1 Introduction

This briefing paper presents a structured overview of potential quality improvement areas for multimorbidity. It provides the committee with a basis for discussing and prioritising quality improvement areas for development into draft quality statements and measures for public consultation.

1.1 Structure

This briefing paper includes a brief description of the topic, a summary of each of the suggested quality improvement areas and supporting information.

If relevant, recommendations selected from the key development source below are included to help the committee in considering potential statements and measures.

1.2 Development source

The key development source referenced in this briefing paper is:

[Multimorbidity: clinical assessment and management](#) (2016) NICE guideline NG56.
No review schedule presented.

2 Overview

2.1 Focus of quality standard

This quality standard covers the clinical assessment, prioritisation and management of health care for adults with 2 or more long-term health conditions (multimorbidity).

2.2 Definition

Multimorbidity is defined as when a person has 2 or more long-term health conditions. At least 1 of these conditions must be a physical health condition.

A long-term condition is 'a condition that cannot, at present, be cured but is controlled by medication and/or other treatment and therapies'¹.

Long-term health conditions include:

- defined physical and mental health conditions such as diabetes or schizophrenia
- ongoing conditions such as learning disability
- symptom complexes such as frailty or chronic pain

¹ Department of Health (2012) [Long-term conditions compendium of Information: 3rd edition](#)

- sensory impairment such as sight or hearing loss
- alcohol and substance misuse.

2.3 Incidence and prevalence

Multimorbidity is common, becomes more common as people age, and is more common in people from less affluent areas. The number of people with comorbidities is set to increase in England from 1.9 million in 2008 to 2.9 million by 2018². A large UK based study found that two-thirds of people aged 65 years or over had multimorbidity, and 47% had 3 or more conditions³. Whereas in older people multimorbidity is largely due to higher rates of physical health conditions, in younger people and people from less affluent areas, multimorbidity is often due to a combination of physical and mental health conditions for example depression.

Many people with multimorbidity will also have frailty, a distinctive health state related to the aging process in which multiple body systems gradually lose their in-built reserves. Around 10% of people aged over 65 years have frailty, rising to between a quarter and a half of those aged over 85 years⁴. Older people living with frailty are at risk of adverse outcomes such as dramatic changes in their physical and mental wellbeing after an apparently minor event which challenges their health, such as an infection or new medication.

2.4 Management

Multimorbidity is associated with reduced quality of life, higher mortality, polypharmacy and high treatment burden, higher rates of adverse drug events, and much greater health services use (including unplanned or emergency care).

For people with multimorbidity, treatment regimens (including non-pharmacological treatments) can easily become very burdensome, and care can become uncoordinated and fragmented. Polypharmacy is often driven by the introduction of multiple medicines intended to prevent future morbidity and mortality. However, the case for using these medicines weakens if life expectancy is reduced by other conditions or frailty. The impact of multimorbidity for healthcare organisation is dependent on which conditions a person has. Groups of conditions that have closely related or concordant treatment, such as diabetes, hypertension and angina, pose fewer problems for coordination than conditions needing quite different treatment (for example, physical and mental health conditions).

² Department of Health (2012) [Long-term conditions compendium of Information: 3rd edition](#)

³ Barnett K, Mercer SW, Norbury M, Watt G, Wyke S, Guthrie B (2012) [Epidemiology of multimorbidity and implications for health care, research, and medical education: a cross-sectional study](#). The Lancet. 380 (9836):37-43

⁴ British Geriatric Society (2014) [Fit for Frailty](#)

Data from the [Health and Social Care Information Centre](#) on medicine utilisation shows that between 2004 and 2014, the average number of prescription items a year for every person in England increased from around 14 to 20. With an ageing population, the use of multiple medicines is increasing.

2.5 *Resource impact assessment*

The resource impact report for NG56 did not anticipate an overall impact on resources following implementation. Initially there may be costs in primary care from longer appointments, optimising treatments and care, and associated training. However, this is expected to be offset by savings from better and more streamlined management of multimorbidity, from fewer unnecessary appointments, fewer medicines prescribed and fewer unplanned hospital admissions.

2.6 *National outcome frameworks*

Tables 1 and 2 show the outcomes, overarching indicators and improvement areas from the frameworks that the quality standard could contribute to achieving.

Table 1 [NHS outcomes framework 2016–17](#)

3 Summary of suggestions

3.1 Responses

In total 13 stakeholders responded to the 2-week engagement exercise 22/09/16 – 06/10/16. 1 stakeholder did not submit areas for quality improvement.

Stakeholders were asked to suggest up to 5 areas for quality improvement. Specialist committee members were also invited to provide suggestions. The responses have been merged and summarised in table 3 for further consideration by the committee.

Full details of all the suggestions provided are given in appendix 2 for information.

3.2 Identification of current practice evidence

Bibliographic databases were searched to identify examples of current practice in UK health and social care settings; 4055 papers were identified for multimorbidity. In addition, 125 papers were suggested by stakeholders at topic engagement and 10 papers internally at project scoping.

Of these papers, 3 have been included in this report. Appendix 1 outlines the search process.

4 Suggested improvement areas

4.1 Identification

4.1.1 Summary of suggestions

Stakeholders suggested use of an appropriate tool to routinely identify people with multimorbidity in primary care who may benefit from a tailored approach to care. This would provide an opportunity to bring together the care people may receive from a variety of services. They felt optimising care may reduce treatment burden, improve quality of life and maximise therapeutic benefit from treatments. Stakeholders reported that this is not yet routine practice.

4.1.2 Selected recommendations from development source

Table 4 below highlights recommendations that have been provisionally selected from the development source that may support potential statement development. These are presented in full after table 4 to help inform the committee’s discussion.

Table 4 Specific areas for quality improvement

Suggested quality improvement area	Suggested source guidance recommendations
Identification	NICE NG56 recommendations 1.2.1, 1.3.1 and 1.3.2

NICE NG56 – Recommendation 1.2.1

Consider an approach to care that takes account of multimorbidity if the person requests it or if any of the following apply:

- they find it difficult to manage their treatments or day-to-day activities
- they receive care and support from multiple services and need additional services
- they have both long-term physical and mental health conditions
- they have frailty or falls
- they frequently seek unplanned or emergency care
- they are prescribed multiple regular medicines.

