What has NICE said?

Secukinumab (Cosentyx) is recommended. It is a possible treatment for adults with active ankylosing spondylitis if treatment with non-steroidal anti-inflammatory drugs (NSAIDs) or TNF-alpha inhibitors hasn't worked.

Treatment should be assessed after 16 weeks and should only continue if there is clear evidence that it is working.

What does this mean for me?

If you have active ankylosing spondylitis and your doctor thinks that secukinumab is right for you, then you should be able to have the treatment on the NHS.

The treatment should be available on the NHS within 3 months of the guidance being issued.

The condition and the treatment

Ankylosing spondylitis is a type of inflammatory arthritis. It is a long-term, progressive condition. The main symptom is back pain.

Secukinumab blocks the action of interleukin-17A, a substance in the body involved in the development of ankylosing spondylitis.
