

# Talazoparib with enzalutamide for untreated hormone-relapsed metastatic prostate cancer

Information for the public

Published: 11 February 2026

[www.nice.org.uk](http://www.nice.org.uk)

Talazoparib (Talzenna) plus enzalutamide is available on the NHS. It is a possible treatment for untreated hormone-relapsed metastatic prostate cancer in adults, if:

- chemotherapy is not suitable, and
- abiraterone plus prednisolone is not suitable or not tolerated.

Hormone-relapsed means the prostate cancer has stopped responding to hormone therapy. Metastatic means that it has spread to other parts of the body.

## Is this treatment right for me?

Your healthcare professionals should give you clear information, talk with you about your options and listen carefully to your views and concerns. Your family can be involved too, if you wish. See [our webpage on shared decision making](#).

## Questions to think about

- How well does it work compared with other treatments?
- What are the risks or side effects? How likely are they?
- How will the treatment affect my day-to-day life?
- What happens if the treatment does not work?
- What happens if I do not want to have treatment? Are there other treatments available?

## Information and support

The [NHS webpage on prostate cancer](#) may be a good place to find out more.