NICE NG56 – Recommendation 1.3.1

Identify adults who may benefit from an approach to care that takes account of multimorbidity:

- opportunistically during routine care

CONFIDENTIAL

- proactively using electronic health records.

Use the criteria in recommendation 1.2.1 to guide this.

NICE NG56 – Recommendation 1.3.2

Consider using a validated tool such as eFI, PEONY or QAdmissions, if available in primary care electronic health records, to identify adults with multimorbidity who are at risk of adverse events such as unplanned hospital admission or admission to care homes.

4.1.3 Current UK practice

No data on current practice was found related to identification. This area is based on stakeholder's knowledge and experience.

4.2 *Frailty*

4.2.1 Summary of suggestions

Stakeholders highlighted that older people with frailty and multimorbidity are frequently admitted to hospital as unplanned emergency admissions and nursing homes. Stakeholders suggested the identification of people with frailty in primary care using the electronic frailty index and in secondary care so that evidence based interventions can be delivered to improve outcomes. Stakeholders reported that frailty assessment is not well implemented across the country.

4.2.2 Selected recommendations from development source

Table 5 below highlights recommendations that have been provisionally selected from the development source that may support potential statement development. These are presented in full after table 5 to help inform the committee’s discussion.

Table 5 Specific areas for quality improvement

Suggested quality improvement area	Selected source guidance recommendations
Frailty	NICE NG56 recommendations 1.4.1, 1.4.2, 1.4.3, 1.4.4 and 1.4.5

NICE NG56 – Recommendation 1.4.1

Consider assessing frailty in people with multimorbidity.

NICE NG56 – Recommendation 1.4.2

Be cautious about assessing frailty in a person who is acutely unwell.

NICE NG56 – Recommendation 1.4.3

Do not use a physical performance tool to assess frailty in a person who is acutely unwell.

NICE NG56 – Recommendation 1.4.4

When assessing frailty in primary and community care settings, consider using 1 of the following:

- an informal assessment of gait speed (for example, time taken to answer the door, time taken to walk from the waiting room)
- self-reported health status (that is, 'how would you rate your health status on a scale from 0 to 10?', with scores of 6 or less indicating frailty)

CONFIDENTIAL

- a formal assessment of gait speed, with more than 5 seconds to walk 4 metres indicating frailty
- the PRISMA-7 questionnaire, with scores of 3 and above indicating frailty.

NICE NG56 – Recommendation 1.4.5

When assessing frailty in hospital outpatient settings, consider using 1 of the following:

- self-reported health status (that is, 'how would you rate your health status on a scale from 0 to 10?', with scores of 6 or less indicating frailty)
- the 'Timed Up and Go' test, with times of more than 12 seconds indicating frailty
- a formal assessment of gait speed, with more than 5 seconds to walk 4 metres indicating frailty
- the PRISMA-7 questionnaire, with scores of 3 and above indicating frailty
- self-reported physical activity, with frailty indicated by scores of 56 or less for men and 59 or less for women using the Physical Activity Scale for the Elderly.

4.2.3 Current UK practice

No data on current practice was found related to identification of frailty. This area is based on stakeholder's knowledge and experience.

4.3 Assessment

4.3.1 Summary of suggestions

Establishing the effects of health problems and treatment on day-to-day activities

Stakeholders suggested people with multimorbidity should be offered a comprehensive assessment of their physical and mental health and wellbeing to reduce the risk of developing further co-morbidity and deterioration or loss of resilience. Stakeholders reported that anxiety and depression increase morbidity and mortality of long term conditions.

Stakeholders reported this area is not yet widely established as part of clinical practice including having a standardised and consistent approach to assessing disease and treatment burden.

Establishing patient goals, values and priorities

Stakeholders highlighted the assessment should establish patient goals, values and priorities as part of a person-centred, goal-orientated approach to care. Stakeholders reported that although it is a key part of clinical practice it is not applied consistently across healthcare settings.

4.3.2 Selected recommendations from development source

Table 6 below highlights recommendations that have been provisionally selected from the development source that may support potential statement development. These are presented in full after table 6 to help inform the committee’s discussion.

Table 6 Specific areas for quality improvement

Suggested quality improvement area	Selected source guidance recommendations
Establishing the effects of health problems and treatment on day-to-day activities	NICE NG56 recommendations 1.6.3 and 1.6.4
Establishing patient goals, values and priorities	NICE NG56 recommendation 1.6.7

Establishing the effects of health problems and treatment on day-to-day activities

NICE NG56 – Recommendation 1.6.3

CONFIDENTIAL

Establish disease burden by talking to people about how their health problems affect their day-to-day life. Include a discussion of:

- mental health
- how disease burden affects their wellbeing
- how their health problems interact and how this affects quality of life.

NICE NG56 – Recommendation 1.6.4

Establish treatment burden by talking to people about how treatments for their health problems affect their day-to-day life. Include in the discussion:

- the number and type of healthcare appointments a person has and where these take place
- the number and type of medicines a person is taking and how often
- any harms from medicines
- non-pharmacological treatments such as diets, exercise programmes and psychological treatments
- any effects of treatment on their mental health or wellbeing.

Establishing patient goals, values and priorities

NICE NG56 – Recommendation 1.6.7

Encourage people with multimorbidity to clarify what is important to them, including their personal goals, values and priorities. These may include:

- maintaining their independence
- undertaking paid or voluntary work, taking part in social activities and playing an active part in family life
- preventing specific adverse outcomes (for example, stroke)
- reducing harms from medicines
- reducing treatment burden
- lengthening life.

4.3.3 Current UK practice

No data on current practice was found related to assessment. This area is based on stakeholder's knowledge and experience.

