doing this already to comply with existing laws, but it does not happen as often as it should. The NICE committee on adult hearing loss understood this, and that informed their recommendations.</p> <p>Also, to be clear, this feedback <u>is not to suggest</u> there is evidence that hearing aids or spectacles reduce the rate of decline in people with dementia – to the best of our knowledge there is no robust data to support that claim. For example, a widely cited Lancet commission on dementia has identified hearing loss as a main modifiable risk factor for dementia, but the full paper explains there is a lack of evidence to support hearing aids modifying that risk. <u>This is about</u> ensuring people with dementia, or at risk of</p>

				it, who might otherwise struggle to access services, have the opportunity to receive hearing and sight tests so they can see and hear as well as possible, and if not that their care package is adapted to reflect this. If the NICE committee can address this, it would help tackle existing inequalities in NHS and social care.	
National Federation of Women's Institutes	short	14	1	In contrast with the previous guideline which placed greater emphasis on the importance of good communication between carers, people living with dementia and healthcare professionals (page 8), this recommendation does not adequately reflect the role and value of carers of people with dementia as partners in care. NFWI research shows that unpaid carers are often heavily relied upon to speak on their loved ones behalf and relay important information about their health and care needs to medical staff. Only 30% of respondents to our survey of 221 carers said that hospital staff recognised and valued their role as a carer all or most of the time, highlighting the need to convey this more clearly in the guideline.	Thank you for your comment. The committee agreed with the importance of good communication, and noted this was included not just in the recommendatinos you mention, but also in the sections of the guideline on staff training, and support for informal carers.

National Mental Capacity Forum Leadership Group	Short	General	General	Overall it is of great concern that the empowering and protective framework of the MCA is almost invisible within this draft. Examples are given below. This is inexplicable given the nature of the population being considered here: the deprivation of liberty safeguards, for example, are used far more to protect the rights of people with dementia than for any other group of people, yet restriction/restraint and deprivation of liberty are nowhere mentioned.	Thank you for your comment. The committee agreed that rather than these issues being considered individually within a condition-specific guideline (which would only be able to consider evidence in people living with dementia, and not the broader evidence on this topic) the most appropriate way to address these issues was by cross-referring to both the Mental Capacity Act and the Care Act within the guideline, as well as the NICE guideline on decision-making and mental capacity (which is due to be published in July 2018).
National Mental Capacity Forum Leadership Group	Short	9	3	Advance care planning This should explain that the MCA provides the way to make LPAs and ADRTs and the advantages.	Thank you for your comment. The committee agreed that the relevant legislation and how this impacted on decisions should be included as part of these discussions.
National Mental Capacity Forum Leadership Group	Short	12	25	1.2.23 (clinical trials) might add reference to the legal framework for research using people who lack capacity to consent to inclusion, see MCA code of practice chapter 11).	Thank you for your comment. The committee agreed the appropriate way to address these issues was via a cross-reference to the Mental Capacity Act and the Code of Practice, which are included in the guideline.
National Mental Capacity Forum Leadership Group	Short	13	22	Care co-ordination: this says 'give special consideration to the views of people who do not have capacity to make decisions about their care, in line with the principles of the Mental Capacity Act 2005 '. This is insufficient: MCA s.4 (best interests) outlines a mandatory checklist of factors to consider, which is far stronger than	Thank you for your comment. The committee agreed these issues were best addressed by the cross-reference in the guideline to the Mental Capacity Act and its accompanying Code of Practice, as well as a cross-reference to the NICE guideline on decision-making and mental capacity (which is due to be published in July 2018).

National Mental Capacity Forum Leadership Group	Short	24	9	1.10.2 should refer to best interests (plural) decision-making in accordance with the statutory checklist in MCA s.4, and the statutory guidance in the MCA code of practice chapter 5.	Thank you for your comment. The committee agreed these issues were best addressed by the cross-reference in the guideline to the Mental Capacity Act and its accompanying Code of Practice, as well as a cross-reference to the NICE guideline on decision-making and mental capacity (which is due to be published in July 2018).
National Mental Capacity Forum Leadership Group	Short	27	3	Staff in general require more than just training on the principles of the MCA: they have a statutory duty to 'have regard to' the MCA code of practice and work within the MCA e.g. in how they assess capacity and work out best interests. Additionally they must know how to recognise restraint as defined within the MCA, how to recognise and respond to situations where someone may be deprived of their liberty. These issues of restraint and deprivation of liberty apply overwhelmingly to older people with dementia (see most recent annual report on the deprivation of liberty safeguards by NHS digital; also the most recent annual CQC State of Care report.)	Thank you for your comment. The committee agreed that rather than these issues being considered individually within a condition-specific guideline (which would only be able to consider evidence in people living with dementia, and not the broader evidence on this topic) the most appropriate way to address these issues was by cross-referring to the Mental Capacity Act (and the accompanying Code of Practice) within the guideline, as well as the NICE guideline on decision-making and mental capacity (which is due to be published in July 2018).
National Mental Capacity Forum Leadership Group	Short	31	6	See comment 3: 1.2.23 (clinical trials) might add reference to the legal framework for research using people who	Thank you for your comment. The committee agreed the Mental Capacity Act was a relevant issue in all situations where people do not have the capacity to consent to research, and that the appropriate way to address all issues around capacity

				lack capacity to consent to inclusion, see MCA code of practice chapter 11).	was via a cross reference to the Mental Capacity Act and its accompanying Code of Practice within the guideline.
NHS England	Short			Might the committee consider saying that signing up to initiatives such as "Join Dementia Research" (https://www.joindementiaresearch.nihr.ac.uk/) would be a good way to encourage people into research.	Thank you for your comment. The committee agreed with the value of making people living with dementia aware of chances to be involved in research, and therefore added a recommendation to "tell people living with dementia (at all stages of the condition) about research studies they could participate in."
NHS England	Short	General	General	I would like to congratulate NICE and the committee for all their hard work into producing such an excellent guideline.	Thank you for your comment and your support for the guideline.
NHS England	Short	3-5		In the background it might be worth mentioning the numbers of people diagnosed with dementia and it seems a shame to simply infer this from a publication now 6 years old that dealt primarily with antipsychotic prescribing. The last figures from NHS Digital is that in December 2017 there were 456,739 people on GP registers as having a formal diagnosis of dementia, of whom 441,782 were over the age of 65. The estimated prevalence in that age group of 647,013 gives a national diagnosis rate of 68.3%. This compares to 2009/10 where there were some 290,000 people on the register with an estimated diagnosis rate of around 40%.	Thank you for your comment. Some additional information has been added to this section around the increase in diagnosis rates in recent years. Specifically: "Finally, in December 2017, there were 456,739 people on GP registers with a formal diagnosis on dementia, up from approximately 290,000 people in 2009/10, with the majority of this difference accounted for by an increase in diagnosis rates."

				Dementia Action Alliance have produced a set of "We" statements which are an update of the original "I" statements and reference to these might be useful. The majority of practitioners are aware of these and they simply articulate good practice and recognise the rights and responsibilities of individuals.	
NHS England	Short	7	1.1.2	I think the use of the term "simplify" text is somewhat patronising in that it suggests that people with dementia need things produced in a simple way – in many ways this is the antithesis to person centred care and I am sure the committee will find, if they are minded, a better and less patronising word for this.	Thank you for your comment. The committee discussed this wording and agreed that the current wording is clear and unambiguous, and should therefore be retained. They agreed that the use of clear and simple text was not patronising, but a basic part of good information provision that should be applied more widely across the healthcare system.
NHS England	Short	9	1.1.1 1	It is open to debate as to when is the right time to offer advice on advance care planning and guidance. I think perhaps the word "timely" rather than "early" would be better as most practitioners would agree that it can sometimes be too early to provide information on advance care planning e.g. at the first clinic appointment.	Thank you for your comment. The committee discussed this issue and agreed there was an important balance between early opportunities to discuss advance care planning, and not introducing it at an inappropriate stage. The committee stressed that early did not necessarily mean at the first opportunity or first appointment. However, they did also note the evidence showed staff were often reluctant to initiate these discussions, and people often wanted to have these conversation before they are currently offered them. They therefore agreed "early" was the

					appropriate word to use, and noted that since the recommendation was phrased as "offer", there would be nothing to stop an individual deciding it was earlier than they wanted to start these conversations, and that it would then be appropriate to offer additional opportunities to discuss at a later date.
NHS England	Short	9	1.2.2	<p>Probably one of the commonest diagnostic tests is the GP Cog and it would be appropriate to mention this. The committee make reference to case finding and PHE's screening committee have said, quite rightly, that screening is not appropriate and yet, three of the six tests suggest that it is a screen.</p> <p>Also, it may be that practitioners are not used the three of the six tests and the test your memory is a self-administered rather than a clinician administered test.</p>	<p>Thank you for your comment. The committee were aware of the use of the GPCOG in practice. However, they noted that the GPCOG has only been tested as a screening test, and no evidence currently exists on the accuracy of the test in a population of people with suspected dementia. The committee noted that studies are likely to find better diagnostic accuracy in an unselected population than one with suspected dementia (as many people in the study will have no cognitive impairment, and therefore will be easily classified by the test), and therefore agreed it was appropriate to recommend only those tests shown to have sufficiently good properties in the relevant population. The committee noted that although there were differences between the six tests recommended (whether or not they were initially designed as screening tests, self-administered versus clinician-administered) they all showed sufficiently good diagnostic accuracy to be useful tools in guiding referral decisions in primary care.</p>
NHS England	Short	10	1.2.6	I think it is an important point to make that not everybody with suspected dementia needs to be	Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft

				referred to a specialist dementia diagnostic service. There are very good examples where the diagnosis can be made in primary care by a GP who knows the person well. For example, an elderly person who has been a long-time resident of a care home who has developed some cognitive impairment in whom the GP has done all the various tests is a situation where it would be clinically inappropriate for that person to be removed and taken to a memory service and subjected to an MRI scan. I have sent examples of this to Harry Allen some time ago. This would be counter to good clinical practice. Many colleagues in Primary Care are able to make a diagnosis and can use the advice of support of specialist memory services without a formal referral being made – perhaps it is the word “refer” that could be amended to reflect the breaking down of barriers between primary and secondary care which is to the benefit of people with dementia and their families.	guideline, in that people interpreted it as saying everyone need to attend an appointment at a secondary care service. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and treatment, but this did not mean the person necessarily had to travel to a physical appointment at that service. To ensure this is clear in the final version of the guideline, an explanation has been added to this section of the guideline, giving the following explanation around the term ‘refer’: “A referral to a diagnostic service does not require that the person be asked to attend a clinic appointment. It can also involve people being seen in community settings (such as their home or a care home), or advice being provided to the referrer without a formal appointment being made. The key issue is to ensure that dementia specialists are involved, both for advice on diagnosis and to ensure appropriate access to post-diagnostic support and treatment.”
NHS England	Short	10	1.2.8	Many people reading the guidance will not know what a verbal episodic memory test is – giving an example would be helpful.	Thank you for your comment. The committee agreed it was appropriate to keep the phrase “verbal episodic memory” as the most specific and accurate term available, but agreed the evidence was not sufficient to recommend one specific test over the others. However, they did agree it was appropriate to

					add a definition of this to the guideline to ensure there was no misunderstanding of what was meant.
NHS England	Short	10	1.2.9	In previous NICE guidance it has been suggested that a brain scan is not necessarily in established disease and reflecting this here +would be useful.	Thank you for your comment. The committee agreed with this suggestion and an additional note has been added to the recommendation to "be aware that structural imaging is not always needed, if dementia is well established and the subtype diagnosis is clear."
NHS England	Short	11	1.2.1 1	I would have thought reference to the generally approved diagnostic criteria such as the International Classification of Diseases (ICD) might be more useful for clinicians rather than going into the very specialist diagnostic criteria, which are often used for research.	Thank you for your comment. The committee noted the ICD codes for dementia where now out of date in a number of areas, and agreed it was important to reference more up to date criteria to guide diagnosis. However, they did agree it may well be appropriate to consider adding reference to the ICD11 criteria in future updates of the guidance, when these are finalised.
NHS England	Short	11	1.2.1 2	Going straight to detailed Cerebrospinal Fluid (CSF) examination or a PET scan seems clinically very inappropriate and the remarkable statement that "if one does not work try the other one" will, in untutored hands, cause a great deal of unnecessary upset for patients and their families. Someone reading this might think that a person in their mid-eighties who has mild loss of memory and in whom the diagnosis of Alzheimer's disease or mild cognitive impairment is uncertain should have a CSF examination and, if this does not give	Thank you for your comment. The committee noted that the 'consider' recommendations for CSF examination and imaging came at the end of the diagnostic pathway, and would consequently only be of relevance for the small number of people who still did not have a diagnosis after all the prior possible diagnostic steps had been considered. However, they noted that a number of stakeholders had interpreted this recommendation as bringing CSF and imaging earlier in the diagnostic pathway, and to counter that conception agreed it

02/01/2018-13/02/2018**

Stakeholder	Document	Page No	Line No	Comments	Developer's response
NHS Leeds North CCG	Short	3	13-14	The Alzheimers Society estimates of the numbers of people with dementia are different to NHS England estimates. The concern is that the Alzheimers Society use an inaccurate methodology, in that constant estimates of dementia risk for each age group are applied to ONS population projections. Whereas research evidence all points to dementia risk decreasing over time, therefore dementia prevalence is likely to increase more slowly than suggested by population projections. See eg. http://www.bmj.com/content/358/bmj.j2856 Although this is preamble rather than recommendation, it seems important to apply the evidence base critically from the start, for the credibility of the guideline.	Thank you for your comment. Some additional information has been added to this section around the increase in diagnosis rates in recent years. The committee agreed that in a condition where there is still considerable under-diagnosis, accurate prevalence estimates were hard to achieve.
NHS Leeds North CCG	Short	3	16-17	The evidence about new diagnoses in 2011 and the increase in new diagnoses reflects success at improving diagnosis. However, in the context of the preceding lines we seem to be conflating this with demographic increase.	Thank you for your comment. Some additional information has been added to this section around the increase in diagnosis rates in recent years.
NHS Leeds North CCG	Short	6	8ff	Two sets of guidance applicable in England: Dementia: Good Care Planning (NHS England, 2016) Implementation Guide and Resource Pack for Dementia (NHS England, 2016)	Thank you for your comment. These resources have been linked to as suggested, since they were agreed by the committee to be relevant to a large number of people involved in delivering care and support for people living dementia.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. Dementia: assessment, management and support for people living with dementia and their carers

**Consultation on draft guideline - Stakeholder comments table
02/01/2018-13/02/2018**

Stakeholder	Document	Page No	Line No	Comments	Developer's response
NHS Leeds North CCG	Short	7	7ff	Concern that involvement in decisions and attempts at person-centred care often lead carers and staff to fire questions at people, which can be stressful for people with dementia and cause agitation. The basis of SPECAL and other communication training is to avoid direct questions and use open conversation methods instead. Would the evidence base support advice on this point ?	Thank you for your comment. The committee noted this concern, and agreed appropriate training was key to managing these interactions well. In response to this and other feedback, the committee agreed to add training in "adapting communication styles" to the section of the guideline on staff training and education.
NHS Leeds North CCG	Short	8	27-29	Surely this is a matter of professional skill and practice, include a best-interests judgement, about how to maintain some form of contact with a vulnerable person who at that moment may be struggling with the diagnosis. The draft reads as a very black-and-white matter that seems to allow us to let people go who really need support.	Thank you for your comment. The committee agreed that whilst the situation would be different in people lacking capacity, those with capacity had the right to decline services and follow-up if they so wished, and therefore the important issues were that people were offered future follow-up and contacts, and that there was a clear route for people back in to services when they wanted/needed it.
NHS Leeds North CCG	Short	9	3ff	I like the idea, but I don't think we've got to the heart of how to approach this honestly and sympathetically with people, or how to capture and record the things people say when they want to talk. The concern is that this list will encourage a 'checklist' approach to care reviews.	Thank you for your comment. The committee noted this concern, and agreed it was not possible at present to provide specific recommendations on how these conversation can best be conducted. However, they did note the evidence was clear that many people living with dementia wanted to have these conversations at an early stage in the process.
NHS Leeds North CCG	Short	10	25-26	a) Structural imaging can inform diagnosis of sub-type, not just rule out other causes. Imaging may also find tumours / lesions as well as reversible causes ?	Thank you for your comment. The committee agreed with this suggestion, and the recommendation on structural imaging has been changed to "rule out reversible causes of cognitive decline and to assist with subtype diagnosis"

NHS Leeds North CCG	Short	13	12-21	<p>I disagree with the approach of specialist services for the review of dementia after diagnosis, and I'm doubtful what the actual evidence is for this approach – I see a study from the Netherlands compares specialist review v primary care, but surely this depends on the quality offered by primary care ? Most people with dementia have comorbid long-term conditions, and a specialist service detracts from a holistic approach to living well with the various challenges. Specialist care is also more stigmatising. Please note also that the NHS England guidance, "Dementia: Good Care Planning" locates the responsibility for review very much with primary care.</p> <p>We have to be careful how evidence is interpreted, and consider the make up of the NICE committee who quite rightly are dementia-focused, and balance this against the holistic approach to long-term conditions which I believe also has an emerging evidence base ? Of course timely access to specialists is important.</p>	Thank you for your comment. The committee agreed that review could be carried out in primary care, and noted this was included as an option in the recommendation. However, they noted that if this was to be the case, it would be important for the primary care service to include/have access to the appropriate multidisciplinary support that people living with dementia are likely to need.
NHS Leeds North CCG	Short	13	22ff	<p>We should not use the term "care co-ordination" or "care co-ordinator" at this stage because it is ambiguous. To mental health services it suggests the role which is allocated under the Care</p>	Thank you for your comment. The committee agreed that both terms were currently in use, but that at the moment "care coordinator" was the more commonly understood term, and

				<p>Programme Approach, which is not needed universally, but in complex, riskier, instances. "Care Navigator" is much more relevant as a universal post-diagnosis provision.</p> <p>We introduced the 'care co-ordinator' term in Quality Standard QS1, it was a mistake then and we can put it right now.</p>	therefore agreed this was the one that should be used in the guideline.
NHS Leeds North CCG	Short	14	25ff	<p>Accessibility to services should include: people who do not have a recorded diagnosis because eg. they are reluctant to seek it, but nevertheless would benefit from services and may be supported towards seeking diagnosis. Any exclusion criteria based on a requirement for recorded diagnosis should have clear, specific justification.</p>	Thank you for your comment. The committee agreed that there was no evidence identified within the guideline that would enable them to make recommendations, but agreed this was a relevant issue. As noted within the committee's discussion of the evidence for the diagnostic section; "the committee commented that it was also important to consider situations where a patient may not want a referral for an assessment/diagnosis, and the potential disadvantageous outcomes that might result from this choice (e.g. problems with obtaining support, care and treatment)."
NHS Leeds North CCG	Short	17	18-27	<p>There is huge variation in prescribing costs for special preparations of AChEIs and memantine, and advice could be included along the lines of a document (link below) prepared by colleagues in Yorkshire and Humber region. Some of the variations are illogical / inexplicable, eg. orodispersible Donepezil in the sugar-free version was one-tenth the price of the sugary version, at</p>	Thank you for your comment. The committee agreed that it was a matter for local areas to ensure they obtained necessary medicines at the lowest possible price, and did not feel it appropriate to reference specific pricing material within the guideline, due to the risk of it quickly becoming out of date.

