Introduction and overview

Introduction

Most women who are pregnant in the UK will have an uncomplicated pregnancy, giving birth to a healthy baby at full term. However, problems during pregnancy (such as miscarriage, fetal growth restriction and preterm birth) remain common, and stillbirth rates have changed little in recent years. Maternal complications such as depression, thromboembolism, haemorrhage and sepsis are also still encountered, with the most extreme cases contributing to a UK maternal mortality rate of around 11 per 100,000 maternities (2006–2008 data; Centre for Maternal and Child Enquiries’ eighth report on confidential enquiries into maternal deaths in the United Kingdom, 2011).

Adverse outcomes of pregnancy are sometimes unpredictable events, but can also be associated with risk factors such as obesity, smoking, diabetes, hypertension, substance misuse or domestic abuse. The aims of antenatal care are to optimise maternal and fetal health, to offer women maternal and fetal screening, to make medical or social interventions available to women where indicated, to improve women’s experience of pregnancy and birth and to prepare women for motherhood whatever their risk status.

This quality standard describes markers of high-quality, cost-effective care that, when delivered collectively, should contribute to improving the effectiveness, safety and experience of care for pregnant women in the following ways:

- Preventing people from dying prematurely.
- Ensuring that people have a positive experience of care.
- Treating and caring for people in a safe environment and protecting them from avoidable harm.

These overarching outcomes are from The NHS Outcomes Framework 2012 to 2013.
The quality standard is also expected to contribute to the following overarching outcome(s) from the Public Health Outcomes Framework 2013 to 2016:

- Health improvement.
- Healthcare public health and preventing premature mortality.

Overview

The quality standard for antenatal care requires that services should be commissioned from and coordinated across all relevant agencies encompassing the antenatal care part of the maternity pathway. An integrated approach to provision of services is fundamental to the delivery of high quality care to pregnant women.

The theme of this quality standard is that pregnancy is a normal physiological process. Women should have the opportunity to make informed decisions about their care and treatment based on the current available evidence, in partnership with healthcare professionals.

This quality standard covers the antenatal care of all pregnant women up to 42 weeks of pregnancy, in all settings that provide routine antenatal care, including primary, community and hospital-based care. The quality standard addresses routine antenatal care, including screening tests for complications of pregnancy, but it does not address the additional care needed to manage these complications if they arise in pregnancy (for example, gestational diabetes, pre-eclampsia and venous thromboembolism).

This quality standard forms part of a suite of maternity quality standards, of which antenatal care, intrapartum care and postnatal care will form the core pathway. The full set of quality standards, including all the maternity quality standards, that should be considered when commissioning and providing high quality maternity services are listed in related NICE quality standards.
List of quality statements

Statement 1 Pregnant women are supported to access antenatal care, ideally by 10 weeks 0 days.

Statement 2 Pregnant women are cared for by a named midwife throughout their pregnancy.

Statement 3 Pregnant women have a complete record of the minimum set of antenatal test results in their hand-held maternity notes.

Statement 4 Pregnant women with a body mass index of 30 kg/m² or more at the booking appointment are offered personalised advice from an appropriately trained person on healthy eating and physical activity.

Statement 5 Pregnant women who smoke are referred to an evidence-based stop smoking service at the booking appointment.

Statement 6 Pregnant women are offered testing for gestational diabetes if they are identified as at risk of gestational diabetes at the booking appointment.

Statement 7 Risk assessment – pre-eclampsia. This statement has been removed. For more details see update information.

Statement 8 Pregnant women at intermediate risk of venous thromboembolism at the booking appointment have specialist advice provided about their care.

Statement 9 Pregnant women at high risk of venous thromboembolism at the booking appointment are referred to a specialist service.

Statement 10 Pregnant women are offered fetal anomaly screening in accordance with current UK National Screening Committee programmes.

Statement 11 Pregnant women with an uncomplicated singleton breech presentation at 36 weeks or later (until labour begins) are offered external cephalic version.

Statement 12 Nulliparous pregnant women are offered a vaginal examination for membrane sweeping at their 40- and 41-week antenatal appointments, and parous pregnant women are offered this at their 41-week appointment.
Quality statement 1: Services – access to antenatal care

Quality statement

Pregnant women are supported to access antenatal care, ideally by 10 weeks 0 days.

Quality measure

Structure

a) Evidence of local services that ensure antenatal care is readily and easily accessible.

Data source: Local data collection. The baseline assessment tool for NICE's guideline on pregnancy and complex social factors can be used to assess current activity related to recording information for women presenting to antenatal care with complex social needs to inform mapping of the local population and to guide service provision.

b) Evidence of local arrangements to encourage pregnant women to access and maintain contact with antenatal care services.

Data source: Local data collection. The baseline assessment tool for NICE's guideline on pregnancy and complex social factors can be used to assess current activity related to recording information for women presenting to antenatal care with complex social needs to inform mapping of the local population and to guide service provision.

Process

Proportion of pregnant women missing a scheduled antenatal appointment who are followed up within locally defined timescales.

Numerator – the number of women in the denominator followed up within locally defined timescales.

Denominator – the number of pregnant women missing a scheduled antenatal appointment.
Data source: Local data collection.

Outcome

a) Pregnant women accessing antenatal care who are seen for booking by 10 weeks 0 days.

**Data source:** The [NHS Digital Maternity Services Dataset](https://www.england.nhs.uk/maternity/) collects data on booking appointment dates and estimated dates of delivery. The [Care Quality Commission Maternity Services Survey](https://www.england.nhs.uk/maternity/) asks the question 'Roughly how many weeks pregnant were you when you had your 'booking' appointment (the appointment where you were given your pregnancy notes?)'.

b) Pregnant women accessing antenatal care who are seen for booking by 12 weeks 6 days.

**Data source:** The [NHS Digital Maternity Services Dataset](https://www.england.nhs.uk/maternity/) collects data on booking appointment dates and estimated dates of delivery. The [Care Quality Commission Maternity Services Survey](https://www.england.nhs.uk/maternity/) asks the question 'Roughly how many weeks pregnant were you when you had your 'booking' appointment (the appointment where you were given your pregnancy notes?)'. The [NHS England Integrated Performance Measure Access to Midwifery](https://www.england.nhs.uk/maternity/) is a collection of data to monitor women seen by a midwife or maternity health professional. This includes a national performance measure on the 'percentage of women who have seen a midwife or a maternity healthcare professional for health and social care assessment of needs, risks and choices by 12 weeks and 6 days'. This is monitored by the Department of Health and Social Care on a quarterly basis.

c) Pregnant women accessing antenatal care who are seen for booking by 20 weeks 0 days.