4.4 *Reviewing medicines and other treatments*

4.4.1 Summary of suggestions

People with multimorbidity can take a variety of medication and stakeholders reported that poor prescribing and medicine management is a major cause of morbidity and harm because of drug interactions and adverse events. Poor prescribing can also result in an inefficient use of resources.

Stakeholders suggested medicines and other treatments should be reviewed regularly, specifically looking at how they work together. This ensures that the medicines prescribed are working effectively and are the best option which in turn increases adherence to medication and quality of life. In some cases this may lead to the discontinuation of some medication.

Stakeholders highlighted that people with multimorbidity or frailty should be screened in primary care using the STOP/START criteria to identify medicine safety concerns.

4.4.2 Selected recommendations from development source

Table 7 below highlights recommendations that have been provisionally selected from the development source that may support potential statement development. These are presented in full after table 7 to help inform the committee’s discussion.

Table 7 Specific areas for quality improvement

Suggested quality improvement area	Selected source guidance recommendations
Reviewing medicines and other treatments	NICE NG56 recommendations 1.6.9 and 1.6.10

NICE NG56 Recommendation 1.6.9

When reviewing medicines and other treatments, use the [database of treatment effects](#) to find information on:

- the effectiveness of treatments
- the duration of treatment trials
- the populations included in treatment trials.

NICE NG56 Recommendation 1.6.10

Consider using a screening tool (for example, the STOPP/START tool in older people) to identify medicine-related safety concerns and medicines the person might

CONFIDENTIAL

benefit from but is not currently taking. [This recommendation is adapted from the NICE guideline on [medicines optimisation](#)].

4.4.3 Current UK practice

No data on current practice was found related to reviewing medicines and treatments. This area is based on stakeholder's knowledge and experience.

4.5 *Management plan*

4.5.1 Summary of suggestions

Developing a management plan

Stakeholders suggested that people with multimorbidity should have a single individualised management plan that sets out their goals, identifies care and support needs to manage their physical and mental health and wellbeing and includes their preferences for care. They reported that this reduces the risk of developing further comorbidity or deterioration of existing conditions.

Reviewing the management plan

Stakeholders suggested the management plan should be reviewed when necessary and as a minimum every 12 months to ensure that care planning remains relevant and effective for the individual.

The review should involve the person with multimorbidity and their carers. It should give the opportunity to discuss what is working, where changes to the plan need to be made and changes in personal priorities. A proactive review may help prevent the development of new conditions or slow the deterioration of existing conditions.

Stakeholders suggested that the management plan should be consistently documented and available to all relevant healthcare professionals. This will avoid duplication of tests and information and enhance continuity of care

Selected recommendations from development source

Table 8 below highlights recommendations that have been provisionally selected from the development source that may support potential statement development. These are presented in full after table 8 to help inform the committee’s discussion.

Table 8 Specific areas for quality improvement

Suggested quality improvement area	Selected source guidance recommendations
Developing a management plan	NICE NG56 Recommendation 1.6.17
Reviewing the management plan	NICE NG56 Recommendation 1.6.17

NICE NG56 Recommendation 1.6.17

After a discussion of disease and treatment burden and the person's, personal goals, values and priorities, develop and agree an individualised management plan with the person. Agree what will be recorded and what actions will be taken. These could include:

- starting, stopping or changing medicines and non-pharmacological treatments
- prioritising healthcare appointments
- anticipating possible changes to health and wellbeing
- assigning responsibility for coordination of care and ensuring this is communicated to other healthcare professionals and services
- other areas the person considers important to them
- arranging a follow-up and review of decisions made.

Share copies of the management plan in an accessible format with the person and (with the person's permission) other people involved in care (including healthcare professionals, a partner, family members and/or carers).

4.5.2 Current UK practice

No data on current practice was found related to management plans. This area is based on stakeholder's knowledge and experience.

4.6 Additional areas

Summary of suggestions

The improvement areas below were suggested as part of the stakeholder engagement exercise. However they were felt to be either unsuitable for development as quality statements, outside the remit of this particular quality standard referral or require further discussion by the committee to establish potential for statement development.

There will be an opportunity for the committee to discuss these areas at the end of the session on 16 November 2016.

Self-management

Stakeholders suggested supported self-management through structured education and peer support is important for people with multimorbidity to improve their understanding of their condition and control over their daily lives. Self-management programmes were considered as part of the guideline development process but the GDG felt there was not sufficient evidence to recommend their use for people with multimorbidity.

Carer assessment

Stakeholders highlighted that many people with multimorbidity, especially those with frailty, will be supported by carers who in turn may also have multimorbidity. Stakeholders suggested carers health and support needs should be assessed and documented as they're own physical and mental health are at risk of getting worse when providing care for someone with multimorbidity. Carer assessments are covered by the Care Act, as legislation they are outside the remit of quality standards.

Training

Stakeholders suggested training for healthcare professionals in recognising the prognostic indicators for approaching end of life in multimorbidity. This area is covered by the end of life care quality standard and the care of the dying adult in the last days of life quality standard. Stakeholders also suggested training for staff to provide coaching techniques to support behaviour change and self-management. Training is outside of the remit of quality standards.

Integrated personalised commissioning

Stakeholders highlighted that integrated personalised commissioning is beginning to achieve success in joining up health and social care provision around the needs of an individual at a local level. It is focused on those with the highest levels of need,

CONFIDENTIAL

including those with multimorbidity. Commissioning models are outside of the remit of quality standards.

Comprehensive geriatric assessment

Stakeholders suggested a comprehensive geriatric assessment for all frail aged over 75 years in secondary care which involves a holistic, multidimensional, interdisciplinary assessment of an individual by a number of specialists of many disciplines. This assessment can improve outcomes by increasing independence and reducing mortality. Comprehensive geriatric assessment is covered by the Transition from inpatient to care settings quality standard which contains the following draft statement 'Older people with complex needs have a comprehensive geriatric assessment started at the point of admission to hospital'.