				the time my colleagues wrote the advice: www.yhscn.nhs.uk/media/PDFs/mhcn/Dementia/DES/Cost%20of%20drugs%20for%20treatment%20of%20Alzheimers%20Disease%2010.7.16.pdf	
NHS Leeds North CCG	Short	17	14-17	Local policy in Leeds on AChEIs is more explicit than this, that the medications do not require specialist review. Previous NICE guidance has required specialist review and looked to discontinue prescribing as dementia progressed. This has led to Memory Services capacity being used for medication reviews rather than timely diagnosis; and other more holistic elements of support going disproportionately to people with dementia medication (and people with eg. vascular dementia being discharged quickly from follow-up). Therefore please consider making a more explicit recommendation, that review and ongoing prescribing can in primary care without specialist advice.	Thank you for your comment. The committee noted that once the first prescription of cholinesterase inhibitor or memantine has been made in primary care, monitoring would also take place within that setting.
NHS Leeds North CCG	Short	20	21-23	I agree in principle with para 1.7.1, that the first questions must always be around possible causes of behaviour, and not assuming it is a 'symptom of dementia'. However, it doesn't address in practice the need for carers / care staff to be able to protect the person with dementia and those around them, whilst a difficult situation with	Thank you for your comment. The committee noted that no evidence was identified around the use of interventions to manage severe and urgent non-cognitive symptoms, and therefore agreed they were not able to make recommendations on this in the guideline.

				agitation and aggression is managed. Could any further recommendations be offered to explicitly addresses the situation where prescribing is being considered as an urgent & interim step ?	
NHS Leeds North CCG	Short	20	21-23	Anecdotally, I have been told of incidents where a dementia specialist clinician (correctly) identified delirium as a possible cause of agitation & distress that had to be investigated; but, they did not go about this in a helpful way. Instead of discussing with the GP and working up an MDT approach, they told the carer to ring the GP. Would it be helpful to clarify that investigating clinical causes should be done in parallel with managing the presenting situation and requires a multi-disciplinary approach and not 'handing off' ?	Thank you for your comment. The committee noted these concerns, but agreed that in the absence of evidence, it was not possible to make any more detailed recommendations than those currently included in the guideline.
NHS Leeds North CCG	Short	22	4-9	In one engagement / consultation exercise, the CCG found one carer who was unhappy that 'their' person with dementia had been given electro-convulsive therapy; and a further example where the carer sought a second opinion after a doctor had recommended ECT. They were concerned that there had been misdiagnosis and inappropriate treatment. Neither this draft guideline, nor the NICE guideline on depression, covers the use of ECT in dementia – though the depression guideline does cover the monitoring	Thank you for your comment. The committee agreed that, in the absence of any evidence being identified for elector-convulsive therapy, it was not possible to make recommendations on this topic within the guideline.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
NHS Leeds North CCG	Short	24	2-4	risks on admission to hospital also include the risks of a prolonged length of stay and severe decline in functioning. Recommendations could include: awareness of disorientation and busy environment causing distress; need to promote meaningful activity and assess needs for support with eating, drinking and medication; reference to John's Campaign; consideration of high quality holistic assessment to enable discharge planning.	Thank you for your comment. The committee noted that the list of factors given here were only examples, and there were many other factors that would need to be taken in to account in individual cases. The specific examples on the list were chosen by the committee as those they agreed were likely to be the most common problems encountered.
NHS Leeds North CCG	Short	26	1-9	Propose that support for carers should include "steps to avoid taking over the life of the person with dementia, and enabling the independence of the person as much as possible". This is anecdotal, but I've been really struck by Wendy Mitchell's approach in her new book ("Somebody I Used To Know") to carry on living alone and what she feels are the advantages of not taking up her daughters' offers to live with them.	Thank you for your comment. The committee discussed this, but agreed that due to the potential high cost impact of widely delivered carer training, it was important to focus the recommendations on areas with robust evidence of effectiveness and cost effectiveness, and few of the studies included specifically included this as a defined aspect of training.
NHS Leeds North CCG	Short	27	4-12	Could we explicitly include <i>communication skills</i> to work with people with dementia, as something that all staff should have training on.	Thank you for your comment. The committee agreed with this suggestion, and training in "adapting communication styles" has been added to this section.
NHS Leeds North CCG	General	general	general	in response to the above question: "Which areas will have the biggest impact on practice and be challenging to implement? Please say for whom and why?"	Thank you for our comment. The committee noted all the challenges mentioned, and had the following comments: 1) Recommendations for particular diagnostic test were based on the evidence for their accuracy, and the committee agreed it was for local areas to decide how to organise their particular

NHS South Gloucestershire CCG	Full	General	general	<p>My main comment is that the guidelines appear out of touch with what is happening on the ground, and in particular do not acknowledge that primary care diagnosis can be safe and appropriate in the frail elderly.</p> <p>This is a very disappointing missed opportunity which will lead to these updated guidelines being as widely ignored as the previous one was. A Primary care focus would have made the updated guidelines hugely more relevant (eg a reference to DiADeM, endorsed by AS)</p> <p>I support the work NICE does but this trend makes its advice increasingly irrelevant to professionals.</p>	<p>Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft guideline, in that people interpreted it as saying everyone need to attend an appointment at a secondary care service. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and treatment, but this did not mean the person necessarily had to travel to a physical appointment at that service. To ensure this is clear in the final version of the guideline, an explanation has been added to this section of the guideline, giving the following explanation around the term 'refer':</p> <p>"A referral to a diagnostic service does not require that the person be asked to attend a clinic appointment. It can also involve people being seen in community settings (such as their home or a care home), or advice being provided to the referrer without a formal appointment being made. The key issue is to ensure that dementia specialists are involved, both for advice on diagnosis and to ensure appropriate access to post-diagnostic support and treatment."</p>
NIHR Nottingham Biomedical Research Centre	Short	7	10	<p>As above. Please specify that devices such as hearing aids, remote microphones and other assistive listening devices, would provide a means to modify communication by making speech</p>	<p>Thank you for your comment. The committee agreed that the appropriate management of identified hearing loss should be covered by the recommendation to "ensure that people living with dementia have equivalent access to diagnostics,</p>

				audible. See Ferguson et al 2017 Cochrane review on hearing aids.	treatments and care services for comorbidities to people who do not have dementia.”
NIHR Nottingham Biomedical Research Centre	Short	9	17	Hearing loss is a significant co-morbidity of dementia and can affect diagnosis of PwD. More than 70% of PwD have hearing loss. A number of the recommendations regarding diagnosis will require the PwD to be able to hear (e.g. 1.2.1 to 1.2.4, 1.2.8). For example taking a history or filling in a questionnaire. There should be some note that if the PwD has a hearing loss, then the hearing loss should be managed with a device (eg. hearing aid, remote microphone, assistive listening devices). In addition, it should be stated that effective communication strategies are used by the person speaking to the PwD (see examples https://www.chs.ca/communication-tips-0).	Thank you for your comment. The committee noted this point, and agreed it was appropriate to include a cross-reference to the NICE guideline on hearing loss to address these issues.
NIHR Nottingham Biomedical Research Centre	Short	15	9	Hearing loss is a significant co-morbidity of dementia and can affect management of PwD. Here, group activities are recommended. However, if the PwD cannot hear what is going on during the group activity they will not be able to fully participate. The result will be withdrawing from the situation, which can lead to psychosocial consequences and mental health problems (see Heffernan et al Int J Audiol 2016). Appropriate management of hearing loss (e.g. hearing aids)	Thank you for your comment. The committee noted this point, and agreed it was appropriate to include a cross-reference to the NICE guideline on hearing loss to address these issues.

				will help improve audibility. Although the one study on hearing loss in PwAD did not show any effect of hearing aids to improve cognition per se, the patient's hearing will have been improved. A recent Cochrane Review on Hearing Aids has shown that hearing aids are effective at improving listening, hearing- and health-related quality of life (Ferguson et al, Cochrane, 2017). Furthermore, hearing loss is significantly related to dementia (see Lin et al JAMA 2011).	
NIHR Nottingham Biomedical Research Centre	Short	22	17	Any reason why hearing loss is not listed as a long-term condition in PwD? NICE guidelines for hearing loss are currently under development, and will be published in May 2018. In these guidelines there are numerous places where dementia is listed and one of the research recommendations is to assess prevalence in people who under-present for Hearing loss (Appendix Q pg 482, Q1); and use of hearing aids in dementia (appendix Q pg 483 Q2). Given there are NICE guidelines on hearing loss that refer to dementia, it would seem appropriate for these dementia guidelines to refer to hearing loss. https://www.nice.org.uk/guidance/gid-cgwave0833/documents/guideline-appendices-2	<p>Thank you for your comment. The committee agreed the most appropriate way to address issues around hearing loss was by adding a cross-reference to the NICE guideline on hearing loss, which makes recommendations on hearing assessments for people with suspected and diagnosed dementia.</p> <p>The committee also agreed it was appropriate to add hearing loss to the list of possible dementia mimics which should be investigated in primary care before referral for diagnosis (recommendation 1.2.6 in the short guideline).</p> <p>Finally, the committee agreed that once hearing loss was identified in a person living with dementia, this should be covered by the recommendation to "ensure that people living with dementia have equivalent access to diagnostics,</p>

				there is no indication anywhere as to how PwD should be referred to specialist audiology services or how and when HCPs can or should test/screen for hearing loss. This should be included in the guidelines.	which makes recommendations on hearing assessments for people with suspected and diagnosed dementia.
Norfolk and Suffolk NHS Foundation Trust	Short	15	9, 10, 11	This recommendation shows a significant shift in language from the previous NICE guidelines, despite further evidence since the previous guidance for the effectiveness of Cognitive Stimulation Therapy (CST). Also, there is no evidence to suggest that "elements" of cognitive stimulation and reminiscence therapy is effective. The vast majority of positive evidence is for structured CST, following a manualised approach. The wording in the draft guidelines is going to lead to increased difficulty with offering our patients alternatives to medication and undermine attempts to advocate for non-pharmacological approaches alongside medication and is very concerning. It seems to be based on a misunderstanding and misinterpretation of the evidence base for CST. Furthermore, the manualised CST programme works very well in community services, where staff are keen to have structured guidance in	Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The committee agreed the evidence base was stronger for CST (as a manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-effectiveness. The committee therefore agreed it was appropriate to split this into two separate recommendations, a stronger recommendation for CST and a weaker recommendation for reminiscence. Specifically: "Offer group cognitive stimulation therapy to people living with mild to moderate dementia. Consider group reminiscence therapy for people living with mild to moderate dementia."

				delivering groups, rather than needing to create their own interventions from scratch.	
Norfolk and Suffolk NHS Foundation Trust	Full	277	37	<p>This section considers the economic analysis of CST, but uses a base case model, rather than published health economic studies. There have been 2 key papers published considering the cost effectiveness of manualised CST (Knapp et al, 2006 which considered CST; D'Amico et al, 2015 which considered maintenance CST). Both are listed in the references in Appendix J, but only D'Amico et al (2015) has been considered in the evidence. These papers show strong evidence for the cost effectiveness of manualised CST and it is important for the Knapp paper to be used, rather than a base case model (see comments 3 and 4 for further discussion of this). These papers look at the cost of the delivery, as well as the changes in use of health and social care services for those in receipt of the intervention.</p> <p>Furthermore, the NHS Institute of Innovations and Improvements invested in an 'economic analysis of the alternatives of anti-psychotics for individuals living with dementia', conducted by Matrix Evidence in 2011: https://www.acss.org.uk/wp-</p>	<p>Thank you for your comment. The Knapp (2006) paper was not a cost-utility study and therefore did not consistent with the reference case. As a result, it is inaccurate to state that this analysis showed that CST is cost effective, as no threshold value has been established for the effectiveness instruments used against which gains could be assessed. The D'Amico (2015) paper however, was a cost-utility study and was eligible for inclusion as part of the economic review.</p> <p>Please note that the effectiveness evidence used in Knapp (2006) was based on Spector (2003), and has been considered by this guideline by the way of inclusion in our quantitative synthesis of parameters for the model developed by NICE.</p>

Norfolk and Suffolk NHS Foundation Trust	Full	296	5	<p>“They noted that in practice the two interventions are not mutually exclusive, with cognitive stimulation and reminiscence both forming part of the activities included within those groups”.</p> <p>Whilst the committee are correct that CST does incorporate some aspects of reminiscence, the statement above shows a misunderstanding of CST (2006). One of the key focuses of CST is on generation of <i>new</i> thoughts, ideas and associations within the sessions. This is believed to engage executive functioning skills and enable new semantic connections to be made. CST is based on theories of mental stimulation, and uses principles of person centred care. It includes clear key principles which need to be adhered to for effectiveness. It also shifts the focus, emphasising the importance of the person's views and options in the current day, rather than focusing on the past (which is the aim of Reminiscence).</p> <p>References Spector A, Thorgrimsen L, Woods B, Orrell M (2006) Making a difference: an evidence based group program to offer Cognitive Stimulation Therapy</p>	<p>Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. 				(CST) to people with dementia. Hawker Publications, UK.	
Norfolk and Suffolk NHS Foundation Trust	Full	296	5	<p>“The committee agreed the most appropriate recommendation was for people to be provided with access to structured group activities, with cognitive stimulation and reminiscence both forming part of the activities included within those groups.... This was likely to lead to better outcomes for a range of people than one narrowly focused on a very specific intervention model”</p> <p>These recommendations are problematic for several reasons. As stated in the comments above, there is a far stronger evidence base for CST than for reminiscence. Additionally, the evidence is for CST when used as a manualised intervention. There is no evidence for any benefits if just elements of the programme are used, and there is no evidence in general for structured group activities. Therefore it is puzzling to see why NICE would recommend something which is not evidence based.</p>	<p>Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. 				<p>In the Trust where I work (NSFT), CST is viewed favourably by staff as having a clear manual, which can be followed by a range of health and social workers at all levels of expertise eases implementation and minimises preparation time, providing a highly cost-effective intervention. This change in wording will create ambiguity and my fear is that it is likely to be interpreted that any type of structured group is sufficient, leading to a lack of clinical governance, and a lack of adherence to any sort of standardisation. The conclusion in the report that "this was likely to lead to better outcomes for a range of people than one narrowly focused on a very specific intervention model" appears to be based on no evidence and also a misunderstanding of CST, which is not "narrowly focused on a specific intervention model". Instead, CST has a variety of interventions depending on the interests and abilities of the group, and is delivered according to important key principles which fit with the underlying theoretical models. I would encourage NICE to argue for more adherence to protocol and evidence base, rather than less.</p>

Norfolk and Suffolk NHS Foundation Trust	Full	300	4	<p><i>“Consider providing structured group activities (including elements of cognitive stimulation and reminiscence therapy) to people living with mild to moderate dementia who are not already accessing them”</i></p> <p>This recommendation, as stated in comment 1, is concerning for all the reasons given in the above comments. CST, unlike AChEs and memantine, is suitable for all different types of dementia, it also shows improvement on measures such as quality of life and mood, as well as cognition. There is a risk that the wording “consider” will imply this is not an important recommendation. Additionally, “who are not already accessing them” may imply any sort of group activity will suffice. Given my comments, I would suggest the wording is changed to be more similar to the 2006 guidelines <i>“People with mild / moderate dementia of all types should be given the opportunity to participate in a structured group cognitive stimulation programme. This should be commissioned and provided by a range of health and social care workers with training and supervision. This should be delivered irrespective of any anti-dementia drug prescribed for the cognitive symptoms of dementia”</i>.</p>	<p>Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The committee agreed the evidence base was stronger for CST (as a manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-effectiveness. The committee therefore agreed it was appropriate to split this into two separate recommendations, a stronger recommendation for CST and a weaker recommendation for reminiscence. 				As no recommendations were made for pre- and peri-diagnostic counselling and support for people with dementia and their families (evidence statement 13.1.4 full guidelines, p.263, line 14), or for post diagnostic interventions (evidence statement 13.1.6 full guidelines, p.266, line 2), there is a real danger that those with dementia will be offered only medication, and it will be even harder for people to access non-pharmacological interventions.	
Norfolk and Suffolk NHS Foundation Trust	Appendix J	10	10	In our Trust (NSFT), we do not have a Band 6 running the sessions – we have 2 Band 4s. This is typical of most organisations. Therefore the cost analysis is not correct, and the Knapp paper (referenced in comment 2) needs to be consulted	<p>Thank you for your comment. In order to best reflect the level of expertise in a typical provision of a course of group CST, members of the GC were consulted with regard to the number and seniority of staff that would be required. The committee recognised that there is variation in the seniority of staff used to deliver CST across CCGs, ranging from two band 6s to two band 4s, and therefore advised that a band 6 and band 4 were an appropriate combination to serve as the baseline for modelling CST.</p> <p>It was important that the combination of number and seniority of staff selected for the base-case model closely reflected the profile of staff used to deliver group CST in studies from which the effectiveness data used in the model were drawn. It is not clear that the intervention would have identical effectiveness if delivered by more or less senior staff.</p>

					<p>However, for all interventions in our model, we provide as estimate of ceiling cost for the magnitude of benefit observed. That is, if providers are able to deliver the benefit provided by group CST as per our model for an amount less than the value specified, this is likely to be reasonable use of NHS/PSS resources. This information can be used to estimate the value for money provided by alternative configurations (although, as noted above, this would only be valid if the effectiveness of the intervention is assumed to be unaltered).</p> <p>The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. 					<p>a stronger recommendation for CST and a weaker recommendation for reminiscence. Specifically:</p> <p>“Offer group cognitive stimulation therapy to people living with mild to moderate dementia.</p> <p>Consider group reminiscence therapy for people living with mild to moderate dementia.”</p>
Norfolk and Suffolk NHS Foundation Trust	Appendix J	10	11	<p>All our CST groups are run from our base, so there is no staff travel time per session. This is typical for most organisations, so it is not correct to assume that the intervention takes place at an external venue. Again, therefore the cost analysis is not correct, and the Knapp paper (referenced in comment 2) needs to be consulted. It is not clear to me why patient travel is included, as presumably this is not a cost to the NHS, as we rarely provide cost of transport. Additionally, unlike for CST, many of our memory medication nurses do make significant journeys across rural Norfolk to see people at their homes, and the cost of their travel does appear to have been included in NICE's economic analyses of memory medication.</p>	<p>Thank you for your comment. Our analyses aim to be representative of what we understand to be typical practice in the NHS, of which there is often variation to differing degrees. In Knapp (2006), the cost of preparing the CST intervention was borne by the research project, and this included travel expenses. The guideline committee was consulted regarding this and indicated that costs for patient travel are sometimes borne by the organisation running the programmes. We are aware that some organisations have facilities available to them for which they do not have to pay, and accordingly a sensitivity analysis was conducted where these costs were excluded. The results of this sensitivity analysis in the base case produced an ICER of £17,111/QALY, making CST cost-effective if QALYs are valued at £20,000 each.</p>