**Data source:** The [NHS Digital Maternity Services Dataset](https://www.england.nhs.uk/maternity/) collects data on booking appointment dates and estimated dates of delivery. The [Care Quality Commission Maternity Services Survey](https://www.england.nhs.uk/maternity/) asks the question 'Roughly how many weeks pregnant were you when you had your 'booking' appointment (the appointment where you were given your pregnancy notes?)'.

d) Median gestation at booking.

**Data source:** The [NHS Digital Maternity Services Dataset](https://www.england.nhs.uk/maternity/) collects data on booking appointment dates and estimated dates of delivery. The [Care Quality Commission Maternity Services Survey](https://www.england.nhs.uk/maternity/) asks the question 'Roughly how many weeks pregnant were you when you had your 'booking' appointment (the appointment where you were given your pregnancy notes?)'.

e) Pregnant women accessing antenatal care attend at least the recommended number of antenatal
appointments.

Data source: The NHS Digital Maternity Services Secondary Uses Dataset collects data on the date of attendance at an antenatal appointment (excluding first contact and booking).

What the quality statement means for different audiences

Service providers ensure that systems are in place to support pregnant women to access antenatal care, ideally by 10 weeks 0 days.

Health and social care professionals support pregnant women to access antenatal care, ideally by 10 weeks 0 days. This includes following up women who have missed a scheduled antenatal appointment.

Commissioners ensure they commission services that are readily and easily accessible and that support pregnant women to access antenatal care, ideally by 10 weeks 0 days.

Pregnant women are encouraged to see a healthcare professional about their pregnancy as early as possible and have regular check-ups from their midwife or doctor throughout their pregnancy (antenatal care). This may include being contacted by their midwife or doctor if they miss a check-up.

Source guidance

- Antenatal care for uncomplicated pregnancies. NICE guideline CG62 (2008), recommendations 1.1.1.1, 1.2.3.1, 1.2.5.1 and 1.6.3.3, and appendix D (antenatal appointments)

- Pregnancy and complex social factors: a model for service provision for pregnant women with complex social factors. NICE guideline CG110 (2010), recommendations 1.1.1, 1.1.2 (key priorities for implementation) and 1.2.8

Definitions

NICE full guideline on antenatal care for uncomplicated pregnancies acknowledges that the ‘booking appointment’ needs to be earlier in pregnancy (ideally by 10 weeks) than may have traditionally occurred.
NICE's guideline on antenatal care for uncomplicated pregnancies recommends that the schedule of antenatal appointments is determined by the woman's needs. For a woman who is nulliparous with an uncomplicated pregnancy, a schedule of 10 appointments should be adequate. For a woman who is parous with an uncomplicated pregnancy, a schedule of 7 appointments should be adequate.

Follow-up after a missed appointment may be undertaken by the maternity service or other community-based service the woman is in contact with, such as a children's centre, addiction service or GP. Follow-up should be via a method of contact that is appropriate to the woman, which may include:

- text message
- letter
- telephone
- community or home visit.

Equality and diversity considerations

Pregnant women include women with complex social needs who may be less likely to access or maintain contact with antenatal care services. Examples of women with complex social needs include, but are not limited to, women who:

- have a history of substance misuse (alcohol and/or drugs)
- have recently arrived as a migrant, asylum seeker or refugee
- have difficulty speaking or understanding English
- are aged under 20
- have experienced domestic abuse
- are living in poverty
- are homeless.

It is therefore appropriate that localities give special consideration to these groups of women within the measures. NICE's guideline on pregnancy and complex social factors has recommendations about how to make antenatal care accessible to pregnant women with complex social needs and how to encourage women to maintain ongoing contact with maternity services.
Quality statement 2: Services – continuity of care

Quality statement

Pregnant women are cared for by a named midwife throughout their pregnancy.

Quality measure

Structure

a) Evidence of local arrangements and audit to ensure that pregnant women are cared for by a named midwife throughout their pregnancy.

Data source: Local data collection.

b) Evidence of local arrangements to ensure that systems are in place to coordinate a pregnant woman's care should her named midwife not be available.

Data source: Local data collection.

Process

The proportion of pregnant women with a named midwife.

Numerator – the number of women in the denominator with a named midwife.

Denominator – the number of pregnant women accessing antenatal care.

Data source: Local data collection.

Outcome

Pregnant women's satisfaction with the continuity of their antenatal care.

Data source: Local data collection. The Care Quality Commission Maternity Services Survey asks the question 'If you saw a midwife for your antenatal check-ups, did you see the same one every time?'
What the quality statement means for different audiences

**Service providers** ensure that systems are in place to enable pregnant women to be cared for by a named midwife throughout their pregnancy.

**Healthcare professionals** follow local systems and guidance to provide continuity of care to pregnant women through the provision of a named midwife.

**Commissioners** ensure they commission services that enable pregnant women to be cared for by a named midwife throughout their pregnancy.

**Pregnant women** are cared for by a named midwife throughout their pregnancy.

**Source guidance**

- [Antenatal care for uncomplicated pregnancies. NICE guideline CG62 (2008), recommendation 1.2.2.1](https://www.nice.org.uk/guidance/cg62)

**Definitions**

A named midwife is a named registered midwife who is responsible for providing all or most of a woman's antenatal and postnatal care and coordinating care should they not be available. [Adapted from the Department of Health's Maternity matters: choice, access and continuity of care in a safe service, 2007](https://www.dh.gov.uk/en/Publicationsandstatistics/Publications/PublicationsPolicyAndGuidance/DH_40816852).
Quality statement 3: Services – record keeping

Quality statement

Pregnant women have a complete record of the minimum set of antenatal test results in their hand-held maternity notes.

Quality measure

Structure

a) Evidence of local arrangements to ensure that pregnant women have a complete record of the minimum set of antenatal test results in their hand-held maternity notes.

Data source: Local data collection.

b) Evidence of local audit to monitor the completeness and accuracy of antenatal test results in women’s hand-held maternity notes.