Shared decision making

Stakeholders suggested that shared-decision making through the provision of clear, accurate, evidence-based, easy to use information can lead to a positive experience of care and improve clinical outcomes. Shared decision making is covered by [QS15 patient experience in adult NHS services](#) statement 6 and [QS120 Medicines optimisation](#) statement 1.

Surgical care

Stakeholders highlighted the people with multimorbidities are more likely to suffer complications and death following surgery. Multimorbidity management for example exercise training, nutrition support, smoking and alcohol cessation through preoperative clinics can improve clinical outcomes. This area is outside the scope of this quality standard and may be considered in future quality standard on perioperative care.

Access to services

Stakeholders suggested that people with co-occurring conditions are often unable to access the care they need for example those who are not mentally unwell enough to meet the thresholds for mental health services are also excluded from lower threshold mental health services. At the most severe end of the mental health spectrum, it is common to hear of people being excluded from adult mental health services because of co-occurring alcohol/drug use. Stakeholders also highlighted that people with mild to moderate learning disabilities have a high level of physical morbidity and there is variation in adjustments services make for these people. This area is outside the scope of this quality standard.

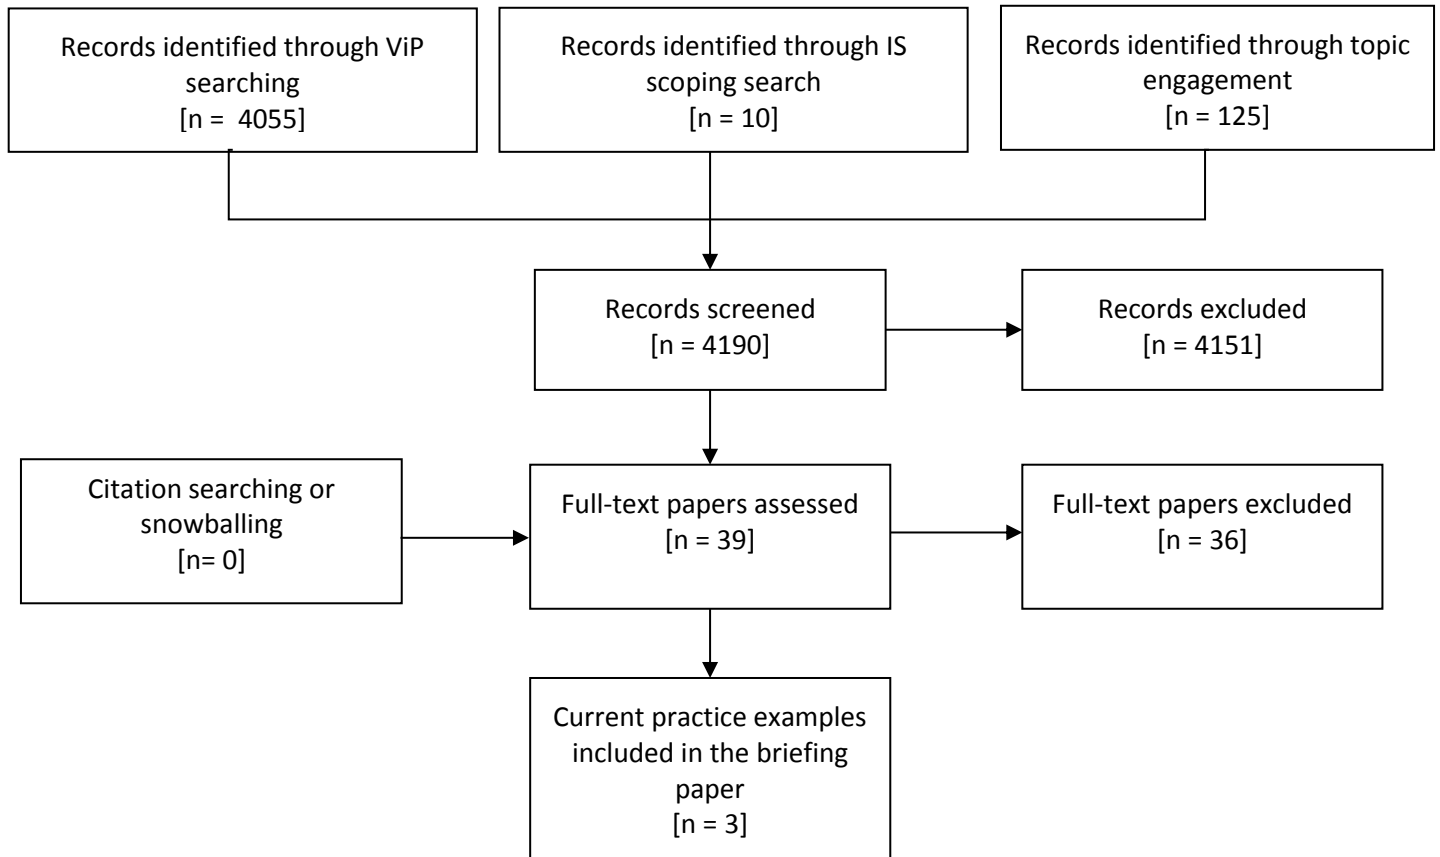

Outcomes

Stakeholders suggested that for people with multimorbidity use of unscheduled care and patient satisfaction are important outcomes. Multimorbidity was identified as one

CONFIDENTIAL

of several drivers in the use of unscheduled care in people with long term conditions. This area will be considered as part of the overarching outcomes the quality standard is aiming to achieve.