					<p>a stronger recommendation for CST and a weaker recommendation for reminiscence. Specifically:</p> <p>“Offer group cognitive stimulation therapy to people living with mild to moderate dementia.</p> <p>Consider group reminiscence therapy for people living with mild to moderate dementia.”</p>
Norfolk County Council	Short	28-29	general	<p>Staff training – Whilst Norfolk County Council expects its own social care practitioners to have relevant experience of dealing with adults suffering from dementia and to understand person-centred outcomes, Norfolk County Council already has 'Dementia awareness' training available for its own staff. It may be that this becomes a mandatory requirement which would have a minor impact on financial resources. Norfolk County Council would be more concerned of the necessity to provide training to all of those involved with providing care (including care providers, informal carers and families) which would create a further financial burden on the local authority.</p>	<p>Thank you for your comment. The committee agreed there could be costs associated with the recommendations in the guideline for both carer support and staff training. However, the committee agreed there was robust evidence that both of these were effective and cost-effective interventions, and therefore were confident to make strong recommendations that they should be implemented.</p>
Norfolk County Council	Short	9	general	<ul style="list-style-type: none"> Advanced Care planning – This is the biggest single proposed change to current practice in Norfolk. Currently, if an adult 	<p>Thank you for your comment. The committee noted that providing ongoing opportunities to discuss advance care planning may be a change in practice for some areas, but that</p>

				<p>makes their views known in respect of advanced care planning, Adult Social Services will record those wishes however, this is not a practice which is currently promoted. Advanced care planning decisions could be formally recorded in 'Advance Decisions to Refuse Treatments' or with 'Lasting Power of Attorneys'. The Care and Compassion website has a very good guide on detailing advance care planning decisions to be taken into account at a later date (should an adult be unable to express their wishes). There is a concern however about the impartiality of social work practitioners being involved in these decisions however regular care reviews should remove the need to spend time and resources on specific assessments related to advance care planning. The local authority would certainly expect practitioners to provide advice to people on where they can get more information/obtain documents should they wish to set up LPAs/ADRTs.</p>	<p>this was an important way to ensure that the wishes and preferences of people living with dementia are respected for the entirety of their lives.</p> <p>The committee acknowledged there are likely to be short-term resource implications in implementing this recommendation, both in ensuring information is appropriately shared, and training of staff so that they are able to carry out these tasks. However, the committee were confident this would be a worthwhile use of resources that would improve care for both people living with dementia and their carers.</p>

				<ul style="list-style-type: none"> If implemented on a wider scale, we would be concerned that current computer technology and software programmes may need some adjustment for specific advanced care planning so that advance wishes were accurately recorded in a way that is easily accessible by all of those to whom this information relates. Active promotion of this is likely to increase the length of time taken to complete Care Act Assessments and place additional burdens on social care budgets. <p>There would also be concerns about a need to review advanced care planning decisions so that this information was kept up to date. That is to say not only would practitioners be reviewing current care needs under the Care Act but may also end up reviewing future needs. There are also implications where family members have not been told of advanced care planning decisions, leaving the local authority vulnerable to potential legal challenges and potential criticism of workers with regard to impartiality (as mentioned above).</p>	
Norfolk County Council	Short	13	26	<ul style="list-style-type: none"> Face to face assessments for adults with dementia where possible – In Norfolk, 	Thank you for your comment. The committee agreed it may not be practical (or necessary) for assessment to take place

				<p>most Care Act assessments are completed face to face with social work practitioners for those suffering with dementia. There are occasions where carers and family are involved with the provision of care to the adult with dementia and where Norfolk County Council feels that care assessments can be accurately completed by telephone or other means although these cases are rare. The Council is concerned that any increase in the number of adults requiring face to face assessments would lead to additional financial pressures on the local authority.</p> <p>All care assessments require regular reviews. Although Norfolk County Council completes nearly all Care Act assessments on a face to face basis for those suffering with dementia, a larger number of reviews are undertaken through other media with those involved with caring for the person as well as family members. The draft guidance does not make it clear whether all reviews must be completed face to face but if so, then this would again have an impact on resources required.</p>	<p>face to face in all cases, and it was for this reason the words "where possible" are included in the recommendation. The committee agreed that in the absence of any evidence, it was not possible for them to make recommendations on whether reviews needed to take place face to face or not.</p>

Norfolk County Council	Short	15	13	Cognitive rehabilitation – Norfolk already offers this to all those receiving NHS services. With ongoing integration between health and social care in Norfolk, it is anticipated that cognitive rehabilitation will be offered to all of those suffering from mild to moderate dementia whose needs become apparent through social care routes. This is part of the local authority's dementia strategy and it is hoped that this will be in place within the next 6 - 12 months.	Thank you for your comment. The committee agreed this was a useful intervention to have available and were pleased to hear it is being rolled out in practice already.
Norfolk County Council	Short	30	5	Dementia Lead – Norfolk does not currently have a dementia lead post however, it does work with jointly with the NHS in the provision of services to those with dementia. Whilst the financial impact of having a dementia lead in place would not be huge, Norfolk County Council is concerned that this is again another additional cost at a time of financial pressures.	Thank you for your comment. The points listed here are merely suggestions for how recommendations could be implemented, and local areas would need to make their own decisions about how best to convert the guideline in to practice.
Northumberland Tyne and Wear NHS Foundation Trust	Full	36	17	<u>Summary of recommendations, point 75</u> We are concerned that the current NICE guidance which states (<i>"People with mild / moderate dementia of all types should be given the opportunity to participate in a structured group cognitive stimulation programme"</i>) is proposed to change to the following guidance (<i>"Consider providing structured group activities (including</i>	Thank you for your comment. 				<p>In terms of research evidence, a relatively recent Cochrane review (1) notes the benefit of CST when compared to a social/group activity control group. Simply being part of a trial often leads to improved outcomes in pharmacological and other trials for dementia, and the fact that CST has been compared to non-CST group activities is an advantage lacking in some other therapeutic trials in dementia.</p> <p>1. Woods B, Aguirre E, Spector AE, Orrell M. Cognitive stimulation to improve cognitive functioning in people with dementia. <i>Cochrane Database Syst Rev.</i> 2012;2:CD005562.</p>	
Northumberland Tyne and Wear NHS Foundation Trust	Full	296	5	<p>The 2018 draft dementia guidelines state "...there would be no difference in cost of delivery between providing an intervention with a more varied range of components, and this was likely to lead to better outcomes for a range of people than one narrowly focused on a very specific intervention model." (13.2.5).</p> <p>This statement is not accompanied by any specific evidence or costings and therefore does not</p>	<p>Thank you for your comment. 				<p>appear evidence-based. CST does in fact have a strong evidence base, particularly when compared to other non-pharmacological interventions such as reminiscence therapy. The cost of CST, at least in our service (likely to be representative of other services) is likely to be low, as it is carried out by clinical staff during normal clinical sessions and forms part of assessment and treatment (which might otherwise result in more individual sessions). The use of a manual allows less experienced staff to deliver the intervention, again likely to reduce the cost. Design of an alternative intervention programme, including elements of CST and other therapies would require specialised input from highly experienced and trained staff and would be therefore likely to cost more. There is no evidence that replacing CST with such an alternative programme would be of benefit to patients so it seems difficult to understand how such a statement has been made in the guidance. These of course are opinions based on our experience rather than research evidence, but the statement made by the committee similarly appears to be opinion-based.</p>	<p>into two separate recommendations, a stronger recommendation for CST and a weaker recommendation for reminiscence. Specifically:</p> <p>“Offer group cognitive stimulation therapy to people living with mild to moderate dementia.</p> <p>Consider group reminiscence therapy for people living with mild to moderate dementia.”</p>

				<p>As mentioned earlier, one member of our team (S-M P) has previously evaluated CST for use in resource limited settings (1) and health economic analysis found costs of CST to be low, and to be recommended. Although those settings were different to those of the UK, notably because of the lack of accessible cholinesterase inhibitors, CST was delivered by trained staff (nurses and occupational therapists) in a similar manner to that usually seen in the UK.</p> <p>Paddick SM, Mkenda S, Mbowe G, et al. Cognitive stimulation therapy as a sustainable intervention for dementia in sub-Saharan Africa: feasibility and clinical efficacy using a stepped-wedge design. <i>Int Psychogeriatr.</i> Jun 2017;29(6):979-989.</p>	
Northumbria Healthcare NHS Foundation Trust	Full	36	17	<p><u>Summary of recommendations, point 75</u> We note the change in the language used from the 2006 guidance (<i>"People with mild / moderate dementia of all types should be given the opportunity to participate in a structured group cognitive stimulation programme"</i>) to the proposed 2018 text (<i>"Consider providing structured group activities (including elements of cognitive stimulation and reminiscence therapy) to people living with mild to moderate dementia</i></p>	<p>Thank you for your comment.</p> <p>The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The committee agreed the evidence base was stronger for CST (as a manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-</p>

				<p><i>who are not already accessing them</i>"). Based on our own knowledge and experience, we cannot agree with this change in language surrounding CST. The evidence base around CST appears to be growing rapidly and there have been some notable additions to the scientific literature that support the use of CST during this time, including our own work.¹⁻⁶ As such, the wording, "Consider providing..." seems rather weak and the change seems hard to justify based on both the evidence presented in the draft guidance and the wider literature.</p> <p>Likewise, the suggestion that only "...elements..." of CST should be considered appears to be out of step with the literature. Our anecdotal experience strongly supports the use of CST as a manualised package. Having a clear framework for the intervention is helpful with regard to training of healthcare workers, but also for patients and their families, who can build on session themes outside of the group. CST was adapted by our group for Tanzania and Nigeria by local healthcare workers⁷ and we feel that it would have been impossible to deliver such an intervention effectively in this setting, in the absence of an overarching framework, such as</p>	<p>effectiveness. The committee therefore agreed it was appropriate to split this in to two separate recommendations, a stronger recommendation for CST and a weaker recommendation for reminiscence. Specifically:</p> <p>"Offer group cognitive stimulation therapy to people living with mild to moderate dementia.</p> <p>Consider group reminiscence therapy for people living with mild to moderate dementia."</p> <p>Please find below a response for each of the papers you have cited:</p> <p>Yamanaka (2013), Orrell (2014) and Woods (2012) were already included as evidence for CST.</p> <p>Capotosto (2017) and Paddick (2017) have now been included as evidence for CST. The inclusion of these studies did not make a meaningful difference to any of the results of the analysis.</p> <p>Stewart (2017) would have been excluded because they used a before-after study design. This type of study design was excluded because there was enough evidence on randomised controlled trials (RCTs).</p>

				<p>unpublished).¹ These findings are supported by work from other researchers.²⁻⁶ Most notably the Cochrane Collaboration systematic review by Woods et al found evidence supporting improvements in quality of life and communication. As such we feel that this statement is misleading and is not supported by current evidence. On a clinical level, this statement also seems implausible. We are unaware of any plausible mechanism whereby a psychosocial intervention would only act to improve cognition in isolation. Rather, improved cognition is likely to occur in tandem with improvements in mood, communication and social and physical function. This in turn is likely to impact positively on quality of life.</p> <p>1. Paddick SM, Mkenda S, Mbowe G, et al. Northumbria Healthcare NHS Foundation Trust	Full	296	5	<p>The guidance notes that "...it was unclear whether it was the specific content of the interventions that was valuable, or simply the result of being part of a group and undertaking any mentally stimulating activity." (13.2.5). Although we agree that it is not yet clear what the key 'active ingredients' of CST are, there is evidence to support the conclusion that it involves more than just being part of a group. In our rural African setting, multigenerational living is the norm and older people will generally have much higher levels of social interaction, particularly with children, than typically seen in the UK and other high-income countries. Village life has a large communal element and village committees have a responsibility to ensure older people are provided for. As such, social isolation in later life is very rare. In our study, although socialisation within a group was clearly important, we did not perceive it to be a major component in the intervention and it is very unlikely to have resulted in the marked improvement in cognition we observed. As such, the statement made seems at odds with our anecdotal experience and, more importantly, with the growing evidence base for CST. Woods et al⁶ noted that the effect of a social control group was notably</p>	<p>Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. 				person-centred care.” Professionals and care workers providing care to people with dementia should also have access to ongoing education to help them respond to ethical problems. ⁵⁶	
Optical Confederation	Short	General	general	The overarching theme for optical professionals within this consultation is communication and access to data. Optical practices should be provided with access to relevant data for patients via the summary care record or similar. This will enable quicker and better decision making regarding patient care and reduce unnecessary stress for patients. Trying to elicit complex information from patients with dementia can be stressful for all involved and this information should be easily available to all who have need to access it.	Thank you for your comment. The committee agreed that sharing of appropriate information is a key aspect of improving care for people living with dementia, and included a specific recommendation on ensuring relevant information is shared.
Optical Confederation	Short	General	general	We cannot see anywhere in the consultation, where the importance of regular sight tests for patients with dementia has been addressed. This should include increasing awareness of domiciliary optical services to help patients maintain their independence and maximise their quality of life. Often people with dementia are less able to verbalise their deteriorating sight,	Thank you for your comment. The committee noted this concern, and agreed it was appropriate to add a new recommendation to the guideline to: “Encourage people living with dementia to have eye tests every 2 years. Consider referring people who cannot organise appointments themselves.”

					information at diagnosis) and recommendation 1.3.4 (on sharing the information contained in care and support plans).
Optical Confederation	Short	8	19-20	It is important that the question includes optical professionals to avoid eye care being excluded from information sharing agreements.	Thank you for your comment. The committee noted that the list of relevant services would be different for different individuals, depending on their individual needs, including any comorbidities. Due to these complexities the committee agreed that it was not appropriate to construct a specific list of services.
Optical Confederation	Short	9	3-15	It is important that any management or treatment plans are made available to all clinicians so that optical professionals can make informed management and referral decisions.	Thank you for your comment. The committee agreed with the importance of sharing care and support plans with relevant services, where consent has been obtained.
Optical Confederation	Short	13	23-24	It is important that this person is easily identified, so that optical professionals know who to contact with regard to care decisions.	Thank you for your comment. The committee agreed it was important this information was shared appropriately so all relevant service know who the correct individual to contact is.
Optical Confederation	Short	14	18-21	Optical professionals see patients in a variety of settings. It is therefore important that the transfer of patient data is quick and smooth.	Thank you for your comment. The committee agreed this recommendation was relevant for all settings in which people would be seen, and that efficient transfers of information were an important part of high quality care.
Optical Confederation	Short	27	4	For clarity we presume this training requirement is intended for care staff not as an additional requirement for optical professionals. If it is not, then care and support providers should provide staff with training proportionate to the respective needs of individual staff, in person-centred and	Thank you for your comment. The committee agreed the training provided should be proportionate to the level of contact and interaction the staff members have with people living with dementia.

				outcome-focused care for people living with dementia...	
Optical Confederation	Short	14 & 15	14 (26-29 & 15(1-4)	Optical practices already provide accessible services via home visits and domiciliary care. While we welcome collaboration in future service design, we are wary of overly onerous requirements. Unfortunately, there are currently technical restrictions on a number of tests that may be conducted by optical professionals. This is due to the requirement for patients to maintain steady fixation to use imaging equipment and visual field screening equipment. In patients with dementia this is not always possible with the current technology.	Thank you for your comment. The committee agreed it was important that services be made accessible to as wide a range of people living with dementia as possible, but agreed there was not sufficient evidence to say how these services should be organised in practice.
Otsuka Pharmaceuticals	Short	13 of 33	19	Review after diagnosis: 1.2.29: there are cognitive, behavioural and functional symptoms for dementia and Alzheimer's Dementia and it is important to make these explicit as part of post diagnosis review. NICE CG42 , " <i>Dementia: supporting people with dementia and their carers in health and social care</i> " makes this clear by stating " A behavioural and functional analysis should be conducted by health and social care professionals with specific skills, in conjunction with carers and care	Thank you for your comment. The committee agreed that, in the absence of evidence, it was not possible to include a recommendation along these lines in the section of the guideline on post-diagnostic review. However, references to a structured assessment are included in both the section on developing care and support plans, and the section on managing non-cognitive symptoms in people living with dementia.