Data source: Local data collection.

Process

Proportion of pregnant women accessing antenatal care who have a complete record of the minimum set of antenatal test results in their hand-held maternity notes, appropriate to their stage of pregnancy.

Numerator – the number of women in the denominator with a complete record of the minimum set of antenatal test results in their hand-held maternity notes, appropriate to their stage of pregnancy.

Denominator – the number of pregnant women accessing antenatal care.

Data source: Local data collection. The baseline assessment tool for NICE’s guideline on pregnancy and complex social factors.
What the quality statement means for different audiences

Service providers ensure that systems are in place to maintain a complete record of the minimum set of antenatal test results in women's hand-held maternity notes.

Healthcare professionals ensure that women have a complete record of the minimum set of antenatal test results in their hand-held maternity notes.

Commissioners ensure they commission services that maintain a complete record of the minimum set of antenatal test results in women's hand-held maternity notes.

Pregnant women are given a complete record of the minimum set of their antenatal test results in their hand-held maternity notes.

Source guidance

- [Antenatal care for uncomplicated pregnancies. NICE guideline CG62 (2008), recommendation 1.2.4.2](https://www.nice.org.uk/guidance/cg62)
- [Pregnancy and complex social factors: a model for service provision for pregnant women with complex social factors. NICE guideline CG110 (2010), recommendation 1.1.10](https://www.nice.org.uk/guidance/cg110)

Definitions

The minimum set of tests for routine scheduled antenatal care has been developed from the appointment schedule in appendix D of NICE guideline on antenatal care for uncomplicated pregnancies.

Table 1 minimum set of tests for routine scheduled antenatal care

<table>
<thead>
<tr>

</tr>
<tr>
<td>Fetal presentation</td>
<td>36 weeks</td>
</tr>
</tbody>
</table>

Note that women should be able to make an informed choice about whether to accept or decline each test, and notes should include a record of any tests offered and declined as well as the results of tests accepted.

**Equality and diversity considerations**

Hand-held maternity notes and the information within them should be accessible to all women, including women who do not speak or read English and those with additional needs such as physical, sensory or learning disabilities.

Women should be able to choose whether to have all the results of their antenatal tests documented in their hand-held maternity notes. This may be particularly important when
information is sensitive (for example, positive screening results for HIV, hepatitis B virus and syphilis). Where a woman declines to have antenatal test results documented in her hand-held notes, the results should instead be recorded within other medical notes.
Quality statement 4: Risk assessment – body mass index

Quality statement

Pregnant women with a body mass index of 30 kg/m² or more at the booking appointment are offered personalised advice from an appropriately trained person on healthy eating and physical activity.

Quality measure

Structure

a) Evidence of local arrangements to ensure that pregnant women have their body mass index calculated and recorded at the booking appointment.

Data source: Local data collection. The self-assessment tool for NICE's guideline on weight management before, during and after pregnancy.

b) Evidence of local arrangements to ensure that pregnant women with a body mass index of 30 kg/m² or more at the booking appointment are offered personalised advice from an appropriately trained person on healthy eating and physical activity.

Data source: Local data collection. The self-assessment tool for NICE's guideline on weight management before, during and after pregnancy.

Process

a) Proportion of pregnant women accessing antenatal care whose body mass index is calculated and recorded at the booking appointment.

Numerator – the number of women in the denominator whose body mass index is recorded at the booking appointment.

Denominator – the number of pregnant women accessing antenatal care.
Data source: The NHS Digital Maternity Services Secondary Uses Dataset collects data on maternal height and weight, and booking appointment date.

b) Proportion of pregnant women with a body mass index of 30 kg/m² or more at the booking appointment who are offered personalised advice from an appropriately trained person on healthy eating and physical activity.

Numerator – the number of women in the denominator offered personalised advice from an appropriately trained person on healthy eating and physical activity.

Denominator – the number of pregnant women with a body mass index of 30 kg/m² or more at the booking appointment.

Data source: Local data collection.

Outcome

Women with a body mass index of 30 kg/m² or more feel confident to make decisions about healthy eating and physical activity during their pregnancy.

What the quality statement means for different audiences

Service providers ensure that systems are in place to offer pregnant women with a body mass index of 30 kg/m² or more at the booking appointment personalised advice from an appropriately trained person on healthy eating and physical activity.

Healthcare professionals offer women with a body mass index of 30 kg/m² or more at the booking appointment personalised advice on healthy eating and physical activity or if they are not appropriately trained to do this, refer them to an appropriately trained person.

Commissioners ensure they commission services that offer pregnant women with a body mass index of 30 kg/m² or more at the booking appointment personalised advice from an appropriately trained person on healthy eating and physical activity.

Pregnant women with a body mass index of 30 kg/m² or more at the booking appointment are offered advice relevant to them from an appropriately trained person on healthy eating and physical activity.
Source guidance

- Antenatal care for uncomplicated pregnancies. NICE guideline CG62 (2008), recommendation 1.2.2.2 and 1.5.1.1
- Maternal and child nutrition. NICE guideline PH11 (2008), recommendation 6
- Weight management before, during and after pregnancy. NICE guideline PH27 (2010), recommendation 2

Definitions

An appropriately trained person can demonstrate expertise and competencies in weight management in pregnancy, including providing advice about nutrition and/or physical activity. This may include obstetricians, GPs, midwives, health visitors, nurses, dietitians, midwifery assistants, support workers and those working in weight management programmes (commercial or voluntary).

Equality and diversity considerations

The body mass index threshold may need adapting for different groups of pregnant women (for example, women from certain ethnic groups). See NICE’s guideline on BMI: preventing ill health and premature death in black, Asian and other minority ethnic groups. A body mass index measure is considered unsuitable for use with those under 18.
Quality statement 5: Risk assessment – smoking cessation

Quality statement

Pregnant women who smoke are referred to an evidence-based stop smoking service at the booking appointment.

Quality measure

Structure

a) Evidence of local arrangements that pregnant women have their smoking status recorded at the booking appointment.

Data source: Local data collection through NHS Digital Maternity Services Secondary Uses Dataset.

b) Evidence of local arrangements to ensure that pregnant women who smoke are referred to an evidence-based stop smoking service.