1	Pfizer Ltd	Pfizer have no additional comments to add to this consultation.			
2	Public Health England	Particular risks around multimorbidity which includes co-occurring mental health and alcohol/drug use conditions	<p>Prevalence and harm</p> <p>Alcohol and drug dependence is common among people with mental health problems and the relationship between the two is complex. Research indicates that up to 70% of people in drug services and 86% of alcohol services users experienced mental health problems (Weaver et al (2003) Comorbidity of substance misuse and mental illness in community mental health and substance misuse services. The British Journal of Psychiatry Sep 2003, 183 (4) 304-313).</p>	<p>Other evidence from research, national data and population surveys paints a picture of very high levels of need and associated health harms including:</p> <p>Evidence from children and young people’s alcohol and drug treatment data which shows high levels of self-harm, domestic violence and sexual exploitation among children and young people, with very low referral rates from mental health treatment into alcohol and drug treatment (Public Health England (2015) Young people’s statistics from the National Drug Treatment Monitoring System (NDTMS) 1 April 2014 to 31 March 2015).</p> <p>The national confidential enquiry into suicide and homicide by people with mental illness found that suicides among patients with a history of alcohol or drug misuse (or both) accounted for 54% of the total sample, an average of 671 deaths per year (The National Confidential Inquiry into Suicide and Homicide by People with Mental Illness Annual Report 2015: England, Northern</p>	

ID	Stakeholder	Suggested key area for quality improvement	Why is this important?	Why is this a key area for quality improvement?	Supporting information
				<p>Ireland, Scotland and Wales July 2015. University of Manchester). Other evidence shows that alcohol use disorder is an important predictor of suicide/premature death (Darvishi, Farhadi, Haghtalab, & Poorolajal, 2015).</p> <p>Co-occurring alcohol use with mental health issues featured prominently in hospital admissions data - of mental health crisis related admissions to acute hospital via A&E in 2012/13, 20% were due to alcohol use (the second highest proportion after self-harm and undetermined injury) (Care Quality Commission (2015) Right here, right now - http://www.cqc.org.uk/sites/default/files/20150611_righthere_mhcrisiscare_summary_3.pdf).</p> <p>A high prevalence among prison populations with the 2009 Bradley report (The Bradley Commission (2009) the Bradley Report http://webarchive.nationalarchives.gov.uk/20130107105354/http://www.dh.gov.uk/prod_consum_dh/groups/dh_digitalassets/documents/digitalasset/dh_098698.pdf) recognising that co-occurring mental health and alcohol/drug use conditions are the norm rather than the exception among most</p>	

ID	Stakeholder	Suggested key area for quality improvement	Why is this important?	Why is this a key area for quality improvement?	Supporting information
				<p>offenders. Prisoners with addiction issues are also at increased risk of self-harm and suicide (The National Confidential Inquiry into Suicide and Homicide by People with Mental Illness Annual Report 2015: England, Northern Ireland, Scotland and Wales July 2015. University of Manchester).</p> <p>Data collected from trial sites commissioned by NHSE under the Liaison and Diversion Programme showed that over 55% of service users identified in with mental health needs also had problem with either drug misuse, alcohol misuse or both. Amongst those with alcohol misuse issues, over three-quarters also suffered a mental health problem. In the case of people with other substance misuse, the percentage who also demonstrated mental health needs was even higher at 79%.</p> <p>The ‘Making Every Adult Matter’ (MEAM) coalition commissioned a report looking at severe and multiple disadvantage in England (Langkelly Chase Foundation (2015) Hard Edges – mapping severe and multiple disadvantage in England). It found that of an estimated 58, 000 people nationally experiencing the most severe and multiple disadvantage (substance misuse, homelessness and criminal justice</p>	

ID	Stakeholder	Suggested key area for quality improvement	Why is this important?	Why is this a key area for quality improvement?	Supporting information
				<p>involvement), over half (55%) had a diagnosed mental health condition and nearly all (92%) had a self-reported mental health problem.</p> <p>There is a growing body of research which describes the use of substances by women to cope with the psychological and physical harm resulting from their experiences of violence (Gilchrist, G, Blazquez, A, Torrens, M (2011) Psychiatric, Behavioural and Social Risk Factors for HIV Infection Among Female Drug Users. AIDS AND BEHAVIOR, Vol. 15, No. 8, 11.2011, p. 1834-1843 and Humphreys, C, Regan, L, River, D and Thiara, R (2005) domestic violence and substance use: tackling complexity. British Journal of Social Work (2005), 1 of 18).</p> <p>Both alcohol and drug misuse and mental health problems are associated with considerable physical morbidity and premature mortality (15-20 years in people with mental health problems and 9-17 years in those with alcohol and drug misuse disorders) compared to national norms (Hayes R, Chang, C, Fernandes A, Broadbent M, Lee W, Hotopf M, Stewart R. Associations between substance use disorder sub-groups, life expectancy and all-cause mortality in a large British specialist</p>	

ID	Stakeholder	Suggested key area for quality improvement	Why is this important?	Why is this a key area for quality improvement?	Supporting information
				<p>mental healthcare service. Drug and Alcohol Dependence, 2011 vol. 116 issue 1).</p> <p>People with mental health problems are more likely to smoke and it is the single largest contributor to their 10-20 year reduced life expectancy. A recent UK study highlighted that men and women living with schizophrenia in the community have a 20.5 and 16.4 year reduced life expectancy respectively (Brown S, Kim M, Mitchell C et al (2010) Twenty-five year mortality of a community cohort with schizophrenia. British Journal of Psychiatry, 196, 116-121).</p> <p>A third (33%) of people with mental health problems and more than two thirds (70%) of people in psychiatric units smoke tobacco. Reductions in smoking rates in the general population over the last 20 years have not been matched by these mental health populations (Royal College of Physicians and Royal College of Psychiatrists (2013) Smoking and Mental Health. A joint report by the Royal College of Physicians and Royal College of Psychiatrists. https://cdn.shopify.com/s/files/1/0924/4392/files/smoking_and_mental_health_-_full_report_web.pdf?7537870595093585378).</p>	