				<p>evidence in Appendix E to support this recommendation is the paper by Aisen (JAMA, 2008) cited under the heading 'Other nutritional interventions'. This paper reported a trial over 18 months of folic acid, vitamins B12 and B6 to lower homocysteine in patients with mild to moderate AD. The summarised results in the Table relate to the whole group of patients which did not show any benefit of the B vitamins treatment. However, on page 1781 of the paper the authors report a subgroup analysis which was not described in the Table in Appendix E. This pre-specified subgroup analysis divided the patients into two subgroups, those with baseline MMSE above the median and those with MMSE below the median. Using the ADAS-cog score, the authors found a significant ($P < 0.001$) beneficial effect of B vitamin treatment after 15 months in those with baseline MMSE above the median, i.e. those with milder AD. The interaction between baseline MMSE and active treatment was also significant in General Estimating Equation analysis ($P = 0.02$). The authors have made available additional data from this trial, which is shown in the Figure below:</p>	<p>was not included in the guideline. 				We would like to ask NICE to reconsider their recommendation not to offer B vitamins to those with dementia but, on the contrary, consider suggesting that those with early stage dementia and moderately raised homocysteine might benefit from this very safe intervention. This is current practice in memory clinics in Sweden (reference cited in Smith & Refsum 2017). Of course, more trials are needed to see whether lowering homocysteine will slow, or prevent, conversion from MCI to dementia, but pending the outcome of such trials it would seem prudent to offer a safe treatment to slow down cognitive decline in those with MCI who have raised homocysteine.	
Parkinson's Disease Nurse Specialist Association	Short	8	23	Document decisions in patients notes – are you referring to psychiatry or main hospital notes, as in many areas, as the 2 services are joined up in many areas, general and psychiatry cannot view each other's notes, and are often in different trusts in the same locality	Thank you for your comment. The committee agreed some confusion has been introduced in this recommendation by the statement to "tell all relevant services what the person has decided", which has now been deleted. The committee noted the importance of having information contained in a single record so it was accessible to multiple services, but agreed that in the absence of evidence, they could not give specific guidance on how this system should be organised.
Parkinson's Disease Nurse Specialist Association	short	8	27	Should written information about being contacted and this discussion particularly about future appointments and documented.	Thank you for your comment. The committee agreed it would be important to document if people took up the option to be contacted at a future date, to ensure this took place.

				recommend the guidance is strengthened by referencing the NICE guidance on Parkinson's to ensure people with Parkinson's and dementia receive a holistic person-centred approach to their care.	
Parkinson's UK	Short	General	General	We believe that the guidance does not adequately address the care of people with dementia with comorbidities. This is particularly important for people with Parkinson's and dementia where the management of symptoms of one condition impacts the other. For example, the need for considering the impact of a person's Parkinson's medication on a person's dementia symptoms as referred to in comment 6 below. People with Parkinson's and dementia will be required to attend multiple appointments from multiple agencies, an issue highlighted in All-Party Parliamentary Group on Dementia's (2016) report 'Dementia rarely travels alone: living with dementia and other health conditions', and so therefore requiring a more holistic person-centred approach. There is a need for condition specific comorbidities guidance as opposed to more general guidance as it does in section 1.8.1.	Thank you for your comment. Evidence was looked for on the management of comorbidities in people living with dementia, but only very limited evidence was identified, and in particular no evidence on the management of Parkinson's disease in people living with dementia. Since consultation, an additional recommendation has been added to the section on care and support plans, stating that care coordinators should "ensure it contains information on the management of any comorbidities the person has."
Parkinson's UK	Short	General	General	We feel that there is a lack of guidance focused on specific care settings, in particular in hospital,	Thank you for your comment. The committee noted that in many areas the evidence base only covered people in a

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				<p>Medicines management is of particular importance to people with Parkinson's, as we know some of the side effects of Parkinson's medication can exacerbate the symptoms of dementia (Varanese, S., Birnbaum, Z., Rossi, R., & Di Rocco, A. (2010). Treatment of Advanced Parkinson's Disease. Parkinson's Disease, 2010, 480260). We also know that some anti-psychotic medication can have a harmful effect on people with Lewy Body Dementia (Ballard C, Grace J, McKeith I, Holmes C. (1998) 'Neuroleptic sensitivity in dementia with Lewy bodies and Alzheimer's disease.' Lancet. 1998 Apr 4;351(9108):1032-3.)</p> <p>We therefore recommend that a further bullet point be added under 'develop a care and support plan, and:' in section 1.3.2 that reads "- Care and support plans should be integrated with existing care and support plans for other pre-existing health conditions"</p>	
Parkinson's UK	Short	20	3-5	We welcome the reference to the NICE Parkinson's guidelines for pharmacological management of Parkinson's Disease Dementia.	Thank you for your comment and your support for this recommendation.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. Royal College of General Practitioners	short	8	18-24	Whose role is it to document this – secondary care, primary care? How will the information be shared to 'all relevant services'?	Thank you for your comment. The committee noted the concerns around how this recommendation was phrased, and it has therefore been amended simply to "document these decisions in the person's records," which would then be the responsibility of the service who have gathered this information.
Royal College of General Practitioners	short	8	27-29	How will this work in practice? Already, people are being discharged from dementia services with no mechanism for annual review or self-referral back into the system. For a degenerative condition, an annual review should be built in as standard, not necessarily an appointment, maybe a telephone call and/or 'paper clinic' when data like numbers of GP/A&E visits/social service contacts is examined to see if there's an escalation of need.	Thank you for your comment. The committee agreed that whilst the situation would be different in people lacking capacity, those with capacity had the right to decline services and follow-up if they so wished, and therefore the important issues were that people were offered future follow-up and contacts, and that there was a clear route for people back in to services when they wanted/needed it.
Royal College of General Practitioners	short	8	6-7	This would require a lot more long-term commitment of both health and social care teams to individual patients than currently exists	Thank you for your comment. The committee agreed that implementing these recommendations required good integration of health and social care services, but this was an important aspect of good care and one that should be encouraged throughout the guideline.
Royal College of General Practitioners	short	9	1-2	This is crucial, but requires an accessible and responsive service – not currently common.	Thank you for your comment. The committee agreed that services are not always currently arranged in a way that makes this possible, and therefore this was an important recommendation to make to drive services to be set up in a way to make it possible.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Royal College of General Practitioners	short	10	12-14	This needs more emphasis e.g. a separate step in the guidelines 'reduce the anticholinergic burden of medication' – and more detail, if you stop a medication how much time does it typically take for any cognitive impairment it may have caused to recover? When to re-assess?	Thank you for your comment. The committee noted the guideline did already contain a recommendation to “consider minimising the use of medicines associated with increased anticholinergic burden, and if possible look for alternatives when assessing whether to refer a person with suspected dementia for diagnosis.” The committee agreed that the limited nature of the evidence available meant this was as much detail as they were able to include in the recommendation.
Royal College of General Practitioners	short	10	27-28	What is the benefit of diagnosing specific subtypes of dementia – how much of the resources should go on potentially expensive tests compared to provision of care? Need clearer guidance on the 'if possible' aspect of this suggestion, especially if diagnostic tests are less accurate in certain age groups.	Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft guideline, in that people interpreted it as saying everyone need to attend an appointment at a secondary care service. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and treatment, but this did not mean the person necessarily had to travel to a physical appointment at that service. To ensure this is clear in the final version of the guideline, an explanation has been added to this section of the guideline, giving the following explanation around the term 'refer': “A referral to a diagnostic service does not require that the person be asked to attend a clinic appointment. It can also involve people being seen in community settings (such as their home or a care home), or advice being provided to the referrer

Royal College of Nursing	Full	General	General	The RCN have done some really helpful work with DAA (Dementia Action Alliance) during 2017 specifically on dementia and prisoners and dementia and learning disability. We feel that these are key areas of activity that require support and attention.	Thank you for your comment. The committee agreed there were a number of subgroups of people living with dementia (including those with learning disabilities) who have particularly complex needs. The committee noted there was currently a lack of evidence on how these individuals should be managed differently which made writing specific recommendations difficult, but they agreed it would be important to consider in future updates of the guideline if such evidence became available. This information has been passed onto NICE's surveillance and commissioning team for future consideration.
Royal College of Nursing	Full	General	General	Guidance is also needed regarding sexual intimacy in people living with dementia, particularly those in care settings. Our intimacy in care homes guidance is currently being refreshed and will be published shortly.	Thank you for your comment. The committee agreed this was an important issue and, whilst the evidence identified did not enable them to make specific recommendations within this guideline, they would welcome the publication of other guidance to cover this important area.
Royal College of Nursing	Full	General	General	The guidelines represent an excellent attempt to implement the ideals of assessment and management of people potentially living with dementia. There are good pockets of practice nationally for specialist diagnosis and it would be reasonably easy to build on these. However there is already conflicting guidance from the Royal College of General Practitioners which could potentially lead to misinterpretation by some	Thank you for your comment. The committee noted that some confusion had been caused by the wording of the draft guideline, in that people interpreted it as saying everyone need to attend an appointment at a secondary care service. The committee agreed the key issue was that everyone with suspected dementia had input from someone with expertise in dementia, both to ensure a correct diagnosis and ensure access to appropriate post-diagnostic support and treatment, but this did not mean the person necessarily had to travel to a

				practitioners. To save confusion it may be sensible to include any additional or supportive guidance for diagnosis of people with dementia who will not attend a specialist service within the NICE guidance.	physical appointment at that service. To ensure this is clear in the final version of the guideline, an explanation has been added to this section of the guideline, giving the following explanation around the term 'refer': "A referral to a diagnostic service does not require that the person be asked to attend a clinic appointment. It can also involve people being seen in community settings (such as their home or a care home), or advice being provided to the referrer without a formal appointment being made. The key issue is to ensure that dementia specialists are involved, both for advice on diagnosis and to ensure appropriate access to post-diagnostic support and treatment."
Royal College of Nursing	Full	General	General	Although services providing diagnosis are widespread there appears to be a shortage of specialist dementia services to provide follow up and ongoing support. In order to provide the standards set out in the guidance, we expect that there would be a large financial burden for many organisations to create these. For example in Dorset there are few services that specialise in dementia care after diagnosis. Most of the work is expected to be actioned by General Practices who may not have any specialist knowledge for dementia care.	Thank you for your comment. The committee noted that there are financial implications in providing post-diagnostic support for the large population of people living with dementia. However, they also agreed that appropriate follow-up and support was essential to ensuring good care for people after a diagnosis. They noted the recommendations made were deliberately not prescriptive about what form that follow-up should take, "a memory service or equivalent hospital- or primary-care-based multidisciplinary dementia service", as models of care vary considerably around the country, and the evidence did not enable them to identify which is the most appropriate.
Royal College of Nursing	Full	General	General	We have heard from our reviewers, that in some areas, the knowledge of dementia is poor outside	Thank you for your comment. The committee agreed with the importance of staff training for people working with people

				those who work older people's specialist care services and therefore, potentially, the need to provide suitable training for many clinicians to skill them up in order to meet the recommendations set out in these guidelines would be high.	living with dementia. They noted that the recommendations for staff training made in this guideline would be relevant for all healthcare staff that provide services for people living with dementia.
Royal College of Nursing	Full	General	General	The 'person centred care' element and the need to include people living with dementia in decision making are key to the effective implementation of these guidelines. We consider that this would have the biggest impact on care. As these are fundamentals of all healthcare, we anticipate that they should be very easy to implement and in reality should be cost neutral.	Thank you for your comment and your support for these recommendations.
Royal College of Occupational Therapists	glossary	420		Abbreviation for General Health Questionnaire should read GHQ (not GDQ)	Thank you for pointing this out – it has now been corrected.
Royal College of Occupational Therapists	General	General	general	There is reference throughout to a lack of evidence of improvement being sustained at long-term follow-up: how realistic an aim is this in a degenerative condition?	Thank you for your comment. Whilst it may be unrealistic to expect people to improve from their baseline in absolute terms at long-term follow-up, the committee agreed it was reasonable to hope that interventions might show sustained benefit compared to the control group in the long-term. The absence of evidence for these long-term improvements was agreed to be a limitation in the evidence base that reduced the committee's confidence in the effectiveness of a number of interventions.

Royal College of Occupational Therapists	Full	General comment		There is a theme of personalised activities, but no specific reference to the role that occupational therapists have in identifying, analysing, adapting and grading activities to meet this goal; either in direct service provision to people living with dementia and their carers (both formal and informal); or in advisory, training, consultative roles.	Thank you for your comment. NICE guidelines do not routinely comment on which specialists should be performing which roles in implementing recommendations unless there is clear evidence to do so. However, the committee did agree that occupational therapists would clearly be a key constituency in implementing these recommendations in practice.
Royal College of Occupational Therapists	Full	36	20-23	Clarity needed for recommendation 76: <i>Recommendation number 76.</i> "Consider providing a needs-based reablement programme (including elements of cognitive rehabilitation and/or occupational therapy) to people living with mild to moderate dementia who are not already accessing them." It seems to suggest that occupational therapy and cognitive rehabilitation are interchangeable- they are separate, albeit complementary interventions.	Thank you for your comment. The committee agreed it was not appropriate to suggest these interventions are interchangeable, and to clarify this the recommendation has been reworded as "consider cognitive rehabilitation or occupational therapy to support functional ability in people living with mild to moderate dementia."
Royal College of Occupational Therapists	Full	36	17-19	<i>Recommendation number 75</i> "Consider providing structured group activities (including elements of cognitive stimulation and reminiscence therapy) to people living with mild to moderate dementia who are not already accessing them."	Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				<p>benefits shown in the recent UK HTA study. Benefits for depression and quality of life were also shown with occupational therapy, although a difference in activities of daily living could not be demonstrated here, as a number of the trials did not measure this as an outcome. However, the committee agreed that since the primary focus of occupational therapy interventions was on ADL, the impairments in quality of life seen were highly likely to be mediated through improvements in ADL. Again, the committee noted the benefits of occupational therapy were primarily found in group interventions, and noted that both elements of cognitive rehabilitation and occupational therapy incorporated could be incorporated within the same programme to help maximise the number of people who could benefit. The committee also agreed it was important to stress access to these interventions be needs-based, as they would be unlikely to be effective for people without problems with activities of daily living at baseline.”</p> <p>The College finds this statement surprising. The four occupational therapy studies included were all dyadic, not group interventions.</p>	<p>separate and alternative approaches to improving functional ability in people living with dementia.</p>

Royal College of Occupational Therapists	Appendix F – excluded studies			<p>Section F11 – Supporting informal carers</p> <p>9.1 The explanation given for excluding both Graff papers (page 149) is that the Community Occupational Therapy intervention (COTiD) is “aimed at the person living with dementia, rather than their carer”. This is not correct. The COTiD intervention is a dyadic intervention aimed at both the person living with dementia and their family carer.</p> <p>WHEDA, the translated version provided within the subsequent German study (page 157) is also a dyadic intervention. The Valuing Active Life in Dementia (VALID) research programme has developed a UK version of the intervention and just completing a RCT with 468 pairs of people with dementia and their family carers, and again, the intervention is aimed at BOTH parties equally.</p> <p>Graff (2006) *Community based occupational therapy for patients with dementia and their care givers: randomised controlled trial *Intervention primarily aimed at the person living with dementia, rather than their carer</p> <p>Graff (2007)</p>	<p>Thank you for your comment. The committee noted there many interventions in the guideline that contained elements aimed at both the person living with dementia and their carer, but for the purpose of the guideline it was necessary to divide these interventions in to categories. The committee decided that interventions would only be included in the section of the guideline on supporting carers if they were primarily aimed at the carer, whilst dyadic interventions would be included in the section on interventions for the person living with dementia.</p> <p>Since the interventions were dyadic aiming at both the person living with dementia and their carer in these papers (Graff 2006, Graff 2007, Voigt-Radloff 2009, Woods 2016), the committee agreed that these interventions were not primarily aimed at the carer of the person living with dementia, and therefore were not included in this section (although they were still included within the guideline). The text in the excluded studies section has been updated to make this clearer.</p>

Royal College of Physicians	Short	General	General	The RCP is grateful for the opportunity to respond to the above consultation, We have liaised with The British Association of Audiovestibular Physicians (BAAP) and with our Hearing loss Guideline Committee, and would like to make the following comments.	Thank you for taking the time to comment on the guideline. Individual comments have been responded to where they appear.
Royal College of Physicians	Short	20-21	19	Managing non-cognitive symptoms. Our experts note that there is no mention of managing sensory impairment in this section but stress that this is a very worthwhile and easily treatable option in this group of people being both cost effective and clinically effective. Managing the hearing loss in someone with hearing difficulties and cognitive impairment can make a huge difference in their understanding of the world around them. Being able to hear speech is fundamental to being able to understand speech. Being able to hear can reduce confusion and anger, improve depression and alleviate feelings of isolation. This is so important in this group and it is such a shame that sensory impairment, and in particular, hearing loss, has been ignored as a treatable option in view of its prevalence in this population.	Thank you for your comment. The committee noted this point, and agreed it was appropriate to include a cross-reference to the NICE guideline on hearing loss to address these issues.

Royal College of Physicians	Short	9	23	<p>Our experts believe that an important step has been omitted from the guideline. It is important that before you carry out tests listed subsequently you ensure the individual is hearing you adequately. Any test that relies on oral communication could not be viewed as a valid test of cognition unless you have previously ensured that the individual can hear. This is important because there is a strong association between hearing loss and dementia (Lin et al 2011, Gurgel et al 2014, Thomson et al 2017). Hearing impairment will affect a person's ability to understand a verbal test and not everyone with hearing loss is aware of their disability, particularly if they have concomitant cognitive</p>	<p>Thank you for your comment. The committee agreed with the point made and hearing loss has been added to the recommendation on reversible causes of cognitive decline that should be investigated in primary care.</p>

				experts reiterate that a hearing test should supersede other assessments.	
Royal College of Physicians	Full	General	General	<p>People of advancing years are not necessarily aware they have difficulty hearing, some accept it as part of the aging process, others do not have the ability to raise the concern themselves. Carers, whether family or professional, are not trained to consider hearing loss as a factor and many are more inclined to put difficulties in understanding down to cognitive decline rather than hearing loss. The whole can be a vicious cycle with hearing loss leading to limited understanding and then depression which in turn leads to worse difficulties with communication with carers stopping talking to the patient leading to greater depression and isolation. Breaking that dreadful cycle with good management of hearing loss puts the whole thing on a different footing – carers are aware of hearing difficulties, hopefully they will make every attempt to communicate effectively and the patient can hear better, understand better and thus respond more. This alleviates anxiety and can help depression and reduce isolation. Our experts note however that first you have to consider that hearing loss may</p>	<p>Thank you for your comment. The committee agreed the most appropriate way to address issues around hearing loss was by adding a cross-reference to the NICE guideline on hearing loss, which makes recommendations on hearing assessments for people with suspected and diagnosed dementia.</p> <p>The committee also agreed it was appropriate to add hearing loss to the list of possible dementia mimics which should be investigated in primary care before referral for diagnosis (recommendation 1.2.6 in the short guideline).</p> <p>Finally, the committee agreed that once hearing loss was identified in a person living with dementia, this should be covered by the recommendation to “ensure that people living with dementia have equivalent access to diagnostics, treatments and care services for comorbidities to people who do not have dementia”</p>

				SE2014-Ch4-Hearing.pdf provides statistic from numerous sources.	
Royal College of Psychiatrists	Short	General	General	<p>We welcome the broadening of the categories of professional staff who can diagnose and prescribe for dementia. It is in keeping with a move to a chronic disease management model of care with secondary expertise becoming more focused upon the more complex or 'risky' presentations. The end of life planning and admission to hospital suggestions are very welcome.</p> <p>The guidance should acknowledge the case for combination therapy as an early and recommended approach. The guidance published by the British Association of Psychopharmacology makes a clear case for the use of combination therapy (https://www.bap.org.uk/pdfs/BAP_Guidelines-AntiDementia.pdf).</p> <p>The suggestions around other psychotropic medication use is clear and welcome.</p>	<p>Thank you for your comments and your support for these recommendations. The committee agreed there was good evidence of benefits from combination therapy in people with moderate to severe Alzheimer's disease, and this led to the recommendation that:</p> <p>"For people with an established diagnosis of Alzheimer's disease who are already taking an AChE inhibitor:</p> <ul style="list-style-type: none"> • consider memantine in addition to an AChE inhibitor if they have moderate disease • offer memantine in addition to an AChE inhibitor if they have severe disease." <p>The committee also made a research recommendation around combination therapy for people with dementia with Lewy bodies, to match that made in the Parkinson's disease guideline for people with Parkinson's disease dementia.</p>
Royal College of Psychiatrists	Short	General	General	Greater clarity would be helpful about which Cognitive Assessment Tests should be used in secondary care Memory Assessment clinics	Thank you for your comment. The committee agreed the evidence available in this area did not enable them to make recommendations around which cognitive test should be used

				<p>3) <u>Unclear whether it was specific content of the interventions or simply being part of a group.</u> We would argue that this is an erroneous conclusion. Whilst the literature on non-pharmacological interventions spans several decades and hundreds of studies, the evidence base for manualised, Cognitive Stimulation is considerably stronger than for other interventions, including Reminiscence. For example, a systematic review by Olazaran et al (2010) concluded that Cognitive Stimulation demonstrates the best evidence for improving cognitive functioning amongst all non-pharmacological interventions. Several trials within the Cochrane review compared Cognitive Stimulation with an active, social control group, yet the results were consistently in favour of structured group Cognitive Stimulation over a social control (Woods et al, 2012).</p> <p>6) <u>The two interventions are not mutually exclusive</u> It is correct that Cognitive Stimulation incorporates some aspects of Reminiscence. However, the key focus of Cognitive Stimulation (more specifically the manualised 'CST' programme which is widely followed) is on</p>

