

# Ribociclib with fulvestrant for treating hormone receptor-positive, HER2-negative advanced breast cancer after endocrine therapy

Information for the public

Published: 31 March 2021

[www.nice.org.uk](http://www.nice.org.uk)

Ribociclib (Kisqali) with fulvestrant is available on the NHS. It is a possible option for adults who have advanced breast cancer that:

- is hormone receptor-positive and HER2-negative and
- has been treated with endocrine therapy and
- if exemestane plus everolimus would be the most appropriate alternative to a cyclin-dependent kinase 4 and 6 inhibitor.

## Is this treatment right for me?

Your healthcare professionals should give you clear information, talk with you about your options and listen carefully to your views and concerns. Your family can be involved too, if you wish. Read more about [making decisions about your care](#).

## Questions to think about

- How well does it work compared with other treatments?
- What are the risks or side effects? How likely are they?
- How will the treatment affect my day-to-day life?
- What happens if the treatment does not work?
- What happens if I do not want to have treatment? Are there other treatments available?

## Information and support

The NHS website may be a good place to find out more about [breast cancer in women and men](#).