ID	Stakeholder	Suggested key area for quality improvement	Why is this important?	Why is this a key area for quality improvement?	Supporting information
				<p>Tobacco smoking is highly prevalent in drug and alcohol users and a significant contributor to illness and death. Many people may recover from their drug or alcohol dependence only to later die of their continued and untreated tobacco dependence (Hurt et al (1996) Mortality following inpatient addictions treatment. Journal of the American Medical Association: JAMA 275:1097–1103).</p>	
3	Royal College of Physicians	<p>The RCP is grateful for the opportunity to respond to the above consultation. We would like to endorse the response submitted by the British Geriatrics Society.</p>			
4	National Community Hearing Association	<p>Key area for quality improvement 1</p>	<p>Hearing loss should be specifically mentioned as an example of a long-term condition in the quality standard, and not grouped under sensory impairment.</p> <p>This is important because awareness of the impact and prevalence of hearing loss is poor and whenever grouped under sensory impairment hearing loss is overlooked. This has been accepted by NICE before, e.g. NICE Quality Standard 50 states that undiagnosed hearing loss remains a significant issue, especially in care homes.</p>	<p>NICE has previously recognised the importance of hearing as a long-term condition. The primary source for this consultation, NG 56, note that:</p> <p>“1.1 General principles</p> <p>1.1.1 Be aware that multimorbidity refers to the presence of 2 or more long-term health conditions, which can include: defined physical and mental health conditions such as diabetes or schizophrenia ongoing conditions such as learning disability symptom complexes such as frailty or chronic pain sensory impairment such as sight or hearing loss” (p. 5).</p>	<p>Scale of the challenge 9 million people in England have a hearing loss and this will increase as the population grows older[i]. Adult hearing loss is the third most common long-term condition and the 6th leading cause of years lived with disability in England[ii]. Age-related hearing loss is the main cause of hearing loss, accounting for nine out of ten cases of hearing loss. This means that the majority of older people with multimorbidities will have hearing loss in</p>

ID	Stakeholder	Suggested key area for quality improvement	Why is this important?	Why is this a key area for quality improvement?	Supporting information
				<p>This should be mirrored in the Multimorbidity quality standard.</p>	<p>addition to another long-term condition – e.g. seven out of ten 70 year olds have hearing loss and this increase to nine out of ten people over the age of 80.</p> <p>Impact Unsupported hearing loss is correlated with increased risk of depression[iii], social isolation[iv], premature retirement[v], reduced quality of life[vi], loneliness[vii] and cognitive decline[viii]. Unsupported hearing loss – as other NICE guidelines state – can also have a negative impact on medicine adherence and health and wellbeing in older people.</p> <p>Benefits of intervention Hearing intervention and ongoing support improves quality of life by reducing the psychological and</p>

ID	Stakeholder	Suggested key area for quality improvement	Why is this important?	Why is this a key area for quality improvement?	Supporting information
					social effects associated with hearing loss[x]. Early intervention can also reduce pressure on health and social services by reducing the risks associated with unsupported hearing loss[x].
5	SCM2	Delivering an approach to care that takes account of multimorbidity	Recommended within NICE Multimorbidity guidance.	Although likely an intrinsic component of primary and secondary care practice in the UK, systems of care and incentivisation schemes (e.g. QOF) are not necessarily aligned with approaches to care that take account of multimorbidity.	
Identification					
6	NHS England	Proactive identification: Find (and code) the most vulnerable patients or those with most need: people with multiple LTCs including frailty and dementia, where these present significant problems to everyday functioning, or where the management of their care has become burdensome to the patient, or who are likely	Finding a target population of people who would then benefit from proactive intervention to improve key outcomes is demonstrated to reduce risk of hospital admission, falls and care home admission. Complex interventions can help older people in the identified risk groups to live safely and independently, and could be tailored to meet individuals' needs and preferences. In one large meta-analysis:	In 2016 the National audit Office reported an 18% increase in emergency admissions of older people between 2010/11 and 2014/15 with 2.7 million bed days occupied by older people no longer needing acute care. The NAO made the following recommendation: with the increase in numbers of older patients, it is critical for health and social care providers to work together to minimise the length of time that such patients spend in hospital. This will be through a combination of admitting only those older people who really need treatment in hospital.	Identification and population prevalence of frailty: the Electronic Frailty Index (eFI) uses routine data (GP read codes) to identify older people with mild, moderate and severe frailty, with robust predictive validity for outcomes of mortality, hospitalisation and nursing home admission (Clegg[1]) Routine implementation of the eFI can enable

ID	Stakeholder	Suggested key area for quality improvement	Why is this important?	Why is this a key area for quality improvement?	Supporting information
		<p>to be within the final year of life and/or whose care involves a number of services working in an uncoordinated way – use of the electronic frailty index (eFI)</p>	<p>Interventions reduced the risk of not living at home (relative risk [RR] 0.95, 95% CI 0.93–0.97). Interventions reduced nursing-home admissions (0.87, 0.83–0.90), but not death (1.00, 0.97–1.02). Risk of hospital admissions (0.94, 0.91–0.97) and falls (0.90, 0.86–0.95) were reduced, and physical function (standardised mean difference –0.08, –0.11 to –0.06) was better in the intervention groups than in other groups. http://www.thelancet.com/pdfs/journals/lancet/PIIS0140673608603426.pdf</p>	<p>With escalating number of older people presenting to urgent care and rising numbers of admissions the proactive identification of those most at risk through the eFI, followed by tailored care planning to reduce the likelihood of requiring hospital care, will help to reduce this burden on acute care systems and unwarranted bed occupancy.</p>	<p>delivery of evidence-based interventions to improve outcomes. The overall prevalence of frailty in the 60+ population is 14% rising exponentially with age (Gale[2])</p> <p>Impact of End of Life Care: 500,000 people die every year with huge variation in outcomes and experience. Typically palliative care registers identify people with terminal cancer whereas other life-limiting illnesses are forgotten. Whilst the proportion of people dying at home or in care homes continues to increase, 25% hospital beds are still occupied by people who are dying. Patients with an Electronic Palliative Care Co-ordination System (EPaCCS) record and those receiving palliative care services such as hospice at home, Gold Standards Framework or</p>

