

Pembrolizumab with carboplatin and paclitaxel for untreated primary advanced or recurrent endometrial cancer

Information for the public

Published: 27 August 2025

www.nice.org.uk

Pembrolizumab (Keytruda) with carboplatin and paclitaxel is available on the NHS. It is a possible first treatment for primary endometrial cancer in adults that has spread (advanced) or come back (recurrent).

Is this treatment right for me?

Your healthcare professionals should give you clear information, talk with you about your options and listen carefully to your views and concerns. Your family can be involved too, if you wish. See [our webpage on shared decision making](#).

Questions to think about

- How well does it work compared with other treatments?
- What are the risks or side effects? How likely are they?
- How will the treatment affect my day-to-day life?
- What happens if the treatment does not work?
- What happens if I do not want to have treatment? Are there other treatments available?

Information and support

The [NHS webpage on womb \(uterus\) cancer](#) may be a good place to find out more.