				<p>workers at all levels of expertise; eases implementation and minimises preparation time, providing a highly cost-effective intervention. This change in wording will create ambiguity and is likely to be interpreted that any type of structured group is sufficient, and there will be a lack of governance and adherence to any sort of standardisation. The conclusion in the report that "this was likely to lead to better outcomes for a range of people than one narrowly focused on a very specific intervention model" appears to be based on no evidence and also a misunderstanding of CST, which is not "narrowly focused on a specific intervention model". Instead, CST has a variety of interventions depending on the interests and abilities of the group, and is delivered according to important key principles which fit with the underlying theoretical models. We would encourage NICE to argue for more adherence to protocol and evidence base, rather than less.</p> <p>7) <u>No difference in cost of delivery</u> The nice report states that "there would be no difference in cost of delivery between providing an intervention with a more varied range of components". We would argue that this</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
				<p>assumption cannot be made without a cost effectiveness analysis. There is strong evidence for the cost effectiveness of manualised CST, with two key papers published since the 2006 guidelines (Knapp et al, 2006; D'Amico et al, 2015). Essentially, the cost of an intervention does not just consider the costs of delivery, but also the changes in use of health and social care services for those in receipt of an intervention. Such complex analysis was completed by health economists as part of two CST trials and cannot be presumed for other interventions.</p> <p>Appendix J (p.10) considers the cost of providing CST. There are several errors in this table. Firstly, it states that band 4 or 6 staff are required to run sessions, when in reality it is often band 2 staff. Secondly, it states that groups are for 5 people, when in fact the key research trials included between 5-10 people in each group and many trusts offer groups for up to ten people. The total cost per session is calculated as £233.19. The Knapp (2006) paper calculated the cost per session as £90. Using the Knapp cost per session calculation, even with just 5 people in each group, the total cost per patient per CST course (14 sessions) is £252, compared to NICE's estimate of £652.94.</p>

				<p>We note that most of the psychosocial interventions are preceded with 'consider', yet many of the pharmacological interventions are 'recommended'; a marked change from the 2006 guidelines.</p> <p><u>2) Changes within NHS and beyond since the 2006 guidelines</u></p> <p>CST is now a required standard for the Memory Services National Accreditation Programme (MSNAP) and an audit in 2017 suggested that around 85% of MSNAP accredited memory services routinely offer group CST to people following a diagnosis of dementia. Approximately x% of all UK memory services are accredited and anecdotal evidence suggests that a similar pattern of CST provision is occurring in non-accredited memory services. This widespread provision is offering hope for people post diagnosis, social support and a structured, evidence-based therapy which maintains cognitive functioning and normalises the experience of dementia. Several other reports have endorsed CST since the 2006 guidelines. For example, the World Alzheimer Report (Alzheimer's Disease International), in 2012 and subsequently; have</p>

Royal College of Psychiatrists	Full	101	General	RCPsych is concerned that this guideline focuses so narrowly on dementia but excludes dementia screening and Mild Cognitive Impairment (MCI) in particular as "not within the scope of this guideline". This can be problematic for those diagnosed with or suspected of having MCI which can have a substantial overlap with early Dementia. It would be helpful if this distinction and the scope of the guideline is explicitly stated at the outset in both the short and full guideline to ensure readers are aware MCI is not included within this guideline.	Thank you for your comment. As you correctly state, dementia screening and the diagnosis and management of mild cognitive impairment was not within the scope of this guideline, and therefore it was not possible to make recommendations on this topic. A number of stakeholders have raised this as an important issue needing guidance, and this feedback has been based to the commissioning team within NICE for consideration when the topics of future guidelines are discussed. The committee noted that the exclusion of these issues is clearly stated within the scope of the guideline.
Royal College of Psychiatrists	Full	101	General	Whilst mention is made of the "challenges of diagnosing Dementia in certain vulnerable groups.", it's surprising that whilst appropriate mention is made of learning disability specialists, no mention, recognition or direction is given towards Old Age Psychiatrists specifically and Old age psychiatric specialist teams who undoubtedly have the necessary specialist training, experience and recognition in assessing and managing patients with all stages and types of Dementia. There is no evidence given of why this omission appears to have been perpetuated throughout this guideline. The statement "specialist diagnostic services" is misleading and of little	Thank you for your comment. The committee agreed that old age psychiatrists are likely to be the most common prescribers, but agreed it was appropriate to be more general in the recommendation to avoid giving the impression that other subtypes of psychiatry (such as learning disabilities psychiatrists) were not appropriate prescribers.

Delirium in the acute phase after</p>	<p>Thank you for your comment. The committee noted that the work undertaken on the 4AT so far all focused on its use as a screening test. The committee noted there had been some confusion at consultation as to the meaning of the included recommendation on dementia/delirium, and stressed this recommendation did not cover either:</p> <ol style="list-style-type: none"> 1) Screening for delirium, which is include in the NICE delirium guideline. 2) Diagnosing delirium in someone who already has a diagnosis of dementia. <p>This recommendation focused on the situation of a person with a current diagnosis of neither delirium nor dementia, but with cognitive impairment that made both a possible diagnosis, and how they should be differentiated. The committee agreed that in this complex situation it was unsurprising that a longer instrument was needed than in the case of screening.</p> <p>The wording of the recommendation has now been amended to try and clarify the meaning.</p>

				Geriatr Psychiatry. 2018;1–15. https://doi.org/10.1002/gps.4852	reference has been passed to the NICE surveillance team for consideration in planning future updates of the guideline.
Royal College of Psychiatrists	Full	161	General	It's unsurprising that the only RCT that was used to compare Memory clinics vs GP care which is the same study repeated as evidence across several chapters of this NICE guideline was one Dutch study; as the NICE guidelines on Dementia required specialist treatment and monitoring until the last few years. There are however dozens of non-RCT studies on memory clinics that in effect should offer sufficient weight. Despite the comment about weighting the study using UK utility weights in a scenario analysis. there is a danger in using none UK evidence generally to compare the level, funding, availability and approach of services from another country, where services are country dependent. A Dutch GP service might not offer equivalent services, facilities or approaches as an example, to a UK GP provider. The role of specifically "Old Age Psychiatric services" in managing complex presentations including BPSD is not mentioned.	Thank you for your comment. The committee agreed with all the concerns raised, but noted that this review question did include a broader range of quantitative studies than RCTs (including before and after and cohort studies). However only a very limited amount of evidence was identified. The committee agreed therefore that, in the absence of a robust body of UK applicable data, it was not possible to make specific recommendations around how people living with dementia should be followed up after diagnosis.
Royal College of Psychiatrists	Full	192	21	This is again a very concerning and misleading approach where physicians are categorised as "...psychiatrists including those specialising in learning disability, neurologists, and physicians	Thank you for your comment. The committee agreed that old age psychiatrists were a key population here. The wording of the statement was designed to ensure that other subtypes of psychiatry (such as learning disabilities) were not excluded

				specialising in the care of older people”, deliberately or ignorantly neglecting to mention the specific role of old age psychiatrists who are the main physicians responsible for the diagnosis and management in secondary care within the UK.	from the evidence. To avoid confusion, old age psychiatrists have been added as a specific population of relevance here.
Royal College of Psychiatrists	Full	197	General	<p>This statement of evidence copied from the NICE consultation document s significantly concerning and suggests implicit age discrimination among the committee. “Although, in Aupperle et al. 2003, the authors did not report standard deviation at 2 year follow up the committee noted that, participants who were seen by a geriatric psychiatrist experienced an overall slight improvement in Clinical Dementia Rating (CDR) over 2 years. The committee thought this would be very unusual, as Alzheimer’s disease is a degenerative condition.”????</p> <p>Considering that this was a study examining the compliance with ant dementia medication prescribed in secondary care vs primary care where there was a high dropout rate with poor compliance, of anti-dementia drugs, it’s very worrying that the committee felt there wouldn’t be improvement in CDR in patients compliant</p>	Thank you for your comment. This comment comes from a misinterpretation of the evidence reported from the Aupperle study, and the committee’s discussion of it. The committee were not suggesting that it was a priori surprising that people managed by specialists did better than people managed in primary care (indeed, this was precisely the hypothesis this question was trying to address). Rather, the committee were surprised that the study found an improvement in CDR scores in absolute terms for the people managed in specialist care, which they agreed was not representative of their clinical experience.

				<p>with anti-dementia drugs compared to those who weren't.</p> <p>Recent evidence suggests that "when health professionals make decisions and judgments about older adults, they may not be aware that these are affected by implicit ageism or age biases that devalue older patients, and thus will not notice the harmful consequences that follow (Swift 2016).</p> <p>Differences in the treatment options offered to younger and older individuals can also be the result of indirect ageism, particularly if limited resources are distributed based on cost-benefit analysis, which disproportionately disadvantages older adults (Swift 2017, CPA, 2009). These analyses tend to use Quality Adjusted Life Years (QALY) to assess the relative cost effectiveness of treatments and procedures for Alzheimer's disease, osteoarthritis, osteoporosis, or age-related macular degeneration, however, such analyses can be problematic and tend to work against people for whom it is estimated have fewer remaining years (CPA, 2009).</p> <p>This is also supported by warning of evidence of ageism in situations as identified above by the World health organisation (WHO 2015).</p>

Royal College of Psychiatrists	Full	217	59/60	RCPsych supports these recommendations. Assessing functioning as mentioned in the evidence does raise the question of why no mention is made under the section on diagnosis and also on monitoring of using evidence based occupational therapy (OT) assessment such as the AMPS or LACL if diagnosis is not clear after neuro imaging, as these would help to identify a decline in function. They can also help decide the most appropriate time to offer medication with a view to improving function.	Thank you for your comment. The committee agreed that, in the absence of any evidence being identified for occupational therapy assessment during diagnosis, it was not possible to make recommendations on this topic.
Royal College of Psychiatrists	Full	249	5	RCPsych has concerns the committee extended the recommendation not to use cholinesterase inhibitors in frontotemporal dementia based on the assumption that there is no underlying cholinergic deficit in frontotemporal dementia. There is a group within the Primary Progressive aphasia's, Logopenic variant (LV) which is associated with cholinergic depletion. The cholinergic deficit in LV in the study by Jolien Schaeffer et al., 2017 provides a potential rationale for off-label use of AChE inhibitors in LV PPA due to underlying AD pathology. Reference: Jolien Schaeffer, Charlotte Evenepoel, Rose Bruffaerts, Koen Van Laere, Guy	Thank you for your comment. The committee agreed it was now common practice to regard logopenic progressive aphasia as an atypical form of Alzheimer's disease, and therefore this would not be covered by the recommendation for frontotemporal dementia.

				It would also be useful to add research recommendations in this area specifically looking at treatment options.	
Royal College of Psychiatrists	Full	277	37	<p>This section considers the economic analysis of CST, but uses a base case model, rather than published health economic studies. There have been 2 key papers published considering the cost effectiveness of manualised CST (Knapp et al, 2006 which considered CST; D'Amico et al, 2015 which considered maintenance CST). Both are listed in the references in Appendix J, but only D'Amico et al (2015) has been considered in the evidence. These papers show strong evidence for the cost effectiveness of manualised CST and it is important for the Knapp paper to be used, rather than a base case model (see comments 3 and 4 for further discussion of this). These papers look at the cost of the delivery, as well as the changes in use of health and social care services for those in receipt of the intervention.</p> <p>Furthermore, the NHS Institute of Innovations and Improvements invested in an 'economic analysis of the alternatives of anti-psychotics for individuals living with dementia', conducted by</p>	<p>Thank you for your comment. The Knapp (2006) paper was not a cost-utility study and therefore did not consistent with the reference case. As a result, it is inaccurate to state that this analysis showed that CST is cost effective, as no threshold value has been established for the effectiveness instruments used against which gains could be assessed. The D'Amico (2015) paper however, was a cost-utility study and was eligible for inclusion as part of the economic review.</p> <p>Please note that the effectiveness evidence used in Knapp (2006) was based on Spector (2003), and has been considered by this guideline by the way of inclusion in our quantitative synthesis of parameters for the model developed by NICE.</p>

				<p>statement above shows a misunderstanding of CST (2006). One of the key focuses of CST is on generation of <i>new</i> thoughts, ideas and associations within the sessions. This is believed to engage executive functioning skills and enable new semantic connections to be made. CST is based on theories of mental stimulation, and uses principles of person centred care. It includes clear key principles which need to be adhered to for effectiveness. It also shifts the focus, emphasising the importance of the person's views and options in the current day, rather than focusing on the past (which is the aim of Reminiscence).</p> <p>"The committee agreed the most appropriate recommendation was for people to be provided with access to structured group activities, with cognitive stimulation and reminiscence both forming part of the activities included within those groups.... This was likely to lead to better outcomes for a range of people than one narrowly focused on a very specific intervention model"</p> <p>These recommendations are problematic for several reasons. As stated in the comments above, there is a far stronger evidence base for</p>	<p>in terms of effectiveness and cost-effectiveness. 				<p>CST than for reminiscence. Additionally, the evidence is for CST when used as a manualised intervention. There is no evidence for any benefits if just elements of the programme are used, and there is no evidence in general for structured group activities. Therefore it is puzzling to see why NICE would recommend something which is not evidence based. The conclusion in the report that "this was likely to lead to better outcomes for a range of people than one narrowly focused on a very specific intervention model" appears to be based on no evidence and also a misunderstanding of CST, which is not "narrowly focused on a specific intervention model". Instead, CST has a variety of interventions depending on the interests and abilities of the group, and is delivered according to important key principles which fit with the underlying theoretical models.</p> <p>As no recommendations were made for pre- and peri-diagnostic counselling and support for people with dementia and their families (evidence statement 13.1.4 full guidelines, p.263, line 14), or for post diagnostic interventions (evidence statement 13.1.6 full guidelines, p.266,</p>

					"adapting communication styles" has been added to the section of the guideline on staff training and education.
Royal College of Speech and Language Therapists	Short	24	23	<p>The RCSLT is disappointed that this is the only reference to eating and swallowing in the short version despite it being a widely recognised challenge. The RCSLT is concerned that there is no information on the assessment of swallowing ability or the management of dysphagia in the guideline.</p> <p>Difficulties with eating, drinking and swallowing (dysphagia) are a recognised challenge for people with dementia. Dysphagia, if not managed, results in malnutrition and dehydration (Hudson, 2000), and is a causal factor in repeated chest infections and choking risk. Early intervention is crucial to avoid costly hospital admissions.</p>	<p>Thank you for your comment. On the specific issue of dysphagia, the committee agreed it was appropriate to add an extra recommendation to the section on palliative care, to "consider involving a speech and language therapist if there are concerns about the safety of eating and drinking."</p>
Royal College of Speech and Language Therapists	Short	24	33	<p>People should be supported to eat and drink if they wish to do so (NICE, 2016). It should be recognised that some people will want to eat and drink despite being unable to do so safely and support from a speech and language therapist will be essential to support risk feeding. The RCP recognises that risk feeding can be achieved through support from a speech and language therapist (RCP, 2010) and this should be added.</p>	<p>Thank you for your comment. The committee agreed with the points raised, both around 'at risk feeding' and the involvement of speech and language therapists, and therefore the recommendations have been amended to address these points. Specifically:</p> <p>"Encourage and support people living with dementia to eat and drink, taking into account their nutritional needs.</p>

					Consider involving a speech and language therapist if there are concerns about the safety of eating and drinking."
Royal College of Speech and Language Therapists	Short	25	14	<p>The RCSLT recommends that carers need to be supported in effective ways to promote safe swallowing, reduce risk of aspiration and enable nutrition and hydration needs to be met.</p> <p>Eating and swallowing is important for staying healthy, but a poor diet can lead to fatigue, risk of infection and less muscle strength. Dehydration and weight loss can result if people with dementia are unable to communicate their needs. It cannot be assumed that carers will know how to manage challenges with eating and swallowing. The RCSLT recommends that this information is offered to carers. Such advice could include changes to texture and consistency of food.</p>	Thank you for your comment. The committee discussed this, but agreed that due to the potential high cost impact of widely delivered carer training, it was important to focus the recommendations on areas with robust evidence of effectiveness and cost effectiveness, and few of the studies included specifically included carer training in these issues.
Royal College of Speech and Language Therapists	Short	25	21	<p>Communication difficulty has been described as one of the most frequent and hardest to cope with experiences for family carers. Optimising the communication skills of both the person with dementia and carer is essential to providing high quality relationship-centred care.</p> <p>One of the crucial roles of speech and language therapists is to support, advise and train carers</p>	Thank you for your comment. The committee agreed that in the absence of evidence, it was not possible to make specific recommendations on the role of speech and language therapists in supporting communication. However, they did agree on the importance on communication, and therefore agreed it was appropriate to add training in "adapting communication styles" to the recommendations on staff training and education.

				about communication needs in dementia, strategies to support and enhance communication, and management of dementia where the primary symptoms are with language and communication rather than memory, for example, primary progressive aphasia and its variant.	
Royal College of Speech and Language Therapists	Short	26	7	Information needs to be available in a range of formats recognising that carers of people with dementia may have communication needs themselves. All information must be provided in an accessible format and tailored to the needs of the individual. This should be supported by tools such as visual materials, communication aids and hearing aids, as appropriate.	Thank you for your comment. The committee agreed with all these points, and agreed these were covered by the recommendation to provide training in "a format suitable for them (for example individual or group sessions, or online training and support)."
Royal College of Speech and Language Therapists	Short	27	3	The RCSLT recommends that training must be provided to all staff to enable them to understand the communication difficulties experienced by people with dementia, and strategies to support communication exchange, which is especially pertinent for issues around consent to care and treatment. Supporting evidence:	Thank you for your comment. The committee agreed with the importance of communication, and noted that the lack of evidence from the study designs included in the guideline (primarily randomised controlled trials and qualitative studies) made it difficult for them to make specific recommendations on this issue. However, they did agree that one particularly relevant issue was around staff training, and training on "adapting communication styles" has been added to the section of the guideline on staff training and education.