Data source: Local data collection through PHQ30.

c) Evidence of local arrangements to ensure that pregnant women who smoke and decide not to attend an evidence-based stop smoking service receive follow-up.

Data source: Local data collection.

Process

a) Proportion of pregnant women accessing antenatal care whose smoking status is recorded at the booking appointment.

Numerator – the number of women in the denominator whose smoking status is recorded at the booking appointment.
Denominator – the number of pregnant women accessing antenatal care.

**Data source:** a) Local data collection. The [NHS Digital Maternity Services Secondary Uses Dataset](https://www.nice.org.uk/terms-and-conditions#notice-of-rights) collects data on mother's smoking status at booking.

b) Proportion of pregnant women who smoke who are offered a referral to an evidence-based stop smoking service.

Numerator – the number of women in the denominator who are offered a referral to an evidence-based stop smoking service.

Denominator – the number of pregnant women accessing antenatal care who smoke.

**Data source:** Local data collection.

c) Proportion of pregnant women who smoke who are referred to an evidence-based stop smoking service.

Numerator – the number of women in the denominator who are referred to an evidence-based stop smoking service.

Denominator – the number of pregnant women accessing antenatal care who smoke.

**Data source:** Local data collection.

d) Proportion of pregnant women who smoke and decide not to attend an evidence-based stop smoking service who receive follow-up.

Numerator – the number of women in the denominator who decide not to attend an evidence-based stop smoking service who receive follow-up.

Denominator – the number of pregnant women who smoke and decide not to attend an evidence-based stop smoking service.

**Data source:** Local data collection.
Outcome

a) Quit rates for pregnant women.

Data source: Local data collection.

b) Smoking rates in pregnancy.

Data source: The Smoking at Time of Delivery (SATOD) collection covers information on the number of women smoking and not smoking at time of delivery (childbirth). Each PCT (and a number of care trusts) is required to submit three figures each quarter:

- total number of maternities
- number of women known to smoke at the time of delivery
- number of women known not to smoke at the time of delivery.

NHS Digital Statistics on women's smoking status at time of delivery: England are available from 2011–12 quarter 3.

The NHS Digital Maternity Services Secondary Uses Dataset collects data on smoking status at booking, delivery and discharge.

PHQ30: Smoking quitters – Number of users of NHS stop smoking services who report that they are not smoking 4 weeks after setting a quit date. Data are broken down into sub-categories, which include 'Pregnant women setting a quit date and outcome'. Monitoring frequency: quarterly.

What the quality statement means for different audiences

Service providers ensure that systems are in place to ensure that all pregnant women who smoke are referred to an evidence-based stop smoking service at their booking appointment.

Healthcare professionals refer all pregnant women who smoke to an evidence-based stop smoking service at their booking appointment.

Commissioners ensure they commission services which refer all pregnant women who smoke to an evidence-based stop smoking service at their booking appointment.
Pregnant women who smoke are referred to an evidence-based stop smoking service at their booking appointment.

**Source guidance**

*Smoking: stopping in pregnancy and after childbirth. NICE guideline PH26 (2010), recommendation 1*

**Definitions**

Advice on smoking cessation should be first provided at the booking appointment and when appropriate throughout the period of antenatal care. The midwife may provide the pregnant woman with information (in a variety of formats, for example a leaflet) about the risks to the unborn child of smoking when pregnant and the hazards of exposure to second-hand smoke for both mother and baby.

Women who smoke or have recently quit smoking should be referred to an evidence-based stop smoking service if:

- they say they smoke, or
- they have a carbon monoxide (CO) reading of 7 ppm or above, or
- they say they have quit smoking in the past 2 weeks, or
- they say they are a light or infrequent smoker but register a low CO reading (for example, 3 ppm).

[Adapted from NICE's guideline on smoking: stopping in pregnancy and after childbirth]

Evidence-based stop smoking services are local services providing accessible, evidence-based and cost-effective support to people who want to stop smoking. The professionals involved may include midwives who have been specially trained to help pregnant women who smoke to quit (NICE’s Pathway on stop smoking interventions and services).

At the time of referral the pregnant woman should be given the number of an evidence-based stop smoking service. This may include the number of the NHS Pregnancy Smoking Helpline (0800 1699 169), details of the NHS smokefree website and a number for a local helpline if one is available.
Quality statement 6: Risk assessment – gestational diabetes

Quality statement

Pregnant women are offered testing for gestational diabetes if they are identified as at risk of gestational diabetes at the booking appointment.

Quality measure

Structure

a) Evidence of local arrangements to ensure that pregnant women have their risk factors for gestational diabetes identified and recorded at the booking appointment.

Data source: Local data collection.

b) Evidence of local arrangements to ensure that pregnant women identified as at risk of gestational diabetes at the booking appointment are offered testing for gestational diabetes.

Data source: Local data collection.

Process

a) Proportion of pregnant women identified as at risk of gestational diabetes at the booking appointment who are offered testing for gestational diabetes.

Numerator – the number of women in the denominator offered testing for gestational diabetes.

Denominator – the number of pregnant women identified as at risk of gestational diabetes at the booking appointment.

Data source: Local data collection. The NHS Digital Maternity Services Secondary Uses Dataset collects data on the following risk factors: maternal height and weight maternal family history of diabetes and ethnic group and obstetric diagnoses from previous pregnancies including gestational diabetes mellitus. The date of the booking appointment is also available.
b) Proportion of pregnant women identified as at risk of gestational diabetes at the booking appointment who receive testing for gestational diabetes.

Numerator – the number of women in the denominator receiving testing for gestational diabetes.

Denominator – the number of pregnant women identified as at risk of gestational diabetes at the booking appointment.

**Data source:** Local data collection. The NHS Digital Maternity Services Secondary Uses Dataset collects data on the following risk factors: maternal height and weight, maternal family history of diabetes and ethnic group and obstetric diagnoses from previous pregnancies including gestational diabetes mellitus. The date of the booking appointment is also available.

### Outcome

Early identification of women with gestational diabetes.

### What the quality statement means for different audiences

**Service providers** ensure that systems are in place to offer pregnant women identified as at risk of gestational diabetes at the booking appointment testing for gestational diabetes.

**Healthcare professionals** offer pregnant women identified as at risk of gestational diabetes at the booking appointment testing for gestational diabetes.

