

**NATIONAL INSTITUTE FOR HEALTH AND CARE EXCELLENCE**

**Health Technology Appraisal**

**Bortezomib for treating multiple myeloma after second or subsequent relapse**

**Draft scope**

**Draft remit/appraisal objective**

To appraise the clinical and cost effectiveness of bortezomib within its marketing authorisation for treating multiple myeloma after second or subsequent relapse.

**Background**

Multiple myeloma is a form of cancer that arises from plasma cells (a type of white blood cell) in the bone marrow. Myeloma cells produce large quantities of an abnormal antibody, known as paraprotein. Unlike normal antibodies, paraprotein has no useful function and lacks the capacity to fight infection. Myeloma cells suppress the development of normal blood cells that are responsible for fighting infection (white blood cells), carrying oxygen around the body (red blood cells) and blood clotting (platelets). The term multiple myeloma refers to the presence of more than one site of affected bone at the time of diagnosis. People with multiple myeloma can experience bone pain, bone fractures, tiredness (due to anaemia), infections, hypercalcaemia (too much calcium in the blood) and kidney problems.

In 2014, 4,652 people were diagnosed with multiple myeloma in England.<sup>1</sup> It is most frequently diagnosed in older people, with 45% of people diagnosed aged 75 years and over.<sup>2</sup> Multiple myeloma is more common in men than in women and the incidence is also reported to be higher in people of African and Caribbean family origin. The 5-year survival rate for adults with multiple myeloma in England and Wales is estimated to be 47%.<sup>3</sup>

Multiple myeloma is an incurable disease. The main aims of therapy are to prolong survival and maintain a good quality of life by controlling the disease and relieving symptoms. The choice of subsequent therapy is influenced by previous treatment and response to it, duration of remission, comorbidities and patient preference.

Bortezomib is available through the Cancer Drugs Fund (CDF) for the treatment of bortezomib naive relapsed multiple myeloma.

For people whose disease is relapsed or refractory after at least 1 prior therapy:

- NICE technology appraisal guidance 129 recommends bortezomib monotherapy as an option for people who are at first relapse having had 1

prior therapy and who have undergone, or are unsuitable for bone marrow transplantation.<sup>a</sup>

For people who have had at least 2 prior therapies:

- NICE technology appraisal guidance 171 recommends lenalidomide in combination with dexamethasone as a treatment option.
- NICE technology appraisal guidance 380 recommends panobinostat in combination with bortezomib and dexamethasone as a treatment option for people with relapsed and refractory multiple myeloma who have received at least 2 prior therapies including bortezomib and an immunomodulatory agent.

For people who have had at least 3 prior therapies:

- NICE technology appraisal guidance 427 recommends pomalidomide in combination with dexamethasone for treating multiple myeloma in adults at third or subsequent relapse
- Other treatment options include bendamustine (available through the Cancer Drugs Fund) or conventional chemotherapy regimens (for example, alkylating agents such as melphalan and cyclophosphamide).

**The technology**

Bortezomib (Velcade, Janssen) is an anticancer drug that works by reversible proteasome inhibition. By inhibiting proteasomes (multi-enzyme complexes present in all cells), bortezomib interferes with the cell cycle leading to cell death. It is administered by intravenous infusion.

Bortezomib has a UK marketing authorisation as monotherapy or in combination with pegylated liposomal doxorubicin or dexamethasone. Bortezomib is indicated for the treatment of adult patients with progressive multiple myeloma who have received at least 1 prior therapy and who have already undergone or are unsuitable for haematopoietic stem cell transplantation.

<b>Intervention(s)</b>	Bortezomib alone or in combination with pegylated liposomal doxorubicin or dexamethasone
<b>Population(s)</b>	People with multiple myeloma who have had at least 2 prior therapies and who have already undergone or are unsuitable for haematopoietic stem cell transplantation.

<sup>a</sup> TA129 did not cover bortezomib in combination with either pegylated liposomal doxorubicin or dexamethasone. TA129 did not make a recommendation for treating multiple myeloma after second or subsequent relapse.