Comments received in the course of consultations carried out by NICE are published in the interests of openness and transparency, and to promote understanding of how recommendations are developed. Stakeholder	Document	Page No	Line No	Comments	Developer's response
				As indicated in the Francis report on the Mid Staffordshire NHS Foundation Trust Public Inquiry (2013), people with dementia should receive care from staff appropriately trained in dementia care. The report clearly recommends that dementia care training should include, "the importance and use of communication skills for working with people with dementia".	
Royal College of Speech and Language Therapists	Short	27	3	The RCSLT also recommends that training should be provided to staff in the management of eating and swallowing difficulties. This would support safe swallowing, reduce the risk of aspiration and enable nutrition and hydration needs to be met.	Thank you for your comment. The committee discussed this, but agreed that due to the potential high cost impact of widely delivered staff training, it was important to focus the recommendations on areas with robust evidence of effectiveness and cost effectiveness. On this basis they agreed it was not possible to include more detailed recommendations in this section of the guideline than those currently included.
Royal College of Speech and Language Therapists	Short	28	11	The RCSLT supports the training of health and social care professionals to initiate and maintain difficult or challenging conversations. We would be happy to work with you to develop this training.	Thank you for your comment and your support for this recommendation. The committee would welcome further research on the most appropriate ways to deliver training for staff working with people living with dementia.
Royal College of Speech and Language Therapists	Short	29	05	The RCSLT is concerned at the list of professionals and those that are omitted from the list. The RCSLT believes that speech and language therapist should be included on the list as experts with specialist knowledge and skills to contribute to a diagnostic decision.	Thank you for your comment. The committee were keen to point out that this definition solely referred to the question of who should give advice before pharmacological treatment for Alzheimer's disease is started. It was not intended as a more general statement around who would count as a specialist

					clinician. The final version of the guidance should make this point clearer.
Royal College of Speech and Language Therapists	Full version	40	11	On admission to hospital the communication needs of an individual must be considered, to enable them to communicate safely with staff and for staff to engage with them. This will allow issues such as pain and other personal issues to be discussed. Support from a speech and language therapist will allow these conversations to take place to maximise communication by both parties.	Thank you for your comment. The committee agreed that in the absence of evidence, it was not possible to make specific recommendations on the role of speech and language therapists in supporting communication. However, they did agree on the importance on communication, and therefore agreed it was appropriate to add training in "adapting communication styles" to the recommendations on staff training and education.
Royal College of Speech and Language Therapists	Full		17	Feedback from carers clearly highlights the problem of communication breakdown and the need for staff to better understand the communication needs of people with dementia and their families.	Thank you for your comment. The committee agreed this was an important issue, and therefore training in "adapting communication styles" has been added to the section of the guideline on staff training and education.
Royal College of Speech and Language Therapists	Full	General		The RCSLT is very concerned that the full guideline does not sufficiently highlight the communication and eating, drinking and swallowing needs of people with dementia. This is despite the fact that almost all people with experience these difficulties during the progression of the condition. It is essential that these needs are clearly flagged up	Thank you for your comment. The committee agreed it was appropriate to make two changes to the recommendations to address these concerns. First, training on "adapting communication styles" has been added to the section of the guideline on staff training. Secondly, a specific recommendation on speech and language therapy has been added to the section on eating and drinking: "consider involving a speech and language therapist if there are concerns about the safety of eating and drinking."

					treatments and care services for comorbidities to people who do not have dementia.”
Royal College of Speech and Language Therapists	Full	36	17	The RCSLT is very concerned that speech and language therapy does not feature in this section on supporting cognition, independence and rehabilitation.	Thank you for your comment. Evidence on the effectiveness of speech and language therapy interventions was looked for as part of the review questions on independence, cognition, functional ability and quality of life. However, no RCT evidence was identified, in contrast to that for other interventions which were included in the guideline, and therefore the committee agreed it was not possible to make any recommendations.
Royal College of Speech and Language Therapists	Full	36	21	The RCSLT is concerned to see occupational therapy highlighted in supporting rehabilitation and reablement but not speech and language therapy.	Thank you for your comment. Evidence on the effectiveness of speech and language therapy interventions was looked for as part of the review questions on independence, cognition, functional ability and quality of life. However, no RCT evidence was identified, in contrast to that for other interventions which were included in the guideline, and therefore the committee agreed it was not possible to make any recommendations.
Royal College of Speech and Language Therapists	Full	37	27	Caring for and caring about people with dementia requires specific communication skills. Carers often receive little information to enable them to meet the communication needs of people with dementia. The RCSLT recommends that carers should receive support and training on communication in dementia. Supporting evidence:	Thank you for your comment. The committee agreed with this point, and noted that communication training was a common feature of many of the effective carer support interventions included in the review, including the START intervention forming the basis of the cost-effectiveness evidence. The recommendation for carer interventions states that it should include “training in adapting communication styles to improve interactions with the person living with dementia.”

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Royal College of Speech and Language Therapists	Full	39	14	For people with signs of repeat behavioural changes caused by pain, consider seeking alternative methods of communicating with the person to discover the extent of their problems. Input from a speech and language therapist should be sought.	Thank you for your comment. The committee noted that no evidence was found on this issue, and therefore agreed it was not possible to make recommendations around speech and language therapy in this section.
Royal College of Speech and Language Therapists	Full	39	41	As dementia progresses the communication ability of individuals will become more difficult. To involve the person in healthcare planning will require additional communication support to be offered. Speech and language therapy support should be included.	Thank you for your comment. The committee noted that no evidence was found on this issue, and therefore agreed it was not possible to make recommendations around speech and language therapy in this section.
Royal College of Speech and Language Therapists	Full	40	7	<p>It needs to be recognised that some people will want to eat and drink but are unable to do so safely. Support from a speech and language therapist can support choice around risk feeding.</p> <p>Supporting evidence:</p> <ul style="list-style-type: none"> • Finucane TE, Christmas C, Travis K. Tube feeding in patients with advanced dementia: a review of the evidence. <i>Journal of the American Medical Association</i> 1999; 282:14, 1365-1370. • Palecek EJ, et al. Comfort feeding only: a proposal to bring clarity to decision-making regarding difficulty with eating for persons 	<p>Thank you for your comment. The committee noted this concern, and agreed it was appropriate to remove the works "can do so safely" from this recommendation to cover the concept of 'at risk feeding'. They also agreed it was appropriate to add a specific recommendation on involving a speech and language therapist at this stage if there are concerns about safety. The new recommendations therefore become:</p> <p>"Encourage and support people living with dementia to eat and drink, taking into account their nutritional needs.</p> <p>Consider involving a speech and language therapist if there are concerns about the safety of eating and drinking."</p>

				with advanced dementia, <i>Journal of the American Geriatric Society</i> 2010; 58:3, 580-584. Sherman FT. Nutrition in advanced dementia. Tube feeding or hand feeding until death? Editorial. <i>Geriatrics</i> 2003; 58:11, 10.	
Royal College of Speech and Language Therapists	Full	257		The Guideline says that specialist dietetic support and speech and language therapy for people with dementia will be considered in the non-pharmacological interventions section of this guideline. However, we are concerned that speech and language therapy is not discussed or highlighted in this section.	Thank you for your comment. Evidence on speech and language therapy was looked for as part of the systematic review conducted for non-pharmacological interventions to improve cognition, functional ability, independence and wellbeing for people living with dementia (see appendix O). They therefore agreed that because of the lack of evidence, it was not possible to make recommendations on speech and language therapy in this section of the guideline.
Royal College of Speech and Language Therapists	Full	354		During end of life or palliative care planning, support must be provided to the individual and the family to make decisions. This includes being able to plan and have their wishes met. To enable such discussions to take place, communication must be supported so the views of the individual are heard. At present the section on end of life care is weak and does not offer sufficient information on how this will happen. Supporting communication must be a central theme in end of life care planning for all healthcare professionals to consider.	Thank you for your comment. The committee agreed the recommendations in this section were as specific as possible given the limited evidence available. However, the committee did agree with the importance of communication training for staff working with people living with dementia, and training on "adapting communication styles" has been added to the section of the guideline on staff training and education.

				(speech language pathologist) throughout palliative care".	
Royal College of Speech and Language Therapists	Full	415		This section includes frequent references to communication, supporting people to "have voice", trying to "find the person inside" and "establishing likes and dislikes". These clearly highlight a role for specialist communication support from a speech and language therapist.	Thank you for your comment. The committee agreed that in the absence of evidence, it was not possible to make specific recommendations on the role of speech and language therapists in supporting communication. However, they did agree on the importance on communication, and therefore agreed it was appropriate to add training in "adapting communication styles" to the recommendations on staff training and education.
Royal College of Speech and Language Therapists	Full	415		The RCSLT agree that people should be supported to eat and swallow for as long as they can safely do so. If people want to continue eating and drinking with unsafe swallowing ability then support from a speech and language therapist must be sought to enable this to happen whilst keeping the person safe. Supporting people's wishes is important for patient choice.	Thank you for your comment. The committee noted this suggestion and agreed it was appropriate to add an extra recommendation to the section on palliative care, to "consider involving a speech and language therapist if there are concerns about the safety of eating and drinking."
Royal College of Speech and Language Therapists	Full	415	Final para, line 58	The RCSLT is very concerned that speech and language therapy support will <u>not</u> be provided to people with dementia because the guideline says it is too expensive. This will create a disadvantage, whereby people after a stroke or head injury will receive speech and language therapy but people with dementia will not.	Thank you for your comment. The committee noted this concern and agreed the wording here was unclear, and therefore this section has been removed from the committee's discussion of the evidence on palliative care.

Royal College of Speech and Language Therapists	Full	416		<p>The RCSLT is concerned that removing specialists from palliative care underestimates the expertise which is essential at this stage of a person's life. This is particularly important in relation to the management of dysphagia which can cause choking, aspiration and pneumonia. Managing this is crucial to avoid hospital admission.</p> <p>Supporting evidence:</p> <ul style="list-style-type: none"> The RCP clearly highlight the role of specialists, "SLTs can advise on strategies to minimise aspiration risk, facilitate eating and drinking, and improve nutritional status..." (pg. 12, 1.65). In relation to nutrition for the person with dementia, best practice includes "assessment by a senior physician in nutrition support and SLT..." (RCP: pages 28, 2.26). <p>Lambert (2012) cited by Chadder et al, 2016 highlights the role of SLT in palliative care. "Impairment and subsequent facilitations of communication or the placement and maintenance of a tracheostomy/enteral feeding tube (for example), are likely to be addressed to, and by, the SLP (speech and language pathologist) throughout palliative care".</p>	<p>Thank you for your comment. The committee agreed with the value of specialist palliative care services, but agreed that in the absence of evidence on specific interventions it was not possible to make recommendations on the role of specialist palliative care services.</p> <p>On the specific issue of dysphagia, the committee agreed it was appropriate to add an extra recommendation to the section on palliative care, to "consider involving a speech and language therapist if there are concerns about the safety of eating and drinking."</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Royal College of Speech and Language Therapists	Full	417	19	<p>The RCSLT believes that this statement (118) does not take into consideration those people living with dementia who wish to eat and drink but are <u>unable to do so safely</u>. People should be supported to undertake risky feeding when supported by a specialist speech and language therapist.</p> <p>Pollens (2004) cited in The Role of Speech-Language Pathologists in Adult Palliative Care (2016) that: "In the palliative model, the SLP can assist in developing strategies to maximise the person's ability to enjoy the pleasure of eating/drinking in the safest and most comfortable way possible".</p>	<p>Thank you for your comment. The committee noted this concern, and agreed it was appropriate to remove the works "can do so safely" from this recommendation to cover the concept of 'at risk feeding'. They also agreed it was appropriate to add a specific recommendation on involving a speech and language therapist at this stage if there are concerns about safety. The new recommendations therefore become:</p> <p>"Encourage and support people living with dementia to eat and drink, taking into account their nutritional needs.</p> <p>Consider involving a speech and language therapist if there are concerns about the safety of eating and drinking."</p>
Royal Surgical Aid Society	Full	352	2-27	<p>We are highly encouraged to read these recommendations. We are piloting 3-day Dementia Carer Support Groups during 2018-2019 specifically for groups of up to 16 family /informal carers. The content and structure of the programmes implement all of these recommendations in one event. The Association of Dementia Studies, Worcester University will be evaluating the outcomes for carers who participate.</p>	<p>Thank you for your comment, and your support for these recommendations. NICE would welcome examples of good practice to be added to its shared learning database, and this can be done using the following link: https://www.nice.org.uk/about/what-we-do/into-practice/shared-learning-case-studies</p>

Social Policy Research Unit, University of York	Full	147	10	Yes – our study (https://www.york.ac.uk/spru/projects/admiral-nursing/) also found that carers felt let down and 'abandoned' by memory services that did not offer regular follow-up	Thank you for your comment. The committee agreed ensuring people feel appropriately supported post diagnosis is an important issue, and it is hoped that current, ongoing research in this area will help to further refine these recommendations in future updates of the guideline.
Social Policy Research Unit, University of York	Full	154	5	Not just the person with dementia's needs – the named coordinator should assess and find ways to meet the carer's needs too (https://www.york.ac.uk/spru/projects/admiral-nursing/)	Thank you for your comment. This whole section refers to care coordination for the person living with dementia themselves. The committee did also look at evidence on case management for carers of people living with dementia, but agreed the evidence was not sufficiently well developed to be able to make recommendations.
South London and Maudsley NHS Foundation Trust	Short	3	2,3	The definition of dementia used says "a collection of symptoms including memory loss...". Dementia need not include memory loss as a symptom so we would suggest changing to "impairment in multiple cognitive domains which may include memory loss"	Thank you for your comment. The committee noted the guideline contains links to diagnostics criteria for specific subtypes of dementia, and that the included was a suitable 'lay' definition for the introduction to the guideline.
South London and Maudsley NHS Foundation Trust	Short	4	13-22	We accept that mild cognitive impairment was out of scope for the guideline but the follow up and management of mci varies considerably from service to service and clinicians and CCGs would welcome some evidence based guidance on the assessment management and follow up of people with this condition. Would it be possible for NICE to consider this topic for a future guideline?	Thank you for your comment. A number of stakeholders have raised this as an important issue needing guidance, and this feedback has been based to the commissioning team within NICE for consideration when the topics of future guidelines are discussed.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
South London and Maudsley NHS Foundation Trust	Short	7	5-19	There is evidence that alcohol misuse is often missed in older people. Heavy alcohol use can contribute to cognitive decline as well as lead to risk of falls, interaction with medication etc It is important that people with dementia and their carers have a history obtained about their alcohol use, are given information about the health risks (including those of cognitive impairment) associated with heavy alcohol use if appropriate and are offered evidence based brief interventions for alcohol misuse if appropriate. (see Royal College guidance on substance misuse in older people).	Thank you for your comment. The committee noted this point, and agreed it should be covered under the recommendation in the guideline to take a history from the person living with dementia (and a suitable informant if one is available).
South London and Maudsley NHS Foundation Trust	Short	9	14	Advance Care planning- our view is that it is vital that care plans are reviewed at transitions of care – eg when moving into a care home. We recommend incorporating this into the recommendation	Thank you for your comment. The committee agreed with this point, and recommendation 1.12.2 states that advance care and support plans should be reviewed after every transition between care settings.
South London and Maudsley NHS Foundation Trust	Short	9	21	Initial assessment 'If possible, from someone who knows the person well' – the importance of collateral history in diagnosis cannot be over-emphasised and we would suggest wording this even more strongly eg "every effort should be made to obtain history from relatives friends or professional carers to get as accurate a picture as possible about the	Thank for your comment. The committee agreed this was an important part of the assessment process, and felt the current wording to do this "if possible" was the most appropriate way to word the recommendation.

				person's symptoms and how they affect activities of daily living."	
South London and Maudsley NHS Foundation Trust	Short	10	11	Previous NICE guidance indicated that it was good practice to request basic blood investigations as part of the assessment of cognitive impairment. We are uncertain why this is not in the current guidance.	Thank you for your comment. The committee agreed with the suggestion that it was appropriate to retain this recommendation from the previous guideline, and therefore "undertake appropriate blood and urine tests to exclude reversible causes of cognitive decline" has been added to the recommendation for initial assessment in non-specialist settings.
South London and Maudsley NHS Foundation Trust	Short	10	25, 26	Structural imaging to "rule out" reversible causes needs more clarity. This could be seen to imply that everyone needs a scan to "rule out" reversible causes. We would wish to avoid scanning a large number of older people with clear history of AD who do not need further test to make the correct diagnosis. It might be better to phrase the guidance " If history suggests that the presentation is not typical for Alzheimer's disease, or if dementia is present in a younger person where rarer causes are more likely , then investigations should be carried out to clarify the diagnosis. The purpose of the scan should be to help make a definitive diagnosis, not to "rule out" extremely rare reversible conditions".	Thank you for your comment. The committee made 2 changes to address this issue. First, the recommendation on structural imaging has been changed from a 'consider' to an 'offer'. Secondly and additional caveat, based on that from the last guideline, has been added that "structural imaging is not always be needed, if dementia is well established and the subtype diagnosis is clear."

South London and Maudsley NHS Foundation Trust	Short	11	15	Access to lumbar puncture for CSF and PET scanning is not widespread. Both procedures are expensive, potentially distressing, and not always accurate or helpful (clinical experience indicates that these tests often do not give an answer, particularly in older people with multiple medical co-morbidities. The recommendation needs more clarity or it could be interpreted in the wrong way. It might be useful to start by saying for whom such investigations are not helpful ie older people with a clear history of gradual cognitive decline and cognitive deficits compatible with AD. The investigations are primarily indicated for younger people where neuropsychological testing and MRI/CT have not clarified the diagnosis.	<p>Thank you for your comment. The committee noted there are issues around access to imaging and CSF examination in certain areas, but agreed the evidence showed these test could be of diagnostic value in some cases, and therefore were appropriate to include in the recommendations.</p> <p>The committee noted that the 'consider' recommendation for CSF examination came at the end of the diagnostic pathway, and would consequently only be of relevance for the small number of people who still did not have a diagnosis after all the prior possible diagnostic steps had been considered. However, they noted that a number of stakeholders had interpreted this recommendation as bringing CSF earlier in the diagnostic pathway, and to counter that conception agreed it was appropriate to add an additional recommendation before all of those on imaging and biomarkers. Specifically:</p> <p>"Only consider further diagnostic tests if:</p> <ul style="list-style-type: none"> • it would help to diagnose a dementia subtype and • knowing more about the dementia subtype would change management."
South London and Maudsley NHS Foundation Trust	Short	15	23	Could transcranial magnetic stimulation be specifically mentioned under the section on non-invasive brain stimulation here please? We are getting referrals asking this to be considered, and carers and relatives are asking about it - whereas	Thank you for your comment. Transcranial magnetic stimulation was included as part of the evidence base considered by the committee, and therefore they agreed it was appropriate to clarify the recommendation to "do not offer non-invasive brain stimulation (including transcranial magnetic

				as far as we are aware there is no evidence that this intervention improves outcomes for people with dementia	stimulation) to treat mild to moderate Alzheimer's disease, except as part of a randomised controlled trial."
South London and Maudsley NHS Foundation Trust	Short	20	14	The example given in the text of a suggested scale to assess anticholinergic side effects is the ACB (anticholinergic burden scale). This scale is now slightly out of date. Please consider also mentioning the AEC scale which was designed as an update to other scales, builds on the work of the ACB scale and is more comprehensive – covering all drugs in the BNF. Its scoring method is based on the most up to date in vitro and clinical data. It is freely available in a simple useable form on line (medichec.com) (reference- Bishara D et al Anticholinergic effect on cognition (AEC) of drugs commonly used in older people (Int J Ger Psych 2016)	Thank you for your comment. The committee noted the existence of this new and potentially improved tool, but were not aware that it had yet been validated in the same way as the other tools included in the review. As a result, the committee agreed it was best to retain the reference to the ABS, but that this was presented solely as an example, and that the use of more modern validated scales would be appropriate when they are available.
South London and Maudsley NHS Foundation Trust	Short	20	19	The guidance should state that antipsychotic medication can be appropriately prescribed for the treatment of psychosis in dementia. This includes both the treatment of long standing psychotic disorders and the treatment of psychotic symptoms in the context of dementia.	Thank you for your comment. The committee agreed with this point and noted the guideline allowed the use of antipsychotics for people with "hallucinations or delusions that are causing them severe distress."