**Commissioners** ensure they commission services that offer pregnant women identified as at risk of gestational diabetes at the booking appointment testing for gestational diabetes.

Pregnant women with a higher than normal chance of developing gestational diabetes (a type of diabetes that occurs during pregnancy) at the booking appointment are offered a test for gestational diabetes.

### Source guidance

- Antenatal care for uncomplicated pregnancies. NICE guideline CG62 (2008), recommendation 1.2.2.2
Definitions

Risk factors are taken from NICE’s guideline on diabetes in pregnancy:

- body mass index above 30 kg/m²
- previous macrosomic baby weighing 4.5 kg or more
- previous gestational diabetes
- family history of diabetes (first-degree relative with diabetes)
- an ethnicity with a high prevalence of diabetes.

Women with any of these risk factors should be offered testing for gestational diabetes.

Testing for gestational diabetes should be carried out in accordance with NICE’s guideline on diabetes in pregnancy:

Use the 2-hour 75-g oral glucose tolerance test (OGTT) to test for gestational diabetes in women with risk factors.

Offer women who have had gestational diabetes in a previous pregnancy:

- early self-monitoring of blood glucose or
- a 75-g 2-hour OGTT as soon as possible after booking (whether in the first or second trimester), and a further 75-g 2-hour OGTT at 24–28 weeks if the results of the first OGTT are normal.

Offer women with any of the other risk factors for gestational diabetes a 75-g 2-hour OGTT at 24–28 weeks.

Equality and diversity considerations

Any risk assessment for gestational diabetes should be corrected for ethnicity. Some ethnicities are risk factors for diabetes (see definitions) and people from these groups should be offered testing in accordance with the guidance.
Quality statement 7: Risk assessment – pre-eclampsia

This statement has been removed. For more details see update information.
Quality statement 8: Risk assessment – intermediate risk of venous thromboembolism

Quality statement

Pregnant women at intermediate risk of venous thromboembolism at the booking appointment have specialist advice provided about their care.

Quality measure

Structure

a) Evidence of local arrangements to ensure that pregnant women have their risk of venous thromboembolism (VTE) assessed and recorded at the booking appointment.

Data source: Local data collection.

b) Evidence of local arrangements to ensure that pregnant women at intermediate risk of VTE at the booking appointment have specialist advice provided about their care.

Data source: Local data collection.

Process

a) Proportion of pregnant women accessing antenatal care who have their risk of VTE recorded at the booking appointment.

Numerator – the number of women in the denominator having their risk of VTE assessed and recorded at the booking appointment.

Denominator – the number of pregnant women accessing antenatal care.

Data source: Local data collection.

b) Proportion of pregnant women at intermediate risk of VTE at the booking appointment who have specialist advice provided about their care.
Numerator – the number of women in the denominator with specialist advice provided about their care.

Denominator – the number of pregnant women at intermediate risk of VTE at the booking appointment.

Data source: Local data collection.

Outcome

Incidence of VTE in pregnant women.

Data source: The NHS Digital Maternity Services Secondary Uses Dataset, collects data on VTE as a maternal critical incident.

What the quality statement means for different audiences

Service providers ensure that systems are in place to provide pregnant women who are at intermediate risk of VTE at the booking appointment with specialist advice.

Healthcare professionals seek or provide specialist advice for pregnant women at intermediate risk of VTE at the booking appointment.

Commissioners ensure they commission services which provide pregnant women at intermediate risk of VTE at the booking appointment with specialist advice.

Pregnant women who at the time of their booking appointment have a moderate risk of developing VTE (a blood clot) have specialist advice sought about their care.

Source guidance

- Antenatal care for uncomplicated pregnancies. NICE guideline CG62 (2008), recommendation 1.2.2.2
- Royal College of Obstetricians and Gynaecologists (RCOG). Thrombosis and embolism during pregnancy and the puerperium, reducing the risk (Green-top guideline No. 37a) (2015), recommendations 1, 4 and 6 (executive summary of recommendations)
Definitions

Definitions are taken from RCOG's guideline on thrombosis and embolism during pregnancy and the puerperium.

Intermediate risk of VTE is defined as any of the following:

- single previous VTE with no family history or thrombophilia (inherited or acquired)
- thrombophilia (inherited or acquired) and no VTE
- medical comorbidities such as:
  - heart or lung disease
  - systemic lupus erythematosus
  - cancer
  - inflammatory conditions
  - nephrotic syndrome
  - sickle cell disease
  - intravenous drug use
- surgical procedures such as appendicectomy

or 3 or more risk factors from the following list (or 2 or more risk factors from the following list if admitted to hospital):

- age above 35 years
- body mass index more than 30 kg/m²
- parity 3 or more
- smoker
- gross varicose veins (symptomatic, above the knee or associated with phlebitis/oedema/skin changes)
- current systemic infection
• immobility (for at least 3 days) such as:
  – paraplegia
  – symphysis pubis dysfunction with reduced mobility
• long-distance travel (greater than 4 hours)
• pre-eclampsia
• dehydration/hyperemesis/ovarian hyperstimulation syndrome
• multiple pregnancy or assisted reproductive therapy.

Women assessed as being at intermediate risk should have specialist advice provided about their care. This would involve the healthcare professional responsible for the pregnant woman's care discussing the woman's risk factors with a specialist service (for example, a trust-nominated thrombosis in pregnancy expert or team) and acting on this advice.
Quality statement 9: Risk assessment – high risk of venous thromboembolism

Quality statement

Pregnant women at high risk of venous thromboembolism at the booking appointment are referred to a specialist service.

Quality measure

Structure

a) Evidence of local arrangements to ensure that pregnant women have their risk of venous thromboembolism (VTE) assessed and recorded at the booking appointment.

Data source: Local data collection.

b) Evidence of local arrangements to ensure that pregnant women at high risk of VTE at the booking appointment are referred to a specialist service.

Data source: Local data collection.

Process

a) Proportion of pregnant women accessing antenatal care who have their risk of VTE recorded at the booking appointment.

Numerator – the number of women in the denominator having their risk of VTE assessed and recorded at the booking appointment.

Denominator – the number of pregnant women accessing antenatal care.

Data source: Local data collection.

b) Proportion of pregnant women at high risk of VTE at the booking appointment who are referred to a specialist service.
Numerator – the number of women in the denominator referred to a specialist service.