					British Geriatrics Society- Fit for Frailty http://www.bgs.org.uk/campaigns/fff/fff_full.pdf
13	SCM1	Identification of people with frailty	Linked closely with multimorbidity and poorer outcomes	There is no standard method of identifying frailty in primary or secondary care. Identifying, recording and monitoring frailty scores will allow active management of multimorbidity aligned with frailty issues which optimises clinician driven patient centred holistic care	Emerging evidence for primary care suggests that electronic tools may support identification of patients to allow optimised management. In secondary care use of tools is sporadic and not standardised.
14	SCM2	Assessment of frailty	Consideration of frailty assessment is recommended as part of NICE Multimorbidity guidance.	Frailty assessment is not well implemented across the UK.	British Geriatrics Society/RCGP/Age UK Fit for Frailty Guideline
15	SCM4	Appropriate use of frailty assessment in primary and secondary care	Frailty has strong impacts on outcomes, and assessing it can be quite easy, as outlined in the guideline. Should encourage GPs and Geriatricians to actually assess frailty, especially in older multimorbid patients (and may be appropriate in younger ones too)	Not aware of any systematic attempt to assess and identify frailty, and it may lead to better identifying those at risk of particularly negative outcomes, including worse results for common adverse events.	
Assessment – Establishing disease and treatment burden					
16	NHS England	Assessment: Ensure this cohort are offered a suitably modified	There is evidence to support comprehensive geriatric assessment for targeted	Targeted assessment is required to trigger care planning as described above.	This would involve ensuring an annual falls assessment and

ID	Stakeholder	Suggested key area for quality improvement	Why is this important?	Why is this a key area for quality improvement?	Supporting information
		<p>comprehensive and structured assessment of their physical and mental health and wellbeing to reduce the risk of developing further co-morbidity, deterioration or loss of resilience (e.g. CGA) and undertake a care planning discussion. Identify any carers and signpost for a carers assessment.</p> <p>Widespread adoption of Patient Activation Measure (PAM) tool would provide an understanding of the capacity of an individual to manage their own health and care and enable a tailored package of support to be developed to increase an individual's activation level (confidence, knowledge and skills) to manage their own health and care.</p>	<p>assessment of individuals at risk with key benefits to health and wellbeing. For example:</p> <p>In one RCT a single outpatient comprehensive geriatric assessment coupled with an adherence intervention can prevent functional and health-related quality-of-life decline among community-dwelling older persons who have specific geriatric conditions.</p> <p>http://onlinelibrary.wiley.com/doi/10.1111/j.1532-5415.1999.tb02988.x/full</p> <p>Similarly a Cochrane evidence review demonstrated that Comprehensive Geriatric Assessment increases a patient's likelihood of being alive and in their own home at up to 12 months.</p> <p>http://onlinelibrary.wiley.com/doi/10.1002/14651858.CD006211.pub2/full</p> <p>Value of understanding activation</p>		<p>medication review, and appropriate, a cognitive review (dementia assessment). The reviews can be done by any qualified practitioner.</p> <p>Since 2014, NHS England has been supporting a PAM Learning Set of 5 CCGs and the UK Renal Registry have been carrying out projects in their local areas to measure patient activation and find ways to support people to become more involved in their health and care. The various organisations are using PAM for people with LTCs such as diabetes, COPD, chronic kidney disease, mental health, chronic heart failure and rheumatoid arthritis among others.</p> <p>The University of Leicester, carrying out the independent qualitative</p>

ID	Stakeholder	Suggested key area for quality improvement	Why is this important?	Why is this a key area for quality improvement?	Supporting information
			<p>levels. PAM: Evidence shows that people at higher levels of activation tend to experience better health, have better health outcomes and fewer episodes of emergency care, and engage in healthier behaviours (such as those correlated to smoking and obesity). On the other hand, patients with lower activation have low confidence in their ability to have an impact on their health and often feel overwhelmed with the task of managing their health. Further information: http://www.kingsfund.org.uk/sites/files/kf/field/field_publication_file/supporting-people-manage-health-patient-activation-may14.pdf A study by Hibbard et al estimated that between 25 and 40 percent of the population have low levels of activation (levels 1 and 2). These people are unlikely to respond to opportunities to improve their health through self-management. They do not understand their role in care process and have limited problem solving skills. As a result, they engage less with preventative</p>		<p>evaluation of the learning set, have found that using the PAM as a tailoring tool encourages the provision of proactive system support for people with long-term conditions to develop the skills, knowledge and confidence to manage health and keep well at home. For example, one GP practice in Sheffield has redesigned their diabetes review process through offering longer appointments using the PAM to tailor discussion according the individual's level of activation. As a quantifiable measure, PAM can be used at scale and to assess whether the services/interventions are providing effective and tailored support to people's needs. For example, Horsham and Mid Sussex CCG's tailored health coaching service used PAM to tailor their</p>

20	Royal College of Psychiatrists	<p>Multi-morbidity and unrecognised somatoform disorder</p> <p>Assessment of evidence for multiple physical co-morbidities and of any mental health disorder in people who present frequently to health services.</p>	<p>About 20% of physical presentations to secondary care are not explained by organic disease. For patients with recurrent presentations, their symptoms may be explained by an underlying mental health disorder, especially somatoform disorder (sometimes referred to as medically unexplained symptoms). Identification of underlying mental disorders is recognised to be highly variable and generally poor, amongst physical health specialists and, if somatoform disorder is recognised, resources for treatment are generally lacking due to limited out-patient resource</p>	<p>Unrecognised somatoform disorder results in patients enduring a series of investigations and admissions with negative results or identifying pathology that does not fully explain their disability. This prevents them from receiving appropriate treatment as well as incurring much avoidable cost for the NHS. Organic disease is not mutually exclusive, and will co-exist with somatoform disorder in the most complex cases to manage. Asthma, irritable bowel syndrome and migraine are some of the most common diagnoses in patients who also have a severe somatoform disorder. Treatment of exacerbations of symptoms in line with the underlying physical diagnosis will increase disability unnecessarily if it is not recognised that the exacerbation is largely due to the co-morbid somatoform disorder.</p>	<p>Reid et al (2001) found that 21% of hospital out-patient appointments for those most frequently referred, resulted in lack of diagnosis for symptoms, most commonly with abdominal pain, headache, back pain or chest pain where up to 70% of symptoms remained medically unexplained. Reid et al (2002) found people presenting frequently who had at least two symptoms fully explained by physical disease accounted for disproportionate costs.</p>

