Indicator

The percentage of patients diagnosed with dementia whose care plan has been reviewed in a face-to-face review in the preceding 12 months.

Indicator type

General practice indicator suitable for use in the Quality and Outcomes Framework.

This document does not represent formal NICE guidance. For a full list of NICE indicators, see our [menu of indicators](#)

To find out how to use indicators and how we develop them, see our [NICE indicator process guide](#)

Rationale

This indicator measures the percentage of people with dementia who have an annual face-to-face review of their care plan with an aim to encourage the coordinated delivery of health and social care services for people with dementia. Care plans should be agreed with health and social services for people who have dementia and there should be formal reviews at agreed frequencies. Regular review is important because the needs of a person with dementia and his or her carers may change over time. A 12-month timeframe has been selected for this indicator in line with the frequency for review of social care plans recommended by the [Department of Health's report on Prioritising need in the context of Putting People First](#) (2010). A face-to-face review allows primary care practitioners to fully assess the changing needs of people with dementia and their carers and ensure that coordination between health and social services is achieved.

Specification

Numerator: The number of patients in the denominator whose care plan has been reviewed in a face-to-face review in the preceding 12 months.

Denominator: The number of patients on the dementia register.

Calculation: Numerator divided by the denominator, multiplied by 100.

Exclusions: None

Minimum population: The indicator would be appropriate to assess performance at individual general practice level.