Denominator – the number of pregnant women at high risk of VTE at the booking appointment.

Data source: Local data collection.

Outcome

Incidence of VTE in pregnant women.

Data source: The NHS Digital Maternity Services Secondary Uses Dataset, collects data on VTE as a maternal critical incident.

What the quality statement means for different audiences

Service providers ensure that systems are in place to provide pregnant women at high risk of VTE at the booking appointment with onward referral to a specialist service.

Healthcare professionals refer pregnant women at high risk of VTE at the booking appointment to a specialist service.

Commissioners ensure they commission services which provide pregnant women at high risk of VTE at the booking appointment with onward referral to a specialist service.

Pregnant women who at the time of their booking appointment have a high chance of developing VTE (a blood clot) are referred to a specialist service.

Source guidance

- Antenatal care for uncomplicated pregnancies. NICE guideline CG62 (2008), recommendation 1.2.2.2

- Royal College of Obstetricians and Gynaecologists (RCOG). Thrombosis and embolism during pregnancy and the puerperium, reducing the risk (Green-top guideline No. 37a) (2015), recommendations 1, 2, 4 and 8 (executive summary of recommendations)
Definitions

Definitions are taken from RCOG’s guideline on thrombosis and embolism during pregnancy and the puerperium.

High risk of VTE is defined as any of the following:

- single previous VTE and thrombophilia (inherited or acquired) or family history
- single previous unprovoked/oestrogen-related VTE
- previous recurrent VTE (more than 1).

Women assessed as being at high risk should be referred to a specialist service, for example a trust-nominated thrombosis in pregnancy expert or team.
Quality statement 10: Screening – national fetal anomaly screening programmes

Quality statement

Pregnant women are offered fetal screening in accordance with current UK National Screening Committee programmes.

Quality measure

Structure

Evidence of local NHS-commissioned services to ensure that all pregnant women are offered fetal screening in accordance with current UK National Screening Committee programmes.

Data source: Local data collection.

Process

Note a pregnant woman would be offered either process a) or b) and always process c).

a) Proportion of pregnant women booking before 14 weeks 2 days who are offered the combined screening test to take place between 10 weeks 0 days and 14 weeks 1 day.

Numerator – the number of women in the denominator offered the combined screening test to take place between 10 weeks 0 days and 14 weeks 1 day.

Denominator – the number of pregnant women booking before 14 weeks 2 days.

Data source: Local data collection. The NHS Digital Maternity Services Secondary Uses Dataset collects data on Down's syndrome screening and fetal anomaly scans.

b) Proportion of pregnant women booking between 14 weeks 2 days and 20 weeks 0 days who are offered the quadruple screening test for Down's syndrome to take place between 14 weeks 2 days and 20 weeks 0 days.
Numerator – the number of women in the denominator offered the quadruple screening test for Down's syndrome to take place between 14 weeks 2 days and 20 weeks 0 days.

Denominator – the number of pregnant women booking between 14 weeks 2 days and 20 weeks 0 days.

**Data source:** Local data collection. The [NHS Digital Maternity Services Secondary Uses Dataset](https://www.nice.org.uk/guidance/qs22) collects data on Down's syndrome screening and fetal anomaly scans.

c) Proportion of pregnant women booking before 21 weeks who are offered ultrasound screening for fetal anomalies to take place between 18 weeks 0 days and 20 weeks 6 days.

Numerator – the number of women in the denominator offered ultrasound screening for fetal anomalies to take place between 18 weeks 0 days and 20 weeks 6 days.

Denominator – the number of pregnant women booking before 21 weeks.

**Data source:** Local data collection. The [NHS Digital Maternity Services Secondary Uses Dataset](https://www.nice.org.uk/guidance/qs22) collects data on Down's syndrome screening and fetal anomaly scans.

**Outcome**

a) Pregnant women feel they have made an informed decision about whether to undergo fetal anomaly screening.

b) Screening uptake rates.

**What the quality statement means for different audiences**

**Service providers** ensure that systems are in place to offer fetal screening to pregnant women in accordance with current UK National Screening Committee programmes.

**Healthcare professionals** offer fetal screening to pregnant women in accordance with current UK National Screening Committee programmes.

**Commissioners** ensure they commission services that offer fetal screening to pregnant women as part of NHS care, in accordance with current UK National Screening Committee programmes.
Pregnant women who access antenatal care before 21 weeks are offered an ultrasound scan to screen for various conditions in their unborn baby.

In addition, pregnant women who access antenatal care before 20 weeks are offered screening for Down’s syndrome in their unborn baby. The type of test carried out (for example, an ultrasound scan and a blood test or just a blood test) will depend on how far advanced the pregnancy is.

Source guidance

- Antenatal care for uncomplicated pregnancies. NICE guideline CG62 (2008), recommendations 1.7.1.1 and 1.7.2.1
- Fetal anomaly screening standards, Public Health England (2020), standard 1

Definitions

Fetal screening in accordance with current UK National Screening Committee programmes

The UK National Screening Committee (UKNSC) recommends all eligible pregnant women in England are offered fetal anomaly screening. The NHS fetal anomaly screening programme (NHS FASP) has responsibility for implementing this policy.

The combined test uses maternal age, gestational age calculated from the crown-rump length measurement, nuchal translucency measurement and two biochemical markers of pregnancy-associated plasma protein A (PAPP-A) and free beta human chorionic gonadotrophin hormone. The optimal time to perform the combined test is between 11 weeks 2 days and 14 weeks 1 day but a maternal blood specimen may be taken from 10 weeks onwards.

For women presenting too late for first trimester testing, the quadruple test (maternal age and four biochemical markers) window runs from 14 weeks 2 days to 20 weeks 0 days.

The fetal anomaly ultrasound scan should be offered to take place between 18 weeks 0 days and 20 weeks 6 days. [Adapted from Public Health England’s Fetal anomaly screening: programme handbook and Fetal anomaly screening standards]
Equality and diversity considerations

The offer and implications of screening should be understood by all women to enable them to make informed decisions. This will necessitate provision of information in an accessible format (particularly for women with physical, sensory or learning disabilities and women who do not speak or read English).
Quality statement 11: Fetal wellbeing – external cephalic version

Quality statement

Pregnant women with an uncomplicated singleton breech presentation at 36 weeks or later (until labour begins) are offered external cephalic version.

