

Durvalumab with chemotherapy before surgery (neoadjuvant) then alone after surgery (adjuvant) for treating resectable non-small-cell lung cancer

Information for the public

Published: 15 January 2025

www.nice.org.uk

Durvalumab (Imfinzi) is available on the NHS, with platinum-based chemotherapy before surgery and then alone after surgery, as a possible treatment for non-small-cell lung cancer if it:

- can be removed with surgery (resectable), and
- does not have genetic mutations in the EGFR gene or genetic mutations called rearrangements in the ALK gene.

Is this treatment right for me?

Your healthcare professionals should give you clear information, talk with you about your options and listen carefully to your views and concerns. Your family can be involved too, if you wish. See [our webpage on making decisions about your care](#).

Questions to think about

- How well does it work compared with other treatments?
- What are the risks or side effects? How likely are they?
- How will the treatment affect my day-to-day life?
- What happens if the treatment does not work?
- What happens if I do not want to have treatment? Are there other treatments available?

Information and support