<p><b>Comparators</b></p>	<p>For people who have had 2 prior therapies:</p> <ul style="list-style-type: none"> <li>• Lenalidomide with dexamethasone</li> <li>• Panobinostat with bortezomib and dexamethasone</li> <li>• Carfilzomib and dexamethasone with or without lenalidomide (subject to NICE guidance)</li> <li>• Daratumumab (subject to NICE guidance)</li> <li>• Ixazomib in combination with lenalidomide and dexamethasone (subject to NICE guidance)</li> </ul> <p>For people who have had at least 3 prior therapies:</p> <ul style="list-style-type: none"> <li>• Pomalidomide with dexamethasone</li> <li>• Carfilzomib and dexamethasone with or without lenalidomide (subject to NICE guidance)</li> <li>• Daratumumab (subject to NICE guidance)</li> <li>• Bendamustine (funded through the Cancer drugs fund)</li> <li>• Conventional chemotherapy.</li> </ul>
<p><b>Outcomes</b></p>	<p>The outcome measures to be considered include:</p> <ul style="list-style-type: none"> <li>• progression-free survival</li> <li>• overall survival</li> <li>• response rates</li> <li>• time to next treatment</li> <li>• adverse effects of treatment</li> <li>• health-related quality of life.</li> </ul>

<p><b>Economic analysis</b></p>	<p>The reference case stipulates that the cost effectiveness of treatments should be expressed in terms of incremental cost per quality-adjusted life year.</p> <p>The reference case stipulates that the time horizon for estimating clinical and cost effectiveness should be sufficiently long to reflect any differences in costs or outcomes between the technologies being compared.</p> <p>Costs will be considered from an NHS and Personal Social Services perspective.</p> <p>The availability of any patient access schemes for the intervention or comparator technologies will be taken into account.</p> <p>The availability and cost of biosimilars should be taken into account.</p>
<p><b>Other considerations</b></p>	<p>Guidance will only be issued in accordance with the marketing authorisation. Where the wording of the therapeutic indication does not include specific treatment combinations, guidance will be issued only in the context of the evidence that has underpinned the marketing authorisation granted by the regulator.</p>

### Questions for consultation

In clinical practice (funded through either routine commissioning, or the Cancer Drugs Fund), is bortezomib alone or in combination with either pegylated liposomal doxorubicin or dexamethasone used:

- at first relapse?
- at second or subsequent relapse?

Should this appraisal consider bortezomib in combination with either pegylated liposomal doxorubicin or dexamethasone to treat multiple myeloma at first relapse?<sup>b</sup>

Would bortezomib alone or in combination with either pegylated liposomal doxorubicin or dexamethasone be used if bortezomib has already been used as an earlier treatment?

Have all relevant comparators for bortezomib alone or in combination with either pegylated liposomal doxorubicin or dexamethasone been included for:

- people with multiple myeloma who have had 2 prior therapies?
- people with multiple myeloma who have had at least 3 prior therapies?

Are the outcomes listed appropriate?

Are there any subgroups of people in whom bortezomib alone or in combination with either pegylated liposomal doxorubicin or dexamethasone is expected to be more clinically effective and cost effective or other groups that should be examined separately?

Where do you consider bortezomib alone or in combination with either pegylated liposomal doxorubicin or dexamethasone will fit into the existing NICE pathway, Multiple myeloma:

<http://pathways.nice.org.uk/pathways/myeloma?>

NICE is committed to promoting equality of opportunity, eliminating unlawful discrimination and fostering good relations between people with particular protected characteristics and others. Please let us know if you think that the proposed remit and scope may need changing in order to meet these aims. In particular, please tell us if the proposed remit and scope:

- could exclude from full consideration any people protected by the equality legislation who fall within the patient population for which bortezomib is licensed;

---

<sup>b</sup> TA129 did not cover bortezomib in combination with either pegylated liposomal doxorubicin or dexamethasone. TA129 did not make a recommendation for treating multiple myeloma after second or subsequent relapse.

- could lead to recommendations that have a different impact on people protected by the equality legislation than on the wider population, e.g. by making it more difficult in practice for a specific group to access the technology;
- could have any adverse impact on people with a particular disability or disabilities.

Please tell us what evidence should be obtained to enable the committee to identify and consider such impacts.

Do you consider bortezomib alone or in combination with either pegylated liposomal doxorubicin or dexamethasone to be innovative in its potential to make a significant and substantial impact on health-related benefits and how it might improve the way that current need is met (is this a 'step-change' in the management of the condition)?

Do you consider that the use of bortezomib alone or in combination with either pegylated liposomal doxorubicin or dexamethasone can result in any potential significant and substantial health-related benefits that are unlikely to be included in the QALY calculation?

Please identify the nature of the data which you understand to be available to enable the Appraisal Committee to take account of these benefits.

NICE intends to appraise this technology through its Single Technology Appraisal (STA) Process. We welcome comments on the appropriateness of appraising this topic through this process. (Information on the Institute's Technology Appraisal processes is available at <http://www.nice.org.uk/article/pmg19/chapter/1-Introduction>).