Quality measure

Structure

a) Evidence of local arrangements to ensure that pregnant women with a suspected breech presentation at 36 weeks or later (until labour begins) are referred for confirmatory ultrasound assessment.

Data source: Local data collection.

b) Evidence of local arrangements to ensure that pregnant women with a confirmed uncomplicated singleton breech presentation at 36 weeks or later (until labour begins) are offered external cephalic version.

Data source: Local data collection.

Process

a) Proportion of pregnant women with a suspected breech presentation at 36 weeks or later (until labour begins) who are referred for confirmatory ultrasound assessment.

Numerator – the number of women in the denominator referred for confirmatory ultrasound assessment.

Denominator – the number of pregnant women with a suspected breech presentation at 36 weeks or later (until labour begins).

Data source: Local data collection.
b) Proportion of pregnant women with a confirmed uncomplicated singleton breech presentation at 36 weeks or later (until labour begins) who are offered external cephalic version.

Numerator – the number of women in the denominator offered external cephalic version.

Denominator – the number of pregnant women with a confirmed uncomplicated singleton breech presentation at 36 weeks or later (until labour begins).

Data source: Local data collection.

Outcome

a) External cephalic version rates.

Data source: Local data collection.

b) Mode of delivery including:

- rates of vaginal birth, emergency and elective caesarean section after successful external cephalic version.
- rates of vaginal birth, emergency and elective caesarean section after unsuccessful external cephalic version.
- rates of vaginal birth and emergency caesarean section after diagnosis of breech presentation in labour.

Data source: Local data collection. The NHS Digital Maternity Services Secondary Uses Dataset collects data on the presentation of the (first) fetus at onset of labour (including option of breech), instance of a critical incident occurring and the method for delivering baby.

What the quality statement means for different audiences

Service providers ensure that systems are in place to offer pregnant women with an uncomplicated singleton breech presentation at 36 weeks or later (until labour begins) external cephalic version.

Healthcare professionals offer pregnant women with an uncomplicated singleton breech presentation at 36 weeks or later (until labour begins) external cephalic version.
Commissioners ensure they commission services that offer pregnant women with an uncomplicated singleton breech presentation at 36 weeks or later (until labour begins) external cephalic version.

Pregnant women with a single baby in the breech position (bottom first with knees either flexed or extended) but with no other problems at 36 weeks or later in their pregnancy are offered external cephalic version (a procedure to move the baby round to the head first position), which includes first having an ultrasound scan to confirm the baby’s position.

Source guidance

Antenatal care for uncomplicated pregnancies. NICE guideline CG62 (2008), recommendations 1.10.5 and 1.11.2.1

Definitions

As detailed in NICE’s guideline on antenatal care for uncomplicated pregnancies, recommendation 1.11.2.1 women in labour or those with 1 or more of the following obstetric complications should not be offered external cephalic version:

- a uterine scar or abnormality
- fetal compromise
- ruptured membranes
- vaginal bleeding
- medical conditions.

When obtaining informed consent for this procedure the woman should be provided with balanced information about the benefits and risks of external cephalic version (for example, the Royal College of Obstetrics and Gynaecologists patient information leaflet on breech baby at end of pregnancy).

Equality and diversity considerations

There may be some women whose breech presentation is not identified and who are not offered an external cephalic version.
Quality statement 12: Fetal wellbeing – membrane sweeping for prolonged pregnancy

Quality statement

Nulliparous pregnant women are offered a vaginal examination for membrane sweeping at their 40- and 41-week antenatal appointments, and parous pregnant women are offered this at their 41-week appointment.

Quality measure

Structure

Evidence of local arrangements to ensure that nulliparous pregnant women are offered a vaginal examination for membrane sweeping at their 40- and 41-week antenatal visits, and parous pregnant women are offered this at their 41-week appointment.

Data source: Local data collection.

Process

a) Proportion of nulliparous pregnant women attending a 40-week antenatal appointment who are offered a vaginal examination for membrane sweeping.

Numerator – the number of women in the denominator offered a vaginal examination for membrane sweeping.

Denominator – the number of nulliparous pregnant women attending a 40-week antenatal appointment.

Data source: Local data collection.

b) Proportion of nulliparous pregnant women attending a 41-week antenatal appointment who are offered a vaginal examination for membrane sweeping.

Numerator – the number of women in the denominator offered a vaginal examination for
membrane sweeping.

Denominator – the number of nulliparous pregnant women attending a 41-week antenatal appointment.

Data source: Local data collection.

c) Proportion of parous pregnant women attending a 41-week antenatal appointment who are offered a vaginal examination for membrane sweeping.

Numerator – the number of women in the denominator offered a vaginal examination for membrane sweeping.

Denominator – the number of parous pregnant women attending a 41-week antenatal appointment.

Data source: Local data collection.

Outcome

a) Rates of induction of labour for women with prolonged pregnancy.

Data source: Local data collection. The NHS Digital Maternity Services Secondary Uses Dataset collects data on the medical induction of labour, the method for delivering baby and neonatal death.

b) Mode of delivery for women with prolonged pregnancy including:

- spontaneous vaginal birth
- instrumental vaginal birth
- elective or emergency caesarean section.

Data source: Local data collection. The NHS Digital Maternity Services Secondary Uses Dataset collects data on the medical induction of labour, the method for delivering baby and neonatal death.

c) Rates of stillbirth beyond 40 weeks gestation (where there is no underlying medical cause).

Data source: Local data collection. The NHS Digital Maternity Services Secondary Uses Dataset
collects data on the medical induction of labour, the method for delivering baby and neonatal death.

What the quality statement means for different audiences

**Service providers** ensure that systems are in place to offer nulliparous pregnant women a vaginal examination for membrane sweeping at their 40- and 41-week antenatal appointments, and parous pregnant women the same at their 41-week appointment.

**Healthcare professionals** offer nulliparous pregnant women a vaginal examination for membrane sweeping at their 40- and 41-week antenatal visits, and parous pregnant women the same at their 41-week appointment.

**Commissioners** ensure they commission services that offer nulliparous pregnant women a vaginal examination for membrane sweeping at their 40- and 41-week antenatal appointments, and parous pregnant women the same at their 41-week appointment.

