

NATIONAL INSTITUTE FOR HEALTH AND CARE EXCELLENCE

Single Technology Appraisal

Aflibercept for treating myopic choroidal neovascularisation

Final scope

Final remit/appraisal objective

To appraise the clinical and cost effectiveness of aflibercept within its marketing authorisation for treating myopic choroidal neovascularisation.

Background

Short-sightedness, or myopia, is a vision problem resulting from excessively long growth of the eye-ball, or a steeply curved cornea. Myopia causes light rays to focus in front of the retina and so close objects are seen clearly whilst distant objects appear blurred. Myopia can be classified as mild, moderate or high, depending on the length of the eye and curvature of the cornea. The focusing power of a lens is measured in dioptres. A negative dioptre indicates an eye with myopia, with the higher the negative value the more severe the myopia. Myopia up to minus 3 dioptres is termed mild, minus 3 to minus 6 dioptres is moderate, and high is minus 6 or more dioptres¹. High myopia (also known as pathological or degenerative myopia) is a chronic condition associated with degenerative changes and damage at the back of the eye.

Choroidal neovascularisation (CNV) occurs when the choroid area of the eye produces new blood vessels (neovascularisation) which grow up through the damaged layers and leak or bleed into the retina. CNV is a common cause of vision loss in people with myopia.

The prevalence of myopia is approximately 1–3% in adults, and 5–11% of people with myopia will develop CNV². In England, it has been estimated that over 300,000 people have pathological myopia and that the incident population of myopic CNV is 3200³. Myopic CNV is reported to be more common in people of Asian family origin². Approximately 35% of people who develop CNV in one eye will develop it in the other eye within 8 years⁴.

The aim of treating CNV is to improve or halt the decline in visual acuity. NICE technology appraisal guidance 298 has recommended ranibizumab as an option for treating visual impairment due to CNV secondary to pathological myopia. Verteporfin photodynamic therapy is also used in clinical practice for treating subfoveal CNV associated with pathological myopia. Bevacizumab does not have a marketing authorisation in the UK for treating eye conditions.

The technology

Aflibercept (Eylea, Bayer Pharma) is a soluble vascular endothelial growth factor (VEGF) receptor fusion protein that binds VEGF-A and the placental growth factor. It is administered by intravitreal injection.

Aflibercept has a marketing authorisation in the UK for “adults for the treatment of visual impairment due to myopic choroidal neovascularisation”. It has been studied in a clinical trial of 122 adults of Asian family origin with vision loss due to CNV secondary to pathologic myopia compared with sham injection (placebo).

Intervention(s)	Aflibercept
Population(s)	Adults with visual impairment due to myopic choroidal neovascularisation
Comparators	<ul style="list-style-type: none"> • ranibizumab • verteporfin photodynamic therapy
Outcomes	<p>The outcome measures to be considered include:</p> <ul style="list-style-type: none"> • best corrected visual acuity (the affected eye) • best corrected visual acuity (both eyes) • contrast sensitivity • adverse effects of treatment • health-related quality of life.
Economic analysis	<p>The reference case stipulates that the cost effectiveness of treatments should be expressed in terms of incremental cost per quality-adjusted life year.</p> <p>The reference case stipulates that the time horizon for estimating clinical and cost effectiveness should be sufficiently long to reflect any differences in costs or outcomes between the technologies being compared.</p> <p>Costs will be considered from an NHS and Personal Social Services perspective.</p> <p>The availability of any patient access schemes for the intervention or comparator technologies will be taken into account.</p> <p>Cost effectiveness analysis should include consideration of the benefit in the best and worst seeing eye.</p>
Other considerations	<p>Guidance will only be issued in accordance with the marketing authorisation. Where the wording of the therapeutic indication does not include specific treatment combinations, guidance will be issued only in the context of the evidence that has underpinned the marketing authorisation granted by the regulator.</p>