		<p>delivery)</p> <p>It should achieve key identified positive system outcomes (optimised use of key resources (urgent and emergency care, primary care)</p>			
33	Parkinson's UK	More discussion around advanced care planning	<p>As Parkinson's is a condition which is always degenerative, it is vital that people with Parkinson's and other comorbidities have health and social care services which increase in-step with their needs.</p> <p>Research conducted by Sheffield Hallam University on behalf of Parkinson's UK found that people with the condition were often unaware of social care and the associated psychological and mental health support services that it can offer, and in many cases only accessed care at 'crisis point' – when their independence was at significant risk.</p> <p>The research therefore recommended an 'anticipatory' approach to social care planning,</p>	<p>The Parkinson's UK audit (2015) highlighted anticipatory care planning is something that needs to improve. In the audit, of those people with Parkinson's who had signs of advanced symptoms (such as dementia, increasing frailty, impaired swallowing, nursing home level of care) discussions about end of life care issues and advice about lasting power of attorney was recorded in only around 28% and 26% of cases, respectively.</p> <p>https://www.parkinsons.org.uk/sites/default/files/audit2015_patientandcarerreport.pdf</p> <p>Numerous sources including Palliative care and end-of-life planning in Parkinson's disease by J Neural Transm and The conceptual framework of palliative care applied to advanced Parkinson's disease Parkinsonism and Related Disorders by Ghoche R (2012) show that people with neurological conditions including Parkinson's are much less likely to have</p>	<p>Resources: Thinking about advanced Parkinson's https://www.parkinsons.org.uk/news/28-october-2014/new-advanced-parkinsons-booklet-available</p> <p>Resource: Arranging the right end of life care: https://www.parkinsons.org.uk/content/arranging-right-end-life-care</p> <p>Harrison N, Cavers D, Campbell C, Murray SA. 			<p>with support that escalates in-step with a person’s growing care needs. An anticipatory approach to care planning which recognises that people with degenerative neurological conditions are likely to have increasing needs for psychological support as their condition progresses can therefore reduce hospital and GP visits and better support individuals to manage their own mental health and maintain their independence for longer.</p> <p>Furthermore, many of the mental and physical symptoms of Parkinson’s can mean people will be unable to express their end of life wishes as the condition becomes more advanced. As many people with Parkinson’s live with multimorbidities, they may have several more complicating factors which prevent them from expressing their wishes.</p> <p>This quality standard must reflect the importance of people with multimorbidities being given</p>	<p>opportunities to take part in advance care planning, or to receive specialist palliative care and end-of-life support than people with other long term conditions such as cancer.</p>	<p>Royal College of Physicians, National Council for Palliative Care, British Society of Rehabilitation Medicine.(2008) Long-term neurological conditions: management at the interface between neurology, rehabilitation and palliative care. 37	Royal College of General Practitioners	<p>Patients are provided with systematic follow up after a collaborative care and support planning consultation.</p> <p>It is important to find ways to measure continuity of care in general practice effectively to ensure standards are maintained. The measures should be ‘real time’ and be able to be bolted on to the GP medical records systems.</p>	<p>This provides people and their carers and family with the opportunity to consider what is working or isn’t, if more support is needed, if new goals need to be agreed.</p> <p>There is a fear that a move towards delivering general practice at scale could jeopardise continuity of care. It is also possible that measures to improve access to care will prioritise timeliness of care to the detriment of quality and continuity. This may result in poorer quality of care for patients with multimorbidity.</p>	<p>Due to capacity and lack of time this part of the process can be forgotten. It is also important that this is a continuous process and people receive the necessary support to enable them to continue to address the issues that are important to them, to ensure ongoing health and wellbeing and to identify any deterioration early, thereby preventing an unplanned admission and improving patient experience and satisfaction.</p>	

ID	Stakeholder	Suggested key area for quality improvement	Why is this important?	Why is this a key area for quality improvement?	Supporting information
38	Royal College of General Practitioners	<p>Continuity of care</p> <p>Patients with multimorbidity are proactively invited for a collaborative care and support planning consultation at least annually or more frequently as the level of complexity increases.</p>	<p>Taking a proactive approach to the care of people with multimorbidity will help to prevent the development of new conditions as well as slow the deterioration of pre-existing conditions. Care has traditionally been reactive and thus has failed to prevent deterioration.</p> <p>People with multimorbidity have complex needs which are best met by developing a long-term relationship with their GP and practice nurses who, over time, can become familiar with their priorities.</p> <p>This will support optimal continuity and co-ordination of care for patients with complex care needs.</p>	<p>Robust call and recall systems for patients with multimorbidity to have a collaborative care and support planning consultation, rather than a single disease specific review, need to be introduced. This should incorporate a systematic overview of the process by MDTs. This means patients are less likely to be lost to follow up and so are more likely to receive all care components required to deliver all quality standards. This in turn will prevent deterioration, reduce admission, improve self-resilience and improve patient experience.</p> <p>This measure will reduce the burden on patients and their family of telling their story multiple times. It will also reassure patients and families that they are getting best possible care from professionals that know about them, their conditions and their care preferences.</p>

44	Older People's Advocacy Alliance (OPAAL) UK	The offer of appropriate independent peer advocacy support to older people with multi-morbidities who are also carers, especially those caring for people with dementia.	Evidence indicates that carers are at risk of depression and dementia themselves through lack of stimulation. Existing multi-morbidities will be adversely affected by either/both of these additional conditions.	A study explored the change in social support of carers and people with dementia compared with a healthy older population. It was found that carers of people with dementia experience loss of social support four times greater than the healthy older population. These findings suggest that carers and people with dementia are suffering from the effects of a lack of social support far more pronounced than in the general older population. Isolation and increased negative interactions might speed up deterioration associated with dementia,	Please see Social Isolation Resulting from Stigma in Dementia by Brigitta Schwartz 2010