**Pregnant women having their first baby** are offered a vaginal examination at their 40- and 41-week antenatal appointments to carry out a membrane sweep, in which a healthcare professional moves a finger around the cervix or massages the cervix, to help start labour.

**Pregnant women having their second or later baby** are offered a vaginal examination at their 41-week appointment to carry out membrane sweep, in which a healthcare professional moves a finger around the cervix or massages the cervix, to help start labour.

Source guidance

- [Antenatal care for uncomplicated pregnancies. NICE guideline CG62](https://www.nice.org.uk/guidance/cg62) (2008), recommendation 1.11.1.1
- [Inducing labour. NICE guideline CG70](https://www.nice.org.uk/guidance/cg70) (2008), recommendations 1.3.1.2 and 1.3.1.3
Using the quality standard

Other national guidance and current policy documents have been referenced during the development of this quality standard. It is important that the quality standard is considered alongside the documents listed in development sources.

The quality measures accompanying the quality statements aim to improve the structure, process and outcomes of areas identified as needing quality improvement. They are not a new set of targets or mandatory indicators for performance management.

Expected levels of achievement for quality measures are not specified. As quality standards are intended to drive up the quality of care, achievement levels of 100% should be aspired to (or 0% if the quality statement states that something should not be done). However, we recognise that this may not always be appropriate in practice when taking account of patient safety, patient choice and clinical judgement and therefore desired levels of achievement should be defined locally.

See NICE’s how to use quality standards for further information, including advice on using quality measures.

Diversity, equality and language

During the development of this quality standard, equality issues have been considered and equality assessments are published on the NICE website.

Good communication between healthcare professionals and pregnant women is essential. Treatment and care, and the information given about it, should be culturally appropriate. It should also be accessible to people with additional needs such as physical, sensory or learning disabilities, and to people who do not speak or read English. Pregnant women should have access to an interpreter or advocate if needed.

Commissioners and providers should aim to achieve the quality standard in their local context, in light of their duties to have due regard to the need to eliminate unlawful discrimination, advance equality of opportunity and foster good relations. Nothing in this quality standard should be interpreted in a way that would be inconsistent with those duties.
Development sources

Evidence sources

The documents below contain clinical guideline recommendations or other recommendations that were used by the Topic Expert Group (TEG) to develop the quality standard statements and measures.

- **Pregnancy and complex social factors: a model for service provision for pregnant women with complex social factors. NICE guideline CG110** (2010; NHS Evidence accredited)
- **Weight management before, during and after pregnancy. NICE guideline PH27** (2010; NHS Evidence accredited)
- **Smoking: stopping in pregnancy and after childbirth. NICE guideline PH26** (2010; NHS Evidence accredited)
- **Maternal and child nutrition. NICE guideline PH11** (2008; NHS Evidence accredited)
- **Inducing labour. NICE guideline CG70** (2008; NHS Evidence accredited)
- **Diabetes in pregnancy: management from preconception to the postnatal period. NICE guideline NG3** (2015, updated 2020; NHS Evidence accredited)
- **Antenatal care for uncomplicated pregnancies. NICE guideline CG62** (2008; NHS Evidence accredited)

Policy context

It is important that the quality standard is considered alongside current policy documents, including:

- **Department of Health. Maternity and early years: making a good start to family life** (2010)

Update information

April 2016: The source recommendations and definitions for statement 6 on risk assessment – gestational diabetes have been updated to reflect changes to NICE's guideline on antenatal care for uncomplicated pregnancies in March 2016.

June 2015: This quality standard has been updated to ensure alignment with NICE's guideline on diabetes in pregnancy, which is a development source for this quality standard. The guideline on diabetes in pregnancy was updated in February 2015.

In particular, information in the definitions section of statement 6 on testing for gestational diabetes has been updated.

For more information about the changes to the diabetes in pregnancy guideline, see the update information section in NICE's guideline on diabetes in pregnancy.

July 2013: Quality statement 7: Risk assessment – pre-eclampsia has been removed and is replaced by quality statement 2 in NICE's quality standard on hypertension in pregnancy.

Minor changes since publication

December 2020: The definition of risk factors for gestational diabetes used in statement 6 on risk assessment – gestational diabetes has been updated to ensure alignment with NICE’s guideline on diabetes in pregnancy. The equality and diversity considerations section for statement 6 has also been updated to align with this guideline.
About this quality standard

NICE quality standards describe high-priority areas for quality improvement in a defined care or service area. Each standard consists of a prioritised set of specific, concise and measurable statements. NICE quality standards draw on existing NICE or NICE-accredited guidance that provides an underpinning, comprehensive set of recommendations, and are designed to support the measurement of improvement.

Expected levels of achievement for quality measures are not specified. Quality standards are intended to drive up the quality of care, and so achievement levels of 100% should be aspired to (or 0% if the quality statement states that something should not be done). However, this may not always be appropriate in practice. Taking account of safety, shared decision-making, choice and professional judgement, desired levels of achievement should be defined locally.

Information about how NICE quality standards are developed is available from the NICE website.

Information about the topic experts is available from the webpage for this quality standard.

This quality standard has been included in the NICE Pathways on diabetes in pregnancy, smoking and antenatal care for uncomplicated pregnancies, which bring together everything we have said on a topic in an interactive flowchart.

NICE has produced a quality standard service improvement template to help providers make an initial assessment of their service compared with a selection of quality statements. This tool is updated monthly to include new quality standards.

NICE produces guidance, standards and information on commissioning and providing high-quality healthcare, social care, and public health services. We have agreements to provide certain NICE services to Wales, Scotland and Northern Ireland. Decisions on how NICE guidance and other products apply in those countries are made by ministers in the Welsh government, Scottish government, and Northern Ireland Executive. NICE guidance or other products may include references to organisations or people responsible for commissioning or providing care that may be relevant only to England.

ISBN: 978-1-4731-1842-3
Supporting organisations

Many organisations share NICE's commitment to quality improvement using evidence-based guidance. The following supporting organisations have recognised the benefit of the quality standard in improving care for patients, carers, service users and members of the public. They have agreed to work with NICE to ensure that those commissioning or providing services are made aware of and encouraged to use the quality standard.

- Royal College of Midwives
- Royal College of Nursing (RCN)
- Royal College of Obstetricians and Gynaecologists