				4) Cohen-Mansfield (2000) Nonpharmacological management of behavioral problems in persons with dementia: The TREA Model. Alzheimer's Care Quarterly 1(4), 22-34	
South London and Maudsley NHS Foundation Trust	Short	22	11	We were concerned that just stating not to use melatonin to manage sleep problems may lead to inappropriate use of even more dangerous and similarly ineffective drugs- such as anticholinergic antihistamines (promethazine) and benzodiazepines (which increase fall risk). We propose either a change in the wording to a more blanket 'Do not offer pharmacological treatments to manage sleep problems in people living with dementia', or else offer cautious support of the use of melatonin for people with dementia with severe insomnia in a time limited fashion for people who have not responded to sleep hygiene measures	Thank you for your comment. The committee noted this concern, but agreed there was not sufficient evidence on other pharmacological treatments to be able to make recommendations (either positive or negative), and agreed that an absence of alternatives was not a reason to promote the use of a drug (melatonin) where there is evidence of a lack of efficacy.
South West London and St George's Mental Health NHS Trust	Short	9	17	Please consider defining a 'non-specialist setting'	Thank you for your comment. This has been addressed by adding some examples of what would be considered a specialist setting, and therefore a non-specialist setting would be anything not covered by that term.

St Helens and Knowsley Teaching Hospitals NHS Trust	Short Long	12 124	24	<p>This comment applies to both the recommendation on case finding in the short version of the draft guidance and the comment on the acute hospital CQUIN within the long version.</p> <p>The recommendation regarding case finding in the short version is clear. Removal of the requirement for case finding would allow the resources currently used for this to be used elsewhere to improve patient care.</p> <p>The comment about the CQUIN within the long version says that "acute hospitals were required to report on the number of positive diagnoses as a proportion of the number of patients who had been formally tested for dementia". This was the second step of the CQUIN. The first step of the CQUIN was case finding so the draft NICE guidance does interact with the requirements of the CQUIN. The reference to the second step in the CQUIN and not the first within the long guidance is misleading. We feel that the committee should consider either issuing a clear statement that their guidance does affect the CQUIN or remove the reference to the CQUIN altogether.</p>	<p>Thank you for your comment, and for pointing out this error. This section of the guideline has been rewritten to make clear that this guideline does not affect the interpretation of the CQUIN:</p> <p>"The committee noted that case finding for dementia was introduced in acute hospitals as part of the Commissioning for Quality and Innovation (CQUIN) 2013/14 guidance, and that the committee's recommendations should be interpreted as applying to situations outside this existing guidance."</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Sweettree Homecare Services	Short	15	9-11	The wording "Consider providing...elements of Cognitive Stimulation" is highly problematic. Whilst there is strong research and clinical evidence for CST when used as a manualised intervention, <i>there is NO evidence for any benefits if just elements of the programme are used and no evidence, in general, for structured group activities</i> . Further, having a clear manual, which can be followed by a range of health and social workers at all levels of expertise; eases implementation and minimises preparation time, providing a highly cost-effective intervention. This change in wording is open to different interpretations and could be concluded that any type of structured group is sufficient, and there will be a lack of governance and adherence to any sort of standardisation. We would suggest reverting to the wording from the 2006 NICE guidelines, which state that <i>"People with mild / moderate dementia of all types should be given the opportunity to participate in a structured group cognitive stimulation programme. This should be commissioned and provided by a range of health and social care workers with training and supervision. This should be delivered irrespective of any anti-dementia drug prescribed for the cognitive symptoms of dementia"</i> .	Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The committee agreed the evidence base was stronger for CST (as a manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-effectiveness. The committee therefore agreed it was appropriate to split this into two separate recommendations, a stronger recommendation for CST and a weaker recommendation for reminiscence. Specifically: "Offer group cognitive stimulation therapy to people living with mild to moderate dementia. Consider group reminiscence therapy for people living with mild to moderate dementia."

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Sweettree Homecare Services	Short	15	1	The challenge here is the recognition of how dementia goes beyond the person and its effect on the family as a whole. This is difficult for a person who has been diagnosed under the age of 65 and their needs are significantly different. This has been highlighted within the short version but how are services going to develop for the younger population. Look to www.ypwd.org as an example	Thank you for your comment. The committee agreed there were specific challenges in delivering care and support for younger people living with dementia, and noted that specific recommendations have been made on this topic throughout the guideline, wherever there is evidence to do so.
Sweettree Homecare Services	short	22	11	The challenge here is that Melatonin is being prescribed for those with dementia. The reason, context and guidance needs to be clear.	Thank you for your comment. The committee agreed it was appropriate to make this recommendation more specific, to focus directly on the population for which there was evidence. Accordingly, this has been amended to "do not offer melatonin to manage insomnia in people living with Alzheimer's disease."
Sweettree Homecare Services	Short	25	15-29	This is a strong recommendation; the challenge here is to make this mandatory, but also to cost out how much this resource would affect services and to map out the number of organisations who provide this across all sectors.	Thank you for your comment. The committee agreed there would be costs associated with providing carers with the specified training and support, but agreed the evidence showed this was an effective and cost effective intervention, and would be an appropriate use of resources.
Sweettree Homecare Services	Short	26	1-9	This needs to be mapped out as to who provides this initial support and the quality of the support provided. Should it be Dementia Advisors or the Memory Clinic team? This needs to be mandatory; allowing individual services to determine their level of support will be led by cost and time.	Thank you for your comment. The committee agreed that due to the number of carers this recommendation is relevant to, this training is likely to need to be a specifically commissioned service. The committee noted that the full guideline contains examples of UK specific training packages (such as START) that can be used to deliver this training in a structured way.

				<p>Several trials within the Cochrane review concluded that the results were consistently in favour of structured group such as Cognitive (Woods et al, 2012).</p> <p>2) <u>"The two interventions are not mutually exclusive"</u></p> <p>It is correct that Cognitive Stimulation incorporates some aspects of Reminiscence. However, the key focus of Cognitive Stimulation (more specifically the manualised 'CST' programme which is widely followed) is on generation of <i>new</i> thoughts, ideas and associations within the sessions. This is believed to engage executive functioning skills. CST is based on theories of mental stimulation, and uses principles of person centred care. It includes clear key principles which need to be adhered to for effectiveness. It also shifts the focus, emphasising the importance of the person's views and options in the current day, rather than focusing on the past (which is the aim of Reminiscence). We run regular CST groups at Sweettree and believe that this provides a different message and thus reduces stigma associated with dementia and old age. The experience of CST groups has been overwhelmingly positive.</p>	<p>recommendation for CST and a weaker recommendation for reminiscence. Specifically:</p> <p>"Offer group cognitive stimulation therapy to people living with mild to moderate dementia.</p> <p>Consider group reminiscence therapy for people living with mild to moderate dementia."</p>

				<p>3) "There would be no difference in cost of delivery between providing an intervention with a more varied range of components".</p> <p>We would argue that this assumption cannot be made without a cost effectiveness analysis. There is strong evidence for the cost effectiveness of manualised CST, with two key papers published since the 2006 guidelines (Knapp et al, 2006; D'Amico et al, 2015). However, an analysis of a different model of provision has not been conducted, to our knowledge.</p> <p>4) "This was likely to lead to better outcomes for a range of people than one narrowly focused on a very specific intervention model".</p> <p>This appears to be based on no evidence and also a misunderstanding of CST, which is not "narrowly focused on a specific intervention model". Instead, CST has a variety of interventions depending on the interests and abilities of the group, and is delivered according to important key principles which fit with the underlying theoretical models. We would encourage NICE to argue for more adherence to protocol and evidence base, rather than less.</p>

					<p>recommendation for CST and a weaker recommendation for reminiscence. Specifically:</p> <p>“Offer group cognitive stimulation therapy to people living with mild to moderate dementia.</p> <p>Consider group reminiscence therapy for people living with mild to moderate dementia.”</p>
Tees Esk and Wear Valleys NHS Foundation Trust	Short	29	8/9	Could Occupational Therapists be listed as specialist clinicians?	Thank you for your comment. The committee were keen to point out that this definition solely referred to the question of who should give advice before pharmacological treatment for Alzheimer's disease is started. It was not intended as a more general statement around who would count as a specialist clinician. The final version of the guidance should make this point clearer.
Tees Esk and Wear Valleys NHS Foundation Trust	Full and Short	general	general	It would be helpful if the guidance could clarify, particularly for the treatment sections, which service is to lead for the standards (i.e., Local Authority/ Primary Care/ Specialist Mental Health Service). Without this detail, there is potential for all services to assume another service is responsible and for gaps in service provision to appear.	Thank you for your comment. The committee would have liked to specify which service should be responsible for each part of the guideline, and noted the concerns you raise, but agreed that in the absence of any evidence on who should be responsible for these standards on which to make recommendations within the guideline, these decisions would have to be made at a local level

Tees Esk and Wear Valleys NHS Foundation Trust	Full	general	general	Guidance on the use of specialist services is limited, particularly specialist mental health physiotherapists and the specialist skill set they have in providing specialist rehabilitation for those with dementia.	Thank you for your comment. No evidence was identified on specialist mental health physiotherapists, and therefore the committee agreed they were not able to make recommendations on this topic.
Tees Esk and Wear Valleys NHS Foundation Trust	Full	297	general	It is noted in the draft full guideline that no recommendation on prescribed exercise will be made until the Dementia and Physical Activity (DAPA) study is published. The website for the DAPA study says it is not due for completion until June 2018 (the same time that this guidance will be published). It is likely that the research will not be published in time to be included in the dementia guidance. Early indications suggest exercise needs to be 'prescriptive' to be most effective; will NICE specify which professionals should be delivering this?	Thank you for your comment. The DAPA study was not published in time for inclusion within the guideline, and therefore the committee agreed it was not possible to make recommendations around exercise at this time. The study has been passed to the NICE surveillance team, who will make a decision about whether the guideline needs to be updated when the study publishes.
The Lewy Body Society	Short	General	General	Our charity has experience of families of people living with Lewy body dementia either not being able to find a care home that will accommodate them due to lack of understanding of the disease by staff or being asked by care home providers to remove family members due to complex needs.	Thank you for your comment. The committee noted this concern, and agreed it was important for services to be available that are accessible to people with all dementia subtypes, including those with complex presentations. However, they agreed the provision and organisation of these services was outside the scope of this guideline.

Stakeholder	Document	Page No	Line No	Comments	Developer's response
The Royal College of Physicians and Surgeons of Glasgow	Short	11 12	15-29 5-11	<p>Our expert reviewer felt the assessment / diagnosis strategy recommended lacks of good supportive data to show that the routine use of biomarkers and sophisticated imaging would be cost-effective and give worthwhile clinical gain.</p> <p>In dementia research, positive biomarkers have become a requirement for participant recruitment in Alzheimer disease-specific trials, and to establish drug-target engagement and as surrogate markers of treatment efficacy. However at present there is no good evidence that their widespread use in clinical practice would significantly improve outcomes. Routine use of biomarkers will only really become justified if disease-modifying treatments become available – and there are no such interventions at present. Therefore the recommendation to use biomarkers in diagnosis is premature and risks diversion of scarce resources.</p> <p>The same is true for diagnosis of dementia with Lewy bodies, front-temporal dementia and vascular dementia.</p>	<p>Thank you for your comment. The committee noted that the 'consider' recommendations for CSF examination and imaging came at the end of the diagnostic pathway, and would consequently only be of relevance for the small number of people who still did not have a diagnosis after all the prior possible diagnostic steps had been considered. However, they noted that a number of stakeholders had interpreted this recommendation as bringing CSF and imaging earlier in the diagnostic pathway, and to counter that conception agreed it was appropriate to add an additional recommendation before all of those on imaging and biomarkers. Specifically:</p> <p>"Only consider further diagnostic tests if:</p> <ul style="list-style-type: none"> • it would help to diagnose a dementia subtype and • knowing more about the dementia subtype would change management." <p>The committee agreed this should address any concerns about the guideline advocating a sudden expansion in the use of complex diagnostic tests, or their use in determining if someone has dementia at all, rather than to support subtyping.</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
The Royal College of Physicians and Surgeons of Glasgow	short	23		There is a lack of information on swallowing assessment / modifying diet in those with dementia who develop dysphagia. Dysphagia is a major problem, particularly in those with more advanced dementia, often exacerbated by inter-current illness and therefore contributing to acute hospital admission. A structured approach to assessment, including use of water swallow test, can detect those at high risk of aspiration. Speech and Language therapists have an important role in advising on dietary modification such as thickening of fluids or optimal food texture, and on positioning when eating / drinking.	Thank you for your comment. On the specific issue of dysphagia, the committee agreed it was appropriate to add an extra recommendation to the section on palliative care, to "consider involving a speech and language therapist if there are concerns about the safety of eating and drinking."
The Royal College of Physicians and Surgeons of Glasgow	Short	23	1	With Reference to the phrase ' <i>Consider using a structured observational pain...</i> ' the wording should be more directive. Pain is under reported in people with dementia. Also we know dementia can be associated with falls. Pain can drive behavioural issues e.g. aggression. Consider is too weak an option. This recommendation should be stronger.	Thank you for your comment. The committee discussed this and agreed that, because of the limited nature of the evidence base available on pain assessment, a 'consider' recommendation remained the most appropriate.

The Society and College of Radiographers	Short	7	12	The Society and College of Radiographers advocate the use of a decision tool and urge that information must be shared with healthcare practitioners ideally prior to any planned visits to imaging/radiotherapy departments. Practitioners will then be enabled to book longer appointment times or make appropriate adjustments for examinations and treatments. The Society and College of Radiographers support the use of a communication passport with people living with dementia. Sharing information is challenging in clinical imaging and radiotherapy; patients attend for relatively short periods of time. There is often no detailed communication from referrers rather simply requests for examination/treatment on short request cards; the provision of information prior to outpatient attendances will alert staff to any additional needs of people living with dementia.	Thank you for your comment. The committee would support any interventions that successfully ensure that information is appropriately shared and available to services when it is needed.
The Society and College of Radiographers	Short	9	10	The Society and College of Radiographers support the notion of advance planning and advance decision to refuse treatment. It will be challenging for practitioners involved in the care of patients to be aware of notifications; specifically attendances for clinical imaging examinations and radiotherapy treatment. How will practitioners	Thank you for your comment. The committee noted this concern, and agreed it as important for local areas to have policies in place to ensure information on advance decisions and planning was appropriately shared.

				consider an atypical presentation such as posterior cortical atrophy (PCA), or logogenic aphasia (LPA). If these atypical forms are not considered, and only verbal episodic memory included in the guidance, then there is a risk that misdiagnoses are made, and individuals who may benefit from treatment will not receive that.	
University College London	Short	10	25	There has been change from previous guidance so that now structural imaging is only with the guidance of "to consider". We think that there are some important consequences of this change, the first is that the use of structural imaging to help in the subtyping of the diagnosis should be included as was reported in the earlier guidance. It is notable that most of the diagnostic criteria and recommendations from consensus groups have recommended imaging and usually MRI as part of diagnosis. For example, for Alzheimer's disease, the NIA – AA recommendations include MRI, the Dubois (IWG) criteria include MRI showing hippocampal or medial temporal lobe atrophy as part of the diagnostic criteria. The international FTD criteria mentioned on page 11 of the draft guidance as also the NINDS-AIREN criteria all recommend the use of MRI in	Thank you for your comment. The committee made 2 changes to address this issue. First, the recommendation on structural imaging has been changed from a 'consider' to an 'offer'. Secondly and additional caveat, based on that from the last guideline, has been added that "structural imaging is not always be needed, if dementia is well established and the subtype diagnosis is clear."

Stakeholder	Document	Page No	Line No	Comments	Developer's response
University College London	Short	12	3	It is reasonable not to use EEG "to diagnose" Alzheimer's disease, but the wording should be changed so that words "in the" should be changed to "to". The reason for this is that as part of the diagnostic process of somebody suspected of Alzheimer's disease, it may well be very important to acquire an EEG because subclinical seizures can be a very treatable cause of memory impairment and otherwise people get a mis-diagnosis of Alzheimer's disease. I think there should be a recommendation to consider the use of EEG in those who may be having seizure activity which may mimic Alzheimer's disease or another dementia.	Thank you for your comment. The committee agreed that, for clarity, this recommendation should be modified to "do not use electroencephalography to diagnose Alzheimer's disease." In the absence of evidence, the committee agreed it was not possible to make a more positive recommendation about when it might be used.
University College London	Short	15	9, 10, 11	"Consider providing structured group activities (including elements of cognitive stimulation and reminiscence therapy) to people living with mild to moderate dementia who are not already accessing them". This is a significant shift from the previous NICE guidelines, which stated that "People with mild / moderate dementia of all types should be given the opportunity to participate in a structured group cognitive stimulation programme. This should be commissioned and provided by a range of health and social care workers with training and	Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The committee agreed the evidence base was stronger for CST (as a manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-effectiveness. The committee therefore agreed it was appropriate to split this into two separate recommendations, a stronger

				following a diagnosis of dementia. Approximately 50% of all UK memory services are accredited and anecdotal evidence suggests that a similar pattern of CST provision is occurring in non-accredited memory services. This widespread provision is offering hope for people post diagnosis, social support and a structured, evidence-based therapy which maintains cognitive functioning and normalises the experience of dementia. Several other reports have endorsed CST since the 2006 guidelines. For example, the World Alzheimer Report (Alzheimer's Disease International), in 2012 and subsequently; have stated that CST should routinely be given to people with early stage dementia. Such a change in wording could have a devastating clinical impact and we recommend reverting to the previous wording, as above.	
University College London	Short	16	19	The recommendations should consider including the situation where somebody is on Memantine (but only Memantine), This may have been started as an alternative to a cholinesterase inhibitor and the guidance should say "consider cholinesterase inhibitor, in addition to Memantine". In other words, the guidance 1.5.3 should be symmetrical in that there are some	Thank you for your comment. The committee noted this concern, but agreed that since the majority of the evidence was specifically on the addition of memantine to a cholinesterase inhibitor, and cholinesterase inhibitors are the recommended first line treatment for people with mild dementia, the current wording of the recommendation was the most correct one. They did, however, note that in practice people were likely to also consider the addition of

				people who would benefit from a cholinesterase inhibitor, who are already on Memantine but because both could not be prescribed together, had only been started on one.	cholinesterase inhibitors for people who had already started on memantine.
University College London	Short	25	14-29	<p>The full document contains specific mention of the START intervention for carers and includes the recommendation: "a specific psychoeducation and skills training intervention was more appropriate than making a more generic recommendation around multicomponent interventions, both because of the economic evidence described in the "trade-off between net health benefits and resource use" section below, and because it was a clearly defined intervention type that should be practical to implement in practice."</p> <p>However, in the short document, the section on 'Supporting carers' (Section 1.11) currently recommends everything that is included in START without mentioning a specific intervention. START, which was developed and evaluated with carers in the UK, should be specifically recommended in the Summary Guidance.</p>	Thank you for your comment. The committee agreed that START was one highly relevant example of an intervention that could be used to meet the requirements of the recommendations for carer training. However, they agreed that many other trials also showed similar benefits to those from the START intervention, and therefore it was not appropriate to specifically mention START ahead of other interventions that could be offered.
University College London	Full d	305-309	Table 79	Table 79 should include the Cochrane review by Ballard et al (2006) (Ballard CG, Waite J, Birks J.	Thank you for your comment. Ballard (2006) was excluded because there was a more recent systematic review available

				evidence base for antipsychotic drug use is discussed almost entirely in the context of aggression and agitation. Suggested amendments include the following:	
University College London	Full	327-328	Section on antipsychotics	'Evidence to recommendations section (14.1.5.1) 'Pharmacological treatments' describes the 'Trade-off between benefits and harms' and the 'Quality of evidence' for antipsychotic drug use. These sections should make reference to the fact that, in the majority of placebo controlled RCTs, psychosis was not the main treatment indication or primary outcome.	Thank you for your comment. Some commentary addressing this has been added to the evidence to recommendations section as suggested.
University College London	Full	277	37	This section considers the economic analysis of CST, but uses a base case model, rather than published health economic studies. There have been two key papers published considering the cost effectiveness of manualised CST (Knapp et al, 2006; D'Amico et al, 2015). Both are listed in the references in Appendix J, but only D'Amico et al (2015) has been considered in the evidence. These papers look at the cost of the delivery, as well as the changes in use of health and social care services for those in receipt of the intervention.	Thank you for your comment. The Knapp (2006) paper was not a cost-utility study and therefore did not consistent with the reference case. The D'Amico (2015) paper however, was a cost-utility study and was eligible for inclusion as part of the economic review. Please note that the effectiveness evidence used in Knapp (2006) was based on Spector (2003), and has been considered by this guideline by the way of inclusion in our quantitative synthesis of parameters for the model developed by NICE.

				<p>It is correct that Cognitive Stimulation incorporates some aspects of Reminiscence. However, the key focus of Cognitive Stimulation (more specifically the manualised 'CST' programme which is widely followed) is on generation of <i>new</i> thoughts, ideas and associations within the sessions. This is believed to engage executive functioning skills and enable new semantic connections to be made. CST is based on theories of mental stimulation, and uses principles of person centred care. It includes clear key principles which need to be adhered to for effectiveness. It also shifts the focus, emphasising the importance of the person's views and options in the current day, rather than focusing on the past (which is the aim of Reminiscence). We believe that this provides a different message and thus reduces stigma associated with dementia and old age.</p> <p>Reference Spector A, Thorgrimsen L, Woods B, Orrell M (2006) Making a difference: an evidence based group program to offer Cognitive Stimulation Therapy</p>	<p>manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-effectiveness. University of Bradford	Short	13	23	This recommendation should be expanded – community resources, services and support	Thank you for your comment. The committee agreed that all these relevant points should be covered within the general term of "care."
University of Bradford	Short	21	17-19	Consider rewording this statement	Thank you for your comment. The committee considered this but agreed the current wording accurately reflected the intent of the recommendation.
University of Bradford	Short	28	3	Is there sufficient evidence to specify multi sensory stimulation as opposed to other therapeutic modalitiies	Thank you for your comment. The committee noted that the evidence identified within the guideline was for multi-sensory stimulation, and therefore agreed this was the appropriate intervention to mention within the guideline.
University of Bradford	Full	General		We are concerned that the overall document only refers to treatment in the context of pharmacological therapy. The implication is that this is the only form of treatment available and all else is social care	Thank you for your comment. Having reconsidered the evidence around CST, the committee agreed it was appropriate to make a stronger recommendation for CST and the recommendation has therefore been amended to an 'offer'. Specifically, "offer group cognitive stimulation therapy to people living with mild to moderate dementia". The committee further agreed that the evidence showed this intervention was as effective in the short-term as pharmacological treatment.
University of Bradford	Full	General	general	The document covers people at all stages of the dementia trajectory from the point of diagnosis to end of life care and in the community as well as hospital and care settings. In so doing what might be key recommendations at different stages and in different environments are lost	Thank you for your comment. The committee noted that in many areas the evidence base only covered people in a particular setting (e.g. the majority of the evidence on staff training came from people living in care homes). The committee agreed that wherever possible it was appropriate to try and extrapolate this evidence to the more general population of people living with dementia, as otherwise there was a risk of particular groups not being covered, solely

					because studies happened not to have been done in those populations.
University of Bradford	Full	General	general	There doesn't seem to be much discussion of diversity in the informal carer population. (Apart from a brief reference on page 348) Might needs differ?	Thank you for your comment. The committee agreed there would be differences in the needs of informal carers depending on their particular background and circumstances. Whilst the committee agreed the RCT evidence identified did not enable them to make different recommendations for interventions for specific groups, they did recommend that the support provided to carers should be "tailored to their needs and preferences and to what they want it to achieve"
Vision UK	Short v	8	3	Section 1.1.6. At the time of diagnosis many patients and carers are in a state of shock and need more time to digest things. Patients and carers can be more receptive to information and help at a time soon after the diagnosis where things are discussed in their own home	Thank you for your comment. The committee agreed that it was important to offer additional opportunities for people to receive information, as people will often not be able to take everything in at the time of diagnosis, but agreed that in the absence of evidence it was not possible to specify how and when these should be done. They noted the guideline did also contain recommendations to "direct people and their family members or carers (as appropriate) to relevant services for information and support", and to ensure "they and their family members or carers (as appropriate) have access to a memory service or equivalent hospital- or primary-care-based multidisciplinary dementia service."
Vision UK	Short	6	18-24	This recommendation should include "the importance of determining the effect of dementia on physical co-morbidities (LT conditions, sensory	Thank you for your comment. The guideline contains a specific review question on the management of comorbidities in people living with dementia, and recommendations on this topic are included in that section of the guideline.

				impairments) and their management and vice versa	
Vision UK	Short	8	23	Need a clearer definition of "a person's record". This should include primary care record, care plan and social care record. Reference the NHS England Guidance on Care Planning	Thank you for your comment. The committee agreed some confusion has been introduced in this recommendation by the statement to "tell all relevant services what the person has decided", which has now been deleted. The committee noted the importance of having information contained in a single record so it was accessible to multiple services, but agreed that in the absence of evidence, they could not give specific guidance on how this system should be organised. A reference to the NHS England document mentioned has now been added to the start of the guideline.
Vision UK	Short	9	18	Need to identify, treat and / or exclude potential physical causes of cognitive impairment and assess anticholinergic burden of medications	Thank you for your comment. The committee agreed with this suggestion and added a recommendation to "conduct a physical examination, undertake appropriate blood and urine tests to exclude reversible causes of cognitive decline, and use cognitive testing."
Vision UK	Short	10	17	Recommend that there is greater clarification that cerebrospinal fluid (CSF) examination will NOT be routine (see lines 28 and 29) but more for younger, atypical and / or early onset dementia. The main issue with is not undertaking this but the standardisation of lab analysis. The specialists likely to be undertaking such examinations will most likely be neurologists who are used to doing such tests for people with neurological and	Thank you for your comment. The committee noted that the 'consider' recommendations for CSF examination and imaging came at the end of the diagnostic pathway, and would consequently only be of relevance for the small number of people who still did not have a diagnosis after all the prior possible diagnostic steps had been considered. However, they noted that a number of stakeholders had interpreted this recommendation as bringing CSF and imaging earlier in the diagnostic pathway, and to counter that conception agreed it

					familiar with the difficulties and able to make appropriate adaptations to the process used."
Vision UK	Short	10	22	Dementia diagnosis in specialist diagnostic services: up to 1/3 of people referred to such services are given a diagnosis of Mild Cognitive Impairment. There should be a recommendation about how such people are managed – bear in mind that some are on the cusp of a diagnosis whilst others maybe much earlier in the disease process to indeed may never develop dementia	Thank you for your comment. The diagnosis and management of mild cognitive impairment was not within the scope of this guideline, and therefore it was not possible to make recommendations on this topic. A number of stakeholders have raised this as an important issue needing guidance, and this feedback has been based to the commissioning team within NICE for consideration when the topics of future guidelines are discussed.
Vision UK	Short	14	9	Recommend include consideration of impact of dementia on physical co-morbidities and sensory impairments and vice versa. See reference for Diabetes and Dementia in the NICE Guideline Type 2 diabetes and adults Dec 2015	Thank you for your comment. The committee agreed with this suggestion and an additional point as been added to this recommendation to "ensure it contains information on the management of any comorbidities the person has."
Vision UK	Short	14	25	Making services accessible: include a statement for those with learning and /or physical and sensory disabilities and people with Young Onset Dementia (YoD).	<p>Thank you for your comment. The committee noted that they did not want to try and create an exhaustive list of groups here, because of the risk of this leading to the assumption that any not mentioned were therefore unimportant. However, they agreed that learning disabilities, sensory impairment and physical disabilities were sufficiently important that they should be added to the recommendation.</p> <p>The committee noted that younger people living with dementia were at least partially covered under the heading of</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
Vision UK	Short	22	23	Recommend inclusion of a sentence about holistic care plans that include an evaluation of the effect of dementia on the management of long-term conditions and vica versa. Most guidelines consider long-term conditions in isolation. Also consider an "Anticipatory Care Plan" in people with LT conditions to avoid inappropriate secondary care presentations / admissions.	Thank you for your comment. The committee agreed with this suggestion, and a point has been added in the section on care and support plans to "ensure it contains information on the management of any comorbidities the person has."
Vision UK	Short	22	24	Pain: Recommend more specific advice about the recognition, assessment and management of Pain in people with dementia. Ref: Rasmussen Foskett, Mason et al Guidance on the recognition, assessment and management of pain in people who have dementia Dec 2014 Recommend greater emphasis on fact that people with dementia usually don't volunteer they have pain or discomfort; carers need to ask specifically and should remember FEET (Feet, eyes, ears and teeth) and the importance of regular review of these areas especially in Care Home residents. References: North West Dementia Centre. Pain in Dementia – factsheet 2005; www.guidelines.co.uk/central_nervous_system_wp_dementia_jun14	Thank you for your comment. The committee agreed that in the absence of evidence meeting the inclusion criteria for the guideline, it was not possible to make more specific recommendations than those currently included for using a structured observational pain assessment tool, and a stepwise treatment protocol for people who are in pain.
Vision UK	Short	24	10	Anticipatory care plans are valuable at other times e.g. for people the long-term conditions to	Thank you for your comment. The committee agreed with this point, and a cross-reference has been added from this

				avoid inappropriate secondary care presentations / admissions.	recommendation to the section on advance care planning to improve the clarity of this recommendation.
Vision UK	Short	25	16	Add a bullet about prevention, recognition and management of delirium to the training	Thank you for your comment. The committee discussed this, but agreed that due to the potential high cost impact of widely delivered carer training, it was important to focus the recommendations on areas with robust evidence of effectiveness and cost effectiveness, and few of the studies included specifically included carer training in delirium
Vision UK	General			This Vision UK response is a result of a collaboration of the Vision UK Dementia and Sight Loss Committee involving representatives from: Blind Veterans UK, GOC, Alzheimer's Society, ABDO, RCGP, RNIB Scotland, Royal College of Psychiatrists, Old Age Faculty, College of Optometrists, UCL, RCN, TPT, Royal College of Ophthalmologists. We are happy to support the submission from these and other members of Vision UK.	Thank you for taking the time to comment on the guideline.
Vision UK	Full	General	General	We are concerned that the use of the phrase 'sensory impairment' may prove confusing and non-specific and would be better replaced with 'vision and hearing impairment'. This is particularly relevant to this document as sensory interventions are quoted which are not the same but easy to confuse.	Thank you for your comment. For clarity, this has now been changed to "sensory impairment (such as sight or hearing loss)".

				sight-loss-committee-statement-dementia-eye-examinations/	The committee agreed that once someone was identified as having visual impairment, they should then be covered by the recommendation to “ensure that people living with dementia have equivalent access to diagnostics, treatments and care services for comorbidities to people who do not have dementia.”
VoiceAbility	Short	14	6	We are concerned that this recommendation fails to recognise an important statutory right. Practitioners (named professionals) should ensure that people are aware of their rights to independent advocacy under the Care Act 2014 as well as the Mental Capacity Act 2005. There is a very close working relationship between these two Acts. Under the Care Act where a person would experience substantial difficulty in doing one or more of the functions outlined in the Care Act s67(4), which encompasses people who may lack capacity to make decisions about their care (including people with fluctuating capacity), they will receive the support of either an appropriate individual if they have one OR an independent advocate OR both (under certain circumstances defined in the Care & Support Independent Advocacy Regulations), to support them to be involved in assessments, care & support planning, care reviews, safeguarding enquiries or review.	<p>Thank you for your comment. The committee noted that there were important issues around capacity (and access to advocacy services) at all stages of the diagnosis and treatment pathway for people living with dementia. They agreed it would be impractical to list every situation in which this was important, and that mentioning what health and social care professional should do in specific circumstances left the risk of people interpreting this as meaning these issues were less important in situations where they are not explicitly mentioned.</p> <p>The committee therefore agreed the most appropriate way to deal with these overarching issues was for the guideline to link to the Mental Capacity Act, the Care Act, and the NICE guideline on decision-making and mental capacity (which is due to be published in July 2018), where these issues can be discussed in more detail.</p>

Stakeholder	Document	Page No	Line No	Comments	Developer's response
VoiceAbility	Short	14	6	We are concerned that the wording 'availability of local advocates (advocacy) services' under this recommendation may not be accurately interpreted as a statutory entitlement. If advice is simply given on the basis of what people may in practice have access to this may mask both need and the failure to commission adequately.	Thank you for your comment. The committee agreed that no recommendation in a NICE guideline can override a person's legal rights, and these issues are covered in detail in the Mental Capacity Act, the Care Act, and the NICE guideline on decision-making and mental capacity (which is due to be published in July 2018). They noted, however, that many areas provide advocacy services over and above just those that are a legal right, and it was important to make people aware of any such services available in their local area.
VoiceAbility	Short	26	12-15	We are concerned that this recommendation does not go far enough. Carers should be informed of their right to an independent advocate under the Care Act 2014 (s67 (3)) to support them with their carers assessment, support plan or review of their plan or safeguarding enquiry or review (s68 (2) if they would experience substantial difficulty in carrying out one or more of the functions in s67 (4) / s68 (3).	Thank you for your comment. The committee agreed that rather than these issues being considered individually within a condition-specific guideline (which would only be able to consider evidence in people living with dementia, and not the broader evidence on this topic) the most appropriate way to address these issues was by cross-referring to the Care Act within the guideline.
VoiceAbility	Short	27	12	We believe staff should also receive training in the statutory principle of the Care Act 2014 as well as the principles of the Mental Capacity Act 2005	Thank you for your comment. The committee agreed with this suggestion, and reference to the Care Act has been added to this recommendation.

				<p>apply if only “elements” of CST were delivered. As such it is unclear what evidence the current guidelines are based upon to be suggesting that structured group activities should include “elements of cognitive stimulation and reminiscence therapy”. Whilst there are elements of reminiscence therapy in the manualised CST groups, there is no evidence to suggest that reminiscence therapy on its own is as effective or comparable to a structured CST group. Research demonstrates that CST is the most effective at improving cognitive functioning compared to all other non-pharmacological interventions (including reminiscence therapy; Olazaràn et al, 2010).</p> <p>There are many different “elements” to the CST groups and it would seem far less “evidence based” and clinically effective for individual clinicians to be making decisions regarding which elements are the effective components. Despite many suggestions that the social contact element of CST groups is one of the main predeterminants of the observed improvements, a study by Woods et al. (2012) demonstrated that results consistently favoured a structured CST group over and beyond a social control group. Therefore, if</p>	<p>manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-effectiveness. The committee therefore agreed it was appropriate to split this into two separate recommendations, a stronger recommendation for CST and a weaker recommendation for reminiscence. Stakeholder	Document	Page No	Line No	Comments	Developer's response
		22	5,6	<p>interventions in addition to pharmacological treatments.</p> <p>It is documented on page 5 that the term 'consider' is used to reflect a recommendation for which the evidence of benefit is less certain". As highlighted in comment 1, we would argue that the evidence for the effectiveness of CST is much more certain and reliable than it was in 2006, and therefore it is not clear why the current guidelines are looking to move away from adherence to a protocol and the evidence base.</p> <p>The use of the tentative term "consider" demonstrates a lack in confidence in the existing evidence base for the effectiveness and importance of offering CST to people living with mild to moderate dementia. It further devalues the importance of psychological and/or non-medical approaches, in an already heavily medical dominated field.</p> <p>We would argue that there is a clear disparity between the language used for non-pharmacological interventions in comparison to the pharmacological interventions. The 2006 guidance clearly "recommended" the use of CST,</p>	<p>equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The committee agreed the evidence base was stronger for CST (as a manualised intervention) than for reminiscence therapy, both in terms of effectiveness and cost-effectiveness. The committee therefore agreed it was appropriate to split this into two separate recommendations, a stronger recommendation for CST and a weaker recommendation for reminiscence. Specifically:</p> <p>"Offer group cognitive stimulation therapy to people living with mild to moderate dementia.</p> <p>Consider group reminiscence therapy for people living with mild to moderate dementia."</p> <p>For the recommendation on treating anxiety and depression, the committee agreed this should remain a 'consider' recommendation for two reasons. First, because the evidence covered a range of different interventions and it was not possible to identify which ones were effective, and secondly because there are cases of more mild depression in which alternatives such as "active monitoring" (recommended in the NICE depression guideline) would be appropriate instead of a psychological intervention.</p>

				<p>whereas despite the growing body of evidence for its effectiveness, the current guidance has opted to move away from the evidence based recommendation of CST and replace this with the option to “consider” the use of CST and Reminiscence, which agreeably has limited supporting evidence for the benefit of this. This is notably distinct from the current guidance on pharmacological treatments which continue to be “recommended”.</p> <p>This tentative use of language also applies to the guidance given for dementia and depression/anxiety, whereby the evidence for psychological treatment is much more robust and indisputable “ For people living with mild to moderate dementia who have mild to moderate depression and /anxiety, consider psychological treatments”</p>	
West London Mental Health NHS Trust	Full	296	5	It is reported on page 296 that “No evidence of benefit [for CST] was found on outcomes other than cognition”. As referred to in comment 1, this is not accurate as there have been a number of studies that have been able to demonstrate significant improvements across a variety of	Thank you for your comment. The committee has reconsidered the evidence base around CST and reminiscence therapy, and come to the conclusion that there were errors in the recommendations made in the draft guideline, both in equating CST and reminiscence therapy, and badging both under the heading of structured group activities. The committee agreed the evidence base was stronger for CST (as a
